Si53304

SILICON LABS

1:6 LOW JITTER UNIVERSAL BUFFER/LEVEL TRANSLATOR WITH 2:1 INPUT MUX AND INDIVIDUAL OE

Features

- 6 differential or 12 LVCMOS outputs
- Ultra-low additive jitter: 100 fs rms
- Wide frequency range: 1 to 725 MHz
- Any-format input with pin selectable output formats: LVPECL, Low Power LVPECL, LVDS, CML, HCSL, LVCMOS
- 2:1 mux with hot-swappable inputs
- Glitchless input clock switching
- Synchronous output enable
- Individual output enable
- Low output-output skew: <50 ps
- Low propagation delay variation: <400 ps
- Independent V_{DD} and V_{DDO}: 1.8/2.5/3.3 V
- Excellent power supply noise rejection (PSRR)
- Selectable LVCMOS drive strength to tailor jitter and EMI performance
- Small size: 32-QFN (5x5 mm)
- RoHS compliant, Pb-free
- Industrial temperature range: –40 to +85 °C
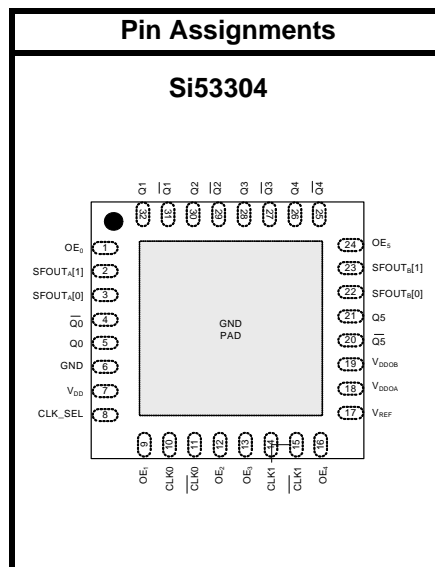

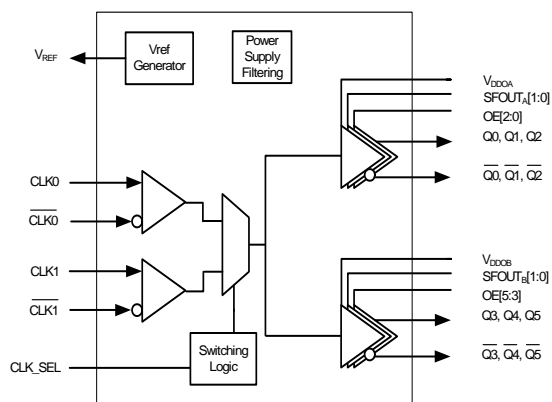

Ordering Information:
See page 25.

Applications

- High-speed clock distribution
- Ethernet switch/router
- Optical Transport Network (OTN)
- SONET/SDH
- PCI Express Gen 1/2/3
- Storage
- Telecom
- Industrial
- Servers
- Backplane clock distribution

Pin Assignments

Si53304

Patents pending

Description

The Si53304 is an ultra low jitter six output differential buffer with pin-selectable output clock signal format and individual OE. The Si53304 features a 2:1 mux with glitchless switching, making it ideal for redundant clocking applications. The Si53304 utilizes Silicon Laboratories' advanced CMOS technology to fanout clocks from 1 to 725 MHz with guaranteed low additive jitter, low skew, and low propagation delay variability. The Si53304 features minimal cross-talk and provides superior supply noise rejection, simplifying low jitter clock distribution in noisy environments. Independent core and output bank supply pins provide integrated level translation without the need for external circuitry.

Table 9. AC Characteristics

(V_{DD} = 1.8 V ± 5%, 2.5 V ± 5%, or 3.3 V ± 10%, T_A = –40 to 85 °C)

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Frequency	F	LVPECL, low power LVPECL, LVDS, CML, HCSL	1	—	725	MHz
		LVCMOS	1	—	200	MHz
Duty Cycle **Note:** 50% input duty cycle.	D_C	200 MHz, 50 Ω to V_{DD}/2, 20/80% T_R/T_F<10% of period (LVCMOS)	TBD	TBD	TBD	%
		20/80% T_R/T_F<10% of period (Differential)	48	50	52	%
Minimum Input Clock Slew Rate[1]	SR	Required to meet prop delay and additive jitter specifications (20–80%)	0.75	—	—	V/ns
Output Rise/Fall Time	T_R/T_F	LVPECL, LVDS, CML, HCSL, 20/80%			350	ps
		200 MHz, 50 Ω, 20/80%, 2 pF load (LVCMOS)	TBD	TBD	750	ps
Minimum Input Pulse Width	T_W		500	—	—	ps
Additive Jitter (Differential Clock Input)	J	V_{DD} = 2.5/3.3 V, LVPECL/LVDS, F = 725 MHz, 0.75 V/ns input slew rate	—	60	80	fs
Propagation Delay	T_{PLH}, T_{PHL}	Low to high, high to low Single-ended	TBD	—	TBD	ns
		Low to high, high to low Differential	TBD	—	TBD	ns
Output Enable Time[2]	T_{EN}	F = 1 MHz	—	2	—	μs
		F = 100 MHz	—	60	—	ns
		F = 725 MHz	—	50	—	ns
Output Disable Time[2]	T_{DIS}	F = 1 MHz	—	2	—	μs
		F = 100 MHz	—	25	—	ns
		F = 725 MHz	—	15	—	ns

Notes:
1. For clock division applications, a minimum input clock slew rate of 30 mV/ns is required.
2. See Figure 4.
3. Defined as skew between outputs on different devices operating at the same supply voltages, temperatures, and equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.
4. Measured for 156.25 MHz carrier frequency. Sine-wave noise added to V_{DDOX} (1.8V=50mV$_{PP}$, 2.5/3.3V=100mV$_{PP}$) and noise spur amplitude measured. See AN491 for further details.

Table 9. AC Characteristics (Continued)

(V_{DD} = 1.8 V ± 5%, 2.5 V ± 5%, or 3.3 V ± 10%, T_A = –40 to 85 °C)

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Output to Output Skew	T_{SK}	Identical Configuration, Single-ended (Q_N to Q_M)	—	—	100	ps
		Identical Configuration, Differential (Q_N to Q_M)	—	—	50	ps
Part to Part Skew[3]	T_{PS}	Identical configuration	—	50	—	ps
Power Supply Noise Rejection[4]	PSRR	10 kHz sinusoidal noise	—	–90	—	dBc
		100 kHz sinusoidal noise	—	–90	—	dBc
		500 kHz sinusoidal noise	—	–80	—	dBc
		1 MHz sinusoidal noise	—	–70	—	dBc

Notes:
1. For clock division applications, a minimum input clock slew rate of 30 mV/ns is required.
2. See Figure 4.
3. Defined as skew between outputs on different devices operating at the same supply voltages, temperatures, and equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.
4. Measured for 156.25 MHz carrier frequency. Sine-wave noise added to V_{DDOX} (1.8V=50mV$_{PP}$, 2.5/3.3V=100mV$_{PP}$) and noise spur amplitude measured. See AN491 for further details.

Thermal Resistance, Junction to Case	θ_{JC}	Still air	32.3	°C/W

Table 11. Absolute Maximum Ratings

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Storage Temperature	T_S		−55	—	150	°C
Supply Voltage	V_{DD}		−0.5	—	3.8	V
Input Voltage	V_{IN}		−0.5	—	V_{DD}+ 0.3	V
Output Voltage	V_{OUT}		—	—	V_{DD}+ 0.3	V
ESD Sensitivity	HBM	HBM, 100 pF, 1.5 kΩ	2000	—	—	V
ESD Sensitivity	CDM		500	—	—	V
Peak Soldering Reflow Temperature	T_{PEAK}	Pb-Free; Solder reflow profile per JEDEC J-STD-020	—	—	260	°C
Maximum Junction Temperature	T_J		—	—	125	°C
Note: Stresses beyond those listed in this table may cause permanent damage to the device. Functional operation specification compliance is not implied at these conditions. Exposure to maximum rating conditions for extended periods may affect device reliability.						

Si53304

2. Functional Description

The Si53304 is a low jitter, low skew 1:6 differential buffer with an integrated 2:1 input mux and individual OE control. The device has a universal input that accepts most common differential or LVCMOS input signals. A clock select pin control is used to select the active input clock. The selected clock input is routed to two independent banks of outputs. Each output bank features control pins to select signal format setting and LVCMOS drive strength. In addition, each clock output has an independent OE pin for individual clock enable/disable.

2.1. Universal, Any-Format Input

The Si53304 has a universal input stage that enables simple interfacing to a wide variety of clock formats, including LVPECL, LVCMOS, LVDS, HCSL, and CML. Tables 12 and 13 summarize the various input ac- and dc-coupling options supported by the device. Figures 1 and 2 show the recommended input clock termination options.
Table 12. LVPECL, LVCMOS, and LVDS

	LVPECL		LVCMOS		LVDS	
	AC-Couple	DC-Couple	AC-Couple	DC-Couple	AC-Couple	DC-Couple
1.8 V	N/A	N/A	No	Yes	Yes	No
2.5/3.3 V	Yes	Yes	No	Yes	Yes	Yes

Table 13. HCSL and CML

	HCSL		CML	
	AC-Couple	DC-Couple	AC-Couple	DC-Couple
1.8 V	No	No	Yes	No
2.5/3.3 V	No	Yes (3.3 V)	Yes	No
Figure 1. Differential LVPECL, LVDS, CML AC-Coupled Input Termination

Note: V_{DDO} and V_{DD} must be at the same voltage level.

Figure 2. LVCMOS DC-Coupled Input Termination

DC Coupled LVPECL Termination Scheme 1

3.3 V LVPECL: R_1 = 127 Ohm, R_2 = 82.5 Ohm
2.5 V LVPECL: R_1 = 250 Ohm, R_2 = 62.5 Ohm

Si53304

2.2. Input Bias Resistors

Internal bias resistors ensure a differential output low condition in the event that the clock inputs are not connected. The noninverting input is biased with a 18.75 kΩ pulldown to GND and a 75 kΩ pullup to V_{DD}. The inverting input is biased with a 75 kΩ pullup to V_{DD}.

R_{PU} = 75 kohm

R_{PD} = 18.75 kohm
Figure 4. Input Bias Resistors

2.3. Universal, Any-Format Output Buffer

The Si53304 has highly flexible output drivers that support a wide range of clock signal formats, including LVPECL, low power LVPECL, LVDS, CML, HCSL, and LVCMOS. SFOUTA[1] and SFOUTB[1] are 3-level inputs that can be pin-strapped to select the Bank A and Bank B clock signal formats, respectively. This feature enables the device to be used for format/level translation in addition to clock distribution, minimizing the number of unique buffer part numbers required in a typical application and simplifying design reuse. For EMI reduction applications, four LVCMOS drive strength options are available for each V_{DDO} setting.

Table 14. Output Signal Format Selection

SFOUTX[1]	SFOUTX[0]	V_{DDOX} = 3.3 V	V_{DDOX} = 2.5 V	V_{DDOX} = 1.8 V
Open*	Open*	LVPECL	LVPECL	N/A
0	0	LVDS	LVDS	LVDS
0	1	LVCMOS, 24mA drive	LVCMOS, 18mA drive	LVCMOS, 12mA drive
1	0	LVCMOS, 18mA drive	LVCMOS, 12mA drive	LVCMOS, 9mA drive

0	Open*	CML	CML	CML
1	Open*	HCSL	HCSL	HCSL
*Note: SFOUTX[1:0] are 3-level input pins. Tie low for "0" setting. Tie high for "1" setting. When left open, the pin floats to V_{DD}/2.				

SILICON LABS

2.4. Glitchless Clock Input Switching

The Si53304 features glitchless switching between two valid input clocks. Figure 5 illustrates that switching between input clocks does not generate runt pulses or glitches at the output.

Notes:

1. Q_n continues with CLK0 for 2-3 falling edges of CLK0.
2. Q_n is disabled low for 2-3 falling edges of CLK1.
3. Q_n starts on the first rising edge after 1 + 2.

Figure 5. Glitchless Input Clock Switch

The Si53304 supports glitchless switching between clocks at the same frequency. In addition, the device supports glitchless switching between 2 input clocks that are up to 10x different in frequency. When a switchover to a new clock is made, the output will disable low after two or three clock cycles of the previously-selected input clock. The outputs will remain low for up to three clock cycles of the newly-selected clock, after which the outputs will start from the newly-selected input. In the case a switchover to an absent clock is made, the output will glitchlessly stop low and wait for edges of the newly selected clock. A switchover from an absent clock to a live clock will also be glitchless. Note that the CLK_SEL input should not be toggled faster than 1/250th the frequency of the slower input clock.

2.5. Synchronous Output Enable

The Si53304 features a synchronous output enable (disable) feature. Output enable is sampled and synchronized on the falling edge of the input clock. This feature prevents runt pulses from being generated when the outputs are enabled or disabled.
Note 1. Outputs are disabled after 1 to 2 negative edges of the input clock.

Figure 6. Synchronous Output Enable

When OEx is low, Qx is held low and $\overline{Qx}$ is held high for differential output formats. For LVCMOS output format options, both Qx and $\overline{Qx}$ are held low when OEx is set low. By default, a clock output is enabled when its output enable pin is unconnected.

Si53304

2.6. Input Mux and Output Enable Logic

The Si53304 provides two clock inputs for applications that need to select between one of two clock sources. The CLK_SEL pin selects the active clock input. The table below summarizes the input and output clock based on the input mux and output enable pin settings.

Table 15. Input Mux and Output Enable Logic

CLK_SEL	CLK0	CLK1	OEx[1]	Qx[2]
L	L	X	H	L
L	H	X	H	H
H	X	L	H	L
H	X	H	H	H
X	X	X	L	L[3]

Notes:
1. Output enable active high
2. On the next negative transition of CLK0 or CLK1.
3. Single-end: Qx = low, $\overline{Qx}$ = high
   Differential: Qx = low, $\overline{Qx}$ = high

## 2.7. Power Supply (V_{DD} and V_{DDOX})

The device includes separate core (V_{DD}) and output driver supplies (V_{DDOX}). This feature allows the core to operate at a lower voltage than V_{DDO}, reducing current consumption in mixed supply applications. The core V_{DD} supports 3.3, 2.5, or 1.8 V. Each output bank has its own V_{DDOX} supply, supporting 3.3, 2.5, or 1.8 V.

SILICON LABS

2.8. Output Clock Termination Options

The recommended output clock termination options are shown below. Unused output clocks should be left floating.

DC Coupled LVPECL Termination Scheme 1

Figure 12. Input Mux Noise Isolation

2.12. Power Supply Noise Rejection

The device supports on-chip supply voltage regulation to reject noise present on the power supply, simplifying low jitter operation in real-world environments. This feature enables robust operation alongside FPGAs, ASICs and SoCs and may reduce board-level filtering requirements. For more information, see AN491: Power Supply Rejection for Low Jitter Clocks.

Table 18. Pin Description (Continued)

Pin	Name	Description
8	CLK_SEL	Mux input select pin (LVCMOS) Clock inputs are switched without the introduction of glitches. When CLK_SEL is high, CLK1 is selected. When CLK_SEL is low, CLK0 is selected. CLK_SEL contains an internal pull-down resistor.
9	OE1	Output enable—Output 1 When OE = high, the Q1 is enabled. When OE = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OE is set low. This pin contains an internal pull-up resistor.
10	CLK0	Input clock 0
11	$\overline{CLK0}$	Input clock 0 (complement) When the CLK0 is driven by a single-end input, connect V_{REF} to $\overline{CLK0}$. $\overline{CLK0}$ contains an internal pull-up resistor.
12	OE2	Output enable—Output 2 When OE = high, the Q2 is enabled. When OE = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OE is set low. OE2 contains an internal pull-up resistor.
13	OE3	Output enable—Output 3 When OE = high, the Q3 is enabled. When OE = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OE is set low. OE3 contains an internal pull-up resistor.
14	CLK1	Input clock 1
15	$\overline{CLK1}$	Input clock 1 (complement) When the CLK1 is driven by a single-end input, connect V_{REF} to $\overline{CLK1}$. $\overline{CLK1}$ contains an internal pull-up resistor.
16	OE4	Output enable—Output 4 When OE = high, the Q4 is enabled. When OE = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OE is set low. This pin contains an internal pull-up resistor.
17	V_{REF}	Input reference voltage When driven by a LVCMOS clock input, connect the unused clock input to V_{REF} and a 0.1 µF cap to ground. When driven by a differential clock, do not connect the V_{REF} pin.
18	V_{DDOA}	Output voltage supply—Bank A (Outputs: Q0 to Q2) Bypass with 1.0 µF capacitor and place as close to the V_{DDOA} pin as possible.

Table 18. Pin Description (Continued)

Pin	Name	Description
19	V$_{DDOB}$	Output voltage supply—Bank B (Outputs: Q3 to Q5) Bypass with 1.0 µF capacitor and place as close to the V$_{DDOB}$ pin as possible.
20	$\overline{Q5}$	Output clock 5 (complement)
21	Q5	Output clock 5
22	SFOUTB[0]	Output signal format control pin for Bank B Three level input control. Internally biased at V$_{DD}$/2. Can be left floating or tied to ground or V$_{DD}$.
23	SFOUTB[1]	Output signal format control pin for Bank B Three level input control. Internally biased at V$_{DD}$/2. Can be left floating or tied to ground or V$_{DD}$.
24	OE5	Output enable—Output 5 When OE = high, the Q5 is enabled. When OE = low, Q is held low and $\overline{Q}$ is held high for differential formats. For LVCMOS, both Q and $\overline{Q}$ are held low when OE is set low. This pin contains an internal pull-up resistor.
25	$\overline{Q4}$	Output clock 4 (complement)
26	Q4	Output clock 4
27	$\overline{Q3}$	Output clock 3 (complement)
28	Q3	Output clock 3
29	$\overline{Q2}$	Output clock 2 (complement)
30	Q2	Output clock 2
31	$\overline{Q1}$	Output clock 1 (complement)
32	Q1	Output clock 1
GND Pad	GND	Ground Pad Power supply ground and thermal relief.

5. Package Outline

5.1. 5x5 mm 32-QFN Package Diagram
Figure 14. Si53304 5x5 mm Package Diagram

Table 19. Package Dimensions

Dimension	Min	Nom	Max
A	0.80	0.85	1.00
A1	0.00	0.02	0.05
b	0.18	0.25	0.30
c	0.20	0.25	0.30
D	5.00 BSC		
D2	2.00	2.15	2.30
e	0.50 BSC		
E	5.00 BSC		
E2	2.00	2.15	2.30
L	0.30	0.40	0.50
aaa	0.10		
bbb	0.10		
ccc	0.08		
ddd	0.10		

Notes:
1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to the JEDEC Solid State Outline MO-220.

6. PCB Land Pattern

6.1. 5x5 mm 32-QFN Package Land Pattern
Figure 15. Si53304 5x5 mm Package Land Pattern

Table 20. PCB Land Pattern

Dimension	Min	Max	Dimension	Min	Max
C1	4.52	4.62	X2	2.20	2.30
C2	4.52	4.62	Y1	0.59	0.69
E	0.50 BSC		Y2	2.20	2.30
X1	0.20	0.30			

Notes:
General
1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.

Solder Mask Design
1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.

Stencil Design
1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads.
4. A 2x2 array of 0.75 mm square openings on 1.15 mm pitch should be used for the center ground pad.

Card Assembly
1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

7. Top Marking

7.1. Si53304 Top Marking
7.2. Top Marking Explanation

Mark Method:	Laser	
Font Size:	2.0 Point (28 mils) Center-Justified	
Line 1 Marking:	Device Part Number	**53304**
Line 2 Marking:	Device Revision/Type	**B-GM**
Line 3 Marking:	YY = Year WW = Work Week	Assigned by the Assembly House. Corresponds to the year and work week of the mold date.
	R = Die Rev F = Wafer Fab	First two characters of the Manufacturing Code from the Assembly Purchase Order form.
Line 4 Marking	Circle = 0.5 mm Diameter Lower-Left Justified	Pin 1 Identifier
	A = Assembly Site I = Internal Code XX = Serial Lot Number	Last four characters of the Manufacturing Code from the Assembly Purchase Order form.
