Features:

- Low Supply Current: 1 µA (Typical), 10 µA (Max.)
- Precision Monitoring Trip Point Options:
  - 2.9V and 4.6V (Standard Offerings)
  - 2.0V to 4.7V in 100 mV Increments,
    (Contact the local Microchip Sales Office)
- Resets Microcontroller in a Power-loss Event
- Reset Delay Time-Out Option:
  - 1.4 ms, 30 ms, 200 ms, or 1.6s (Typical)
- Watchdog Timer Input Time-Out Options:
  - 6.3 ms, 102 ms, 1.6s, or 25.6s (Typical)
- Manual Reset (MR) Input (Active-low)
- Single and Complementary Reset Output(s)
- Reset Output Options:
  - Push-Pull (Active-high or Active-low)
  - Open-Drain (Internal or External Pull-up)
- Temperature Range:
  - -40°C to +85°C for Trip Points 2.0 to 2.4V and,
  - -40°C to +125°C for Trip Points > 2.5V
- Voltage Range: 1.0V to 5.5V
- Lead Free Packaging

Description:

The MCP131X/2X are voltage supervisor devices designed to keep a microcontroller in Reset until the system voltage has reached and stabilized at the proper level for reliable system operation. The table below shows the available features for these devices.

Device Features

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

Supply Voltage (VDD to VSS) . . . . . . . . . . . . . . . . 7.0V
Input current (VDD) . . . . . . . . . . . . . . . . . . . . . . . . . . .10 mA
Output current (RST) . . . . . . . . . . . . . . . . . . . . . . . . . . .10 mA
Voltage on all inputs and outputs, except Open-Drain RST
(with no internal pull-up resistor), w.r.t. VSS . .-0.6V to (VDD + 1.0V)
Voltage on Open-Drain RST
(with no internal pull-up resistor) w.r.t. VSS . . -0.6V to 13.5V
Storage temperature . . . . . . . . . . . . . . . . . .-65°C to +150°C
Ambient temp. with power applied . . . . . . . .-40°C to +125°C
Maximum Junction temp. with power applied . . . . . . +150°C
Power Dissipation (TA ≤ +70°C):
5-Pin SOT-23A .......................................................240 mW
ESD protection on all pins ...........................................≥ 4 kV

† Notice: Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, all limits are specified for VDD = 1V to 5.5V, RPU = 100 kΩ (only MCP1320, MCP1321 and MCP1322), TA = -40°C to +125°C.

</table>

Note 1: Trip point is ±1.5% from typical value.
2: Trip point is ±2.5% from typical value.
3: Hysteresis is minimum = 1%, maximum = 6% at +25°C.
4: This specification allows this device to be used in PIC® microcontroller applications that require the In-Circuit Serial Programming™ (ICSP™) feature (see device-specific programming specifications for voltage requirements). The total time that the RST pin can be above the maximum device operational voltage (5.5V) is 100s. Current into the RST pin should be limited to 2 mA. It is recommended that the device operational temperature be maintained between 0°C to +70°C (+25°C preferred). For additional information, refer to Figure 2-35.
5: This parameter is established by characterization and is not 100% tested.
6: Custom ordered voltage trip point; minimum order volume requirement. Information available upon request.
## DC CHARACTERISTICS (CONTINUED)

### Electrical Specifications:
Unless otherwise indicated, all limits are specified for $V_{DD} = 1V$ to 5.5V, $R_{PU} = 100 \, k\Omega$ (only MCP1320, MCP1321, and MCP1322), $T_A = -40^\circ C$ to $+125^\circ C$.

**Note:**
1. Trip point is ±1.5% from typical value.
2. Trip point is ±2.5% from typical value.
3. Hysteresis is minimum = 1%, maximum = 6% at +25°C.
4. This specification allows this device to be used in PIC® microcontroller applications that require the In-Circuit Serial Programming™ (ICSP™) feature (see device-specific programming specifications for voltage requirements). The total time that the RST pin can be above the maximum device operational voltage (5.5V) is 100s. Current into the RST pin should be limited to 2 mA. It is recommended that the device operational temperature be maintained between 0°C to +70°C (+25°C preferred). For additional information, refer to Figure 2-35.
5. This parameter is established by characterization and is not 100% tested.
6. Custom ordered voltage trip point; minimum order volume requirement. Information available upon request.
### DC CHARACTERISTICS (CONTINUED)

**Note 1:** Open-Drain output with internal pull-up resistor.
3.1 Ground Terminal (VSS)

VSS provides the negative reference for the analog input voltage. Typically, the circuit ground is used.

3.2 Supply Voltage (VDD)

VDD can be used for power supply monitoring or a voltage level that requires monitoring.

3.3 Reset Output (RST and RST)

There are four types of Reset output pins. These are:

1. Open-Drain active-low Reset, External pull-up resistor required
2. Open-Drain active-low Reset, Internal pull-up resistor
3. Push-Pull active-low Reset
4. Push-Pull active-high Reset

Some devices have both an active-low and active-high Reset output.

3.3.1 ACTIVE-LOW (RST) – OPEN-DRAIN, EXTERNAL PULL-UP RESISTOR

The RST open-drain output remains low while VDD is below the Reset voltage threshold (VTRIP). Once the device voltage (VDD) returns to a high level (VTRIP + VHY), the device will remain in Reset for the Reset delay timer (TRST). After that time expires, the RST pin will float, and an external pull-up resistor is required to bring the output to the high state.

3.3.2 ACTIVE-LOW (RST) – OPEN-DRAIN, INTERNAL PULL-UP RESISTOR

The RST open-drain output remains low while VDD is below the Reset voltage threshold (VTRIP). Once the device voltage (VDD) returns to a high level (VTRIP + VHY), the device will remain in Reset for the Reset delay timer (TRST). After that time expires, the RST pin will be pulled high by an internal pull-up resistor (typically 4.7 kΩ).

3.3.3 ACTIVE-LOW (RST) – PUSH-PULL

The RST push-pull output remains low while VDD is below the Reset voltage threshold (VTRIP). Once the device voltage (VDD) returns to a high level (VTRIP + VHY), the device will remain in Reset for the Reset delay timer (TRST). After that time expires, the RST pin will be driven to the high state.

3.3.4 ACTIVE-HIGH (RST) – PUSH-PULL

The RST push-pull output remains high while VDD is below the Reset voltage threshold (VTRIP). Once the device voltage (VDD) returns to a high level (VTRIP + VHY), the device will remain in Reset for the Reset delay timer (TRST). After that time expires, the RST pin will be driven to the low state.

3.4 Manual Reset Input (MR)

The Manual Reset (MR) input pin allows a push button switch to easily be connected to the system. When the push button is depressed, it forces a system Reset. This pin has circuitry that filters noise that may be present on the MR signal.

The MR pin is active-low and has an internal pull-up resistor.

3.5 Watchdog Input

In some systems, it is desirable to have an external Watchdog Timer to monitor the operation of the system. This is done by requiring the embedded controller to “pet” the Watchdog Timer within a predetermined time frame (TWD). If the MCP131X/2X is not “petted” within this time frame, the MCP131X/2X will force the Reset pin(s) active.

The embedded controller “pets” the MCP131X/2X by forcing an edge transition on the WDI pin. The WDT Timer is activated by the first falling edge on the WDI pin.

The standard offering devices have a typical Watchdog Timer period (TWD) of 1.6 s. Table 1-3 shows the available Watchdog Timer periods.
4.0 OPERATIONAL DESCRIPTION

For many of today's microcontroller applications, care must be taken to prevent low-power conditions that can cause many different system problems. The most common causes are brown-out conditions, where the system supply drops below the operating level momentarily. The second most common cause is when a slowly decaying power supply causes the microcontroller to begin executing instructions without sufficient voltage to sustain volatile memory (RAM), thus producing indeterminate results. Figure 4-1 shows a typical application circuit.

The MCP131X/2X family of voltage supervisor devices are designed to keep a microcontroller in Reset, until the system voltage has reached and stabilized at the proper level for reliable system operation. These devices also operate as protection from brown-out conditions when the system supply voltage drops below a safe operating level.

Some MCP131X/2X family members include a Watchdog Timer feature that after being enabled (by a falling edge on the WDI pin), monitors the WDI pin for falling or rising edges. If an edge transition is not detected within the expected time frame, the MCP131X/2X devices will force the Reset pin active. This is useful to ensure that the embedded system's Host Controller program is operating as expected.

Some MCP131X/2X family members include a Manual Reset feature that allow a push button switch to be directly connected to the MCP131X/2X devices (on the MR pin). This allows the system to easily be reset from the external control of the push button switch.

A superset block diagram is shown in Figure 4-2, with device specific block diagrams shown in Figure 4-3 through Figure 4-12.

Note 1: Resistor $R_{PU}$ may be required with the MCP1320, MCP1321 or MCP1322 due to the open-drain output. Resistor $R_{PU}$ may not be required with the MCP1316M, MCP1318M or MCP1319M due to the internal pull-up resistor. The MCP1316, MCP1317, MCP1318 and MCP1319 do not require the external pull-up resistor.

2: Not all devices offer the active-high Reset output pin.

FIGURE 4-11: MCP1321 Block Diagram.

FIGURE 4-12: MCP1322 Block Diagram.
4.1 Reset Voltage Trip Point ($V_{\text{TRIP}}$) Operation

The device’s Reset voltage trip point ($V_{\text{TRIP}}$) is selected when the device is ordered. As the voltage on the device’s $V_{\text{DD}}$ pin is above or below this selected trip point, the output of the Reset pin (RST/RST) will be forced to either the inactive or active state.

For the voltage trip point, there is a minimum trip voltage ($V_{\text{TRIPMIN}}$) and a maximum trip voltage ($V_{\text{TRIPMAX}}$). The voltage that the device “actually” trips at will be referred to as $V_{\text{TRIP}}$. The trip voltage is specified for the falling of the device $V_{\text{DD}}$.

There is also a hysteresis ($V_{\text{HYS}}$) on the trip point. This is so that noise on the device voltage ($V_{\text{DD}}$) does not cause the Reset pin (RST/RST) to “jitter” (change between driving an active and inactive state).

The Reset pin (RST or RST) will be forced active if any of the following occur:

- The Manual Reset input (MR) goes low
- The Watchdog Timer times out
- $V_{\text{DD}}$ goes below the threshold
- During device power-up

After the device exits the Reset condition, the delay circuitry will hold the RST and RST pins active until the appropriate Reset delay time ($t_{\text{RST}}$) has elapsed.

</table>

Note: 1: Requires External Pull-up resistor.
       2: Has Internal Pull-up resistor.
       3: The RST pin output is always push-pull.
4.1.1 POWER-UP/RISING VDD

As the device VDD rises, the device’s Reset circuit will remain active until the voltage rises above the “actual” trip point (VTRIP) plus the hysteresis (VHYS).

Figure 4-13 shows a power-up sequence and the waveform of the RST and RST pins.

As the device powers up, the voltage will start below the valid operating voltage of the device. At this voltage, the Reset output value is not valid. Once the voltage is above the minimum operating voltage (1V) and below the selected VTRIP, the Reset output will be active.

Once the device voltage rises above the “actual” trip point (VTRIP) plus the hysteresis (VHYS), the Reset delay timer (tRST) starts. When the Reset delay timer times out, the Reset output (RST/RST) is driven inactive.

Note: While the Reset delay timer (tRST) is active, additional system current is consumed.

4.1.2 POWER-DOWN/BROWN-OUTS

As the device powers-down/brown-outs, the voltage (VDD) falls from a voltage above the device’s trip point (VTRIP). The device’s “actual” trip point voltage (VTRIP) will be between the minimum trip point (VTRIPMIN) and the maximum trip point (VTRIPMAX). Once the device voltage (VDD) goes below this voltage, the Reset pin(s) will be forced to the active state. There is a hysteresis on this trip point. This is so noise on the device voltage (VDD) does not cause the Reset pin (RST/RST) to “jitter” (change between driving an active and inactive).

Figure 4-14 shows the waveform of the RST pin as determined by the VDD voltage, while Table 4-1 shows the state of the RST pin.

4.1.2.1 Operation of RST pin with Internal Pull-Up Resistor

Note: Only the MCP1316M, MCP1318M and MCP1319M devices have an open-drain RST output pin with an internal pull-up resistor.

The internal pull-up resistor has a typical value of 4.7 kΩ. The internal pull-up eliminates the need for an external resistor.

To reduce the current consumption of the device, when the RST pin is driving low, the resistor is disconnected.
4.2 Reset Delay Timer (t_RST)

The Reset delay timer ensures that the MCP131X/2X device will "hold" the embedded system in Reset until the system voltage has stabilized. There are several time-out options to better meet the requirements of different applications. These Reset delay timer time-outs are shown in Table 4-2. The Standard offering time-out is typically 200 ms.

The Reset delay timer (t_RST) starts after the device voltage rises above the "actual" trip point (V_TRIP) plus the hysteresis (V_HYS). When the Reset delay timer times-out, the Reset output pin (RST/RST) is driven inactive.

Note: While the Reset delay timer (t_RST) is active, additional system current is consumed.

<table>

</tbody>
</table>

This is the minimum time that the Reset delay timer will "hold" the Reset pin active after V_DD rises above V_TRIP + V_HYS

This is the maximum time that the Reset delay timer will "hold" the Reset pin active after V_DD rises above V_TRIP + V_HYS

Note 1: Shaded rows are custom ordered time outs.

4.2.1 EFFECT OF TEMPERATURE ON RESET POWER-UP TIMER (T_RPU)

The Reset delay timer time-out period (t_RST) determines how long the device remains in the Reset condition. This time-out is affected by both the device V_DD and temperature. Typical responses for different V_DD values and temperatures are shown in Figures 2-33, 2-32 and 2-31.
4.3 Negative Going $V_{DD}$ Transients

The minimum pulse width (time) required to cause a Reset may be an important criteria in the implementation of a Power-on Reset (POR) circuit. This time is referred to as transient duration. The MCP131X/2X devices are designed to reject a level of negative-going transients (glitches) on the power supply line.

Transient duration is the amount of time needed for these supervisory devices to respond to a drop in $V_{DD}$. The transient duration time ($t_{TRAN}$) is dependant on the magnitude of $V_{TRIP} - V_{DD}$ (overdrive). Any combination of duration and overdrive that lies under the duration/overdrive curve will not generate a Reset signal. Generally speaking, the transient duration time decreases with, and increases in, the $V_{TRIP} - V_{DD}$ voltage. Combinations of duration and overdrive that lie above the duration/overdrive curve are detected as a brown-out or power-down condition.

Figure 4-16 shows a typical transient duration versus Reset comparator overdrive, for which the MCP131X/2X will not generate a Reset pulse. It shows that the farther below the trip point the transient pulse goes, the duration of the pulse required to cause a Reset gets shorter. Figure 4-16 shows the transient response characteristics for the MCP131X/2X.

Transient immunity can be improved by adding a bypass capacitor (typically 0.1 µF) as close as possible to the $V_{DD}$ pin of the MCP131X/2X device.

4.4 Manual Reset Input

The Manual Reset input pin (MR) allows the Reset pins (RST/DIRST) to be manually forced to their active states. The MR pin has circuitry to filter noise pulses that may be present on the pin. Figure 4-17 shows a block diagram for using the MCP131X/2X with a push-button switch. To minimize the required external components, the MR input has an internal pull-up resistor.

A mechanical push button or active logic signal can drive the MR input.

Once MR has been low for a time, $t_{MRD}$ (the Manual Reset delay time), the Reset output pins are forced active. The Reset output pins will remain in their active states for the Reset delay timer time-out period ($t_{RST}$). Figure 4-18 shows a waveform for the Manual Reset switch input and the Reset pins output.

4.4.1 NOISE FILTER

The noise filter filters out noise spikes (glitches) on the Manual Reset pin (MR). Noise spikes less than 100 ns (typical) are filtered.
4.5 Watchdog Timer

The purpose of the Watchdog Timer (WDT) is to increase system reliability. The Watchdog Timer feature can be used to detect when the Host Controller’s program flow is not as expected. The Watchdog Timer monitors for activity on the Watchdog Input pin (WDI). The WDI pin is expected to be strobed within a given time frame. When this time frame is exceeded, without an edge transition on the WDI pin, the Reset pin is driven active to reset the system. This stops the Host Controller from continuing its erratic behavior (“run-away” code execution).

The Watchdog Timer is external to the main portion of the control system and monitors the operation of the system. This feature is enabled by a falling edge on the WDI pin (after device POR). Monitoring is then done by requiring the embedded controller to force an edge transition (falling or rising) on the WDI pin (“pet the Watchdog”) within a predetermined time frame (T_{WD}). If the MCP131X/2X does not detect an edge on the WDI pin within the expected time frame, the MCP131X/2X device will force the Reset pin active.

The Watchdog Timer is in the disabled state when:
- The Device Powers up
- A POR event occurred
- A WDT event occurred
- A Manual Reset (MR) event occurred

When the Watchdog Timer is in the disabled state, the WDI pin has an internal smart pull-up resistor enabled. This pull-up resistor has a typical value of 52 kΩ. This pull-up resistor holds the WDI signal in the high state, until it is forced to another state.

After the embedded controller has initialized, if the Watchdog Timer feature is to be used, then the embedded controller can force the WDI pin low (V_{IL}). This also enables the Watchdog Timer feature and disables the WDI pull-up resistor. Disabling the pull-up resistor reduces the device’s current consumption. The pull-up resistor will remain disconnected until the device has a power-on, a Reset event occurs, or after the WDT time out.

Once the Watchdog Timer has been enabled, the Host Controller must force an edge transition (falling or rising) on the WDI pin before the minimum Watchdog Timer time out to ensure that the Watchdog Timer does not force the Reset pins (RST/RST) to the active state.

If an edge transition does not occur before the maximum time out occurs, then the MCP131X/2X will force the Reset pins to their active state.

The MCP131X/2X supports four time outs. The standard offering devices have a typical Watchdog Timer period (T_{WDT}) of 1.6 s. Table 4-3 shows the available Watchdog Timer periods. The T_{WDT} time-out is a function of the device voltage and temperature.

Table 4-3: Watchdog Timer Periods

</tr>
</tbody>
</table>

If the time between WDI edges is less than this, it ensures that the MCP131X/2X never forces a Reset.

If the time between WDI edges is greater than this, it ensures that the MCP131X/2X always forces a Reset.

Note 1: Shaded rows are custom ordered Watchdog Timer Periods (t_{WDT}) time outs. For information on ordering devices with these t_{WDT} time outs, please contact your local Microchip sales office. Minimum purchase volumes are required.

The software routine that strobes WDI is critical. The code must be in a section of software that is executed frequently enough so the time between edge transitions is less than the Watchdog time-out period. One common technique controls the Host Controllers I/O line from two sections of the program. The software might set the I/O line high while operating in the Foreground mode and set it low while in the Background or Interrupt modes. If both modes do not execute correctly, the Watchdog Timer issues Reset pulses.

Figure 4-19 shows a block diagram for using the MCP131X/2X with a PIC® microcontroller (MCU) and the Watchdog input.

![Figure 4-19: Watchdog Timer](image)
5.0 APPLICATION INFORMATION

This section shows application-related information that may be useful for your particular design requirements.

5.1 Supply Monitor Noise Sensitivity

The MCP131X/2X devices are optimized for fast response to negative-going changes in \( V_{DD} \). Systems with an inordinate amount of electrical noise on \( V_{DD} \) (such as systems using relays) may require a 0.01 \( \mu F \) or 0.1 \( \mu F \) bypass capacitor to reduce detection sensitivity. This capacitor should be installed as close to the MCP131X/2X as possible to keep the capacitor lead length short.

**FIGURE 5-1:** Typical Application Circuit with Bypass Capacitor.

5.2 Conventional Voltage Monitoring

Figure 5-2 and Figure 5-3 show the MCP131X/2X in conventional voltage monitoring applications.

**FIGURE 5-2:** Battery Voltage Monitor.

**FIGURE 5-3:** Power Good Monitor.

5.3 Using in PIC® Microcontroller, ICSP™ Applications

**Note:** This operation can only be done using the device with the Open-Drain RST pin (MCP1320, MCP1321, and MCP1322). Devices that have the internal pull-up resistor are not recommended due to the current path of the internal pull-up resistor.

**Note:** It is recommended that the current into the RST pin be current limited by a 1 k\( \Omega \) resistor.

**FIGURE 5-4:** Typical Application Circuit for PIC® Microcontroller with the ICSP™ Feature.
5.4 Modifying The Trip Point, $V_{TRIP}$

Although the MCP131X/2X device has a fixed voltage trip point ($V_{TRIP}$), it is sometimes necessary to make custom adjustments. This can be accomplished by connecting an external resistor divider to the MCP131X/2X $V_{DD}$ pin. This causes the $V_{SOURCE}$ voltage to be at a higher voltage than when the MCP131X/2X input equals its $V_{TRIP}$ voltage (Figure 5-5).

To maintain detector accuracy, the bleeder current through the divider should be significantly higher than the 10 µA maximum operating current required by the MCP131X/2X. A reasonable value for this bleeder current is 1 mA (100 times the 10 µA required by the MCP131X/2X). For example, if $V_{TRIP} = 2V$ and the desired trip point is 2.5V, the value of $R_1 + R_2$ is 2.5 kΩ (2.5V/1 mA). The value of $R_1 + R_2$ can be rounded to the nearest standard value and plugged into the equation of Figure 5-5 to calculate values for $R_1$ and $R_2$. 1% tolerance resistors are recommended.

![FIGURE 5-5: Modify Trip-Point using External Resistor Divider.]

$$V_{SOURCE} \times \frac{R_1}{R_1 + R_2} = V_{TRIP}$$

Where:
- $V_{SOURCE}$ = Voltage to be monitored
- $V_{TRIP}$ = Threshold Voltage setting

**Note:** In this example, $V_{SOURCE}$ must be greater than ($V_{TRIP}$).

5.5 MOSFET Low-Drive Protection

Low operating power and small physical size make the MCP131X/2X series ideal for many voltage detector applications. Figure 5-6 shows a low-voltage gate drive protection circuit that prevents overheating of the logic-level MOSFET due to insufficient gate voltage. When the input signal is below the threshold of the MCP131X/2X, its output grounds the gate of the MOSFET.

![FIGURE 5-6: MOSFET Low-Drive Protection.]

5.6 Low-Power Applications

In some low-power applications, the longer the microcontroller (such as a PIC® MCU) can be in the “Sleep mode”, the lower the average system current consumption will be.

The WDT feature can be used to “wake-up” the PIC MCU at a regular interval to service the required tasks before returning to sleep. This “wake-up” occurs after the PIC MCU detects a MCLR reset during Sleep mode (for mid-range family, POR = 1, BOR = 1, TO = 1, and PD = 1).
5.7 Controllers and Processors With Bidirectional I/O Pins

Some microcontrollers have bidirectional Reset pins. Depending on the current drive capability of the controller pin, an indeterminate logic level may result if there is a logic conflict. This can be avoided by adding a 4.7 kΩ resistor in series with the output of the MCP131X/2X (Figure 5-7). If there are other components in the system that require a Reset signal, they should be buffered so as not to load the Reset line. If the other components are required to follow the Reset I/O of the microcontroller, the buffer should be connected as shown with the solid line.

![Figure 5-7: Interfacing the MCP131X/2X Push-Pull Outputs to a Bidirectional Reset I/O.](image)

5.8 RESET Signal Integrity During Power-Down

The MCP131X/2X Reset output is valid to $V_{DD} = 1.0V$. Below this 1.0V, the output becomes an "open circuit" and does not sink or source current. This means CMOS logic inputs to the microcontroller will be floating at an undetermined voltage. Most digital systems are completely shut down well above this voltage. However, in situations where the Reset signal must be maintained valid to $V_{DD} = 0V$, external circuitry is required.

For devices where the Reset signal is active-low, a pull-down resistor must be connected from the MCP131X/2X Reset pin(s) to ground to discharge stray capacitances and hold the output low (Figure 5-8).

Similarly, for devices where the Reset signal is active-high, a pull-up resistor to $V_{DD}$ is required to ensure a valid high Reset signal for $V_{DD}$ below 1.0V.

This resistor value, though not critical, should be chosen such that it does not appreciably load the Reset pin(s) under normal operation (100 kΩ will be suitable for most applications).

![Figure 5-8: Ensuring a Valid Active-low Reset Pin Output State as $V_{DD}$ Approaches 0V.](image)
6.0 STANDARD DEVICE OFFERINGS

Table 6-1 shows the standard devices that are available and their respective configuration. The configuration includes:
- Voltage Trip Point (V\text{TRIP})
- Reset Time Out (t\text{RST})
- Watchdog Time Out (t\text{WDT})

Table 6-1 also shows the order number for that given device configuration.

Note 1: This delay timing combination is not the standard offering. For information on ordering devices with these delay times, contact your local Microchip sales office. Minimum purchase volumes are required.
7.0 DEVELOPMENT TOOLS

7.1 Evaluation/Demonstration Boards

The SOT-23-5/6 Evaluation Board (VSUPEV2) can be used to evaluate the characteristics of the MCP131X/2X devices.

This blank PCB has footprints for:

- Pull-up Resistor
- Pull-down Resistor
- Loading Capacitor
- In-line Resistor

There is also a power supply filtering capacitor.

For evaluating the MCP131X/2X devices, the selected device should be installed into the Option A footprint.

![FIGURE 1: SOT-23-5/6 Voltage Supervisor Evaluation Board (VSUPEV2).](image)

This board may be purchased directly from the Microchip web site at [www.microchip.com](http://www.microchip.com).
8.0 PACKAGING INFORMATION

8.1 Package Marking Information

Legend:  XX...X  Customer-specific information
         Y       Year code (last digit of calendar year)
         YY      Year code (last 2 digits of calendar year)
         WW      Week code (week of January 1 is week ‘01’)
         NNN     Alphanumeric traceability code
         (e3)    Pb-free JEDEC designator for Matte Tin (Sn)
         *       This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.
5-Lead Plastic Small Outline Transistor (OT) [SOT-23]

APPENDIX A: REVISION HISTORY

Revision D (August 2012)
The following is the list of modifications:
1. Updated Figure 2-22 and Figure 2-23.

Revision C (February 2012)
The following is the list of modifications:
2. Corrected text in Section 4.0, Operational Description.
3. Updated package specification in Section 8.0, Packaging Information to show all drawings available.
4. Other minor typographical corrections.

Revision B (October 2007)
The following is the list of modifications:
1. Clarified that devices with a Voltage Trip Point \( \leq 2.4\text{V} \) are tested from \(-40^\circ\text{C} \) to \(+85^\circ\text{C}\). Devices with a Voltage Trip Point \( \geq 2.5\text{V} \) are tested from \(-40^\circ\text{C} \) to \(+125^\circ\text{C}\).

Revision A (November 2005)
• Original Release of this Document.
### PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

#### Device:
- **MCP1316T**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1316MT**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1317T**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1318T**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1318MT**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1319T**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1319MT**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1320T**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1321T**: MicroPower Voltage Detector (Tape and Reel)
- **MCP1322T**: MicroPower Voltage Detector (Tape and Reel)

#### VTRIP Options:
- 29 = 2.90V
- 46 = 4.60V

#### Time-Out Options:
- \( L = \tau_{RST} = 200 \text{ ms (typ.)} \)
- \( \tau_{WDT} = 1.6 \text{ s (typ.)} \)

#### Temperature Range:
- **I**: -40°C to +85°C (Only for trip points 2.0V to 2.4V)
- **E**: -40°C to +125°C (For trip point \( \geq 2.5V \))

#### Package:
- OT = SOT-23, 5-lead

#### Examples:
- a) MCP1316T-29LE/OT: 5-Lead SOT-23-5
- b) MCP1316T-46LE/OT: 5-Lead SOT-23-5
- c) MCP1316MT-29LE/OT: 5-Lead SOT-23-5
- d) MCP1316MT-46LE/OT: 5-Lead SOT-23-5

#### Note 1:
Custom ordered voltage trip points and time outs available. Please contact your local Microchip sales office for additional information. Minimum purchase volumes are required.
Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip’s Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip’s code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.
