

Ultra Low Noise, Precision Voltage Reference

ISL21090

The ISL21090 is a ultra low noise, high DC accuracy precision voltage reference with wide input voltage range. The ISL21090 uses the new Intersil Advanced Bipolar technology to achieve sub $1.0\mu\text{V}_{\text{P-P}}$ (1.25V option) 0.1Hz - 10Hz noise with an initial voltage accuracy of 0.02% (2.5V option).

The ISL21090 offers 2.5V and 1.25V output voltage options with 7ppm/°C temperature coefficient and also provides excellent line and load regulation. These devices are offered in an 8 Ld SOIC package.

The ISL21090 is ideal for high-end instrumentation, data acquisition and processing applications requiring high DC precision where low noise performance is critical.

Features

- Reference Output Voltage Option
 - 1.25V, and 2.5V (Released)
 - 5.0V, 7V, and 10V (Coming Soon)
- Initial Accuracy $\pm 0.02\%$ (2.5V option)
- Output Voltage Noise (0.1Hz to 10Hz) $1.0\mu\text{V}_{\text{P-P}}$ Typ (1.25V Option)
- Supply Current $750\mu\text{A}$ (1.25V Option)
- Temperature Coefficient
 - Grade A - 3ppm/°C Max (Coming Soon)
 - Grade B - 7ppm/°C Max
- Output Current Capability 20mA
- Line Regulation $.8\text{ppm/V}$
- Load Regulation 2.5ppm/mA
- Operating Temperature Range -40°C to $+125^\circ\text{C}$

Applications

- High-End Instrumentation
- Precision Voltage Sources for Data Acquisition System, Industrial Control, Communication Infrastructure
- Process Control and Instrumentations
- Active Source for Sensors

ISL21090BFB825Z-TK	21090 BFZ25	2.5	0.02	7	-40 to +125	8 Ld SOIC	M8.15E
<i>Coming Soon</i> ISL21090AFB825Z-TK	21090AF Z25	2.5	0.02	3	-40 to +125	8 Ld SOIC	M8.15E

NOTES:

1. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [ISL21090](#). For more information on MSL please see Tech Brief [TB363](#).

ISL21090

Absolute Maximum Ratings

Max Voltage	
V_{IN} to GND	-0.5V to +40V
V_{OUT} to GND (10s)	-0.5V to $V_{OUT} + 0.5V$
Voltage on any Pin to Ground	-0.5V to $+V_{OUT} + 0.5V$
Voltage on DNC pins	No connections permitted to these pins
Input Voltage Slew Rate (Max)	0.1V/ μ s
ESD Ratings	
Human Body Model	3kV
Machine Model	200V
Charged Device Model	2kV

Thermal Information

Thermal Resistance (Typical)	θ_{JA} ($^{\circ}$ C/W)	θ_{JC} ($^{\circ}$ C/W)
8 Ld SOIC Package (Notes 4, 5)	110	60
Continuous Power Dissipation ($T_A = +125^{\circ}$ C)	.217mW	
Maximum Junction Temperature (T_{JMAX})	+150 $^{\circ}$ C	
Storage Temperature Range	-65 $^{\circ}$ C to +150 $^{\circ}$ C	
Pb-Free Reflow Profile (Note 6)	see link below	
	http://www.intersil.com/pbfree/Pb-FreeReflow.asp	

Recommended Operating Conditions

Temperature Range (Industrial)	-40 $^{\circ}$ C to +125 $^{\circ}$ C
--------------------------------	---------------------------------------

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief [TB379](#) for details.
- For θ_{JC} , the "case temp" location is taken at the package top center.
- Post-reflow drift for the ISL21090 devices can exceed 100 μ V to 1.0mV based on experimental results with devices on FR4 double sided boards. The system engineer must take this into account when considering the reference voltage after assembly.

Electrical Specifications $V_{IN} = 5V$ (1.25V option), $I_{OUT} = 0$, $C_L = 0.1\mu F$ and $C_c = 0.01\mu F$, unless otherwise specified. **Boldface limits apply over the operating temperature range, -40 $^{\circ}$ C to +125 $^{\circ}$ C.**

PARAMETER	DESCRIPTION	CONDITIONS	MIN (Note 7)	TYP	MAX (Note 7)	UNIT

V_N	Broadband Voltage Noise	$10Hz \leq f \leq 1kHz$, $V_{OUT} = 2.5V$		1.6		μV_{RMS}
	Noise Density	$f = 1kHz$, $V_{OUT} = 2.5V$		50		nV/ \sqrt{Hz}
$\Delta V_{OUT} / \Delta t$	Long Term Stability	$T_A = +25^\circ C$		20		ppm

NOTES:

- Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design.
- $V_{IN}-V_{OUT}$ measured at the point where V_{OUT} drops 1mV from the nominal measured value.
- Over the specified temperature range. Temperature coefficient is measured by the box method whereby the change in V_{OUT} is divided by the temperature range; in this case, $-40^\circ C$ to $+125^\circ C = +165^\circ C$.
- Dropout Voltage is the minimum $V_{IN} - V_{OUT}$ differential voltage measured at the point where V_{OUT} drops 1mV from $V_{IN} = nominal$ at $T_A = +25^\circ C$.

Device Operation

Precision Bandgap Reference

The ISL21090 uses a bandgap architecture and special trimming circuitry to produce a temperature compensated, precision voltage reference with high input voltage capability and moderate output current drive. Low noise performance is achieved using optimized biasing techniques. Key features for precision low noise portable applications, such as handheld meters and instruments are supply current (900 μ A) and noise (0.1Hz to 10Hz bandwidth) 1.0 μ V_{P-P} to 1.9 μ V_{P-P}. Data Converters in particular can utilize the ISL21090 as an external voltage reference. Low power DAC and ADC circuits will realize maximum resolution with lowest noise. The device maintains output voltage during conversion cycles with fast response, although it is helpful to add an output capacitor, typically 1 μ F. In case of the 1.25V option, a 0.01 μ F capacitor must be added to the COMP (pin 3) for stabilization purposes. and a minimum of 0.1 μ F capacitor must be added at the output.

Applications Information

Board Mounting Considerations

For applications requiring the highest accuracy, the board mounting location should be reviewed. The device uses a plastic SOIC package, which subjects the die to mild stresses when the printed circuit (PC) board is heated and cooled, which slightly changes the shape. Because of these die stresses, placing the device in areas subject to slight twisting can cause degradation of reference voltage accuracy. It is normally best to place the device near the edge of a board, or on the shortest side, because the axis of bending is most limited in that location. Mounting the device in a cutout also minimizes flex. Obviously, mounting the device on flexprint or extremely thin PC material will likewise cause loss of reference accuracy.

Board Assembly Considerations

Some PC board assembly precautions are necessary. Normal output voltage shifts of 100 μ V to 500 μ V can be expected with Pb-free reflow profiles or wave solder on multi-layer FR4 PC boards. Precautions should be taken to avoid excessive heat or extended exposure to high reflow or wave solder temperatures.

Noise Performance and Reduction

The output noise voltage in a 0.1Hz to 10Hz bandwidth is typically 1.9 μ V_{P-P} ($V_{OUT} = 2.5V$). The noise measurement is made with a bandpass filter. The filter is made of a 1-pole high-pass filter, with a corner frequency at 0.1Hz, and a 2-pole low-pass filter, with a corner frequency (3dB) at 9.9Hz, to create a filter with a 9.9Hz bandwidth. Noise in the 10Hz to 1kHz bandwidth is approximately 1.6 μ V_{RMS} ($V_{OUT} = 2.5V$), with 0.1 μ F capacitance on the output. This noise measurement is made with a 2 decade bandpass filter. The filter is made of a 1-pole high-pass filter with a corner frequency at 10Hz of the center frequency, and 1-pole low-pass filter with a corner frequency at 1kHz. Load capacitance up to 10 μ F can be added but will result in only marginal improvements in output noise and transient response.

Turn-On Time

Normal turn-on time is typically 150 μ s, as shown in Figure 28. The circuit designer must take this into account when looking at power-up delays or sequencing.

Temperature Coefficient

The limits stated for temperature coefficient (Tempco) are governed by the method of measurement. The overwhelming standard for specifying the temperature drift of a reference is to measure the reference voltage at two temperatures, take the total variation, ($V_{HIGH} - V_{LOW}$), and divide by the temperature extremes of measurement ($T_{HIGH} - T_{LOW}$). The result is divided by the nominal reference voltage (at $T = +25^{\circ}C$) and multiplied by 10^6 to yield ppm/ $^{\circ}C$. This is the "Box" method for specifying temperature coefficient.

Output Voltage Adjustment

The output voltage can be adjusted above and below the factory-calibrated value via the trim terminal. The trim terminal is the negative feedback divider point of the output op amp. The positive input of the amplifier is about 1.216V, and in feedback, so will be the trim voltage. The trim terminal has a 5000 Ω resistor to ground internally, and in the case of the 2.5V output version, there is a feedback resistor of approximately 5000 Ω from V_{OUT} to trim.

The suggested method to adjust the output is to connect a very high value external resistor directly to the trim terminal and connect the other end to the wiper of a potentiometer that has a much lower total resistance and whose outer terminals connect to V_{OUT} and ground. If a 1M Ω resistor is connected to trim, the output adjust range will be $\pm 6.3mV$. It is important to minimize the capacitance on the trim terminal to preserve output amplifier stability. It is also best to connect the series resistor directly to the trim terminal, to minimize that capacitance and also to minimize noise injection. Small trim adjustments will not disturb the factory-set temperature coefficient of the reference, but trimming near the extreme values can.

DATE	REVISION	CHANGE
March 5, 2012	FN6993.1	Added 1.25V option "Electrical Specifications" table to page 3. Added 1.25V Typical Performance Curves section. Changed MIN limit for V_{IN} 2.5V option on page 4.
June 8, 2011	FN6993.0	Initial Release

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: [ISL21090](http://intersil.com/ISL21090)

To report errors or suggestions for this datasheet, please go to: www.intersil.com/askourstaff

FITs are available from our website at: <http://rel.intersil.com/reports/search.php>

For additional products, see www.intersil.com/product_tree

Intersil products are manufactured, assembled and tested utilizing ISO9000 quality systems as noted in the quality certifications found at www.intersil.com/design/quality

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use.
