

TinkerKit 2/3 Axis Accelerometer

Overview

An **accelerometer** is a device that measures acceleration. It is very common in consumer electronics such as portable electronic devices and video game controllers to detect movement using accelerometers.

Output: This module outputs 0V to 5V on one of its two signal pins when its G-force is changed (e.g. is moved). The value is approximately 2.5V when there is 0G on the X or Y axis. When you connect this module to the input on an Arduino using the TinkerKit Shield, you can expect to read values between 0 to 1023 while moving the module.

Module description: On the back of the module you can find two signal amplifier and a green LED that signals that the module is correctly powered. The module is based on the [LIS344AL](#) by ST Microelectronics, and is a three-axis accelerometer. You can get data about the third axis (referred to as Z) by soldering a header to the thru-hole labeled "Z".

This module is a **SENSOR**. The connector is an **OUTPUT** which must be connected to one of the **INPUT** connectors on the **TinkerKit Shield**.

Datasheet: [LIS344AL](#)

Code Example

```
/*
Double Analog input, Double analog output, serial output

Reads from two analog input pins, a T000020 Accelerometer Module connected
to I0 and I1, maps the result to a range from 0 to 255
and uses the result to set the pulsewidth modulation (PWM) on two T010111
LED Modules connected on O0 and O1.
Also prints the results to the serial monitor.

// These constants won't change. They're used to give names
// to the pins used:
const int analogInPin1 = I0; // Analog input pin that the Accelerometer's
first pin is attached to
const int analogInPin2 = I1; // Analog input pin that the Accelerometer's
second pin is attached to

const int analogOutPin1= O0; // Analog output pin that the LED is attached
to
const int analogOutPin2= O1; // Analog output pin that the LED is attached
to

int sensorValue1 = 0; // value read from the Accelerometer's first pin
int sensorValue2 = 0; // value read from the Accelerometer's second pin

int outputValue1 = 0; // value output to the PWM (analog out)
int outputValue2 = 0; // value output to the PWM (analog out)
```

```
void setup() {  
  // initialize serial communications at 9600 bps:  
  Serial.begin(9600);  
}  
  
void loop() {  
  // read the both analog in values:  
  sensorValue1 = analogRead(analogInPin1);  
  sensorValue2 = analogRead(analogInPin2);  
  // map it to the range of the analog out:  
  outputValue1 = map(sensorValue1, 0, 1023, 0, 255);  
  outputValue2 = map(sensorValue2, 0, 1023, 0, 255);  
  // change the analog out value:  
  analogWrite(analogOutPin1, outputValue1);  
  analogWrite(analogOutPin2, outputValue2);  
  
  // print the results to the serial monitor:  
  Serial.print("accelerometer X = " );  
  Serial.print(sensorValue1);  
  Serial.print("\t accelerometer Y = " );  
  Serial.print(sensorValue2);  
  Serial.print("\t output 1 = " );  
  Serial.print(outputValue1);  
  Serial.print("\t output 2 = " );  
  Serial.println(outputValue2);  
  
  // wait 10 milliseconds before the next loop  
  // for the analog-to-digital converter to settle  
  // after the last reading:  
  delay(10);  
}
```
