Microchip

MCP6071/2/4

110 μA, High Precision Op Amps

Features

• Low Offset Voltage: ±150 μV (maximum)
• Low Quiescent Current: 110 μA (typical)
• Rail-to-Rail Input and Output
• Wide Supply Voltage Range: 1.8V to 6.0V
• Gain Bandwidth Product: 1.2 MHz (typical)
• Unity Gain Stable
• Extended Temperature Range: -40°C to +125°C
• No Phase Reversal

Applications

• Automotive
• Portable Instrumentation
• Sensor Conditioning
• Battery Powered Systems
• Medical Instrumentation
• Test Equipment
• Analog Filters

Design Aids

• SPICE Macro Models
• FilterLab® Software
• MAPS (Microchip Advanced Part Selector)
• Analog Demonstration and Evaluation Boards
• Application Notes

Typical Application

\[ Z_{IN} = R_L + j\omega C \]

\[ L = R_LRC \]

Description

The Microchip Technology Inc. MCP6071/2/4 family of operational amplifiers (op amps) has low input offset voltage (±150 μV, maximum) and rail-to-rail input and output operation. This family is unity gain stable and has a gain bandwidth product of 1.2 MHz (typical). These devices operate with a single supply voltage as low as 1.8V, while drawing low quiescent current per amplifier (110 μA, typical). These features make the family of op amps well suited for single-supply, high precision, battery-powered applications.

The MCP6071/2/4 family is offered in single (MCP6071), dual (MCP6072), and quad (MCP6074) configurations.

The MCP6071/2/4 is designed with Microchip’s advanced CMOS process. All devices are available in the extended temperature range, with a power supply range of 1.8V to 6.0V.

1.0 ELECTRICAL CHARACTERISTICS

1.1 Absolute Maximum Ratings †

- \( V_{DD} - V_{SS} \) .................................................. 7.0V
- Current at Input Pins .................................................. \( \pm 2 \) mA
- Analog Inputs \((V_{IN+}, V_{IN-})\) †† ................................ \( V_{SS} - 1.0\text{V} \) to \( V_{DD} + 1.0\text{V} \)
- All Other Inputs and Outputs ................................ \( V_{SS} - 0.3\text{V} \) to \( V_{DD} + 0.3\text{V} \)
- Difference Input Voltage .................................... \( |V_{DD} - V_{SS}| \)
- Output Short-Circuit Current ........................................ continuous
- Current at Output and Supply Pins ......................... \( \pm 30 \) mA
- Storage Temperature ............................................ -65°C to +150°C
- Maximum Junction Temperature (TJ) ......................... +150°C
- ESD protection on all pins (HBM; MM) ...................... \( \geq 4 \text{kV; 400V} \)

† Notice: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

†† See 4.1.2 “Input Voltage Limits”

**Note 1:** The internal junction temperature ($T_{J}$) must not exceed the absolute maximum specification of +150°C.
1.3 Test Circuits

The circuit used for most DC and AC tests is shown in Figure 1-1. This circuit can independently set $V_{CM}$ and $V_{OUT}$; see Equation 1-1. Note that $V_{CM}$ is not the circuit's common mode voltage ($(V_P + V_M)/2$), and that $V_{OST}$ includes $V_{OS}$ plus the effects (on the input offset error, $V_{OST}$) of temperature, CMRR, PSRR and $A_{OL}$.

**EQUATION 1-1:**

$$G_{DM} = \frac{R_F}{R_G}$$

$$V_{CM} = \frac{(V_P + V_{DD}/2)}{2}$$

$$V_{OST} = V_{IN-} - V_{IN+}$$

$$V_{OUT} = \left(V_{DD}/2\right) + \left(V_P - V_M\right) + V_{OST}(1 + G_{DM})$$

Where:

- $G_{DM}$ = Differential Mode Gain (V/V)
- $V_{CM}$ = Op Amp’s Common Mode Input Voltage
- $V_{OST}$ = Op Amp’s Total Input Offset Voltage (mV)

**FIGURE 1-1:** AC and DC Test Circuit for Most Specifications.
2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated, $T_A = +25^\circ C$, $V_{DD} = +1.8V$ to $+6.0V$, $V_{SS} = GND$, $V_{CM} = V_{DD}/2$, $V_{OUT} = V_{DD}/2$, $V_L = V_{DD}/2$, $R_L = 10 \, k\Omega$ to $V_L$ and $C_L = 60 \, pF$.

**FIGURE 2-1:** Input Offset Voltage with $V_{DD} = 3.0V$.

**FIGURE 2-2:** Input Offset Voltage Drift with $V_{DD} = 3.0V$ and $T_A \leq +85^\circ C$.

**FIGURE 2-3:** Input Offset Voltage Drift with $V_{DD} = 3.0V$ and $T_A \geq +85^\circ C$.

**FIGURE 2-4:** Input Offset Voltage vs. Common Mode Input Voltage with $V_{DD} = 6.0V$.

3.1 Analog Outputs

The output pins are low-impedance voltage sources.

3.2 Analog Inputs

The non-inverting and inverting inputs are high-impedance CMOS inputs with low bias currents.

3.3 Power Supply Pins

The positive power supply (V_{DD}) is 1.8V to 6.0V higher than the negative power supply (V_{SS}). For normal operation, the other pins are at voltages between V_{SS} and V_{DD}.

Typically, these parts are used in a single (positive) supply configuration. In this case, V_{SS} is connected to ground and V_{DD} is connected to the supply. V_{DD} will need bypass capacitors.

3.4 Exposed Thermal Pad (EP)

There is an internal electrical connection between the Exposed Thermal Pad (EP) and the V_{SS} pin; they must be connected to the same potential on the Printed Circuit Board (PCB).
4.0 APPLICATION INFORMATION

The MCP6071/2/4 family of op amps is manufactured using Microchip’s state-of-the-art CMOS process and is specifically designed for low-power, high precision applications.

4.1 Rail-to-Rail Input

4.1.1 PHASE REVERSAL

The MCP6071/2/4 op amps are designed to prevent phase reversal when the input pins exceed the supply voltages. Figure 2-34 shows the input voltage exceeding the supply voltage without any phase reversal.

4.1.2 INPUT VOLTAGE LIMITS

In order to prevent damage and/or improper operation of these amplifiers, the circuit must limit the voltages at the input pins (see Section 1.1, Absolute Maximum Ratings †).

The ESD protection on the inputs can be depicted as shown in Figure 4-1. This structure was chosen to protect the input transistors and to minimize input bias current (I_B).

![FIGURE 4-1: Simplified Analog Input ESD Structures.](image)

The input ESD diodes clamp the inputs when they try to go more than one diode drop below V_SS. They also clamp any voltages that go well above V_DD; their breakdown voltage is high enough to allow normal operation, but not low enough to protect against slow over-voltage (beyond V_DD) events. Very fast ESD events (that meet the spec) are limited so that damage does not occur.

In some applications, it may be necessary to prevent excessive voltages from reaching the op amp inputs. Figure 4-2 shows one approach to protecting these inputs.

![FIGURE 4-2: Protecting the Analog Inputs.](image)

A significant amount of current can flow out of the inputs when the Common Mode voltage (V_CM) is below ground (V_SS). See Figure 2-36.

4.1.3 INPUT CURRENT LIMITS

In order to prevent damage and/or improper operation of these amplifiers, the circuit must limit the voltages at the input pins (see Section 1.1, Absolute Maximum Ratings †).

Figure 4-3 shows one approach to protecting these inputs. The resistors R1 and R2 limit the possible currents in or out of the input pins (and the ESD diodes, D1 and D2). The diode currents will go through either V_DD or V_SS.

![FIGURE 4-3: Protecting the Analog Inputs.](image)

4.1.4 NORMAL OPERATION

The input stage of the MCP6071/2/4 op amps use two differential input stages in parallel. One operates at a low common mode input voltage (V_CM), while the other operates at a high V_CM. With this topology, the device operates with a V_CM up to 300 mV above V_DD and 300 mV below V_SS. (See Figure 2-13). The input offset voltage is measured at V_CM = V_SS – 0.3V and V_DD + 0.3V to ensure proper operation.

The transition between the input stages occurs when V_CM is near V_DD – 1.1V (See Figures 2-4, 2-5 and Figure 2-6). For the best distortion performance and gain linearity, with non-inverting gains, avoid this region of operation.
4.2 Rail-to-Rail Output

The output voltage range of the MCP6071/2/4 op amps is \( \text{V}_{\text{SS}} + 15 \text{ mV} \) (minimum) and \( \text{V}_{\text{DD}} - 15 \text{ mV} \) (maximum) when \( R_L = 10 \text{ k}\Omega \) is connected to \( \text{V}_{\text{DD}}/2 \) and \( \text{V}_{\text{DD}} = 6.0 \text{ V} \). Refer to Figures 2-27 and 2-28 for more information.

4.3 Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the feedback loop’s phase margin decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response. While a unity-gain buffer (\( G = +1 \)) is the most sensitive to capacitive loads, all gains show the same general behavior.

When driving large capacitive loads with these op amps (e.g., > 100 pF when \( G = +1 \)), a small series resistor at the output (\( R_{ISO} \) in Figure 4-4) improves the feedback loop’s phase margin (stability) by making the output load resistive at higher frequencies. The bandwidth will be generally lower than the bandwidth with no capacitance load.

After selecting \( R_{ISO} \) for your circuit, double-check the resulting frequency response peaking and step response overshoot. Modify \( R_{ISO} \)'s value until the response is reasonable. Bench evaluation and simulations with the MCP6071/2/4 SPICE macro model are very helpful.

4.4 Supply Bypass

With this family of operational amplifiers, the power supply pin (\( \text{V}_{\text{DD}} \) for single-supply) should have a local bypass capacitor (i.e., 0.01 \( \mu \text{F} \) to 0.1 \( \mu \text{F} \)) within 2 mm for good high frequency performance. It can use a bulk capacitor (i.e., 1 \( \mu \text{F} \) or larger) within 100 mm to provide large, slow currents. This bulk capacitor can be shared with other analog parts.

4.5 Unused Op Amps

An unused op amp in a quad package (MCP6074) should be configured as shown in Figure 4-6. These circuits prevent the output from toggling and causing crosstalk. Circuit A sets the op amp at its minimum noise gain. The resistor divider produces any desired reference voltage within the output voltage range of the op amp; the op amp buffers that reference voltage. Circuit B uses the minimum number of components and operates as a comparator, but it may draw more current.
4.6 PCB Surface Leakage

In applications where low input bias current is critical, Printed Circuit Board (PCB) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is $10^{12}\, \Omega$. A 5V difference would cause 5 pA of current to flow; which is greater than the MCP6071/2/4 family's bias current at +25°C (±1.0 pA, typical).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 4-7.

![Guard Ring Diagram](image)

**FIGURE 4-7:** Example Guard Ring Layout for Inverting Gain.

1. **Non-inverting Gain and Unity-Gain Buffer:**
   a. Connect the non-inverting pin ($V_{IN^+}$) to the input with a wire that does not touch the PCB surface.
   b. Connect the guard ring to the inverting input pin ($V_{IN^-}$). This biases the guard ring to the common mode input voltage.

2. **Inverting Gain and Transimpedance Gain Amplifiers** (convert current to voltage, such as photo detectors):
   a. Connect the guard ring to the non-inverting input pin ($V_{IN^+}$). This biases the guard ring to the same reference voltage as the op amp (e.g., $V_{DD}/2$ or ground).
   b. Connect the inverting pin ($V_{IN^-}$) to the input with a wire that does not touch the PCB surface.
4.7 Application Circuits

4.7.1 GYRATOR

The MCP6071/2/4 op amps can be used in gyrator applications. The gyrator is an electric circuit which can make a capacitive circuit behave inductively. Figure 4-8 shows an example of a gyrator simulating inductance, with an approximately equivalent circuit below. The two $Z_{IN}$ have similar values in typical applications. The primary application for a gyrator is to reduce the size and cost of a system by removing the need for bulky, heavy and expensive inductors. For example, RLC bandpass filter characteristics can be realized with capacitors, resistors and operational amplifiers without using inductors. Moreover, gyrators will typically have higher accuracy than real inductors, due to the lower cost of precision capacitors than inductors.

\[
Z_{IN} = R_L + j\omega L \\
L = R_L RC
\]

4.7.2 INSTRUMENTATION AMPLIFIER

The MCP6071/2/4 op amps are well suited for conditioning sensor signals in battery-powered applications. Figure 4-9 shows a two op amp instrumentation amplifier, using the MCP6072, that works well for applications requiring rejection of common mode noise at higher gains. The reference voltage ($V_{REF}$) is supplied by a low impedance source. In single supply applications, $V_{REF}$ is typically  $V_{DD}/2$.

\[
V_{OUT} = (V_1 - V_2)(1 + \frac{R_1}{R_2} + \frac{2R_1}{R_G}) + V_{REF}
\]

4.7.3 PRECISION COMPARATOR

Use high gain before a comparator to improve the latter’s input offset performance. Figure 4-10 shows a gain of 11 V/V placed before a comparator. The reference voltage $V_{REF}$ can be any value between the supply rails.

\[
V_{IN} \quad \frac{+}{-} \quad \frac{1 \text{ M} \Omega}{100 \text{ k} \Omega} \quad V_{REF} \quad \text{MCP6071} \quad \text{MCP6541} \quad V_{OUT}
\]
5.0 DESIGN AIDS

Microchip provides the basic design tools needed for the MCP6071/2/4 family of op amps.

5.1 SPICE Macro Model

The latest SPICE macro model for the MCP6071/2/4 op amps is available on the Microchip web site at www.microchip.com. The model was written and tested in official Orcad (Cadence) owned PSPICE. For the other simulators, it may require translation.

The model covers a wide aspect of the op amp's electrical specifications. Not only does the model cover voltage, current, and resistance of the op amp, but it also covers the temperature and noise effects on the behavior of the op amp. The model has not been verified outside of the specification range listed in the op amp data sheet. The model behaviors under these conditions can not be guaranteed that it will match the actual op amp performance.

Moreover, the model is intended to be an initial design tool. Bench testing is a very important part of any design and cannot be replaced with simulations. Also, simulation results using this macro model need to be validated by comparing them to the data sheet specifications and characteristic curves.

5.2 FilterLab® Software

Microchip’s FilterLab® software is an innovative software tool that simplifies analog active filter (using op amps) design. Available at no cost from the Microchip web site at www.microchip.com/filterlab, the FilterLab design tool provides full schematic diagrams of the filter circuit with component values. It also outputs the filter circuit in SPICE format, which can be used with the macro model to simulate actual filter performance.

5.3 MAPS (Microchip Advanced Part Selector)

MAPS is a software tool that helps semiconductor professionals efficiently identify Microchip devices that fit a particular design requirement. Available at no cost from the Microchip website at www.microchip.com/maps, the MAPS is an overall selection tool for Microchip's product portfolio that includes Analog, Memory, MCUs and DSCs. Using this tool you can define a filter to sort features for a parametric search of devices and export side-by-side technical comparison reports. Helpful links are also provided for Data Sheets, purchase, and sampling of Microchip parts.

5.4 Analog Demonstration and Evaluation Boards

Microchip offers a broad spectrum of Analog Demonstration and Evaluation Boards that are designed to help you achieve faster time to market. For a complete listing of these boards and their corresponding user’s guides and technical information, visit the Microchip web site at www.microchip.com/analotools.

Some boards that are especially useful are:
- MCP6XXX Amplifier Evaluation Board 1
- MCP6XXX Amplifier Evaluation Board 2
- MCP6XXX Amplifier Evaluation Board 3
- MCP6XXX Amplifier Evaluation Board 4
- Active Filter Demo Board Kit
- 5/6-Pin SOT-23 Evaluation Board, P/N VSUPEV2
- 8-Pin SOIC/MSOP/TSSOP/DIP Evaluation Board, P/N SOIC8EV
- 14-Pin SOIC/TSSOP/DIP Evaluation Board, P/N SOIC14EV

5.5 Application Notes

The following Microchip Analog Design Note and Application Notes are available on the Microchip web site at www.microchip.com/appnotes and are recommended as supplemental reference resources.
- ADN003: “Select the Right Operational Amplifier for your Filtering Circuits”, DS21821
- AN722: “Operational Amplifier Topologies and DC Specifications”, DS00722
- AN723: “Operational Amplifier AC Specifications and Applications”, DS00723
- AN884: “Driving Capacitive Loads With Op Amps”, DS00884
- AN990: “Analog Sensor Conditioning Circuits – An Overview”, DS00990
- AN1177: “Op Amp Precision Design: DC Errors”, DS01177
- AN1228: “Op Amp Precision Design: Random Noise”, DS01228
- AN1332: “Current Sensing Circuit Concepts and Fundamentals”, DS01332

These application notes and others are listed in the design guide:
- “Signal Chain Design Guide”, DS21825
6.0 PACKAGING INFORMATION

6.1 Package Marking Information

Legend:

- XX...X Customer-specific information
- Y Year code (last digit of calendar year)
- YY Year code (last 2 digits of calendar year)
- WW Week code (week of January 1 is week ‘01’)
- NNN Alphanumeric traceability code
- \( e3 \) Pb-free JEDEC designator for Matte Tin (Sn)
- * This package is Pb-free. The Pb-free JEDEC designator \( e3 \) can be found on the outer packaging for this package.

Example:

5-Lead SOT-23 (MCP6071)

Example:

8-Lead SOIC (150 mil) (MCP6071, MCP6072)

Example:

8-Lead 2x3 TDFN (MCP6071, MCP6072)

Example:

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.
Package Marking Information (Continuation)

14-Lead SOIC (150 mil) (**MCP6074**)  
Example:

```
XXXXXXXXXXXX
XXXXXXXXXXXX
YYWWNNN
```

14-Lead TSSOP (**MCP6074**)  
Example:

```
XXXXXXXX
YYWW
NNN
```

```
MCP6074
E/SL 1044 256
```
**5-Lead Plastic Small Outline Transistor (OT) [SOT-23]**

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at [http://www.microchip.com/packaging](http://www.microchip.com/packaging)

APPENDIX A:  REVISION HISTORY

Revision B (December 2010)

The following is the list of modifications:

1. Added new SOT-23-5 package type for MCP6071 device.
2. Corrected Figures 2-13, 2-22, 2-23, 2-24, 2-28, 2-29 and 2-34 in Section 2.0 “Typical Performance Curves”.
3. Modified Table 3-1 to show the pin column for MCP6071, SOT-23-5 package.
4. Updated Section 4.1.2 “Input Voltage Limits”.
5. Added Section 4.1.3 “Input Current Limits”.
6. Added new document item in Section 5.5 “Application Notes”.
7. Updated the Product Identification System page.

Revision A (March 2009)

• Original Release of this Document.
PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

c) MCP6074-E/ST: 14LD TSSOP pkg
d) MCP6074T-E/ST: Tape and Reel, 14LD TSSOP pkg
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks
The Microchip name and logo, the Microchip logo, dsPIC, KEELOG, KEELOG logo, MPLAB, PIC, PICmicro, PICSTART, PIC® logo, rPIC and Uni/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MXDEV, MXLAB, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Omniscient Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICKit, PICtail, REAL ICE, rLAB, Select Mode, Total Endurance, TSHARC, UniWinDriver, WiperLock and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

All other trademarks mentioned herein are property of their respective companies.

Printed on recycled paper.

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company’s quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
