About this document

This document concerns the EB006V9 E-blocks PICmicro multiprogrammer board (version 9).

1. Trademarks and copyright
PIC and PICmicro are registered trademarks of Arizona Microchip Inc. E-blocks is a trademark of Matrix Technology Solutions Ltd.

2. Disclaimer
The information provided within this document is correct at the time of going to press. Matrix TSL reserves the right to change specifications from TSL to time.

3. Testing this product
It is advisable to test the product upon receiving it to ensure it works correctly. Matrix provides test procedures for all E-blocks, which can be found in the Support section of the website.

4. Product support
If you require support for this product then please visit the Matrix website, which contains many learning resources for the E-blocks series. On our website you will find:

- How to get started with E-blocks - if you are new to E-blocks and wish to learn how to use them from the beginning there are resources available to help.
- Relevant software and hardware that allow you to use your E-blocks product better.
- Example files and programs.
- Ways to get technical support for your product, either via the forums or by contacting us directly.

General information

The EB006 V9 PICmicro microcontroller programmer connects to your PC via USB to provide you with a low cost and flexible PICmicro microcontroller programmer. This board can be used with conventional microcontroller programs that generate hex code for the PIC family: MPLAB, C compilers, BASIC compilers etc. The EB006 V9 has many features that are optimised for use with Flowcode version 6 including Ghost technology.

The board will program most 8, 14, 18, 20, 28 and 40 pin flash PICmicro microcontroller devices using the free ‘mLoader’ programming software provided. mLoader can be downloaded from the Matrix web site.

The board also provides ‘clean’ access to all Input/Output lines on the relevant PICmicro microcontroller device. These are presented on 9 way D-type connectors: 8 bits and earth. A range of additional E-blocks boards can plug into these D-type connectors to provide a rapid prototyping system for learning and development.

More information on Ghost technology can be found on our website at www.matrixtsl.com/ghost.

1. Features
- E-blocks compatible
- Low cost
- Used as a programmer and as a development board
- Programs a wide range of PICmicro MCU devices
- Full suite of programming software available
- Ghost technology included
- Removable crystal oscillator source
- 5 I/O ports
- In-Circuit Debugging via PICkit2 connector
- In-Circuit Debug with Flowcode 6
- In-Circuit Test with Flowcode 6
- Charge pump capability to allow high voltage programming from USB supply
- 2mm power connector sockets
- Powerful 16bit host chip with Ghost technology operating system included
- All pins on target device monitored by host microcontroller
- On-board SRAM memory for data storage
- LEDs for Power, In-Circuit -Debug, In-Circuit -Test, and Program
- Lower operating voltage (9V)
2. Block schematic

3. Support devices
Currently mLoader and the EB006V9 support the following PICmicro devices:

12F Devices
PIC12F609, PIC12F615, PIC12F629, PIC12F635, PIC12F675, PIC12F635, PIC12F683

16F Devices

18F Devices
PIC18F242, PIC18F248, PIC18F252, PIC18F258, PIC18F442, PIC18F448, PIC18F452, PIC18F458, PIC18F1220, PIC18F1230, PIC18F1231, PIC18F1320, PIC18F1330, PIC18F1331, PIC18F13K50, PIC18F14K50, PIC18F2220, PIC18F2221, PIC18F2320, PIC18F2321, PIC18F2331, PIC18F2410, PIC18F2420, PIC18F2423, PIC18F2431, PIC18F2439, PIC18F2450, PIC18F2455, PIC18F2458, PIC18F2480, PIC18F24J10, PIC18F2510, PIC18F2515, PIC18F2520, PIC18F2523, PIC18F2525, PIC18F2539, PIC18F2550, PIC18F2553, PIC18F2580, PIC18F2585, PIC18F2586, PIC18F25J10, PIC18F2610, PIC18F2620, PIC18F2680, PIC18F2681, PIC18F2682, PIC18F2685, PIC18F2420, PIC18F2421, PIC18F4320, PIC18F4321, PIC18F4331, PIC18F4410, PIC18F4420, PIC18F4423, PIC18F4431, PIC18F4439, PIC18F4450, PIC18F4455, PIC18F4458, PIC18F4480, PIC18F44J10, PIC18F4510, PIC18F4515, PIC18F4520, PIC18F4523, PIC18F4525, PIC18F4539, PIC18F4550, PIC18F4553, PIC18F4580, PIC18F4585, PIC18F4586, PIC18F45J10, PPIC18F4610, PIC18F4620, PIC18F4680, PIC18F4681, PIC18F4682, PIC18F4685
Board layout

1. Power connector - either polarity 7.5 – 9V
2. USB connector
3. Reset switch
4. Port E I/O
5. Port A I/O
6. Port B I/O
7. Port C I/O
8. Port D I/O
9. PICkit ICSP Header
10. Removable crystal / oscillator pin assignment jumper
11. 2mm sockets for supplying power to downstream E-block boards
12. Analogue switch to allow programming and debug pins to be connected / disconnected from circuit
13. Power screw terminals
14. USB/ICSP programming selector
15. USB/PSU power selector
16. 5V voltage regulator
17. 3V3/5V VDD voltage selector
18. Bridge rectifier
19. 3V3 voltage regulator
20. SRAM storage IC
21. Status LEDs, Power, ICD, Test, Program
22. Powerful host microcontroller
23. Charge pump circuitry
24. Turned pin DIL socket for 18 pin PICmicro devices
25. Turned pin DIL socket for 28 and 40 pin PICmicro devices / 40 pin 16F1937 Target Microcontroller (supplied)
26. Turned pin DIL socket for 8, 14, 20 pin PICmicro devices
The multiprogrammer solution is made up of two parts: a circuit board that allows various slave PICmicro devices to be programmed, and the Windows based programming utility ‘mLoader’.

1. Power supply
The board is normally operated from a regulated DC supply of 7.5 - 9V or from a USB supply. This allows full operation including programming. The board can be operated solely from the USB cable provided. However care must be taken, as there is only limited power that can be taken from a computer’s USB port.

The jumper link system, J11, allows the user to decide on the source of the power supply. If using a regulated 7.5V power supply the jumper should be positioned to the right hand side of the jumper system labeled ‘PSU’. If using USB power place the jumper on the left hand side of the jumper system. LED D6 indicates that power is correctly supplied to the board.

Please note that both USB and the PSU cables should be removed for the Multiprogrammer board BEFORE changing the position of this jumper.

Remember that other E-blocks will have to receive their voltage by placing a connecting wire from the “+V” screw terminal of the Multiprogrammer to the “+V” screw terminal of each E-Block that requires a voltage.

WARNING: Take extra care when wiring in a power supply 12V may cause the board to run hot.

2. Programming circuit
The Multiprogrammer connects to a personal computer via the USB socket. Any USB socket on the PC can be used. The host microcontroller is used to communicate between the USB bus and the Multiprogrammer circuitry. The host is connected to a network of analogue switches formed by U4 and a charge pump circuit which is used to multiply the operating voltage up to the 9-12V programming voltage. This circuitry routes 0V, VDD and VPP to appropriate pins on the slave PICmicro devices as and when necessary.

3. DIL sockets and I/O ports
The slave PICmicro DIL sockets are wired in parallel (see table of connections below) and the ports are fed out to 5 D-type sockets grouped in ports. These signals are also available on a 40-way header (J5) for expansion purposes. Other important signals can be accessed via the other expansion header J24 (see table of connections below). Port E has only 3 connections, which reflects the pin outs of the various PICmicro devices themselves. When using an 8-pin or 14-pin device it should be placed in the upper pins of the 20-pin DIL socket as marked on the board. Please refer to device datasheets for availability of port outputs on each device.

NOTE: RA4 on some PICmicro devices has an open collector output. This means that you will most likely need a pull up resistor to be able to drive an LED etc. Please see the datasheet on the device you are using for further details. (Does not apply to 16F1937 device supplied with the board).

WARNING: Only fit one PICmicro device at a time. Inserting more then one PICmicro device will cause programming to fail and may even cause damage to the board or the PICmicros.

4. Reset push button
PB1 provides a reset by pulling the MCLR pin low. Note that the programming chip will reset the slave PICmicro as part of the send routine so that you do not need to press this switch each time you send your program to the board. If you are using a device with internal MCLR functionality then you will have to ensure that the chip is configured with an external MCLR to allow the reset operation to work. Devices using the internal MCLR configuration setting will be able to use the reset switch as a digital input.

5. Frequency selection
By default the board is fitted with a 19.6608MHz crystal. The crystal fits into a small socket, which allows the crystal to be easily changed. For older Matrix TSL courses a 3.2768MHz crystal is recommended. These frequencies are chosen as they divide down by PICmicro prescalers to give suitable frequencies for clock systems and for facilitating serial communication using standard baud rates.

The Jumper link system J18, J19 allows PICmicro devices with internal oscillators to route the signals from the oscillator pins through to Port A pins 6 and 7. This allows the devices with internal oscillators to use all 8-bits of the Port A for I/O operation.
6. In-Circuit Debugging
The Multiprogrammer board has an in-circuit debugging (ICD) connection between the USB peripheral device and the target microcontroller. This allows the Flowcode software to start, stop, step and inspect an active program, synchronized both in hardware and Flowcode 6 software. As well as the standard ICD operation, Flowcode is capable of reading back real time variable values from the target device.

To use the Microchip PICkit2 ICSP interface, remove the power supply and the USB cable from the Multiprogrammer. Then place the 3-way jumper link associated with J12-14 to the left hand side of the 3 x 3 header pins, labeled 'ICSP'. Then simply connect the PICkit into the Multiprogrammer via header J20.

7. In-Circuit Test
The Multiprogrammer board has an in-circuit test (ICT) connection between the USB peripheral device and all of the target microcontroller’s I/O pins. This allows the Flowcode 6 software to monitor all of the signals on the board in either analogue or digital modes.

The in circuit test feature can be combined with packet decoding to allow data and control busses to be explored and debugged.

8. Low voltage programming
Many PICmicros have a low voltage programming mode where it is possible to program the device without the need for a 12V supply line or charge pump. The difficulty here is that different families of PICmicro devices use different pins as the Low Voltage programming pin. B3 is predominantly used for this function but B4 and B5 are also used on some devices. For this reason the version 9 EB006 does not support low voltage programming modes so care must be taken when generating the chip configuration to disable the low voltage programming functionality. If the low voltage programming configuration is left enabled then you will not be able to use the LVP pin as an I/O pin in your application.

Protective cover
Most of the boards in the E-blocks range can be fitted with a plastic cover as an optional extra. These covers are there to protect your E-blocks board therefore extending the life of the board. The covers also prevent the removal of external components while still allowing for the adjustment of applicable parts on the board.

12mm M3 spacers, anti-slip M3 nuts and 25mm M3 bolts can be used to attached the cover to the board. These are not included but can be bought separately from our website.

The order code for the EB006 PICmicro® MCU microcontroller cover is EB706.
PICmicro microcontroller pin out details

Broadly speaking the ranges of PICmicro devices are designed to be upwards compatible: the pin functions on an 18-pin device are available on a 28-pin device and a 40-pin device. This can be seen from the following excerpt from the Microchip product selector card. The following diagram shows the pin out of the various PICmicro devices:

**18-pin PICmicro**
- RA2/AN2/Vrefout
- RA3/AN3/CMP1/Vrefin
- RA4/T0CKI/CMP2
- Vpp/VAS/THV/XTCLR
- Vss
- RB0/INT
- RB1/RX/DT
- RB2/TX/CK
- RB3/CMP1

**19-pin PICmicro**
- Vdd
- RA0/AN0
- RA3/AN1/Vref
- RA4/AN2/Vref
- RA5/OSC1/CLKIN
- RA6/OSC2/CMP2
- RA7/OSC1/CLKOUT/RA6
- RA8/AN8/OSC2/CLKOUT
- RA9/AN9/SDO/T1SOCC
- RB0/INT
- RB1/RX/DT
- RB2/TX/CK
- RB3/CMP1

**20-pin PICmicro**
- Vdd
- RA5/OSC1/CLKIN
- RA4/AN2/CLKOUT
- RA3/MCLR/Vpp
- RA6/AN8/OSC1/CLKOUT
- RA7/AN7/PGM
- RA8/AN8/OSC2/CLKOUT
- RA9/AN9/SDO/T1SOCC
- RB0/INT
- RB1/RX/DT
- RB2/TX/CK
- RB3/CMP1

**28-pin PICmicro**
- Vpp/MCLR
- RA0/AN0
- RA1/AN1
- RA2/AN2/VR
- RA3/AN3/VR
- RA4/T0CKI
- RA5/AN4/SS/Avdd/Lvdd
- Vss
- OSC1/CLKI
- OSC2/CLKO/1CKI
- RCO/T1OSO/CCP2
- RC1/T1OSO/CCP2
- RC2/CCP1
- RC3/SKOL/SCL

**38-pin PICmicro**
- RB7/PGO
- RB6/PGC
- RB5
- RB4
- RB3/PGM
- RB2/T2E
- RB1/INT2
- RB0/INT0
- Vdd
- Vss
- OSC1/CLKI
- OSC2/CLKO/1CKI
- RCO/T1OSO/CCP2
- RC1/T1OSO/CCP2
- RC2/CCP1
- RC3/SKOL/SCL
- RD0/PSP0/C1IN
- RD1/PSP1/C1IN

**40-pin PICmicro**
- RB7/PGO
- RB6/PGC
- RB5
- RB4
- RB3/PGM
- RB2/T2E
- RB1/INT2
- RB0/INT0
- Vdd
- Vss
- OSC1/CLKI
- OSC2/CLKO/1CKI
- RCO/T1OSO/CCP2
- RC1/T1OSO/CCP2
- RC2/CCP1
- RC3/SKOL/SCL
- RD0/PSP0/C1IN
- RD1/PSP1/C1IN

Note that GP0 maps to RB7
GP1 maps to RB6
GP2/AN0 maps to RA0/AN0
GP2/AN1/Vref maps to RA1/AN1
GP3/MCLR maps to RA3/AN3/Vref
GP4/OSC2/AN3/CLKOUT marches to RA4/AN2/VR
GP5/OSC1/CLKIN marches to RA5/AN4/SS/Avdd/Lvdd

Bus connections

1. Expansion bus
The pin connections on the expansion bus exactly mirror the pin numbering on the 40-pin DIL socket. Note that the pin numbering on the IDC socket is slightly different to that on a DIL socket which results in the seemingly odd arrangement of pins on the IDC pin chart.

For the 18, 28 and 40 pin devices the buses on devices are largely upwards compatible - pin connections on an 18-pin device appear on a 28-pin device and a 40-pin device, and pins on a 28-pin device appear on a 40-pin device. This allows the 18, 28 and 40 pin DIL sockets to be connected in parallel with the PICmicro bus structure intact.

* This parallel connection is not possible with 8, 14 and 20 pin devices due to programming requirements which means that there are anomalies with the pin connections for the 8, 14 and 20 pin devices as follows:
