Package

General Description

- N channel vertical power MOSFET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS® technology.
- Providing embedded protective functions

Applications

- μ C compatible high-side power switch with diagnostic feedback for 12V and 24V grounded loads
- All types of resistive, inductive and capacitive loads
- Most suitable for loads with high inrush currents, so as lamps
- Replaces electromechanical relays, fuses and discrete circuits

Basic Functions

- Very low standby current
- CMOS compatible input
- Improved electromagnetic compatibility (EMC)
- Fast demagnetization of inductive loads
- Stable behaviour at undervoltage
- Wide operating voltage range
- Logic ground independent from load ground

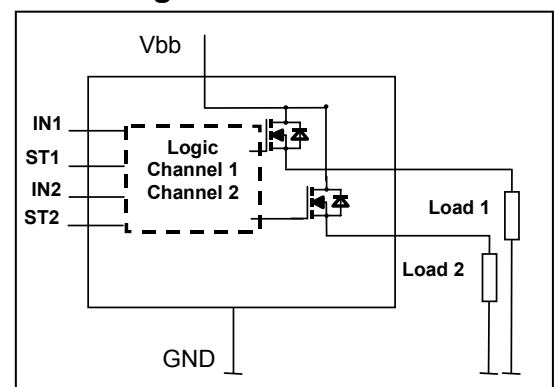

Protection Functions

- Short circuit protection
- Overload protection
- Current limitation
- Thermal shutdown
- Overvoltage protection (including load dump) with external resistor
- Reverse battery protection with external resistor
- Loss of ground and loss of V_{bb} protection
- Electrostatic discharge protection (ESD)

Diagnostic Function

- Diagnostic feedback with open drain output
- Open load detection in OFF-state
- Feedback of thermal shutdown in ON-state

Pin Definitions and Functions

| Pin | Symbol | Function |
|--------------|----------|---|
| 1,7, 8,14 | V_{bb} | Positive power supply voltage. Design the wiring for the simultaneous max. short circuit currents from channel 1 to 2 and also for low thermal resistance |
| 2 | GND | Logic Ground |
| 3 | IN1 | Input 1,2 activates channel 1,2 in case of logic high signal |
| 5 | IN2 | |
| 4 | ST1 | Diagnostic feedback 1,2 of channel 1,2 open drain |
| 6 | ST2 | |
| 12,13 | OUT1 | Output 1,2 protected high-side power output of channel 1,2. Design the wiring for the max. short circuit current; both output pins have to be connected in parallel for operation according this spec. |
| 9,10 | OUT2 | |
| 11 | NC | Not Connected |

1) Supply voltages higher than $V_{bb(AZ)}$ require an external current limit for the GND and status pins (a 150 Ω resistor for the GND connection is recommended).

2) R_l = internal resistance of the load dump test pulse generator

3) $V_{Load\ dump}$ is setup without the DUT connected to the generator per ISO 7637-1 and DIN 40839

4) Device on 50mm*50mm*1.5mm epoxy PCB FR4 with 6cm² (one layer, 70 μm thick) copper area for V_{bb} connection. PCB is vertical without blown air. See page 14

5) only for testing

¹⁰⁾ is the voltage, where the device doesn't change its switching condition for 15ms after the supply voltage falling below the lower limit of $V_{bb(\text{on})}$

¹¹⁾ not subject to production test, specified by design

¹²⁾ Supply voltages higher than $V_{bb(\text{AZ})}$ require an external current limit for the GND and status pins (a 150 Ω resistor for the GND connection is recommended). See also $V_{\text{ON}(\text{CL})}$ in table of protection functions and circuit diagram on page 9.

¹³⁾ Measured with load; for the whole device; all channels off

¹⁴⁾ Add I_{ST} , if $I_{\text{ST}} > 0$

¹⁵⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

¹⁶⁾ If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest $V_{\text{ON}(\text{CL})}$

¹⁷⁾ Requires a 150 Ω resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Power dissipation is higher compared to normal operating conditions due to the voltage drop across the drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 4 and circuit page 9).

¹⁸⁾ If ground resistors R_{GND} are used, add the voltage drop across these resistors.

¹⁹⁾ not subject to production test, specified by design

Truth Table

(each channel)

| | IN | OUT | ST |
|------------------|----|-----|------------------|
| Normal operation | L | L | H |
| | H | H | H |
| Open load | L | Z | L ²⁰⁾ |
| | H | H | H |
| Overtemperature | L | L | H |
| | H | L | L |

L = "Low" Level X = don't care Z = high impedance, potential depends on external circuit
H = "High" Level Status signal valid after the time delay shown in the timing diagrams

Parallel switching of channel 1 and 2 is easily possible by connecting the inputs and outputs in parallel (see truth table). If switching channel 1 to 2 in parallel, the status outputs ST1 and ST2 have to be configured as a 'Wired OR' function with a single pull-up resistor.

Terms

Leadframe (V_{bb}) is connected to pin 1,7,8,14

External R_{GND} optional; single resistor $R_{GND} = 150 \Omega$ for reverse battery protection up to the max. operating voltage.

²⁰⁾ L, if potential at the Output exceeds the OpenLoad detection voltage

Input circuit (ESD protection), IN1 or IN2

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

Status output, ST1 or ST2

ESD-Zener diode: 6.1 V typ., max 0.3 mA; $R_{ST(ON)} < 375 \Omega$ at 1.6 mA. The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

Inductive and overvoltage output clamp, OUT1 or OUT2

V_{ON} clamped to $V_{ON(CL)} = 47 \text{ V typ.}$

Overvolt. and reverse batt. protection

$V_{Z1} = 6.1 \text{ V typ.}$, $V_{Z2} = 47 \text{ V typ.}$, $R_{GND} = 150 \Omega$, $R_{ST} = 15 \text{ k}\Omega$, $R_1 = 3.5 \text{ k}\Omega \text{ typ.}$

In case of reverse battery the load current has to be limited by the load. Temperature protection is not active

Open-load detection, OUT1 or OUT2

OFF-state diagnostic condition:

Open Load, if $V_{OUT} > 3 \text{ V typ.}$; IN low

GND disconnect

Any kind of load. In case of IN=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$. Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

GND disconnect with GND pull up

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off
 Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

V_{bb} disconnect with energized inductive load

For inductive load currents up to the limits defined by Z_L (max. ratings and diagram on page 10) each switch is protected against loss of V_{bb} .

Consider at your PCB layout that in the case of V_{bb} disconnection with energized inductive load all the load current flows through the GND connection.

Inductive load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left(1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

Maximum allowable load inductance for a single switch off (one channel)⁴⁾

$$L = f(I_L); T_{j,start} = 150^\circ C, V_{bb} = 12 V, R_L = 0 \Omega$$

Typ. on-state resistance

$R_{ON} = f(V_{bb}, T_j); I_L = 2\text{ A}, I_N = \text{high}$

Typ. standby current

$I_{bb(off)} = f(T_j); V_{bb} = 9...34\text{ V}, I_{N1,2} = \text{low}$
