Cherry sensors deliver unmatched performance and reliability to a broad range of OEM products. At ZF Electronics GmbH, the owner of the Cherry brand, we specialize in economical sensors that are suitable for the most rigorous environments, including extremes of temperature, humidity, thermal shock and vibration. Choose a standard product, or partner with ZF Electronics design engineers as they help you to develop a custom solution.

Customers in the heavy truck, off highway, recreational vehicle, appliance, automotive and medical markets all rely on Cherry sensors for practical designs and durable products.

High-Performance Sensors for Demanding Environments

Cherry offers seven standard sensor product series:
- MP — Magnetic Position Sensors
- GS — Geartooth Speed Sensors
- SD — Geartooth Speed and Direction Sensors
- VN — Ferrous Vane Sensors
- AN — Angular Position Sensors
- AS — Magnetic Actuators and Mating Connectors
Your Total Design Partner

When you need a custom sensor, Cherry provides the design expertise and development tools needed to bring your product to market quickly. We focus on innovation within our core competencies of magnetics, packaging, electronic design, and sealing technologies to assure our customers reliable sensing solutions.

Consider a few of the capabilities Cherry can deliver to your next custom sensor project:

- Using a solid model design concept developed by the customer, Cherry design engineers apply 3D magnetic modeling to ensure appropriate airgaps and magnetic fields are designed in at the start of the project.

- When harsh environments are involved, Cherry recommends appropriate packaging and sealing technology. Our packaging innovations have resulted in sensors that perform under extreme conditions: temperatures up to 150°C, immersion in solvents to IP68, and exposure to salt spray, dust, gravel and repeated thermal shock.

- With Cherry’s in-house stereolithography and prototype line, we can quickly provide a highly engineered design.

- We match the latest solid state magnetic sensor technologies to proprietary circuits capable of providing EMI, ESD, EMC and Conducted Immunity resistance tough enough to exceed automotive standards.

- To simulate the wide range of environments that our products experience in the field, Cherry’s testing facilities provide concept evaluation, design and product validation, and continuous conformance testing to international standards.

- In-house high-density circuit board assembly assures the quality of our electronics.

- TS-16949 certified factories on multiple continents provide you with advantages in speed, cost and flexibility.

Put Cherry’s broad capabilities to work for you in your most demanding applications.

For more information on Cherry products contact ZF Electronics today.

Notes: These sensors require the use of an external pull-up resistor, the value of which is dependent on the supply voltage. See page 27 for recommendations. Pull-up resistor should be connected between output (Green) and Vcc (Red). Unipolar switch output turns low in presence of magnetic south pole. Bipolar latch output latches high in presence of magnetic south poles and latches low in presence of magnetic north pole.

Applications

- Door position sensing
- Flow sensing
- Pedal switch

Specifications subject to change without notice.
Solid state, magnetic position sensors in adjustable, threaded housing.

Features
- Excellent output stability over operating temperature range
- Regulated power supply not required
- Reverse battery protection to -24 VDC
- Wire: 20 AWG, tin plated, polyolefin insulation
- Anodized aluminum housing
- South pole activated
- RoHS Compliant
- Open Collector (NPN) output can be used with bipolar or CMOS logic circuits with suitable pull up resistor
  - Output switches low (off) when the magnetic field at the sensor exceeds the operate point threshold
  - Output switches high (on) when the magnetic field is reduced to below the release point threshold

Applications
- Limit switch
- Home security
- Door position

**VN1015 Series**

Magnetically activated digital vane sensor in a rugged, overmolded plastic housing with three pins or 3-wire flying leads.

### Features
- Immune to moisture and dust
- Reliable and repeatable
- No mechanical contacts to wear out
- Operates from 4.5 to 24 VDC
- Reverse battery protection to -24 VDC
- RoHS Compliant
- Open collector (sinking or NPN) output can be used with bipolar or CMOS logic circuits with suitable pull up resistor
- Sensor body material: glass-filled polyester
- Recommended vane parameters: low carbon material at least 0.040" thick, should penetrate to a depth < 0.120" from bottom of sensor slot.
- 25 kHz maximum operating speed

**Open Collector Sinking Block Diagram**

Specifications subject to change without notice.
Circuit-protected, Hall-effect geartooth speed sensor with adjustable stainless steel housing.

Features

- Senses motion of ferrous geartooth targets
- Near zero speed sensing capability
- Immune to rotational alignment
- 10 bit dynamic threshold detection offers
  - Automatically adjusting magnetic range
  - Self compensating to target geometry
  - Immune to target run out
- Compatible with unregulated power supply
- Reverse battery protected to -24 VDC
- Internal circuit protection to IEC529 1,000
  - EMI resistant to 10 V/m, 30 MHz to 1 GHz
  - ESD resistant to 4 kV (contact discharge)
  - Fast transient resistant to 2 kV
  - Conducted immunity resistant to 10VRMS@150kHz to 80MHz
  - EMC compatible 30A/m@50Hz

Applications

- CNC machine tools
- Transmission speed
- Industrial feedback control

Open Collector Sinking Block Diagram
GEARTOOTH SPEED SENSOR

GS1012 Series

Flange mount gear sensor rated to 150°C.

Features

- Capable of operating up to 150°C
- Sealed design exceeds IEC60529 IP67 standard for immersion
- Resistant to fuels, solvents, and lubricants associated with engines, transmissions, brakes and chassis systems
- Easily customizable connector orientation
- ESD resistant to 15kV (contact discharge)
- Operates at arbitrarily low speeds
- Mating connector Delphi 12162280

Applications

- Transmission speed
- Wheel speed
- Engine speed
- Anti-lock braking systems

* For continuous operation at 150°C, supply voltage should be limited to 5.5 V max.

** Delphi 12162280

Dimensions  inches (mm)

All tolerances ±0.005 (0.13) unless otherwise noted.

Specifications subject to change without notice.
Hall-effect geartooth speed and direction sensor with adjustable aluminum or flange-mount plastic housing.

Features
- Sense speed and direction of ferrous geartooth targets
- Plastic flange mount sensor rated to 125°C
- Near zero speed sensing capability
- Capable of 8000+ Hz target speed
- 10 bit dynamic threshold detection offers:
  - Automatically adjusting magnetic range
  - Self compensating to target geometry
  - Immune to target run out
- Compatible with unregulated power supply
- Reverse battery protected to -30V DC
- Internal circuit protection to IEC529 1,000
  - EMI resistant to 10 V/m, 30 MHz to 1 GHz
  - ESD resistant to 4 kV (Contact discharge)
  - Fast transient resistant to 2 kV
  - Conducted immunity resistant to 10 VRMS@150kHz to 80MHz
- EMC compatible 30 A/m @ 50 Hz
- Meets IEC60529 IP67 for dust and water protection
  - Integral Connector version: 4-pin
  - Delphi Metri Pack 150.2 No. 12162833.
  - Mates with Terminal No. 12124075.
  - Discrete wire version: 20 AWG, PVC insulation, UL1007/1569

Applications
- Wheel speed and direction
- Transmission speed and direction
- Hoist speed and direction

Notes: SD101201 uses Delphi Metri-Pack 150.2 Series Part No. 12162833. Mating terminal: Delphi Part No. 12124075. A pull up resistor is required between power and each output. Resistor value is dependent upon input voltage. See page 27 for recommendations.

Dimensions inches (mm)
All tolerances ±0.005 (0.13) unless otherwise noted.

Specifications subject to change without notice.
Intrinsically Linear Angular Position Sensor

Features
- Patented non-contact angular position sensor
- Magnet/sensor orientation provides intrinsically linear output up to 85 degrees of electrical rotation (120 degrees mechanical rotation) without need for electrical compensation
- Provided with programmed output or end-user re-programmable to eliminate mechanical and process tolerances in your final assembly
- Adjustable rising or falling output slope with programmable offset, gain temperature compensation, and clamping voltage
- Return spring provides resistance to CCW motion
- Provided with EMI/ESD protection
- Fully encapsulated electronics to IEC 60529 IP67
- ILAPS® technology can be custom packaged to meet your exact requirements (minimum quantities apply)

Applications
- Throttle and valve position sensing
- User interface controls (vehicles, gaming)
- Pedal position sensing
- Implement position sensing
- Gear Selection
- Joystick position

Environmental Specifications
- Vibration: 10G’s peak, 20Hz to 1,000Hz
- Shock: 20G’s, half sine pulse, 13ms duration
- Operating Temperature: -40°C to +125°C
- Storage Temperature: -40°C to +135°C

Electrical Specifications
- Effective Rotational Sensing Range: Maximum 85° electrical output
- Input Voltage: 5.0V ± 10%
- Input Current: 10mA, max. @ 5VDC
- Input Current, Output(s) Shorted to Ground: 25mA, max. per output
- Max Overvoltage: 16VDC
- Sensor Output @ 5VDC: 0.5V to 4.5V Max, programmable within 5% to 95% of the nominal voltage with positive or negative slopes
- Output Linearity @ 5VDC: ± 2%
- Resolution: Analog
- Response Time: 0.23 mSEC
- Bulk Current Injection: SAE J1113-4, 250kHz to 500MHz, 60mA/m
- Conduction and Coupling: SAE J1113-12, ± 200V
- Electronic Discharge: SAE J1113-13, ± 15kV
- Radiated Immunity: SAE J1113-21, 10kHz to 18GHz, 100V/m
- Immunity to Magnetic Fields: SAE J1113-22, 600uT AC Field, 5Hz to 2kHz, 2mT & 1mT DC Field
- Immunity to AC Fields: SAE J1113-26, 15,000V/m
- Radiated Emissions: SAE J1113-41, Class 4

Mechanical Specifications
- Mechanical Travel: 120° CCW maximum rotational travel
- Rotation Torque: 0.12N-m max with return spring
- Mass: 12 grams
- Life: + 10 million full cycles
- Dither (2° Travel): + 80 million cycles
- Mating Connection: Connector: Packard metri-pack 150 12162185
  Terminal: 12124075

AN101101
85° Sensor Output
(Typically Based on 5V Supply)
Programmable, non-contact magnetic position sensors capable of continuous rotation

**Features and Benefits**

- **Angular position with high tolerance for misalignment**
- **Provides non-contact angular position sensing and full 360° rotation**
- **5VDC ratiometric device.**
- **Linear output over specific angular rotation ranges available on request**
- **Sealed design exceeds IEC 60529 IP67 standard for immersion**
- **Performs with AS500106 standard magnetic carrier**
- **Sensor can be programmed for use with custom magnets**
- **Custom programming option for rising or falling output slope with selectable offset, gain, clamp voltage**
- **PWM output option available for custom applications**
- **Provided with EMI/ESD protection to SAE J1113 standards**
- **No mechanical interface means no parts to wear out**

**Description**

The sensor is applied by rotating a magnetic actuator close to the face of the sensor. Output voltage varies with angular position of the magnet relative to the sensor.

Optimal performance is achieved with Cherry’s AS500106 magnetic actuator. Sensor kits including this standard magnet are available

**Applications**

- **Throttle position sensor**
- **Replacement for smart bearings**
- **PRNDL switch for harsh environments**
- **Steer wheel position for drive by wire systems**
- **Pedal position sensor**

Electrical Specifications

- **Effective rotational sensing range**: 0 to 360 degrees of rotation
- **Input Voltage**: 5.0 V DC ± 10 %
- **Max Overvoltage**: 14 V DC reversed voltage -10 V DC
- **Output Current Range**: 8 mA
- **Resolution**: Analog
- **Conduction and Coupling**: SAE J1113-12; ± Level 3
- **Electronic Discharge**: SAE J1113-13; ± 15kV
- **Immunity to Magnetic Fields**: SAE J1113-21
- **Conducted Transient Emissions**: SAE J1113-42
- **Radiated Emissions**: SAE J1113-41; Class 4
- **Output Linearity (with supplied magnet)**: ± 2.5 % Full Scale
- **Analog Output Slew Rate**: 200 V.ms
- **Accuracy**: ± 2 %
- **Operating Temperature**: -40 to 125°C

Magnets

**Actuator Magnet**

**AS101001**

- Easy to install actuator magnet with threaded aluminum holder.
- South pole facing Alnico magnet
- Also available in the same package:
  - **AS101002** with north pole facing Alnico magnet
  - **AS101003** with south pole facing samarium cobalt magnet

**Magnet Carrier**

**AS500106**

- PPS Housing
- SmCo28 Magnet
- Recommended fastener: M4 Cap Screw
- Recommended torque: 3 Nm (26.5 in lbs.)

*Includes AN8 sensor and AS500106 magnetic actuator
Magnetic Reed Sensor

Features
- Hermetically sealed contacts for long life
- Available in SPST-NO/NC & SPDT versions
- Choice of higher electrical rating, magnet, termination, different cable types & cable lengths
- Moisture and dirt resistant
- Magnet available with same housing
- Zero power consumption

Application
- Door sensing

Infrared Vane Sensor

Features
- High-speed capability (> 2.5 m/sec.)
- EMI/EMC compliant
- Encapsulated to meet IP65
- Available in NPN open collector, Opto transistor output
- Wide range of input voltages
- Separate LED indication for power & output
- Choice of different termination & cable lengths
- Highly immune to environmental factors (dust, temperature)

Application
- Floor Level Sensing in High Speed Elevators

Door Information Sensor

Feature
- Ferrite magnet (40 x 25 x 10 mm) or ring magnet separately available
- Latch type

Application
- Door sensing

Cylindrical Proximity Sensor

Features
- NO/NC type contacts available
- Customized wire length
- Available with ferrite magnet (40 x 25 x 10 mm)

Application
- Floor level sensing in elevators
Level Sensor

Features
- External mount
- Fast fitting
- Compact size
- Easily serviceable
- Customized wire length
- Operating temperature – 10°C to + 60°C

Application
- Float and level sensing (water/oil)

Bistable Latch Sensor

Features
- Latch type
- Lifetime: 100,000 operations min.
- Zero power consumption

Application
- Door sensing

ATEX approved Sensor

Features
- Hermatically sealed contacts
- Available in SPST NO/NC version
- Customized cable length and termination
- Resistance to moisture and dirt
- CE & ATEX approvals

Application
- Fuel Dispensing pumps
In General

Airgap
The switching distance of a sensor to a magnet or any other target to be detected depends on several factors, including:
- Sensing characteristics of the sensor
- Magnet material
- Magnet dimensions
- Relative motion of the magnet with respect to the sensor
- Presence of nearby magnetic or ferrous materials

ESD Sensitivity
- Cherry Reed sensors are not solid-state devices and thus immune to ESD
- Several of our solid-state series sensors, among them GS1001-1004, GS1012 and SD1012, are equipped with additional circuitry to enhance ESD immunity. They have been tested for ESD immunity in accordance with IEC publication 1000-4-2 using testing standard EN50082-2.
Other sensors, including MP1013, MP1021, GS1005-1009 and VN1015, should be treated as ESD sensitive and handled like other ESD-sensitive devices.

Connection
Depending on the type and version, Cherry sensors are equipped either with a defined standard connector or with wires for individual connection.

Housing
Cherry sensors are delivered in ready-for-assembly housings for the indicated protection class.

Vane Sensors
These sensors are actuated by vanes passing by the airgap. The ferromagnetic vane thereby changes the magnetic field between the sensor and the magnet in the two arms of the fork.

Vane Material
In general, all ferrous materials should have suitable vanes. We recommend iron or steel.

Vane Dimensions
We recommend a minimum vane material thickness of at least 1 millimeter and minimum width of at least 6.35 millimeters. The vane should penetrate a depth of less than 3 millimeters from the bottom of the sensor slot.

Vane Dimensions mm

Magnetic Proximity Sensors

Hall and Reed sensors, two types of magnetic proximity sensors, are most commonly used for long-life position and presence sensing. Cherry offers a wide range of Hall and Reed sensors.

Different Designs
Hall and Reed sensors differ greatly in the way they function. A Hall sensor is a solid-state device whose output changes when exposed to a magnetic field. A Reed sensor, on the other hand, is electrically switched with tiny contacts that open or close in the absence or presence of a magnetic field.

Different Applications
Both types of sensors can be used for many similar applications, but there also cases where one is clearly better than the other.

Unlimited Lifespan
Thanks to its almost unlimited lifespan, Hall sensors are ideal for gear tooth speed and rotary position sensing. Reed sensors cannot match the virtually infinite life of a Hall sensor.

Energy Efficiency
Reed Sensors have zero power consumption in stand-by mode and are, thus, very energy efficient. In addition, they are immune to ESD. Reed sensors are also frequently used for applications with supply voltages outside the typical 5VDC to 24VDC range of Hall sensors. They can effectively switch 110VAC at low current.

Reed Sensors
Cherry offers Reed sensors in different contact configurations:

- **Normally open (Form A)**: This sensor is normally open in the absence of a magnetic field, and closed near a magnetic field
- **Normally closed (Form B)**: This sensor is closed in the absence of a magnetic field, and open near a magnetic field
- **Changeover (Form C)**: This sensor has three leads representing the normally open, normally closed and common contacts. It is a "changeover" device because the common contact changes from the normally closed to the normally open position when a magnetic field is nearby

Magnetic Poles
Most solid-state sensors of our standard product line are south-pole sensitive. Exceptions: the bipolar latching sensors MP101303 and MP101304, which are latched with a south pole and unlatched with a north pole. The MP1021 series includes both north pole-sensitive devices and latching devices. All of our Reed sensors (MP2007 through MP2019) are omnipolar

Airgap (Distance Sensor – Magnet)
The field strength at various points around a permanent magnet is dependent on several factors, including the shape, size and material of the magnet. Our bipolar latching sensors MP101303 and MP102104 have relatively low gauss thresholds, allowing for somewhat wider airgaps.

Switching Hysteresis
The switching hysteresis is determined by the difference between the sensing face and magnet detection distance as well as the sensing face and magnet release distance.

Sensor Operation

A Reed Sensor is an omnipolar, magnetically activated switch. It can be approached by a magnet from any angle and with either pole. Several possible operating methods are shown below.

---

**Nose-to-nose activation**
- **Perpendicular magnet travel**
- **Parallel magnet travel**
- **Rotational magnet travel**

Both ends of the magnet work equally well

Specifications subject to change without notice.
Geartooth Sensors

The category geartooth sensors comprises speed sensors as well as combined speed and direction sensors.

### Speed and Direction Measurement

The Cherry SD series speed & direction sensors provide both speed and direction output. The SD series sensor incorporates two Hall effect ICs that are slightly offset from one another. Internal conditioning logic analyzes the phase difference between the two sensors to determine the direction of the target rotation.

The standard SD series sensor has two separate digital outputs. It uses an open collector (sinking) output. The speed output switches from high (Vcc) to low (close to zero) when it detects a transition from “no-tooth” to “tooth present.” The separate direction output is high when gear rotation is clockwise, and low when gear rotation is counter-clockwise.

### Operating a Speed Sensor

Although commonly called a geartooth sensor, a solid-state speed sensor can detect the motion of various ferrous objects with some type of discontinuous surface.

Examples of appropriate targets include:
- Sprockets
- Bolt heads
- Roller chains
- Cavities in smooth surfaces

For best results, we recommend targets made from low carbon cold-rolled steel. Other factors that influence sensor performance include geartooth height and width, space between teeth, shape of the teeth and target thickness. As a general guideline, consider a target with the following minimum parameters:

<table>
<thead>
<tr>
<th>Tooth height</th>
<th>Tooth width</th>
<th>Distance between teeth</th>
<th>Target thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 mm (.200&quot;)</td>
<td>2.5 mm (.100&quot;)</td>
<td>10 mm (.400&quot;)</td>
<td>6.25 mm (.250&quot;)</td>
</tr>
</tbody>
</table>

### Orientation

Cherry GS series geartooth sensors are not orientation-sensitive. Cherry SD series speed & direction sensors do have an orientation requirement, and the appropriate orientation is noted on the part itself.

### Operating Life

As a solid-state device with no moving parts, a Cherry geartooth sensor’s operational life is virtually unlimited.

### Frequency

The measuring range is somewhat dependent on the target and particular sensor, but maximum frequency is generally >10 kHz. Care must be taken in calculating the frequency depending on the target geometry. With asymmetrical targets, for example, ones with narrow tooth widths compared to tooth gaps, the time between the leading and trailing edge of the tooth is generally the governing factor. Our sensors have maximum response times from approximately 10 µS (MP series) to 50 µS (GS series) due to internal Hall cell processing schemes. If your response time is close to these numbers, unexpected results, such as lost counts, can occur.

As opposed to a variable reluctance sensor, a Cherry GS series geartooth sensor has an output amplitude that is independent of input frequency. It does not require a minimum speed. However, it does require some initial movement of the target in order to locate the tooth edge. We therefore call it a “near-zero-speed” sensor, whereas others refer to similar products as “zero-speed” sensors.

### Position Sensor with Ring Magnet

Cherry’s solid-state magnetic position sensors also make excellent speed sensors when coupled with a rotating ring magnet. Advantages of this approach include:
- lower sensor cost
- larger airgaps and
- absolute zero-speed sensing.
## Current Sink Interfacing

### 3-Wire Sinking Interface

Sinking outputs are often used in negative logic applications, where a low signal is required for an active state. There, sinking outputs normally have current flowing into the device output lead when the device is active. Also called “open collector outputs,” sinking outputs are compatible with any logic family since a wide voltage range may be used for Vcc. Furthermore, the voltage level used to power the Hall effect assembly may differ from the pull-up resistor to which it is attached. The external pull-up resistor connected between the output and Vcc is required for proper operation. With the resistor connected as shown, the output will be “pulled up” to Vcc when off and (approximately) to ground when on.

### Recommended pull-up resistor values are as follows:

<table>
<thead>
<tr>
<th>Volts dc</th>
<th>Ohms</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>1 k</td>
</tr>
<tr>
<td>9</td>
<td>1.8 k</td>
