
WL18xxMOD WiLink™ 8 Single-Band Combo Module – Wi-Fi®, Bluetooth®, and Bluetooth Low Energy (BLE)

1 Device Overview

1.1 Features

- **General**
 - Integrates RF, Power Amplifiers (PAs), Clock, RF Switches, Filters, Passives, and Power Management
 - Quick Hardware Design With TI Module Collateral and Reference Designs
 - Operating Temperature: –20°C to 70°C
 - Small Form Factor: 13.3 × 13.4 × 2 mm
 - 100-Pin MOC Package
 - FCC, IC, ETSI/CE, and TELEC Certified With Chip Antennas
- **Wi-Fi**
 - WLAN Baseband Processor and RF Transceiver Support of IEEE Std 802.11a, 802.11b, 802.11g, and 802.11n
 - 20- and 40-MHz SISO and 20-MHz 2 × 2 MIMO at 2.4 GHz for High Throughput: 80 Mbps (TCP), 100 Mbps (UDP)
 - 2.4-GHz MRC Support for Extended Range
 - Fully Calibrated: Production Calibration Not Required
 - 4-Bit SDIO Host Interface Support
 - Wi-Fi Direct Concurrent Operation (Multichannel, Multirole)
- **Bluetooth and BLE (WL183xMOD Only)**
 - Bluetooth 4.1 and CSA2 Support
 - Host Controller Interface (HCI) Transport for Bluetooth Over UART
 - Dedicated Audio Processor Support of SBC Encoding + A2DP
 - Dual-Mode Bluetooth and BLE
 - Bluetooth + LE Certified Stack Provided by TI
- **Key Benefits**
 - Reduces Design Overhead
 - Differentiated Use-Cases by Configuring WiLink 8 Simultaneously in Two Roles (STA and AP) to Connect Directly With Other Wi-Fi Devices on Different RF Channel (Wi-Fi Networks)
 - Best-in-Class Wi-Fi With High-Performance Audio and Video Streaming Reference Applications With Up to 1.4X the Range Versus a Single Antenna
 - Different Provisioning Methods for In-Home Devices Connectivity to Wi-Fi in One Step
 - Lowest Wi-Fi Power Consumption in Connected Idle (< 800 μA)
 - Configurable Wake on WLAN Filters to Only Wake Up the System
 - Wi-Fi-Bluetooth Single Antenna Coexistence

1.2 Applications

- Internet of Things
- Multimedia
- Home Electronics
- Home Appliances and White Goods
- Industrial and Home Automation
- Smart Gateway and Metering
- Video Conferencing
- Video Camera and Security

1.3 Description

The certified WiLink 8 module from TI offers high throughput and extended range along with Wi-Fi and *Bluetooth* coexistence (WL1835MOD only) in a power-optimized design. The WL18x5MOD device is a 2.4-GHz module, two antenna solution. The device is FCC, IC, ETSI/CE, and TELEC certified for AP and client. TI offers drivers for high-level operating systems such as Linux®, Android™, WinCE, and RTOS.

5 Specifications

5.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

PARAMETER	VALUE	UNIT
VBAT	4.8 ⁽²⁾	V
VIO	–0.5 to 2.1	V
Input voltage to analog pins	–0.5 to 2.1	V
Input voltage limits (CLK_IN)	–0.5 to VDD_IO	V
Input voltage to all other pins	–0.5 to (VDD_IO + 0.5 V)	V
Operating ambient temperature range	–20 to +70 ⁽³⁾	°C

- Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- 4.8 V cumulative to 2.33 years, including charging dips and peaks
- Operating free-air temperature range at which the device can operate reliably for 15K cumulative active TX power-on hours (assuming a maximum junction temperature of (T_j) of 125°C). [Section 5.3, Power-On Hours \(POH\)](#), describes the correlation between T_j and PoH. In the WL18xx system, a control mechanism automatically ensures T_j < 125°C. Whenever T_j approaches the threshold, this mechanism controls the transmitter patterns.

5.2 Handling Ratings

		MIN	MAX	UNIT
T _{stg}	Storage temperature range	–40	+85	°C
ESD stress voltage ⁽¹⁾	Human body model (HBM) ⁽²⁾	–1000	+1000	V
	Charged device model (CDM) ⁽³⁾	–250	+250	

- ESD measures device sensitivity and immunity to damage caused by electrostatic discharges into the device.
- The level listed is the passing level per ANSI/ESDA/JEDEC JS-001. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 500-V HBM is possible, if necessary precautions are taken. Pins listed as 1000 V can actually have higher performance.
- The level listed is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 250-V CDM is possible, if necessary precautions are taken. Pins listed as 250 V can actually have higher performance.

5.3 Power-On Hours (POH)

OPERATING JUNCTION TEMPERATURE (°C)	POH
125	15,000
120	20,000
115	27,000
110	37,000
105	50,000

5.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VBAT ⁽¹⁾	DC supply range for all modes	2.9		4.8	V
	1.8-V I/O ring power supply voltage	1.62		1.95	V
V _{IH}	I/O high-level input voltage	0.65 x VDD_IO		VDD_IO	V
V _{IL}	I/O low-level input voltage	0		0.35 x VDD_IO	V
VIH_EN	Enable inputs high-level input voltage	1.365		VDD_IO	V

- 4.8 V is applicable only for 2.3 years (30% of the time). Otherwise, maximum VBAT must not exceed 4.3 V.

Recommended Operating Conditions (continued)

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
VIL_EN	Enable inputs low-level input voltage		0		0.4	V

Maximum power dissipation	WLAN operation				2.8	W
	Bluetooth operation				0.2	

(2) Applies to all digital lines except SDIO, UART, I2C, PCM and slow clock lines

5.5 External Digital Slow Clock Requirements

The supported digital slow clock is 32.768 kHz digital (square wave). All core functions share a single input.

PARAMETER	CONDITION	SYMBOL	MIN	TYP	MAX	UNIT
Input slow clock frequency				32768		Hz
Input slow clock accuracy (Initial + temp + aging)	WLAN, Bluetooth				±250	ppm
Input transition time T _r , T _f (10% to 90%)		T _r , T _f			200	ns
Frequency input duty cycle			15	50	85	%
Input voltage limits	Square wave, DC-coupled	V _{ih}	0.65 x VDD_IO		VDD_IO	V _{peak}
		V _{il}	0		0.35 x VDD_IO	
Input impedance			1			MΩ
Input capacitance					5	pF

- (1) CL1p% PA is connected to VBAT, 3.7 V.
- (2) Advertising in all three channels, 1.28-s advertising interval, 15 bytes advertise data
- (3) Listening to a single frequency per window, 1.28-s scan interval, 11.25-ms scan window
- (4) Zero slave connection latency, empty TX and RX LL packets

5.12 Timing and Switching Characteristics

5.12.1 Power Management

5.12.1.1 Block Diagram – Internal DC2DCs

The device incorporates three internal DC2DCs (switched-mode power supplies) to provide efficient internal supplies, derived from V_{BAT}.

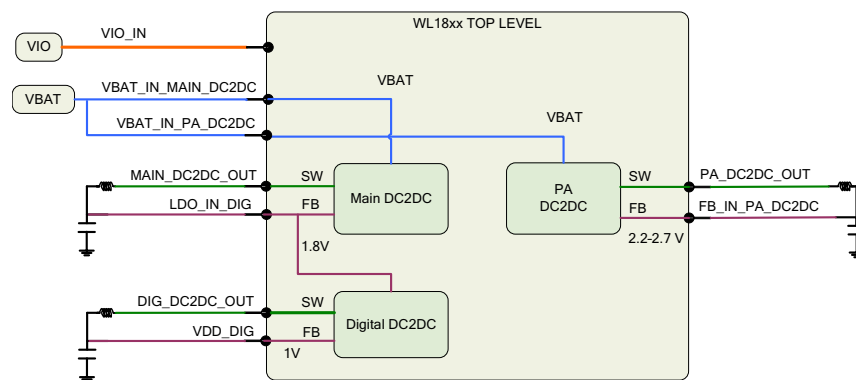

Figure 5-1. Internal DC2DCs

5.12.2 Power-Up and Shut-Down States

The correct power-up and shut-down sequences must be followed to avoid damage to the device.

While V_{BAT} or V_{IO} or both are deasserted, no signals should be driven to the device. The only exception is the slow clock that is a fail-safe I/O.

While V_{BAT}, V_{IO}, and slow clock are fed to the device, but WL_EN is deasserted (low), the device is in SHUTDOWN state. In SHUTDOWN state all functional blocks, internal DC2DCs, clocks, and LDOs are disabled.

To perform the correct power-up sequence, assert (high) WL_EN. The internal DC2DCs, LDOs, and clock start to ramp and stabilize. Stable slow clock, V_{IO}, and V_{BAT} are prerequisites to the assertion of one of the enable signals.

To perform the correct shut-down sequence, deassert (low) WL_EN while all the supplies to the device (V_{BAT}, V_{IO}, and slow clock) are still stable and available. The supplies to the chip (V_{BAT} and V_{IO}) can be deasserted only after both enable signals are deasserted (low).

Figure 5-2 shows the general power scheme for the module, including the powerdown sequence.

- NOTE:
1. Either V_{BAT} or V_{IO} can come up first.
 2. V_{BAT} and V_{IO} supplies and slow clock (SCLK), must be stable prior to EN being asserted and at all times when the EN is active.
 3. At least 60 μs is required between two successive device enables. The device is assumed to be in shutdown state during that period, meaning all enables to the device are LOW for that minimum duration.
 4. EN must be deasserted at least 10 μs before V_{BAT} or V_{IO} supply can be lowered. (Order of supply turn off after EN shutdown is immaterial)
 5. SCLK - Fail safe I/O

5.12.6 WLAN SDIO Transport Layer

The SDIO is the host interface for WLAN. The interface between the host and the WL18xx module uses an SDIO interface and supports a maximum clock rate of 50 MHz.

The device SDIO also supports the following features of the SDIO V3 specification:

- 4-bit data bus
- Synchronous and asynchronous in-band interrupt
- Default and high-speed (HS, 50 MHz) timing
- Sleep and wake commands

5.12.7 HCI UART Shared Transport Layers for All Functional Blocks (Except WLAN)

The device incorporates a UART module dedicated to the *Bluetooth* shared-transport, host controller interface (HCI) transport layer. The HCI interface transports commands, events, and ACL between the *Bluetooth* device and its host using HCI data packets acting as a shared transport for all functional blocks except WLAN.

WLAN	SHARED HCI FOR ALL FUNCTIONAL BLOCKS EXCEPT WLAN	BLUETOOTH VOICE-AUDIO
WLAN HS SDIO	Over UART	<i>Bluetooth</i> PCM

The HCI UART supports most baud rates (including all PC rates) for all fast-clock frequencies up to a maximum of 4 Mbps. After power up, the baud rate is set for 115.2 kbps, regardless of the fast-clock frequency. The baud rate can then be changed using a VS command. The device responds with a Command Complete Event (still at 115.2 kbps), after which the baud rate change occurs.

HCI hardware includes the following features:

- Receiver detection of break, idle, framing, FIFO overflow, and parity error conditions
- Receiver-transmitter underflow detection
- CTS, RTS hardware flow control
- 4 wire (H4)

Table 5-3 lists the UART default settings.

Table 5-3. UART Default Setting

PARAMETER	VALUE
Bit rate	115.2 kbps
Data length	8 bits
Stop bit	1
Parity	None

5.12.7.1 UART 4-Wire Interface – H4

The interface includes four signals:

- TXD
- RXD
- CTS
- RTS

Flow control between the host and the device is byte-wise by hardware.

When the UART RX buffer of the device passes the flow-control threshold, the buffer sets the UART_RTS signal high to stop transmission from the host. When the UART_CTS signal is set high, the device stops transmitting on the interface. If HCI_CTS is set high in the middle of transmitting a byte, the device finishes transmitting the byte and stops the transmission.

Figure 5-10 shows the UART timing.

6 Detailed Description

The WiLink 8 module is a self-contained connectivity solution based on WiLink 8 connectivity. As the eighth-generation connectivity combo chip from TI, the WiLink 8 module is based on proven technology.

Table 6-1 through Table 6-3 list performance parameters along with shutdown and sleep currents.

Table 6-1. WLAN Performance Parameters

TX current (SISO20) ⁽²⁾	238 mA	MCS7, 2.4 GHz, +11.2 dBm
Maximum peak current consumption during calibration ⁽³⁾	850 mA	

- (1) System design power scheme must comply with both peak and average TX bursts.
 (2) WLAN maximum VBAT current draw of 725 mA with MIMO continues burst configuration.
 (3) Peak current VBAT can hit 850 mA during device calibration.
- At wakeup, the WiLink 8 module performs the entire calibration sequence at the center of the 2.4-GHz band.
 - Once a link is established, calibration is performed periodically (every 5 minutes) on the specific channel tuned.
 - The maximum VBAT value is based on peak calibration consumption with a 30% margin.

6.1 WLAN

The device supports the following WLAN features:

- Integrated 2.4-GHz power amplifiers (PAs) for a complete WLAN solution
- Baseband processor: IEEE Std 802.11b/g and IEEE Std 802.11n data rates with 20- or 40-MHz SISO and 20-MHz MIMO
- Fully calibrated system (production calibration not required)
- Medium access controller (MAC)
 - Embedded ARM® central processing unit (CPU)
 - Hardware-based encryption-decryption using 64-, 128-, and 256-bit WEP, TKIP, or AES keys
 - Requirements for Wi-Fi-protected access (WPA and WPA2.0) and IEEE Std 802.11i (includes hardware-accelerated Advanced Encryption Standard [AES])
- New advanced coexistence scheme with *Bluetooth* and BLE
- 2.4-GHz radio
 - Internal LNA and PA
 - IEEE Std 802.11b, 802.11g, and 802.11n
- 4-bit SDIO host interface, including high speed (HS) and V3 modes

6.2 Bluetooth

The device supports the following *Bluetooth* features:

- *Bluetooth* 4.0 as well as CSA2
- Concurrent operation and built-in coexisting and prioritization handling of *Bluetooth*, BLE, audio processing, and WLAN
- Dedicated audio processor supporting on-chip SBC encoding + A2DP
 - Assisted A2DP (A3DP): SBC encoding implemented internally
 - Assisted WB-speech (AWBS): modified SBC codec implemented internally

6.3 BLE

The device supports the following BLE features:

- Bluetooth 4.0 BLE dual-mode standard
- All roles and role combinations, mandatory as well as optional
- Up to 10 BLE connections
- Independent LE buffering allowing many multiple connections with no affect on BR-EDR performance

7.1.2 Design Recommendations

This section describes the layout recommendations for the (X)WL1835 module, RF trace, and antenna.

[Table 7-2](#) summarizes the layout recommendations.

Table 7-2. Layout Recommendations Summary

ITEM	DESCRIPTION
	Thermal
1	The proximity of ground vias must be close to the pad.
2	Signal traces must not be run underneath the module on the layer where the module is mounted.
3	Have a complete ground pour in layer 2 for thermal dissipation.
4	Have a solid ground plane and ground vias under the module for stable system and thermal dissipation.
5	Increase the ground pour in the first layer and have all of the traces from the first layer on the inner layers, if possible.
6	Signal traces can be run on a third layer under the solid ground layer, which is below the module mounting layer.
	RF Trace and Antenna Routing
7	The RF trace antenna feed must be as short as possible beyond the ground reference. At this point, the trace starts to radiate.
8	The RF trace bends must be gradual with an approximate maximum bend of 45 degrees with trace mitered. RF traces must not have sharp corners.
9	RF traces must have via stitching on the ground plane beside the RF trace on both sides.
10	RF traces must have constant impedance (microstrip transmission line).
11	For best results, the RF trace ground layer must be the ground layer immediately below the RF trace. The ground layer must be solid.
12	There must be no traces or ground under the antenna section.
13	RF traces must be as short as possible. The antenna, RF traces, and modules must be on the edge of the PCB product. The proximity of the antenna to the enclosure and the enclosure material must also be considered.
	Supply and IF
14	The power trace for VBAT must be at least 40-mil wide.
15	The 1.8-V trace must be at least 18-mil wide.
16	Make VBAT traces as wide as possible to ensure reduced inductance and trace resistance.
17	If possible, shield VBAT traces with ground above, below, and beside the traces.
18	SDIO signals traces (CLK, CMD, D0, D1, D2, and D3) must be routed in parallel to each other and as short as possible (less than 12 cm). In addition, every trace length must be the same as the others. There should be enough space between traces – greater than 1.5 times the trace width or ground – to ensure signal quality, especially for the SDIO_CLK trace. Remember to keep these traces away from the other digital or analog signal traces. TI recommends adding ground shielding around these buses.
19	SDIO and digital clock signals are a source of noise. Keep the traces of these signals as short as possible. If possible, maintain a clearance around them.

7.1.3 RF Trace and Antenna Layout Recommendations

[Figure 7-2](#) shows the location of the antenna on the WL1835MODCOM8 board as well as the RF trace routing from the (X)WL1835 module (TI reference design). The TDK chip multilayer antennas are mounted on the board with a specific layout and matching circuit for the radiation test conducted in FCC, CE, and IC certifications.

Figure 7-2. Location of Antenna and RF Trace Routing on the TMDXWL1835MODCOM8T Board

Follow these RF trace routing recommendations:

- RF traces must have 50-Ω impedance.
- RF traces must not have sharp corners.
- RF traces must have via stitching on the ground plane beside the RF trace on both sides.
- RF traces must be as short as possible. The antenna, RF traces, and module must be on the edge of the PCB product in consideration of the product enclosure material and proximity.

7.1.4 Module Layout Recommendations

Figure 7-3 shows layer 1 and layer 2 of the TI module layout:

Figure 7-3. TI Module Layout

Follow these module layout recommendations:

- Ensure a solid ground plane and ground vias under the module for stable system and thermal dissipation.

- Do not run signal traces underneath the module on a layer where the module is mounted.
- Signal traces can be run on a third layer under the solid ground layer and beneath the module mounting.
- Run the host interfaces with ground on the adjacent layer to improve the return path.
- TI recommends routing the signals as short as possible to the host.

7.1.5 Thermal Board Recommendations

The TI module uses μ vias for layers 1 through 6 with full copper filling, providing heat flow all the way to the module ground pads.

TI recommends using one big ground pad under the module with vias all the way to connect the pad to all ground layers (see [Figure 7-4](#)).

Figure 7-4. Block of Ground Pads on Bottom Side of Package

[Figure 7-5](#) shows via array patterns, which are applied wherever possible to connect all of the layers to the TI module central or main ground pads.

7.1.6 Baking and SMT Recommendations

7.1.6.1 Baking Recommendations

Follow these baking guidelines for the WiLink 8 module:

- Follow MSL level 3 to perform the baking process.
- After the bag is open, devices subjected to reflow solder or other high temperature processes must be mounted within 168 hours of factory conditions (< 30°C/60% RH) or stored at <10% RH.
- if the Humidity Indicator Card reads >10%, devices require baking before being mounted.
- If baking is required, bake devices for 8 hours at 125 °C.

7.1.6.2 SMT Recommendations

Figure 7-6 shows the recommended reflow profile for the WiLink 8 module.

Figure 7-6. Reflow Profile for the WiLink 8 Module

Table 7-3 lists the temperature values for the profile shown in Figure 7-6.

Table 7-3. Temperature Values for Reflow Profile

ITEM	TEMPERATURE (°C)	TIME (s)
Preheat	D1 to approximately D2: 140 to 200	T1: 80 to approximately 120
Soldering	D2: 220	T2: 60 ±10
Peak temperature	D3: 250 max	T3: 10

8.1.1 Development Support

For a complete listing of development-support tools, visit the Texas Instruments [WL18xx Wiki](#). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

8.1.2 Device Support Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers. These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices.

- X Experimental, preproduction, sample or prototype device. Device may not meet all product qualification conditions and may not fully comply with TI specifications. Experimental/Prototype devices are shipped against the following disclaimer: "This product is still in development and is intended for internal evaluation purposes." Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability of fitness for a specific purpose, of this device.
- null Device is qualified and released to production. TI's standard warranty applies to production devices.

8.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
