

TMS320C6454

Fixed-Point Digital Signal Processor

Check for Samples: [TMS320C6454](#)

1 Features

- High-Performance Fixed-Point DSP (C6454)
 - 1.39-, 1.17-, and 1-ns Instruction Cycle Time
 - 720-MHz, 850-MHz, and 1-GHz Clock Rate
 - Eight 32-Bit Instructions/Cycle
 - 8000 MIPS/MMACS (16-Bits)
 - Commercial Temperature [0°C to 90°C]
 - Extended Temperature [-40°C to 105°C]
- TMS320C64x+™ DSP Core
 - Dedicated SPLOOP Instruction
 - Compact Instructions (16-Bit)
 - Instruction Set Enhancements
 - Exception Handling
- TMS320C64x+ Megamodule L1/L2 Memory Architecture:
 - 256K-Bit (32K-Byte) L1P Program Cache [Direct Mapped]
 - 256K-Bit (32K-Byte) L1D Data Cache [2-Way Set-Associative]
 - 8M-Bit (1048K-Byte) L2 Unified Mapped RAM/Cache [Flexible Allocation]
 - 256K-Bit (32K-Byte) L2 ROM
 - Time Stamp Counter
- Endianness: Little Endian, Big Endian
- 64-Bit External Memory Interface (EMIFA)
 - Glueless Interface to Asynchronous Memories (SRAM, Flash, and EEPROM) and Synchronous Memories (SBSRAM, ZBT SRAM)
 - Supports Interface to Standard Sync Devices and Custom Logic (FPGA, CPLD, ASICs, etc.)
 - 32M-Byte Total Addressable External Memory Space
- DDR2 Memory Controller
 - Interfaces to DDR2-533 SDRAM
 - 32-Bit/16-Bit, 533-MHz (data rate) Bus
 - 512M-Byte Total Addressable External Memory Space
- EDMA3 Controller (64 Independent Channels)
- 32-/16-Bit Host-Port Interface (HPI)
- 32-Bit 33-/66-MHz, 3.3-V Peripheral Component Interconnect (PCI) Master/Slave Interface Conforms to *PCI Local Bus Specification (v2.3)*
- One Inter-Integrated Circuit (I²C) Bus
- Two McBSPs
- 10/100/1000 Mb/s Ethernet MAC (EMAC)
 - IEEE 802.3 Compliant
 - Supports Multiple Media Independent Interfaces (MII, GMII, RMII, and RGMII)
 - 8 Independent Transmit (TX) and 8 Independent Receive (RX) Channels
- Two 64-Bit General-Purpose Timers, Configurable as Four 32-Bit Timers
- 16 General-Purpose I/O (GPIO) Pins
- System PLL and PLL Controller
- Secondary PLL and PLL Controller, Dedicated to EMAC and DDR2 Memory Controller
- Advanced Event Triggering (AET) Compatible
- Trace-Enabled Device
- IEEE-1149.1 (JTAG™) Boundary-Scan-Compatible
- 697-Pin Ball Grid Array (BGA) Package (CTZ, GTZ, or ZTZ Suffix), 0.8-mm Ball Pitch
- 0.09-μm/7-Level Cu Metal Process (CMOS)
- 3.3-/1.8-/1.5-V I/Os, 1.25-/1.2-V Internal
- Pin-Compatible with the TMS320C6455 Fixed-Point Digital Signal Processor

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

1.2 Description

The TMS320C64x+™ DSPs (including the TMS320C6454 device) are the highest-performance fixed-point DSP generation in the TMS320C6000™ DSP platform. The C6454 device is based on the third-generation high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for applications including video and telecom infrastructure, imaging/medical, and wireless infrastructure (WI). The C64x+™ devices are upward code-compatible from previous devices that are part of the C6000™ DSP platform.

The C6454 device offers a lower cost pin-compatible migration path for C6455 customers who don't need the 2MB of the C6455 or the high-speed interconnect provided by Serial RapidIO. The C6454 device also provides an excellent migration path for existing C6414/6415/6416 customers who require C6454 advanced peripherals; DDR2 at 533 MHz provides 2x performance boost over older SDRAM interface, gigabit Ethernet provides low-cost high-performance ubiquitous packet interface, and 66-MHz PCI (revision 2.3 compliant) provides legacy high-bandwidth interconnect.

Based on 90-nm process technology and with performance of up to 8000 million instructions per second (MIPS) [or 8000 16-bit MMACs per cycle] at a 1-GHz clock rate, the C6454 device offers cost-effective solutions to high-performance DSP programming challenges. The C6454 DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors.

The C64x+ DSP core employs eight functional units, two register files, and two data paths. Like the earlier C6000 devices, two of these eight functional units are multipliers or .M units. Each C64x+ .M unit doubles the multiply throughput versus the C64x core by performing four 16-bit x 16-bit multiply-accumulates (MACs) every clock cycle. Thus, eight 16-bit x 16-bit MACs can be executed every cycle on the C64x+ core. At a 1-GHz clock rate, this means 8000 16-bit MMACs can occur every second. Moreover, each multiplier on the C64x+ core can compute one 32-bit x 32-bit MAC or four 8-bit x 8-bit MACs every clock cycle.

The C6454 DSP integrates a large amount of on-chip memory organized as a two-level memory system. The level-1 (L1) program and data memories on the C6454 device are 32KB each. This memory can be configured as mapped RAM, cache, or some combination of the two. When configured as cache, L1 program (L1P) is a direct mapped cache whereas L1 data (L1D) is a two-way set associative cache. The level-2 (L2) memory is shared between program and data space and is 1048KB in size. L2 memory can also be configured as mapped RAM, cache, or some combination of the two. The C64x+ Megamodule also has a 32-bit peripheral configuration (CFG) port, an internal DMA (IDMA) controller, a system component with reset/boot control, interrupt/exception control, a power-down control, and a free-running 32-bit timer for time stamp.

The peripheral set includes: an inter-integrated circuit bus module (I2C); two multichannel buffered serial ports (McBSPs); a user-configurable 16-bit or 32-bit host-port interface (HPI16/HPI32); a peripheral component interconnect (PCI); a 16-pin general-purpose input/output port (GPIO) with programmable interrupt/event generation modes; an 10/100/1000 Ethernet media access controller (EMAC), which provides an efficient interface between the C6454 DSP core processor and the network; a management data input/output (MDIO) module (also part of the EMAC) that continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system; a glueless external memory interface (64-bit EMIFA), which is capable of interfacing to synchronous and asynchronous peripherals; and a 32-bit DDR2 SDRAM interface.

The I2C ports on the C6454 device allow the DSP to easily control peripheral devices and communicate with a host processor. In addition, the standard multichannel buffered serial port (McBSP) may be used to communicate with serial peripheral interface (SPI) mode peripheral devices.

The C6454 DSP has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows® debugger interface for visibility into source code execution.

1.3 Functional Block Diagram

Figure 1-2 shows the functional block diagram of the C6454 device.

- A. McBSPs: Framing Chips - H.100, MVIP, SCSA, T1, E1; AC97 Devices; SPI Devices; Codecs.
- B. The PCI peripheral pins are muxed with some of the HPI peripheral pins. For more detailed information, see the *Device Configuration* section.
- C. Each of the TIMER peripherals (TIMER1 and TIMER0) is configurable as a 64-bit general-purpose timer, dual 32-bit general-purpose timers, or a watchdog timer.
- D. The PLL2 controller also generates clocks for the EMAC.
- E. When accessing the internal ROM of the DSP, the CPU frequency must always be less than 750 MHz.

2.2 CPU (DSP Core) Description

The C64x+ Central Processing Unit (CPU) consists of eight functional units, two register files, and two data paths as shown in [Figure 2-1](#). The two general-purpose register files (A and B) each contain 32 32-bit registers for a total of 64 registers. The general-purpose registers can be used for data or can be data address pointers. The data types supported include packed 8-bit data, packed 16-bit data, 32-bit data, 40-bit data, and 64-bit data. Values larger than 32 bits, such as 40-bit-long or 64-bit-long values are stored in register pairs, with the 32 LSBs of data placed in an even register and the remaining 8 or 32 MSBs in the next upper register (which is always an odd-numbered register).

The eight functional units (.M1, .L1, .D1, .S1, .M2, .L2, .D2, and .S2) are each capable of executing one instruction every clock cycle. The .M functional units perform all multiply operations. The .S and .L units perform a general set of arithmetic, logical, and branch functions. The .D units primarily load data from memory to the register file and store results from the register file into memory.

The C64x+ CPU extends the performance of the C64x core through enhancements and new features.

Each C64x+ .M unit can perform one of the following each clock cycle: one 32 x 32 bit multiply, two 16 x 16 bit multiplies, two 16 x 32 bit multiplies, four 8 x 8 bit multiplies, four 8 x 8 bit multiplies with add operations, and four 16 x 16 multiplies with add/subtract capabilities (including a complex multiply). There is also support for Galois field multiplication for 8-bit and 32-bit data. Many communications algorithms such as FFTs and modems require complex multiplication. The complex multiply (CMPY) instruction takes for 16-bit inputs and produces a 32-bit real and a 32-bit imaginary output. There are also complex multiplies with rounding capability that produces one 32-bit packed output that contain 16-bit real and 16-bit imaginary values. The 32 x 32 bit multiply instructions provide the extended precision necessary for audio and other high-precision algorithms on a variety of signed and unsigned 32-bit data types.

The .L or (Arithmetic Logic Unit) now incorporates the ability to do parallel add/subtract operations on a pair of common inputs. Versions of this instruction exist to work on 32-bit data or on pairs of 16-bit data performing dual 16-bit add and subtracts in parallel. There are also saturated forms of these instructions.

The C64x+ core enhances the .S unit in several ways. In the C64x core, dual 16-bit MIN2 and MAX2 comparisons were only available on the .L units. On the C64x+ core they are also available on the .S unit which increases the performance of algorithms that do searching and sorting. Finally, to increase data packing and unpacking throughput, the .S unit allows sustained high performance for the quad 8-bit/16-bit and dual 16-bit instructions. Unpack instructions prepare 8-bit data for parallel 16-bit operations. Pack instructions return parallel results to output precision including saturation support.

Other new features include:

- **SPLOOP** - A small instruction buffer in the CPU that aids in creation of software pipelining loops where multiple iterations of a loop are executed in parallel. The SPLOOP buffer reduces the code size associated with software pipelining. Furthermore, loops in the SPLOOP buffer are fully interruptible.
- **Compact Instructions** - The native instruction size for the C6000 devices is 32 bits. Many common instructions such as MPY, AND, OR, ADD, and SUB can be expressed as 16 bits if the C64x+ compiler can restrict the code to use certain registers in the register file. This compression is performed by the code generation tools.
- **Instruction Set Enhancements** - As noted above, there are new instructions such as 32-bit multiplications, complex multiplications, packing, sorting, bit manipulation, and 32-bit Galois field multiplication.
- **Exception Handling** - Intended to aid the programmer in isolating bugs. The C64x+ CPU is able to detect and respond to exceptions, both from internally detected sources (such as illegal op-codes) and from system events (such as a watchdog time expiration).
- **Privilege** - Defines user and supervisor modes of operation, allowing the operating system to give a basic level of protection to sensitive resources. Local memory is divided into multiple pages, each with read, write, and execute permissions.
- **Time-Stamp Counter** - Primarily targeted for Real-Time Operating System (RTOS) robustness, a free-running time-stamp counter is implemented in the CPU which is **not** sensitive to system stalls.

For more details on the C64x+ CPU and its enhancements over the C64x architecture, see the following documents:

- *TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide* (literature number [SPRU732](#))
- *TMS320C64x+ DSP Cache User's Guide* (literature number [SPRU862](#))
- *TMS320C64x+ Megamodule Reference Guide* (literature number [SPRU871](#))
- *TMS320C6455 Technical Reference* (literature number [SPRU965](#))
- *TMS320C64x to TMS320C64x+ CPU Migration Guide* (literature number [SPRAA84](#))

- A. On .M unit, *dst2* is 32 MSB.
- B. On .M unit, *dst1* is 32 LSB.
- C. On C64x CPU .M unit, *src2* is 32 bits; on C64x+ CPU .M unit, *src2* is 64 bits.
- D. On .L and .S units, *odd dst* connects to odd register files and *even dst* connects to even register files.

(1) The EMIFA $\overline{CE0}$ and $\overline{CE1}$ are **not** functionally supported on the C6454 device and, therefore, are **not** pinned out.

2.4 Boot Sequence

The boot sequence is a process by which the DSP's internal memory is loaded with program and data sections and the DSP's internal registers are programmed with predetermined values. The boot sequence is started automatically after each power-on reset, warm reset, and system reset. For more details on the initiators of these resets, see [Section 7.6, Reset Controller](#).

There are several methods by which the memory and register initialization can take place. Each of these methods is referred to as a boot mode. The boot mode to be used is selected at reset through the BOOTMODE[3:0] pins.

Each boot mode can be classified as a hardware boot mode or as a software boot mode. Software boot modes require the use of the on-chip bootloader. The bootloader is DSP code that transfers application code from an external source into internal or external program memory after the DSP is taken out of reset. The bootloader is permanently stored in the internal ROM of the DSP starting at byte address 0010 0000h. Hardware boot modes are carried out by the boot configuration logic. The boot configuration logic is actual hardware that does not require the execution of DSP code. [Section 2.4.1, Boot Modes Supported](#), describes each boot mode in more detail.

When accessing the internal ROM of the DSP, the CPU frequency must always be less than 750 MHz. Therefore, when using a software boot mode, care must be taken such that the CPU frequency does not exceed 750 MHz at any point during the boot sequence. After the boot sequence has completed, the CPU frequency can be programmed to the frequency required by the application.

2.4.1 Boot Modes Supported

The C6454 device has five boot modes:

- No boot (BOOTMODE[3:0] = 0000b)

With no boot, the CPU executes directly from the internal L2 SRAM located at address 0x80 0000. Note: device operations is undefined if invalid code is located at address 0x80 0000. This boot mode is a hardware boot mode.

- Host boot (BOOTMODE[3:0] = 0001b and BOOTMODE[3:0] = 0111b)

If host boot is selected, after reset, the CPU is internally "stalled" while the remainder of the device is released. During this period, an external host can initialize the CPU's memory space as necessary through Host Port Interface (HPI) or the Peripheral Component Interconnect (PCI) interface. Internal configuration registers, such as those that control the EMIF can also be initialized by the host with two exceptions: Device State Control registers ([Section 3.4](#)), PLL1 and PLL2 Controller registers ([Section 7.7](#) and [Section 7.8](#)) cannot be accessed through any host interface, including HPI and PCI.

Once the host is finished with all necessary initialization, it must generate a DSP interrupt (DSPINT) to complete the boot process. This transition causes boot configuration logic to bring the CPU out of the "stalled" state. The CPU then begins execution from the internal L2 SRAM located at 0x80 0000. Note that the DSP interrupt is registered in bit 0 (channel 0) of the EDMA Event Register (ER). This event must be cleared by software before triggering transfers on DMA channel 0.

All memory, with the exceptions previously described, may be written to and read by the host. This allows for the host to verify what it sends to the DSP if required. After the CPU is out of the "stalled" state, the CPU needs to clear the DSPINT, otherwise, no more DSPINTs can be received.

As previously mentioned, for the C6454 device, the Host Port Interface (HPI) and the Peripheral Component Interconnect (PCI) interface can be used for host boot. To use the HPI for host boot, the PCI_EN pin (Y29) must be low [default] (enabling the HPI peripheral) and BOOTMODE[3:0] must be set to 0001b at device reset. Conversely, to use the PCI interface for host boot, the PCI_EN pin (Y29) must be high (enabling the PCI peripheral) and BOOTMODE[3:0] must be set to 0111b at device reset. For the HPI host boot, the DSP interrupt can be generated through the use of the DSPINT bit in the HPI Control (HPIC) register.

For the HPI host boot, the CPU is actually held in reset until a DSP interrupt is generated by the host. The DSP interrupt can be generated through the use of the DSPINT bit in the HPI Control (HPIC) register. Since the CPU is held in reset during HPI host boot, it will not respond to emulation software

such as Code Composer Studio.

For the PCI host boot, the CPU is out of reset, but it executes an IDLE instruction until a DSP interrupt is generated by the host. The host can generate a DSP interrupt through the PCI peripheral by setting the DSPINT bit in the Back-End Application Interrupt Enable Set Register (PCIBINTSET) and the Status Set Register (PCISTATSET).

Note that the HPI host boot is a hardware boot mode while the PCI host boot is a software boot mode.

If PCI boot is selected, the on-chip bootloader configures the PLL1 Controller such that CLKIN1 is multiplied by 15. More specifically, PLLM is set to 0Eh (x15) and RATIO is set to 0 (÷1) in the PLL1 Multiplier Control Register (PLLM) and PLL1 Pre-Divider Register (PREDIV), respectively. The CLKIN1 frequency must not be greater than 50 MHz so that the maximum speed of the internal ROM, 750 MHz, is not violated. The CFGGP[2:0] pins must be set to 000b during reset for proper operation of the PCI boot mode.

As mentioned previously, a DSP interrupt must be generated at the end of the host boot process to begin execution of the loaded application. Since the DSP interrupt generated by the HPI and PCI is mapped to the EDMA event DSP_EVT (DMA channel 0), it will get recorded in bit 0 of the EDMA Event Register (ER). This event must be cleared by software before triggering transfers on DMA channel 0.

- EMIFA 8-bit ROM boot (BOOTMODE[3:0] = 0100b)

After reset, the device will begin executing software out of an Asynchronous 8-bit ROM located in EMIFA CE3 space using the default settings in the EMIFA registers. This boot mode is a hardware boot mode.

- Master I2C boot (BOOTMODE[3:0] = 0101b)

After reset, the DSP can act as a master to the I2C bus and copy data from an I2C EEPROM or a device acting as an I2C slave to the DSP using a predefined boot table format. The destination address and length are contained within the boot table. This boot mode is a software boot mode.

- Slave I2C boot (BOOTMODE[3:0] = 0110b)

A Slave I2C boot is also implemented, which programs the DSP as an I2C Slave and simply waits for a Master to send data using a standard boot table format.

Using the Slave I2C boot, a single DSP or a device acting as an I2C Master can simultaneously boot multiple slave DSPs connected to the same I2C bus. Note that the Master DSP may require booting via an I2C EEPROM before acting as a Master and booting other DSPs.

The Slave I2C boot is a software boot mode.

2.4.2 2nd-Level Bootloaders

Any of the boot modes can be used to download a 2nd-level bootloader. A 2nd-level bootloader allows for any level of customization to current boot methods as well as definition of a completely customized boot. TI offers a few 2nd-level bootloaders, such as an EMAC bootloader, which can be loaded using the Master I2C boot.

2.5 Pin Assignments

2.5.1 Pin Map

Figure 2-2 through Figure 2-5 show the C6454 device pin assignments in four quadrants (A, B, C, and D).

2.6 Signal Groups Description

A. This pin functions as GP[1] by default. For more details, see [Section 3](#).

Figure 2-6. CPU and Peripheral Signals

- A. This pin functions as GP[1] by default. For more details, see the *Device Configuration* section of this document.
- B. These McBSP1 peripheral pins are muxed with the GPIO peripheral pins and by default these signals function as GPIO peripheral pins. For more details, see the *Device Configuration* section of this document.
- C. These PCI peripheral pins are muxed with the GPIO peripheral pins and by default these signals function as GPIO peripheral pins. For more details, see the *Device Configuration* section of this document.

Figure 2-7. Timers/GPIO Peripheral Signals

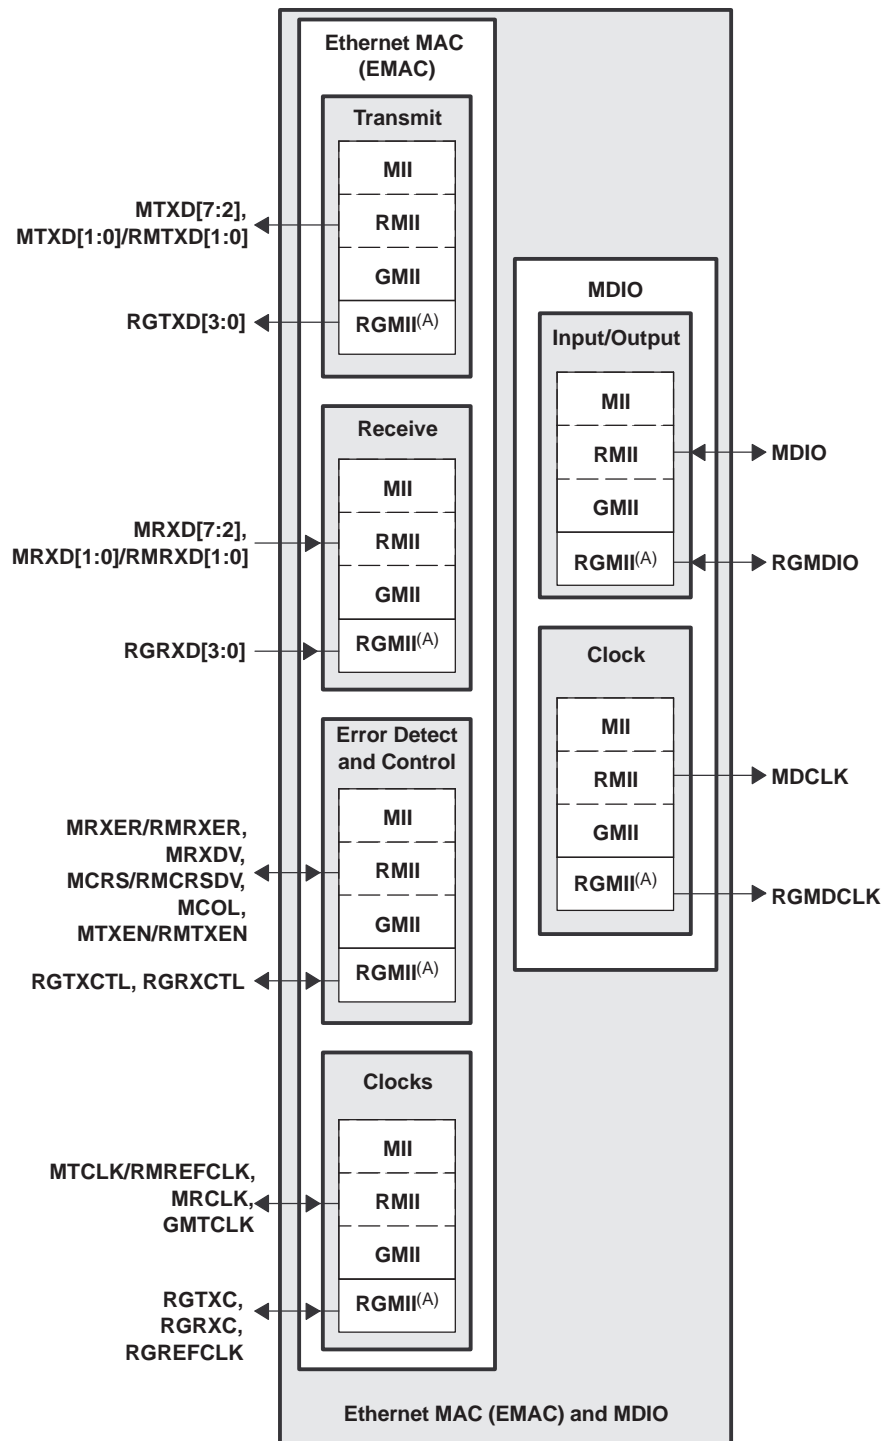

Figure 2-8. EMIFA and DDR2 Memory Controller Peripheral Signals

- A. These HPI pins are muxed with the PCI peripheral. By default, these pins function as HPI. When the HPI is enabled, the number of HPI pins used depends on the HPI configuration (HPI16 or HPI32). For more details on these muxed pins, see the *Device Configuration* section of this document.
- B. These McBSP1 peripheral pins are muxed with the GPIO peripheral pins and by default these signals function as GPIO peripheral pins. For more details, see the *Device Configuration* section of this document.

Figure 2-9. HPI/McBSP/I2C Peripheral Signals

A. RGMII signals are mutually exclusive to all other EMAC signals.

Figure 2-10. EMAC/MDIO [MII, GMII, RMII, and RGMII] Peripheral Signals

A. These PCI pins are muxed with the HPI or GPIO peripherals. By default, these signals function as HPI or GPIO or EMAC. For more details on these muxed pins, see the *Device Configuration* section of this document.

Figure 2-11. PCI Peripheral Signals

2.7 Terminal Functions

The terminal functions table (Table 2-3) identifies the external signal names, the associated pin (ball) numbers along with the mechanical package designator, the pin type (I, O/Z, or I/O/Z), whether the pin has any internal pullup/pulldown resistors, and a functional pin description. For more detailed information on device configuration, peripheral selection, multiplexed/shared pins, and pullup/pulldown resistors, see Section 3, *Device Configuration*.

Table 2-3. Terminal Functions

SIGNAL NAME	NO.	TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
CLOCK/PLL CONFIGURATIONS				
CLKIN1	N28	I	IPD	Clock Input for PLL1.
CLKIN2	G3	I	IPD	Clock Input for PLL2.
PLLV1	T29	A		1.8-V I/O supply voltage for PLL1
PLLV2	A5	A		1.8-V I/O supply voltage for PLL2
SYSCLK4/GP[1] ⁽³⁾	AJ13	I/O/Z	IPD	SYSCLK4 is the clock output at 1/8 of the device speed (O/Z) or this pin can be programmed as the GP1 pin (I/O/Z) [default].
JTAG EMULATION				
TMS	AJ10	I	IPU	JTAG test-port mode select
TDO	AH8	O/Z	IPU	JTAG test-port data out
TDI	AH9	I	IPU	JTAG test-port data in
TCK	AJ9	I	IPU	JTAG test-port clock
$\overline{\text{TRST}}$	AH7	I	IPD	JTAG test-port reset. For IEEE 1149.1 JTAG compatibility, see Section 7.18.3.1.1.
EMU0 ⁽⁴⁾	AF7	I/O/Z	IPU	Emulation pin 0

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal

(2) IPD = Internal pulldown, IPU = Internal pullup. For most systems, a 1-k Ω resistor can be used to oppose the IPU/IPD. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.7, *Pullup/Pulldown Resistors*.

(3) These pins are multiplexed pins. For more details, see Section 3, *Device Configuration*.

(4) The C6454 DSP does not require external pulldown resistors on the EMU0 and EMU1 pins for normal or boundary-scan operation.

Table 2-3. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
EMU1 ⁽⁴⁾	AE11	I/O/Z	IPU	Emulation pin 1
EMU2	AG9	I/O/Z	IPU	Emulation pin 2
EMU3	AF10	I/O/Z	IPU	Emulation pin 3
EMU4	AF9	I/O/Z	IPU	Emulation pin 4
EMU5	AE12	I/O/Z	IPU	Emulation pin 5
EMU6	AG8	I/O/Z	IPU	Emulation pin 6
EMU7	AF12	I/O/Z	IPU	Emulation pin 7
EMU8	AF11	I/O/Z	IPU	Emulation pin 8
EMU9	AH13	I/O/Z	IPU	Emulation pin 9
EMU10	AD10	I/O/Z	IPU	Emulation pin 10
EMU11	AD12	I/O/Z	IPU	Emulation pin 11
EMU12	AE10	I/O/Z	IPU	Emulation pin 12
EMU13	AD8	I/O/Z	IPU	Emulation pin 13
EMU14	AF13	I/O/Z	IPU	Emulation pin 14
EMU15	AE9	I/O/Z	IPU	Emulation pin 15
EMU16	AH12	I/O/Z	IPU	Emulation pin 16
EMU17	AH10	I/O/Z	IPU	Emulation pin 17
EMU18	AE13	I/O/Z	IPU	Emulation pin 18
RESETS, INTERRUPTS, AND GENERAL-PURPOSE INPUT/OUTPUTS				
$\overline{\text{RESET}}$	AG14	I		Device reset
NMI	AH4	I	IPD	Nonmaskable interrupt, edge-driven (rising edge) Any noise on the NMI pin may trigger an NMI interrupt; therefore, if the NMI pin is not used, it is recommended that the NMI pin be grounded versus relying on the IPD.
$\overline{\text{RESETSTAT}}$	AE14	O		Reset Status pin. The $\overline{\text{RESETSTAT}}$ pin indicates when the device is in reset
$\overline{\text{POR}}$	AF14	I		Power on reset.
GP[7]	AG2	I/O/Z	IPD	General-purpose input/output (GPIO) pins (I/O/Z).
GP[6]	AG3	I/O/Z	IPD	
GP[5]	AJ2	I/O/Z	IPD	
GP[4]	AH2	I/O/Z	IPD	
$\overline{\text{PREQ}}/ \text{GP}[15]$	P2	I/O/Z		PCI peripheral pins or General-purpose input/output (GPIO) [15:12, 2] pins (I/O/Z) [default]
$\overline{\text{PINTA}}^{(5)}/ \text{GP}[14]$	P3	I/O/Z		
$\overline{\text{PRST}}/ \text{GP}[13]$	R5	I/O/Z		
$\overline{\text{PGNT}}/ \text{GP}[12]$	R4	I/O/Z		
FSX1/GP[11]	AG4	I/O/Z	IPD	
FSR1/GP[10]	AE5	I/O/Z	IPD	
DX1/GP[9]	AG5	I/O/Z	IPD	
DR1/GP[8]	AH5	I/O/Z	IPD	
CLKX1/GP[3]	AF5	I/O/Z	IPD	
$\overline{\text{PCBE0}}/ \text{GP}[2]$	P1	I/O/Z		
SYSCLK4/GP[1]	AJ13	O/Z	IPD	PCI bus request (O/Z) or GP[15] (I/O/Z) [default] PCI interrupt A (O/Z) or GP[14] (I/O/Z) [default] PCI reset (I) or GP[13] (I/O/Z) [default] PCI bus grant (I) or GP[12] (I/O/Z) [default] PCI command/byte enable 0 (I/O/Z) or GP[2] (I/O/Z) [default] McBSP1 transmit clock (I/O/Z) or GP[3] (I/O/Z) [default] McBSP1 receive clock (I/O/Z) or GP[0] (I/O/Z) [default] GP[1] pin (I/O/Z). SYSCLK4 is the clock output at 1/8 of the device speed (O/Z) or this pin can be programmed as a GP[1] pin (I/O/Z) [default].
CLKR1/GP[0]	AF4	I/O/Z	IPD	
HOST-PORT INTERFACE (HPI) or PERIPHERAL COMPONENT INTERCONNECT (PCI)				
PCI_EN	Y29	I	IPD	PCI enable pin. This pin controls the selection (enable/disable) of the HPI and GP[15:8], or PCI peripherals. This pin works in conjunction with the McBSP1_EN (AEA5 pin) to enable/disable other peripherals (for more details, see Section 3, Device Configuration).

(5) These pins function as open-drain outputs when configured as PCI pins.

Table 2-3. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
$\overline{\text{HINT}}/\overline{\text{PFRAME}}$	U3	I/O/Z		Host interrupt from DSP to host (O/Z) or PCI frame (I/O/Z)
$\overline{\text{HCNTL1}}/\overline{\text{PDEVSEL}}$	U4	I/O/Z		Host control - selects between control, address, or data registers (I) [default] or PCI device select (I/O/Z)
$\overline{\text{HCNTL0}}/\overline{\text{PSTOP}}$	U5	I/O/Z		Host control - selects between control, address, or data registers (I) [default] or PCI stop (I/O/Z)
$\overline{\text{HHWIL}}/\overline{\text{PCLK}}$	V3	I/O/Z		Host half-word select - first or second half-word (not necessarily high or low order) [For HP116 bus width selection only] (I) [default] or PCI clock (I)
$\overline{\text{HR}}/\overline{\text{PCBE2}}$	T5	I/O/Z		Host read or write select (I) [default] or PCI command/byte enable 2 (I/O/Z)

EMIFA (64-BIT) - BUS ARBITRATION				
\overline{AHOLDA}	N26	O	IPU	EMIFA hold-request-acknowledge to the host
\overline{AHOLD}	R29	I	IPU	EMIFA hold request from the host
ABUSREQ	L27	O	IPU	EMIFA bus request output
EMIFA (64-BIT) - ASYNCHRONOUS/SYNCHRONOUS MEMORY CONTROL				
AECLKIN	N29	I	IPD	EMIFA external input clock. The EMIFA input clock (AECLKIN or SYSCLK4 clock) is selected at reset via the pullup/pulldown resistor on the AEA[15] pin. Note: AECLKIN is the default for the EMIFA input clock.

Table 2-3. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
AECLKOUT	V29	O/Z	IPD	EMIFA output clock [at EMIFA input clock (AECLKIN or SYSCLK4) frequency]
$\overline{\text{AAWE}}/\overline{\text{ASWE}}$	AB25	O/Z	IPU	Asynchronous memory write-enable/Programmable synchronous interface write-enable
AARDY	K29	I	IPU	Asynchronous memory ready input
$\overline{\text{AR}}/\overline{\text{W}}$	W25	O/Z	IPU	Asynchronous memory read/write
$\overline{\text{AAOE}}/\overline{\text{ASOE}}$	Y28	O/Z	IPU	Asynchronous/Programmable synchronous memory output-enable
$\overline{\text{ASADS}}/\overline{\text{ASRE}}$	R26	O/Z	IPU	Programmable synchronous address strobe or read-enable <ul style="list-style-type: none"> For programmable synchronous interface, the R_ENABLE field in the Chip Select x Configuration Register selects between $\overline{\text{ASADS}}$ and $\overline{\text{ASRE}}$: <ul style="list-style-type: none"> If R_ENABLE = 0, then the $\overline{\text{ASADS}}/\overline{\text{ASRE}}$ signal functions as the $\overline{\text{ASADS}}$ signal. If R_ENABLE = 1, then the $\overline{\text{ASADS}}/\overline{\text{ASRE}}$ signal functions as the $\overline{\text{ASRE}}$ signal.
EMIFA (64-BIT) - ADDRESS				
AEA19/BOOTMODE3	N25	O/Z	IPD	EMIFA external address (word address) (O/Z) Controls initialization of the DSP modes at reset (I) via pullup/pulldown resistors [For more detailed information, see Section 3, Device Configuration .] Note: If a configuration pin must be routed out from the device and 3-stated (not driven), the internal pullup/pulldown (IPU/IPD) resistor should not be relied upon; TI recommends the use of an external pullup/pulldown resistor. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.7, Pullup/Pulldown Resistors .
AEA18/BOOTMODE2	L26			
AEA17/BOOTMODE1	L25			
AEA16/BOOTMODE0	P26			
AEA15/AECLKIN_SEL	P27			
AEA14/HPI_WIDTH	R25			
AEA13/LENDIAN	R27	O/Z	IPU	<ul style="list-style-type: none"> Boot mode - device boot mode configurations (BOOTMODE[3:0]) [Note: the peripheral must be enabled to use the particular boot mode.] AEA[19:16]: 0000 - No boot (default mode) 0001 - Host boot (HPI) 0010 - Reserved 0011 - Reserved 0100 - EMIFA 8-bit ROM boot 0101 - Master I2C boot 0110 - Slave I2C boot 0111 - Host boot (PCI) 1000 thru 1111 - Reserved For more detailed information on the boot modes, see Section 2.4, Boot Sequence. CFGGP[2:0] pins must be set to 000b during reset for proper operation of the PCI boot mode. EMIFA input clock source select Clock mode select for EMIFA (AECLKIN_SEL) AEA15: 0 - AECLKIN (default mode) 1 - SYSCLK4 (CPU/x) Clock Rate. The SYSCLK4 clock rate is software selectable via the Software PLL1 Controller. By default, SYSCLK4 is selected as CPU/8 clock rate. HPI peripheral bus width (HPI_WIDTH) select [Applies only when HPI is enabled; PCI_EN pin = 0] AEA14: 0 - HPI operates as an HPI16 (default). (HPI bus is 16 bits wide. HD[15:0] pins are used and the remaining HD[31:16] pins are reserved pins in the Hi-Z state.) 1 - HPI operates as an HPI32. Device Endian mode (LENDIAN) AEA13: 0 - System operates in Big Endian mode 1 - System operates in Little Endian mode(default)
AEA12	R28			
AEA11	T25	O/Z	IPD	<ul style="list-style-type: none"> For proper C6454 device operation, the AEA12 and AEA11 pins must be externally pulled down with a 1-kΩ resistor at device reset.

Table 2-3. Terminal Functions (continued)

SIGNAL		TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
NAME	NO.			
AEA10/MACSEL1	M25	O/Z	IPD	<ul style="list-style-type: none"> EMAC/MDIO interface select bits (MACSEL[1:0]) There are two configuration pins — MACSEL[1:0] — to select the EMAC/MDIO interface. AEA[10:9]: MACSEL[1:0] 00 - 10/100 EMAC/MDIO MII Mode Interface (default) 01 - 10/100 EMAC/MDIO RMII Mode Interface 10 - 10/100/1000 EMAC/MDIO GMII Mode Interface 11 - 10/100/1000 with RGMII Mode Interface [RGMII interface requires a 1.8-V or 1.5-V I/O supply] PCI I2C EEPROM Auto-Initialization (PCI_EEAI) AEA8: PCI auto-initialization via external I2C EEPROM If the PCI peripheral is disabled (PCI_EN pin = 0), this pin must not be pulled up. 0 - PCI auto-initialization through I2C EEPROM is disabled (default). 1 - PCI auto-initialization through I2C EEPROM is enabled. PCI Frequency Selection (PCI66) [The PCI peripheral <i>needs</i> be enabled (PCI_EN = 1) to use this function] Selects the PCI operating frequency of 66-MHz or 33-MHz PCI operating frequency is selected at reset via the pullup/pulldown resistor on the PCI66 pin: AEA6: 0 - PCI operates at 33 MHz (default). 1 - PCI operates at 66 MHz. Note: If the PCI peripheral is disabled (PCI_EN = 0), this pin must not be pulled up. McBSP1 Enable bit (MCBSP1_EN) Selects which function is enabled on the McBSP1/GPIO muxed pins AEA5: 0 - GPIO pin functions enabled (default). 1 - McBSP1 pin functions enabled. SYSCLKOUT Enable pin (SYSCLKOUT_EN) Selects which function is enabled on the SYSCLK4/GP[1] muxed pin AEA4: 0 - GP[1] pin function of the SYSCLK4/GP[1] pin enabled (default). 1 - SYSCLK4 pin function of the SYSCLK4/GP[1] pin enabled. Configuration GPI (CFGGP[2:0]) (AEA[2:0]) These pins are latched during reset and their values are shown in the DEVSTAT register. These values can be used by software routines for boot operations. <p>AEA3: For proper C6454 device operation, the AEA3 pin must be pulled down to V_{SS} using a 1-kΩ resistor.</p>

MANAGEMENT DATA INPUT/OUTPUT (MDIO) FOR RGMII				
RGMDCLK	B4	O/Z		MDIO serial clock (RGMII mode) (RGMDCLK) (O)
RGMDIO	A4	I/O/Z		MDIO serial data (RGMII mode) (RGMDIO) (I/O)
ETHERNET MAC (EMAC) [MII/RMII/GMII]				
There are two configuration pins - the MAC_SEL[1:0] (AEA[10:9] pins) - that select one of the four interface modes (MII, RMII, GMII, or RGMII) for the EMAC/MDIO interface. For more detailed information on the EMAC configuration pins, see Section 3, Device Configuration .				
MRCLK	H1	I		This pin is EMAC receive clock (MRCLK) for MII [default] or GMII. MACSEL[1:0] dependent.
MCRS/ RMCRS DV	J4	I/O/Z		This pin is EMAC carrier sense (MCRS) (I) for MII [default] or GMII, or EMAC carrier sense/receive data valid (RMCRS DV) (I) for RMII. MACSEL[1:0] dependent.
MRXER/ RMRXER	H4	I		This pin is EMAC receive error (MRXIR) (I) for MII [default], RMII, or GMII. MACSEL[1:0] dependent.
MRXD V	H5	I		This pin is EMAC MII [default] or GMII receive data valid (MRXD V) (I). MACSEL[1:0] dependent.
MRXD7	M2	I		EMAC receive data bus for MII [default], RMII, or GMII. These pins function as EMAC receive data pins for MII [default], RMII, or GMII (MRXD[x:0]) (I). MACSEL[1:0] dependent.
MRXD6	H2			
MRXD5	L2			
MRXD4	L1			
MRXD3	J3			
MRXD2	J1			
MRXD1/ RMRXD1	H3			
MRXD0/ RMRXD0	J2			
GMTCLK	K5	O/Z		This pin is EMAC GMII transmit clock (GMTCLK) (O). MACSEL[1:0] dependent.
MTCLK/ RMREFCLK	N4	I		This pin is either EMAC MII [default] or GMII transmit clock (MTCLK) (I) or the EMAC RMII reference clock (RMREFCLK) (I). The EMAC function is controlled by the MACSEL[1:0] (AEA[10:9] pins). For more detailed information, see Section 3, Device Configuration .

Table 2-3. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
MCOL	K3	I/O/Z		This pin is the EMAC collision sense (MCDL) (I) for MII [default] or GMII. MACSEL[1:0] dependent.
MTXEN/ RMTXEN	J5	I/O/Z		This pin is either the EMAC transmit enable (MTXEN) (O) for MII [default], RMII, or GMII. MACSEL[1:0] dependent.
MTXD7	N5	O/Z		EMAC transmit data bus for MII [default], RMII, or GMII. These pins function as EMAC transmit data pins (MTXD[x:0]) (O) for MII, RMII, or GMII. MACSEL[1:0] dependent.

Table 2-3. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
ETHERNET MAC (EMAC) [RGMII]				
There are two configuration pins - the MAC_SEL[1:0] (AEA[10:9] pins) - that select one of the four interface modes (MII, RMII, GMII, or RGMII) for the EMAC/MDIO interface. For more detailed information on the EMAC configuration pins, see Section 3, Device Configuration .				
RGREFCLK	C4	O/Z		RGMII reference clock (O). This 125-MHz reference clock is provided as a convenience. It can be used as a clock source to a PHY, so that the PHY may generate RXC clock to communicate with the EMAC. This clock is stopped while the device is in reset. This pin is available only when RGMII mode is selected (MACSEL[1:0] = 11).
RGTXC	D4	O/Z		RGMII transmit clock (O). This pin is available only when RGMII mode is selected (MACSEL[1:0] = 11).
RGTXD3	A2	O/Z		RGMII transmit data [3:0] (O). This pin is available only when RGMII mode is selected (MACSEL[1:0] = 11).
RGTXD2	C3			
RGTXD1	B3			
RGTXD0	A3			
RGTXCTL	D3	O/Z		RGMII transmit enable (O). This pin is available only when RGMII mode is selected (MACSEL[1:0] = 11).
RGRXC	E3	I		RGMII receive clock (I). This pin is available only when RGMII mode is selected (MACSEL[1:0] = 11).
RGRXD3	C1	I		RGMII receive data [3:0] (I). This pin is available only when RGMII mode is selected (MACSEL[1:0] = 11).
RGRXD2	E4	I		
RGRXD1	E2	I		
RGRXD0	E1	I		
RGRXCTL	C2	I		RGMII receive control (I). This pin is available only when RGMII mode is selected (MACSEL[1:0] = 11).
RESERVED FOR TEST				
RSV02	V5			Reserved. These pins must be connected directly to core supply (CV _{DD}) for proper device operation.
RSV03	W3			
RSV04	N11			
RSV05	P11			
RSV07	G4	I		Reserved. This pin must be connected directly to 1.5-/1.8-V I/O supply (DV _{DD15}) for proper device operation. NOTE: If the EMAC RGMII is not used, these pins can be connected directly to ground (V _{SS}).
RSV09	D26	I		Reserved. This pin must be connected directly to the 1.8-V I/O supply (DV _{DD18}) for proper device operation.
RSV11	D24			Reserved. This pin must be connected to ground (V _{SS}) via a 200-Ω resistor for proper device operation. NOTE: If the DDR2 Memory Controller is not used, the V _{REFSSTL} , RSV11, and RSV12 pins can be connected directly to ground (V _{SS}) to save power. However, connecting these pins directly to ground will prevent boundary-scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.4 .
RSV12	C24			Reserved. This pin must be connected to the 1.8-V I/O supply (DV _{DD18}) via a 200-Ω resistor for proper device operation. NOTE: If the DDR2 Memory Controller is not used, the V _{REFSSTL} , RSV11, and RSV12 pins can be connected directly to ground (V _{SS}) to save power. However, connecting these pins directly to ground will prevent boundary-scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.4 .
RSV13	F2			Reserved. This pin must be connected to ground (V _{SS}) via a 200-Ω resistor for proper device operation. NOTE: If the RGMII mode of the EMAC is not used, the DV _{DD15} , V _{REFHSTL} , RSV13, and RSV14 pins can be connected to directly ground (V _{SS}) to save power. However, connecting these pins directly to ground will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, see Section 7.3.4 .

Table 2-3. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
RSV14	F1			Reserved. This pin must be connected to the 1.5/1.8-V I/O supply (DV_{DD15}) via a 200- Ω resistor for proper device operation. NOTE: If the RGMII mode of the EMAC is not used, the DV_{DD15} , $V_{REFHSTL}$, RSV13, and RSV14 pins can be connected to directly ground (V_{SS}) to save power. However, connecting these pins directly to ground will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, see Section 7.3.4 .
RSV15	T1			Reserved. This pin must be connected via a 39- Ω resistor directly to ground (V_{SS}) for proper device operation. The resistor used should have a minimal rating of 1/10 W.
RSV16	T2			Reserved. This pin must be connected via a 20- Ω resistor directly to 3.3-V I/O Supply (DV_{DD33}) for proper device operation. The resistor used should have a minimal rating of 1/10 W.
RSV17	AE21	A		Reserved. (Leave unconnected, do not connect to power or ground.)

Table 2-3. Terminal Functions (continued)

SIGNAL NAME	NO.	TYPE ⁽¹⁾	IPD/IPU ⁽²⁾	DESCRIPTION
SUPPLY VOLTAGE MONITOR PINS				
CV _{DDMON}	N1			Die-side 1.2-V core supply (CV _{DD}) voltage monitor pin. The monitor pins indicate the voltage on the die and, therefore, provide the best probe point for voltage monitoring purposes. If the CV _{DDMON} pin is not used, it should be connected directly to the 1.2-V core supply (CV _{DD}).
DV _{DD33MON}	L6			Die-side 3.3-V I/O supply (DV _{DD33}) voltage monitor pin. The monitor pins indicate the voltage on the die and, therefore, provide the best probe point for voltage monitoring purposes. If the DV _{DD33MON} pin is not used, it should be connected directly to the 3.3-V I/O supply (DV _{DD33}).
DV _{DD15MON}	F3	I		Die-side 1.5-/1.8-V I/O supply (DV _{DD15}) voltage monitor pin. The monitor pins indicate the voltage on the die and, therefore, provide the best probe point for voltage monitoring purposes. If the DV _{DD15MON} pin is not used, it should be connected directly to the 1.5-/1.8-V I/O supply (DV _{DD15}). NOTE: If the RGMII mode of the EMAC is not used, the DV _{DD15} , DV _{DD15MON} , V _{REFHSTL} , RSV13, and RSV14 pins can be connected directly to ground (V _{SS}) to save power. However, connecting these pins directly to ground will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, see Section 7.3.4 .
DV _{DD18MON}	A26			Die-side 1.8-V I/O supply (DV _{DD18}) voltage monitor pin. The monitor pins indicate the voltage on the die and, therefore, provide the best probe point for voltage monitoring purposes. If the DV _{DD18MON} pin is not used, it should be connected directly to the 1.8-V I/O supply (DV _{DD18}).
SUPPLY VOLTAGE PINS				
V _{REFSSTL}	C14	A		(DV _{DD18} /2)-V reference for SSTL buffer (DDR2 Memory Controller). This input voltage can be generated directly from DV _{DD18} using two 1-k Ω resistors to form a resistor divider circuit. NOTE: The DDR2 Memory Controller is not used, the V _{REFSSTL} , RSV11, and RSV12 pins can be connected directly to ground (V _{SS}) to save power. However, connecting these pins directly to ground will prevent boundary-scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, see Section 7.3.4 .
V _{REFHSTL}	B2	A		(DV _{DD15} /2)-V reference for HSTL buffer (EMAC RGMII). V _{REFHSTL} can be generated directly from DV _{DD15} using two 1-k Ω resistors to form a resistor divider circuit. NOTE: If the RGMII mode of the EMAC is not used, the DV _{DD15} , V _{REFHSTL} , RSV13, and RSV14 pins can be connected to directly ground (V _{SS}) to save power. However, connecting these pins directly to ground will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, see Section 7.3.4 .
AV _{DLL1}	A13	A		1.8-V I/O supply voltage.
AV _{DLL2}	E18			
DV _{DD15}	A1	S		1.8-V or 1.5-V I/O supply voltage for the RGMII function of the EMAC. NOTE: If the RGMII mode of the EMAC is not used, the DV _{DD15} , V _{REFHSTL} , RSV13, and RSV14 pins can be connected to directly ground (V _{SS}) to save power. However, connecting these pins directly to ground will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, see Section 7.3.4 .

2.8 Development

2.8.1 Development Support

In case the customer would like to develop their own features and software on the C6454 device, TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The tool's support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of C6000™ DSP-based applications:

Software Development Tools: Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools: Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug) EVM (Evaluation Module)

2.8.2 Device Support

2.8.2.1 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP devices and support tools. Each DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMS320C6454GTZ**). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications.
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification.
- TMS** Fully qualified production device.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product.

TMX and TMP devices and TMDX development-support tools are shipped with against the following disclaimer:

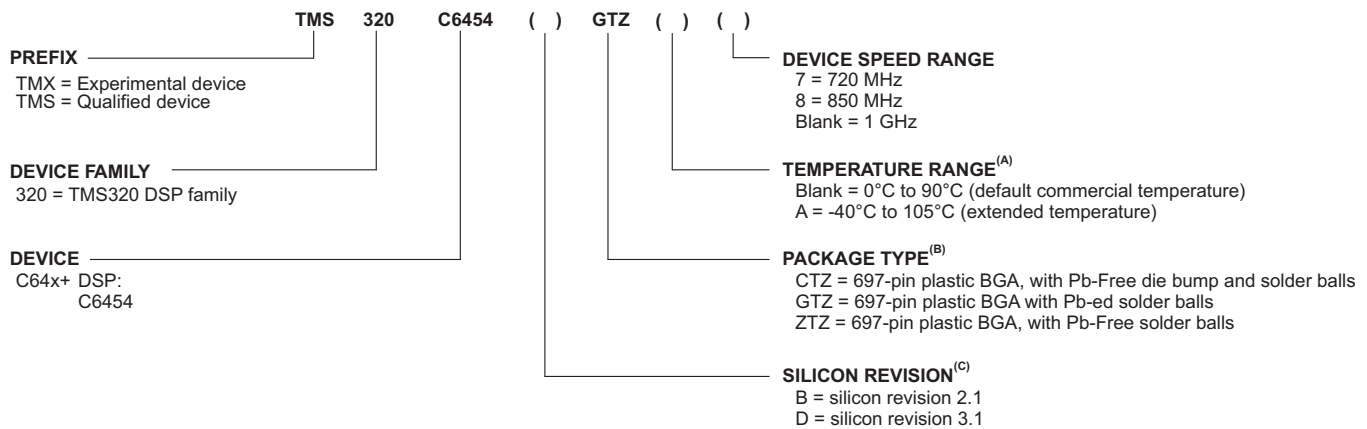

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GTZ), the temperature range (for example, blank is the default commercial temperature range), and the device speed range, in megahertz (for example, blank is 1000 MHz [1 GHz]). Figure 2-12 provides a legend for reading the complete device name for any TMS320C64x+™ DSP generation member.

For device part numbers and further ordering information for TMS320C6454 in the CTZ/GTZ/ZTZ package type, see the TI website (www.ti.com) or contact your TI sales representative.

- A. The extended temperature "A version" devices may have different operating conditions than the commercial temperature devices. For more details, see Section 6.2, *Recommended Operating Conditions*.
- B. BGA = Ball Grid Array
- C. For silicon revision information, see the *TMS320C6455/54 Digital Signal Processor Silicon Errata* (literature number [SPRZ234](#)).

Figure 2-12. TMS320C64x+™ DSP Device Nomenclature (including the TMS320C6454 DSP)

2.8.2.2 Documentation Support

The following documents describe the TMS320C6454 Fixed-Point Digital Signal Processor. Copies of these documents are available on the Internet at www.ti.com. *Tip:* Enter the literature number in the search box provided at www.ti.com.

[SPRU871](#) **TMS320C64x+ DSP Megamodule Reference Guide.** Describes the TMS320C64x+ digital signal processor (DSP) megamodule. Included is a discussion on the internal direct memory access (IDMA) controller, the interrupt controller, the power-down controller, memory protection, bandwidth management, and the memory and cache.

[SPRU732](#) **TMS320C64x/C64x+ DSP CPU and Instruction Set Reference Guide.** Describes the CPU architecture, pipeline, instruction set, and interrupts for the TMS320C64x and TMS320C64x+ digital signal processors (DSPs) of the TMS320C6000 DSP family. The C64x/C64x+ DSP generation comprises fixed-point devices in the C6000 DSP platform. The C64x+ DSP is an enhancement of the C64x DSP with added functionality and an expanded instruction set.

[SPRAA84](#) **TMS320C64x to TMS320C64x+ CPU Migration Guide.** Describes migrating from the Texas Instruments TMS320C64x digital signal processor (DSP) to the TMS320C64x+ DSP. The objective of this document is to indicate differences between the two cores. Functionality in the devices that is identical is not included.

[SPRU889](#) **High-Speed DSP Systems Design Reference Guide.** Provides recommendations for meeting the many challenges of high-speed DSP system design. These recommendations include information about DSP audio, video, and communications systems for the C5000 and C6000 DSP platforms.

[SPRU971](#) **TMS320C645x DSP External Memory Interface (EMIF) User's Guide.** This document describes the operation of the external memory interface (EMIF) in the TMS320C645x DSPs.

- [SPRU970](#) ***TMS320C645x DSP DDR2 Memory Controller User's Guide.*** This document describes the DDR2 memory controller in the TMS320C645x digital-signal processors (DSPs).
- [SPRU969](#) ***TMS320C645x DSP Host Port Interface (HPI) User's Guide.*** This guide describes the host port interface (HPI) on the TMS320C645x digital signal processors (DSPs). The HPI enables an external host processor (host) to directly access DSP resources (including internal and external memory) using a 16-bit (HPI16) or 32-bit (HPI32) interface.
- [SPRUEC6](#) ***TMS320C645x/C647x Bootloader User's Guide.*** This document describes the features of the on-chip Bootloader provided with the TMS320C645x/C647x digital signal processors (DSPs). Included are descriptions of the available boot modes and any interfacing requirements associated with them, instructions on generating the boot table, and information on the different versions of the Bootloader.
- [SPRU966](#) ***TMS320C645x DSP Enhanced DMA (EDMA3) Controller User's Guide.*** This document describes the Enhanced DMA (EDMA3) Controller on the TMS320C645x digital signal processors (DSPs).
- [SPRU580](#) ***TMS320C6000 DSP Multichannel Buffered Serial Port (McBSP) Reference Guide.*** Describes the operation of the multichannel buffered serial port (McBSP) in the digital signal processors (DSPs) of the TMS320C6000 DSP family. The McBSP consists of a data path and a control path that connect to external devices. Separate pins for transmission and reception communicate data to these external devices. The C6000 CPU communicates to the McBSP using 32-bit-wide control registers accessible via the internal peripheral bus.
- [SPRU975](#) ***TMS320C645x DSP EMAC/MDIO Module User's Guide.*** This document provides a functional description of the Ethernet Media Access Controller (EMAC) and Physical layer (PHY) device Management Data Input/Output (MDIO) module integrated with the TMS320C645x digital signal processors (DSPs).
- [SPRUE60](#) ***TMS320C645x DSP Peripheral Component Interconnect (PCI) User's Guide.*** This document describes the peripheral component interconnect (PCI) port in the TMS320C645x digital signal processors (DSPs). See the PCI Specification revision 2.3 for details on the PCI interface.
- [SPRUE56](#) ***TMS320C645x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide.*** This document describes the operation of the software-programmable phase-locked loop (PLL) controller in the TMS320C645x digital signal processors (DSPs). The PLL controller offers flexibility and convenience by way of software-configurable multipliers and dividers to modify the input signal internally. The resulting clock outputs are passed to the TMS320C645x DSP core, peripherals, and other modules inside the TMS320C645x digital signal processors (DSPs).
- [SPRU974](#) ***TMS320C645x DSP Inter-Integrated Circuit (I2C) Module User's Guide.*** This document describes the inter-integrated circuit (I2C) module in the TMS320C645x Digital Signal Processor (DSP). The I2C provides an interface between the TMS320C645x device and other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus) specification version 2.1 and connected by way of an I2C-bus. This document assumes the reader is familiar with the I2C-bus specification.
- [SPRU968](#) ***TMS320C645x DSP 64-Bit Timer User's Guide.*** This document provides an overview of the 64-bit timer in the TMS320C645x digital signal processors (DSPs). The timer can be configured as a general-purpose 64-bit timer, dual general-purpose 32-bit timers, or a watchdog timer. When configured as a dual 32-bit timers, each half can operate in conjunction (chain mode) or independently (unchained mode) of each other.

[SPRU724](#) ***TMS320C645x DSP General-Purpose Input/Output (GPIO) User's Guide.*** This document describes the general-purpose input/output (GPIO) peripheral in the TMS320C645x digital signal processors (DSPs). The GPIO peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs. When configured as an input, you can detect the state of the input by reading the state of an internal register. When configured as an output, you can write to an internal register to control the state driven on the output pin.

2.8.2.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

[TI E2E Community](#) ***TI's Engineer-to-Engineer (E2E) Community.*** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

[TI Embedded Processors Wiki](#) ***Texas Instruments Embedded Processors Wiki.*** Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

3 Device Configuration

On the C6454 device, certain device configurations like boot mode, pin multiplexing, and endianness, are selected at device reset. The status of the peripherals (enabled/disabled) is determined after device reset. By default, the peripherals on the C6454 device are disabled and need to be enabled by software before being used.

3.1 Device Configuration at Device Reset

Table 3-1 describes the C6454 device configuration pins. The logic level of the AEA[19:0], ABA[1:0], and PCI_EN pins is latched at reset to determine the device configuration. The logic level on the device configuration pins can be set by using external pullup/pulldown resistors or by using some control device (e.g., FPGA/CPLD) to intelligently drive these pins. When using a control device, care should be taken to ensure there is no contention on the lines when the device is out of reset. The device configuration pins are sampled during reset and are driven after the reset is removed. To avoid contention, the control device should only drive the EMIFA pins when RESETSTAT is low.

NOTE

If a configuration pin must be routed out from the device and 3-stated (not driven), the internal pullup/pulldown (IPU/IPD) resistor should not be relied upon; TI recommends the use of an external pullup/pulldown resistor. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.7, *Pullup/Pulldown Resistors*.

Table 3-1. C6454 Device Configuration Pins (AEA[19:0], ABA[1:0], and PCI_EN)

1	SYSCLK4 (CPU/x) Clock Rate. The SYSCLK4 clock rate is software selectable via the Software PLL1 Controller. By default, SYSCLK4 is selected as CPU/8 clock rate.																				

(1) IPD = Internal pulldown, IPU = Internal pullup. For most systems, a 1-k Ω resistor can be used to oppose the IPU/IPD. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 3.7, *Pullup/Pulldown Resistors*.

Table 3-1. C6454 Device Configuration Pins (AEA[19:0], ABA[1:0], and PCI_EN) (continued)

CONFIGURATION PIN	NO.	IPD/ IPU ⁽¹⁾	FUNCTIONAL DESCRIPTION
AEA14	R25	IPD	HPI peripheral bus width select (HPI_WIDTHH). 0 HPI operates in HPI16 mode (default). HPI bus is 16 bits wide; HD[15:0] pins are used and the remaining HD[31:16] pins are reserved pins in the Hi-Z state. 1 HPI operates in HPI32 mode. HPI bus is 32 bits wide; HD[31:0] pins are used. Applies only when HPI function of HPI/PCI multiplexed pins is selected (PCI_EN pin = 0).
AEA13	R27	IPU	Device Endian mode (LENDIAN). 0 System operates in Big Endian mode. 1 System operates in Little Endian mode (default).
AEA12	R28	IPD	For proper C6454 device operation, this pin must be externally pulled down with a 1-kΩ resistor at device reset.
AEA11	T25	IPD	For proper C6454 device operation, this pin must be externally pulled down with a 1-kΩ resistor at device reset.
AEA[10:9]	[M25, M27]	IPD	EMAC Interface Selects (MACSEL[1:0]). These pins select the interface used by the EMAC/MDIO peripheral. 00 10/100 EMAC/MDIO with MII Interface [default] 01 10/100 EMAC/MDIO with RMII Interface 10 10/100/1000 EMAC/MDIO with GMII Interface 11 10/100/1000 EMAC/MDIO with RGMII Interface For more detailed information on the MAC_SEL[1:0] control pin selections, see .
AEA8	P25	IPD	PCI I2C EEPROM Auto-Initialization (PCI_EEA1). PCI auto-initialization via external I2C EEPROM 0 PCI auto-initialization through external I2C EEPROM is disabled. The PCI peripheral uses the specified PCI default values (default). 1 PCI auto-initialization through external I2C EEPROM is enabled. The PCI peripheral is configured through external I2C EEPROM provided the PCI peripheral pins are enabled (PCI_EN = 1). Note: If the PCI pin function is disabled (PCI_EN pin = 0), this pin must not be pulled up.
AEA7	N27	IPD	For proper C6454 device operation, do not oppose the IPD on this pin.
AEA6	U27	IPD	PCI Frequency Selection (PCI66). Selects the operating frequency of the PCI (either 33 MHz or 66 MHz). 0 PCI operates at 33 MHz (default) 1 PCI operates at 66 MHz Note: If the PCI pin function is disabled (PCI_EN pin = 0), this pin must not be pulled up.
AEA5	U28	IPD	McBSP1 pin function enable bit (MCBSP1_EN). Selects which function is enabled on the McBSP1/GPIO multiplexed pins. 0 GPIO pin function enabled (default). This means all multiplexed McBSP1/GPIO pins function as GPIO pins. 1 McBSP1 pin function enabled. This means all multiplexed McBSP1/GPIO pins function as McBSP1 pins.
AEA4	T28	IPD	SYCLKOUT Enable bit (SYCLKOUT_EN). Selects which function is enabled on the SYCLK4/GP[1] muxed pin. 0 GP[1] pin function is enabled (default) 1 SYCLK4 pin function is enabled
AEA3	T27	IPD	For proper C6454 device operation, the AEA3 pin must be pulled down to V _{SS} using a 1-kΩ resistor.
AEA[2:0]	[T26, U26, U25]	IPD	Configuration General-Purpose Inputs (CFGGP[2:0]) The value of these pins is latched to the Device Status Register following device reset and is used by the on-chip bootloader for some boot modes. For more information on the boot modes, see Section 2.4, Boot Sequence .

Table 3-1. C6454 Device Configuration Pins (AEA[19:0], ABA[1:0], and PCI_EN) (continued)

CONFIGURATION PIN	NO.	IPD/ IPU ⁽¹⁾	FUNCTIONAL DESCRIPTION
PCI_EN	Y29	IPD	PCI pin function enable bit (PCI_EN). Selects which function is enabled on the HPI/PCI multiplexed pins. 0 HPI pin function enabled (default) This means all multiplexed HPI/PCI pins function as HPI pins. 1 PCI pin function enabled This means all multiplexed HPI/PCI pins function as PCI pins.
ABA0	V26	IPD	DDR2 Memory Controller enable (DDR2_EN). 0 DDR2 Memory Controller peripheral pins are disabled (default) 1 DDR2 Memory Controller peripheral pins are enabled
ABA1	V25	IPD	EMIFA enable (EMIFA_EN). 0 EMIFA peripheral pins are disabled (default) 1 EMIFA peripheral pins are enabled

3.2 Peripheral Configuration at Device Reset

Some C6454 device peripherals share the same pins (internally multiplexed) and are mutually exclusive. Therefore, not all peripherals may be used at the same time. The device configuration pins described in [Section 3.1, Device Configuration at Device Reset](#), determine which function is enabled for the multiplexed pins.

Note that when the pin function of a peripheral is disabled at device reset, the peripheral is permanently disabled and cannot be enabled until its pin function is enabled and another device reset is executed. Also, note that enabling the pin function of a peripheral does not enable the corresponding peripheral. All peripherals on the C6454 device are disabled by default, except when used for boot, and must be enabled through software before being used.

Other peripheral options like PCI clock speed and EMAC/MDIO interface mode can also be selected at device reset through the device configuration pins. The configuration selected is also fixed at device reset and cannot be changed until another device reset is executed with a different configuration selected.

The multiply factor of the PLL1 Controller is not selected through the configuration pins. The PLL1 multiply factor is set in software through the PLL1 controller registers after device reset. The PLL2 multiply factor is fixed. For more information, see [Section 7.7, PLL1 and PLL1 Controller](#), and [Section 7.8, PLL2 and PLL2 Controller](#).

On the C6454 device, the PCI peripheral pins are multiplexed with the HPI pins. The PCI_EN pin selects the function for the HPI/PCI multiplexed pins. The PCI66, PCI_EEAI, and HPI_WIDTH control other functions of the PCI and HPI peripherals. [Table 3-2](#) describes the effect of the PCI_EN, PCI66, PCI_EEAI, and HPI_WIDTH configuration pins.

Table 3-2. PCI_EN, PCI66, PCI_EEAI, and HPI_WIDTH Peripheral Selection (HPI and PCI)

CONFIGURATION PIN SETTING ⁽¹⁾				PERIPHERAL FUNCTION SELECTED			
PCI_EN PIN [Y29]	PCI66 AEA6 PIN [U27]	PCI_EEAI AEA8 PIN [P25] ⁽¹⁾	HPI_WIDTH AEA14 PIN [R25]	HPI DATA LOWER	HPI DATA UPPER	32-BIT PCI (66-/33-MHz)	PCI AUTO-INIT
0	0	0	0	Enabled	Hi-Z	Disabled	N/A
0	0	0	1	Enabled	Enabled	Disabled	N/A
1	1	1	X	Disabled		Enabled (66 MHz)	Enabled (via External I2C EEPROM)
1	1	0	X	Disabled			Disabled

(1) PCI_EEAI is latched at reset as a configuration input. If PCI_EEAI is set as one, then default values are loaded from an external I2C EEPROM.

Table 3-2. PCI_EN, PCI166, PCI_EEAI, and HPI_WIDTH Peripheral Selection (HPI and PCI) (continued)

CONFIGURATION PIN SETTING ⁽¹⁾				PERIPHERAL FUNCTION SELECTED			
PCI_EN PIN [Y29]	PCI166 AEA6 PIN [U27]	PCI_EEAI AEA8 PIN [P25] ⁽¹⁾	HPI_WIDTH AEA14 PIN [R25]	HPI DATA LOWER	HPI DATA UPPER	32-BIT PCI (66-/33-MHz)	PCI AUTO-INIT
1	0	0	X	Disabled		Enabled (33 MHz)	Disabled (default values)
1	0	1	X	Disabled			Enabled (via External I2C EEPROM)

The MAC_SEL[1:0] configuration pins (AEA[10:9]) control which interface is used by the EMAC/MDIO. [Table 3-3](#) describes the effect of the MACSEL[1:0] configuration pins.

Table 3-3. MAC_SEL[1:0] Peripheral Selection (EMAC)

MAC_SEL[1:0]/ AEA[10:9] PINS [M25, M27] CONFIGURATION PIN SETTING	EMAC/MDIO PERIPHERAL FUNCTION SELECTED
00b	10/100 EMAC/MDIO with MII Interface [default]
01b	10/100 EMAC/MDIO with RMII Interface
10b	10/100/1000 EMAC/MDIO with GMII Interface
11b	10/100/1000 EMAC/MDIO with RGMII Interface ⁽¹⁾

(1) RGMII interface requires a 1.5-/1.8-V I/O supply.

3.3 Peripheral Selection After Device Reset

On the C6454 device, peripherals can be in one of several states. These states are listed in [Table 3-4](#).

Table 3-4. Peripheral States

STATE	DESCRIPTION	PERIPHERALS THAT CAN BE IN THIS STATE
Static powerdown	Peripheral pin function has been completely disabled through the device configuration pins. Peripheral is held in reset and clock is turned off.	HPI PCI McBSP1 EMAC/MDIO EMIFA DDR2 Memory Controller
Disabled	Peripheral is held in reset and clock is turned off. Default state for all peripherals not in static powerdown mode.	I2C Timer 0 Timer 1 GPIO EMAC/MDIO McBSP0 McBSP1 HPI PCI
Enabled	Clock to the peripheral is turned on and the peripheral is taken out of reset.	I2C Timer 0 Timer 1 GPIO MDIO EMAC/MDIO McBSP0 McBSP1 HPI PCI EMIFA DDR2 Memory Controller

Table 3-4. Peripheral States (continued)

STATE	DESCRIPTION	PERIPHERALS THAT CAN BE IN THIS STATE
Enable in progress	Not a user-programmable state. This is an intermediate state when transitioning from an disabled state to an enabled state.	All peripherals that can be in an enabled state.

Following device reset, all peripherals that are not in the static powerdown state are in the disabled state by default. Peripherals used for boot such as HPI and PCI are enabled automatically following a device reset.

Peripherals are only allowed certain transitions between states (see [Figure 3-1](#)).

Figure 3-1. Peripheral Transitions Between States

[Figure 3-2](#) shows the flow needed to change the state of a given peripheral on the C6454 device.

Figure 3-2. Peripheral State Change Flow

A 32-bit key (value = 0x0F0A 0B00) must be written to the Peripheral Lock register (PERLOCK) in order to allow access to the PERCFG0 register. Writes to the PERCFG1 register can be done directly without going through the PERLOCK register.

NOTE

The instructions that write to the PERLOCK and PERCFG0 registers must be in the same fetch packet if code is being executed from external memory. If the instructions are in different fetch packets, fetching the second instruction from external memory may stall the instruction long enough such that PERCFG0 register will be locked before the instruction is executed.

3.4 Device State Control Registers

The C6454 device has a set of registers that are used to control the status of its peripherals. These registers are shown in [Table 3-5](#) and described in the next sections.

NOTE

The device state control registers can only be accessed using the CPU or the emulator.

Table 3-5. Device State Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
02AC 0000	-	Reserved
02AC 0004	PERLOCK	Peripheral Lock Register
02AC 0008	PERCFG0	Peripheral Configuration Register 0
02AC 000C	-	Reserved
02AC 0010	-	Reserved
02AC 0014	PERSTAT0	Peripheral Status Register 0
02AC 0018	PERSTAT1	Peripheral Status Register 1
02AC 001C - 02AC 001F	-	Reserved
02AC 0020	EMACCFG	EMAC Configuration Register
02AC 0024 - 02AC 002B	-	Reserved
02AC 002C	PERCFG1	Peripheral Configuration Register 1
02AC 0030 - 02AC 0053	-	Reserved
02AC 0054	EMUBUFPD	Emulator Buffer Powerdown Register
02AC 0058	-	Reserved

3.4.1 Peripheral Lock Register Description

When written with correct 32-bit key (0x0F0A0B00), the Peripheral Lock Register (PERLOCK) allows one write to the PERCFG0 register within 16 SYSCLK3 cycles.

NOTE

The instructions that write to the PERLOCK and PERCFG0 registers must be in the same fetch packet if code is being executed from external memory. If the instructions are in different fetch packets, fetching the second instruction from external memory may stall the instruction long enough such that PERCFG0 register will be locked before the instruction is executed.

LEGEND: R/W = Read/Write; -n = value after reset

Figure 3-3. Peripheral Lock Register (PERLOCK) - 0x02AC 0004

Table 3-6. Peripheral Lock Register (PERLOCK) Field Descriptions

Bit	Field	Value	Description
31:0	LOCKVAL		When programmed with 0x0F0A 0B00 allows one write to the PERCFG0 register within 16 SYSCLK3 clock cycles.

3.4.2 Peripheral Configuration Register 0 Description

The Peripheral Configuration Register (PERCFG0) is used to change the state of the peripherals. One write is allowed to this register within 16 SYSCLK3 cycles after the correct key is written to the PERLOCK register.

NOTE

The instructions that write to the PERLOCK and PERCFG0 registers must be in the same fetch packet if code is being executed from external memory. If the instructions are in different fetch packets, fetching the second instruction from external memory may stall the instruction long enough that the PERCFG0 register is locked before the instruction is executed.

		1	Set EMAC/MDIO to enabled mode
3:0	Reserved		Reserved.

3.4.3 Peripheral Configuration Register 1 Description

The Peripheral Configuration Register (PERCFG1) is used to enable the EMIFA and DDR2 Memory Controller. EMIFA and the DDR2 Memory Controller do not have corresponding status bits in the Peripheral Status Registers. The EMIFA and DDR2 Memory Controller peripherals can be used within 16 SYSCLK3 cycles after EMIFACTL and DDR2CTL are set to 1. Once EMIFACTL and DDR2CTL are set to 1, they cannot be set to 0. Note that if the DDR2 Memory Controller and EMIFA are disabled at reset through the device configuration pins (DDR2.EN[ABA0] and EMIFA[ABA1]), they cannot be enabled through the PERCFG1 register.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

3.4.5 EMAC Configuration Register (EMACCFG) Description

The EMAC Configuration Register (EMACCFG) is used to assert and deassert the reset of the Reduced Media Independent Interface (RMII) logic of the EMAC. For more details on how to use this register, see [Section 7.14, Ethernet MAC \(EMAC\)](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 3-8. EMAC Configuration Register (EMACCFG) - 0x02AC 0020

Table 3-11. EMAC Configuration Register (EMACCFG) Field Descriptions

Bit	Field	Value	Description
31:19	Reserved		Reserved. Writes to this register must keep the default values of these bits.
18	RMII_RST	0	RMII reset bit. This bit is used to reset the RMII logic of the EMAC. RMII logic reset is released.
		1	RMII logic reset is asserted.
17:0	Reserved		Reserved. Writes to this register must keep this bit as 0.

3.4.6 Emulator Buffer Powerdown Register (EMUBUFPD) Description

The Emulator Buffer Powerdown Register (EMUBUFPD) is used to control the state of the pin buffers of emulator pins EMU[18:2]. These buffers can be powered down if the device trace feature is not needed.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 3-9. Emulator Buffer Powerdown Register (EMUBUFPD) - 0x02AC 0054

Table 3-12. Emulator Buffer Powerdown Register (EMUBUFPD) Field Descriptions

Bit	Field	Value	Description
31:1	Reserved		Reserved
0	EMUCTL	0	Buffer powerdown for EMU[18:2] pins Power-up buffers
		1	Power-down buffers

3.5 Device Status Register Description

The device status register depicts the device configuration selected upon device reset. Once set, these bits will remain set until a device reset. For the actual register bit names and their associated bit field descriptions, see [Figure 3-10](#) and [Table 3-13](#).

Note that enabling or disabling peripherals through the Peripheral Configuration Registers (PERCFG0 and PERCFG1) does not affect the DEVSTAT register. To determine the status of peripherals following writes to the PERCFG0 and PERCFG1 registers, read the Peripherals Status Registers (PERSTAT0 and PERSTAT1).

Bit	Field	Value	Description
31:23	Reserved		Reserved. Read-only, writes have no effect.
22	EMIFA_EN	0 1	EMIFA Enable (EMIFA_EN) status bit Shows the status of whether the EMIFA peripheral pins are enabled/disabled. 0 EMIFA peripheral pins are disabled (default) 1 EMIFA peripheral pins are enabled
21	DDR2_EN	0 1	DDR2 Memory Controller Enable (DDR2_EN) status bit Shows the status of whether the DDR2 Memory Controller peripheral pins are enabled/disabled. 0 DDR2 Memory Controller peripheral pins are disabled (default) 1 DDR2 Memory Controller peripheral pins are enabled
20	PCI_EN	0 1	PCI Enable (PCI_EN) status bit Shows the status of which function is enabled on the HPI/PCI multiplexed pins. 0 HPI pin functions are enabled (default) 1 PCI pin functions are enabled
19:17	CFGGP[2:0]		Used as General-Purpose inputs for configuration purposes. These pins are latched at reset. These values can be used by S/W routines for boot operations.
16	Reserved		Reserved. Read-only, writes have no effect.
15	SYCLKOUT_EN	0 1	SYCLKOUT Enable (SYCLKOUT_EN) status bit Shows the status of which function is enabled on the SYCLK4/GP[1] muxed pin. 0 GP[1] pin function of the SYCLK4/GP[1] pin enabled (default) 1 SYCLK4 pin function of the SYCLK4/GP[1] pin enabled

Table 3-13. Device Status Register (DEVSTAT) Field Descriptions (continued)

Bit	Field	Value	Description
14	MCBSP1_EN	0 1	McBSP1 Enable (MCBSP1_EN) status bit Shows the status of which function is enabled on the McBSP1/GPIO muxed pins. GPIO pin functions enabled (default) McBSP1 pin functions enabled
13	PCI66	0 1	PCI Frequency Selection (PCI66) status bit Shows the PCI operating frequency selected at reset. PCI operates at 33 MHz (default) PCI operates at 66 MHz
11	PCI_EEAI	0 1	PCI I2C EEPROM Auto-Initialization (PCI_EEAI) status bit Shows whether the PCI auto-initialization via external I2C EEPROM is enabled/disabled. PCI auto-initialization through external I2C EEPROM is disabled; the PCI peripheral uses the specified PCI default values (default). PCI auto-initialization through external I2C EEPROM is enabled; the PCI peripheral is configured through external I2C EEPROM provided the PCI peripheral pin is enabled (PCI_EN = 1).
10:9	MACSEL[1:0]	00 01 10 11	EMAC Interface Select (MACSEL[1:0]) status bits Shows which EMAC interface mode has been selected. 10/100 EMAC/MDIO with MII Interface (default) 10/100 EMAC/MDIO with RMII Interface 10/100/1000 EMAC/MDIO with GMII Interface 10/100/1000 EMAC/MDIO with RGMII Mode Interface [RGMII interface requires a 1.8-V or 1.5-V I/O supply]
8:7	Reserved		Reserved. Read-only, writes have no effect.
6	LENDIAN	0 1	Device Endian mode (LENDIAN) Shows the status of whether the system is operating in Big Endian mode or Little Endian mode (default). System is operating in Big Endian mode System is operating in Little Endian mode (default)
5	HPI_WIDTH	0 1	HPI bus width control bit. Shows the status of whether the HPI bus operates in 32-bit mode or in 16-bit mode (default). HPI operates in 16-bit mode. (default) HPI operates in 32-bit mode
4	AECLKINSEL	0 1	EMIFA input clock select Shows the status of what clock mode is enabled or disabled for EMIFA. AECLKIN (default mode) SYSCLK4 (CPU/x) Clock Rate. The SYSCLK4 clock rate is software selectable via the PLL1 Controller. By default, SYSCLK4 is selected as CPU/8 clock rate.
3:0	BOOTMODE[3:0]	0000 0001 0010 0011 0100 0101 0110 0111 1000 thru 1111	Boot mode configuration bits Shows the status of what device boot mode configuration is operational. BOOTMODE[3:0] [Note: if selected for boot, the corresponding peripheral is automatically enabled after device reset.] No boot (default mode) Host boot (HPI) Reserved Reserved EMIFA 8-bit ROM boot Master I2C boot Slave I2C boot Host boot (PCI) Reserved For more detailed information on the boot modes, see Section 2.4, Boot Sequence .

3.6 JTAG ID (JTAGID) Register Description

The JTAG ID register is a read-only register that identifies to the customer the JTAG/Device ID. For the C6454 device, the JTAG ID register resides at address location 0x02A8 0008. For the actual register bit names and their associated bit field descriptions, see [Figure 3-11](#) and [Table 3-14](#).

31	28 27	12 11	1 0
VARIANT (4-bit)	PART NUMBER (16-bit)	MANUFACTURER (11-bit)	LSB
R-n	R-0000 0000 1000 1010b	0000 0010 111b	R-1

LEGEND: R = Read only; -n = value after reset

Figure 3-11. JTAG ID (JTAGID) Register - 0x02A8 0008

Table 3-14. JTAG ID (JTAGID) Register Field Descriptions

Bit	Field	Value	Description
31:28	VARIANT		Variant (4-Bit) value. The value of this field depends on the silicon revision being used. For more information, see the <i>TMS320C6455/54 Digital Signal Processor Silicon Errata</i> (literature number SPRZ234). Note: the VARIANT field may be invalid if no CLKIN1 signal is applied.
27:12	PART NUMBER		Part Number (16-Bit) value. C6454 device value: 0000 0000 1000 1010b.
11:1	MANUFACTURER		Manufacturer (11-Bit) value. C6454 device value: 0000 0010 111b.
0	LSB		LSB. This bit is read as a "1" for the C6454 device.

3.7 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the C6454 device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The C6454 device features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for external pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- *Device Configuration Pins:* If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor **must** be used, even if the IPU/IPD matches the desired value/state.
- *Other Input Pins:* If the IPU/IPD does not match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.

For the device configuration pins (listed in [Table 3-1](#)), if they are both routed out and 3-stated (not driven), it is **strongly** recommended that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device configuration pins. In addition, applying external pullup/pulldown resistors on the device configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the DV_{DD} rail.

For most systems, a 1-k Ω resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-k Ω resistor can be used to compliment the IPU/IPD on the device configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For more detailed information on input current (I_I), and the low-/high-level input voltages (V_{IL} and V_{IH}) for the C6454 device, see [Section 6.3, Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Case Temperature](#).

To determine which pins on the C6454 device include internal pullup/pulldown resistors, see [Table 2-3, Terminal Functions](#).

3.8 Configuration Examples

[Figure 3-12](#) and [Figure 3-13](#) illustrate examples of peripheral selections/options that are configurable on the C6454 device.

Shading denotes a peripheral module not available for this configuration.

DEVSTAT Register: 0x0061 8161

PCI_EN = 0 (PCI disabled, default)

4 System Interconnect

On the C6454 device, the C64x+ Megamodule, the EDMA3 transfer controllers, and the system peripherals are interconnected through two switch fabrics. The switch fabrics allow for low-latency, concurrent data transfers between master peripherals and slave peripherals. The switch fabrics also allow for seamless arbitration between the system masters when accessing system slaves.

4.1 Internal Buses, Bridges, and Switch Fabrics

Two types of buses exist in the C6454 device: data buses and configuration buses. Some C6454 device peripherals have both a data bus and a configuration bus interface, while others only have one type of interface. Furthermore, the bus interface width and speed varies from peripheral to peripheral.

Configuration buses are mainly used to access the register space of a peripheral and the data buses are used mainly for data transfers. However, in some cases, the configuration bus is also used to transfer data. For example, data is transferred to the McBSP via its configuration bus. Similarly, the data bus can also be used to access the register space of a peripheral. For example, the EMIFA and DDR2 memory controller registers are accessed through their data bus interface.

The C64x+ Megamodule, the EDMA3 traffic controllers, and the various system peripherals can be classified into two categories: masters and slaves. Masters are capable of initiating read and write transfers in the system and do not rely on the EDMA3 for their data transfers. Slaves on the other hand rely on the EDMA3 to perform transfers to and from them. Masters include the EDMA3 traffic controllers and PCI. Slaves include the McBSP and I2C.

The C6454 device contains two switch fabrics through which masters and slaves communicate. The data switch fabric, known as the data switched central resource (SCR), is a high-throughput interconnect mainly used to move data across the system (for more information, see [Section 4.2](#)). The data SCR connects masters to slaves via 128-bit data buses running at a SYSCLK2 frequency (SYSCLK2 is generated from PLL1 controller). Peripherals that have a 128-bit data bus interface running at this speed can connect directly to the data SCR; other peripherals require a bridge.

The configuration switch fabric, also known as the configuration switch central resource (SCR) is mainly used by the C64x+ Megamodule to access peripheral registers (for more information, see [Section 4.3](#)). The configuration SCR connects C64x+ Megamodule to slaves via 32-bit configuration buses running at a SYSCLK2 frequency (SYSCLK2 is generated from PLL1 controller). As with the data SCR, some peripherals require the use of a bridge to interface to the configuration SCR. Note that the data SCR also connects to the configuration SCR.

Bridges perform a variety of functions:

- Conversion between configuration bus and data bus.
- Width conversion between peripheral bus width and SCR bus width.
- Frequency conversion between peripheral bus frequency and SCR bus frequency.

For example, the EMIFA and DDR2 memory controller require a bridge to convert their 64-bit data bus interface into a 128-bit interface so that they can connect to the data SCR.

Note that some peripherals can be accessed through the data SCR and also through the configuration SCR.

4.2 Data Switch Fabric Connections

[Figure 4-1](#) shows the connection between slaves and masters through the data switched central resource (SCR). Masters are shown on the right and slaves on the left. The data SCR connects masters to slaves via 128-bit data buses running at a SYSCLK2 frequency. SYSCLK2 is supplied by the PLL1 controller and is fixed at a frequency equal to the CPU frequency divided by 3.

Some peripherals, like PCI and the C64x+ Megamodule, have both slave and master ports. Note that each EDMA3 transfer controller has an independent connection to the data SCR.

Note that masters can access the configuration SCR through the data SCR. The configuration SCR is described in [Section 4.3](#).

Not all masters on the C6454 DSP may connect to all slaves. Allowed connections are summarized in [Table 4-1](#).

Figure 4-1. Switched Central Resource Block Diagram

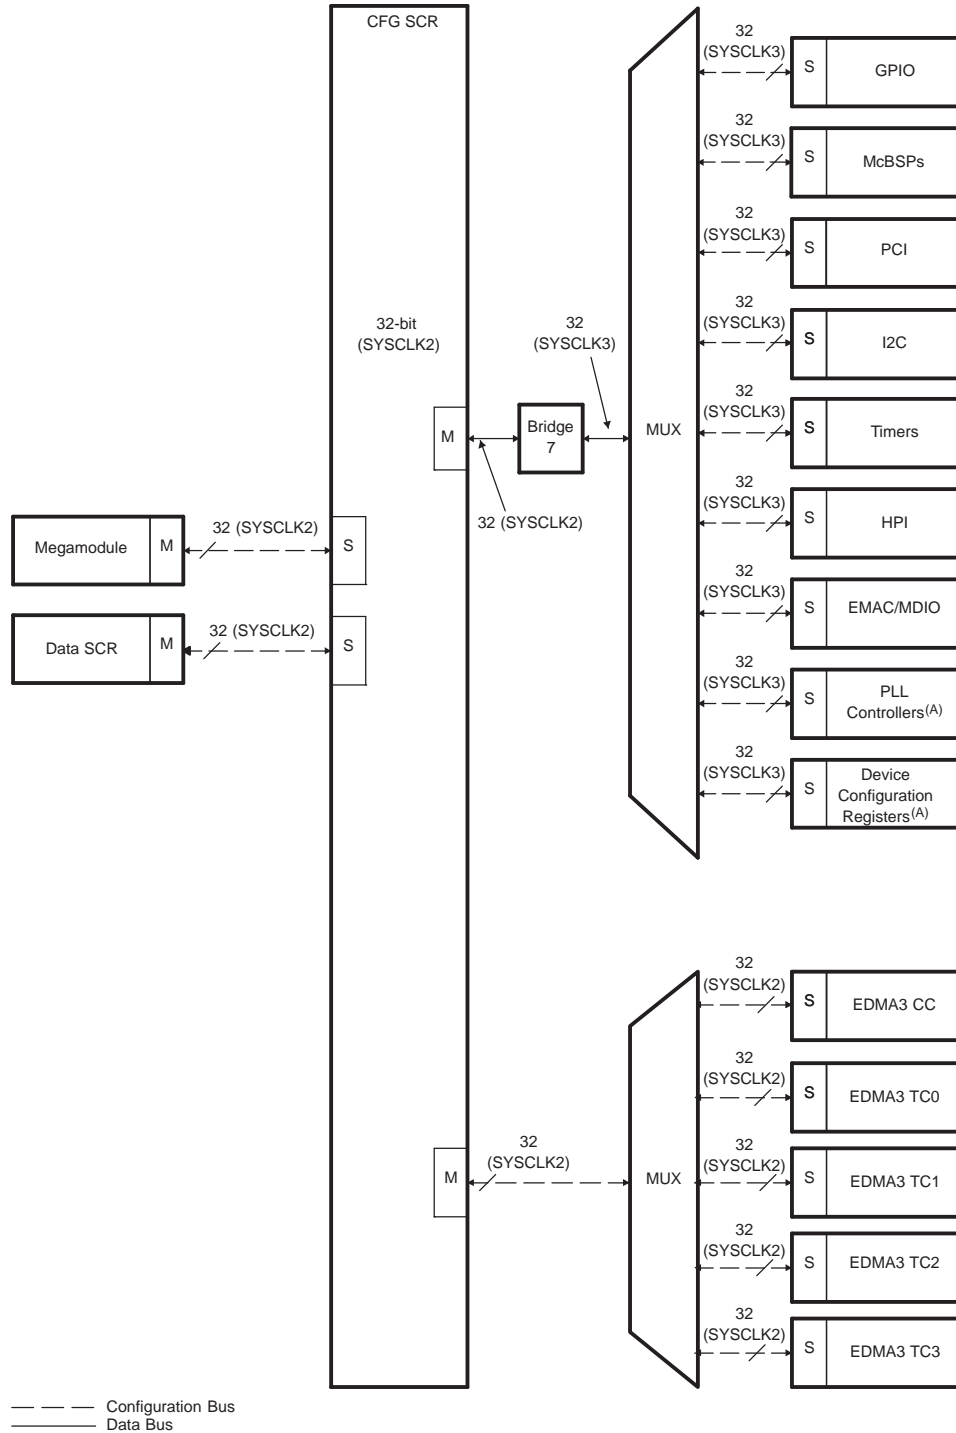

Table 4-1. SCR Connection Matrix

	McBSPs	CONFIGURATION SCR	PCI	DDR2 MEMORY CONTROLLER	EMIFA	MEGAMODULE
TC0	N	N	N	Y	Y	Y
TC1	Y	Y	Y	Y	Y	Y
TC2	N	N	Y	Y	Y	Y
TC3	N	N	Y	Y	Y	Y
EMAC	N	N	N	Y	Y	Y
HPI	N	Y	N	Y	Y	Y
PCI	N	Y	N	Y	Y	Y

4.3 Configuration Switch Fabric

Figure 4-2 shows the connection between the C64x+ Megamodule and the configuration switched central resource (SCR). The configuration SCR is mainly used by the C64x+ Megamodule to access peripheral registers. The data SCR also has a connection to the configuration SCR which allows masters to access most peripheral registers. The only registers not accessible by the data SCR through the configuration SCR are the device configuration registers and the PLL1 and PLL2 controller registers; these can only be accessed by the C64x+ Megamodule.

The configuration SCR uses 32-bit configuration buses running at SYSCLK2 frequency. SYSCLK2 is supplied by the PLL1 controller and is fixed at a frequency equal to the CPU frequency divided by 3.

- A. Only accessible by the C64x+ Megamodule.
- B. All clocks in this figure are generated by the PLL1 controller.

Figure 4-2. C64x+ Megamodule - SCR Connection

4.4 Bus Priorities

On the C6454 device, bus priority is programmable for each master. The register bit fields and default priority levels for C6454 bus masters are shown in Table 4-2. The priority levels should be tuned to obtain the best system performance for a particular application. Lower values indicate higher priorities. For some masters, the priority values are programmed at the system level by configuring the PRI_ALLOC register. Details on the PRI_ALLOC register are shown in Figure 4-3. The C64x+ megamodule and EDMA masters contain registers that control their own priority values.

The priority is enforced when several masters in the system are vying for the same endpoint. Note that the configuration SCR port on the data SCR is considered a single endpoint meaning priority will be enforced when multiple masters try to access the configuration SCR. Priority is also enforced on the configuration SCR side when a master (through the data SCR) tries to access the same endpoint as the C64x+ megamodule.

In the PRI_ALLOC register, the HOST field applies to the priority of the HPI and PCI peripherals. The EMAC field specifies the priority of the EMAC peripheral.

Table 4-2. C6454 Default Bus Master Priorities

BUS MASTER	DEFAULT PRIORITY LEVEL	PRIORITY CONTROL
EDMA3TC0	0	QUEPRI.PRIQ0 (EDMA3 register)
EDMA3TC1	0	QUEPRI.PRIQ1 (EDMA3 register)
EDMA3TC2	0	QUEPRI.PRIQ2 (EDMA3 register)
EDMA3TC3	0	QUEPRI.PRIQ3 (EDMA3 register)
EMAC	1	PRI_ALLOC.EMAC
PCI	2	PRI_ALLOC.HOST
HPI	2	PRI_ALLOC.HOST
C64x+ Megamodule (MDMA port)	7	MDMAARBE.PRI (C64x+ Megamodule Register)

LEGEND: R/W = Read/Write; R = Read only; -n = value at reset

Figure 4-3. Priority Allocation Register (PRI_ALLOC)

5 C64x+ Megamodule

The C64x+ Megamodule consists of several components — the C64x+ CPU, the L1 program and data memory controllers, the L2 memory controller, the internal DMA (IDMA), the interrupt controller, power-down controller, and external memory controller. The C64x+ Megamodule also provides support for memory protection (for L1P, L1D, and L2 memories) and bandwidth management (for resources local to the C64x+ Megamodule). Figure 5-1 shows a block diagram of the C64x+ Megamodule.

A. When accessing the internal ROM of the DSP, the CPU frequency must always be less than 750 MHz.

Figure 5-1. 64x+ Megamodule Block Diagram

For more detailed information on the TMS320C64x+ Megamodule on the C6454 device, see the *TMS320C64x+ Megamodule Reference Guide* (literature number [SPRU871](#)).

5.1 Memory Architecture

The TMS320C6454 device contains a 1024KB level-2 memory (L2), a 32KB level-1 program memory (L1P), and a 32KB level-1 data memory (L1D).

The L1P memory configuration for the C6454 device is as follows:

- Region 0 size is 0K bytes (disabled).
- Region 1 size is 32K bytes with no wait states.

The L1D memory configuration for the C6454 device is as follows:

- Region 0 size is 0K bytes (disabled).
- Region 1 size is 32K bytes with no wait states.

L1D is a two-way set-associative cache while L1P is a direct-mapped cache.

The L1P and L1D cache can be reconfigured via software through the L1PMODE field of the L1P Configuration Register (L1PMODE) and the L1DMODE field of the L1D Configuration Register (L1DCFG) of the C64x+ Megamodule. After device reset, L1P and L1D cache are configured as all cache or all SRAM. The on-chip Bootloader changes the reset configuration for L1P and L1D. For more information, see the *TMS320C645x Bootloader User's Guide* (literature number [SPRUJEC6](#)).

Figure 5-2 and Figure 5-3 show the available SRAM/cache configurations for L1P and L1D, respectively.

Figure 5-2. TMS320C6454 L1P Memory Configurations

Figure 5-3. TMS320C6454 L1D Memory Configurations

The L2 memory configuration for the C6454 device is as follows:

- Port 0 configuration:
 - Memory size is 1024KB
 - Starting address is 0080 0000h
 - 2-cycle latency
 - 4 × 128-bit bank configuration
- Port 1 configuration:
 - Memory size is 32K bytes (this corresponds to the internal ROM)
 - Starting address is 0010 0000h
 - 1-cycle latency
 - 1 × 256-bit bank configuration

L2 memory can be configured as all SRAM or as part 4-way set-associative cache. The amount of L2 memory that is configured as cache is controlled through the L2MODE field of the L2 Configuration Register (L2CFG) of the C64x+ Megamodule. Figure 5-4 shows the available SRAM/cache configurations for L2. By default, L2 is configured as all SRAM after device reset.

Figure 5-4. TMS320C6454 L2 Memory Configurations

For more information on the operation L1 and L2 caches, see the *TMS320C64x+ DSP Cache User's Guide* (literature number [SPRU862](#)).

All memory on the C6454 device has a unique location in the memory map (see [Table 2-2](#)).

When accessing the internal ROM of the DSP, the CPU frequency must always be less than 750 MHz. Therefore, when using a software boot mode, care must be taken such that the CPU frequency does not exceed 750 MHz at any point during the boot sequence. After the boot sequence has completed, the CPU frequency can be programmed to the frequency required by the application. For more detailed information on the boot modes, see [Section 2.4, Boot Sequence](#).

5.2 Memory Protection

Memory protection allows an operating system to define who or what is authorized to access L1D, L1P, and L2 memory. To accomplish this, the L1D, L1P, and L2 memories are divided into pages. There are 16 pages of L1P (2KB each), 16 pages of L1D (2KB each), and 16 pages of L2 (64KB each). The L1D, L1P, and L2 memory controllers in the C64x+ Megamodule are equipped with a set of registers that specify the permissions for each memory page.

Each page may be assigned with fully orthogonal user and supervisor read, write, and execute permissions. Additionally, a page may be marked as either (or both) locally or globally accessible. A local access is a direct CPU access to L1D, L1P, and L2, while a global access is initiated by a DMA (either IDMA or the EDMA3) or by other system masters. Note that EDMA or IDMA transfers programmed by the CPU count as global accesses.

The CPU and the system masters on the C6454 device are all assigned a privilege ID of 0. Therefore it is only possible to specify whether memory pages are locally or globally accessible. The AID0 and LOCAL bits of the memory protection page attribute registers specify the memory page protection scheme, see [Table 5-1](#).

Table 5-1. Available Memory Page Protection Schemes

AID0 Bit	LOCAL Bit	Description
0	0	No access to memory page is permitted.
0	1	Only direct access by CPU is permitted.
1	0	Only accesses by system masters and IDMA are permitted (includes EDMA and IDMA accesses initiated by the CPU).
1	1	All accesses permitted

For more information on memory protection for L1D, L1P, and L2, see the *TMS320C64x+ Megamodule Reference Guide* (literature number [SPRU871](#)).

5.3 Bandwidth Management

When multiple requestors contend for a single C64x+ Megamodule resource, the conflict is solved by granting access to the highest priority requestor. The following four resources are managed by the Bandwidth Management control hardware:

- Level 1 Program (L1P) SRAM/Cache
- Level 1 Data (L1D) SRAM/Cache
- Level 2 (L2) SRAM/Cache
- Memory-mapped registers configuration bus

The priority level for operations initiated within the C64x+ Megamodule; e.g., CPU-initiated transfers, user-programmed cache coherency operations, and IDMA-initiated transfers, are declared through registers in the C64x+ Megamodule. The priority level for operations initiated outside the C64x+ Megamodule by system peripherals is declared through the Priority Allocation Register (PRI_ALLOC), see [Section 4.4](#). System peripherals with no fields in PRI_ALLOC have their own registers to program their priorities.

More information on the bandwidth management features of the C64x+ Megamodule can be found in the *TMS320C64x+ Megamodule Reference Guide* (literature number [SPRU871](#)).

5.4 Power-Down Control

The C64x+ Megamodule supports the ability to power-down various parts of the C64x+ Megamodule. The power-down controller (PDC) of the C64x+ Megamodule can be used to power down L1P, the cache control hardware, the CPU, and the entire C64x+ Megamodule. These power-down features can be used to design systems for lower overall system power requirements.

NOTE

The C6454 device does not support power-down modes for the L2 memory at this time.

More information on the power-down features of the C64x+ Megamodule can be found in the *TMS320C64x+ Megamodule Reference Guide* (literature number [SPRU871](#)).

5.5 Megamodule Resets

[Table 5-2](#) shows the reset types supported on the C6454 device and they affect the resetting of the Megamodule, either both globally or just locally.

Table 5-2. Megamodule Reset (Global or Local)

RESET TYPE	GLOBAL MEGAMODULE RESET	LOCAL MEGAMODULE RESET
Power-On Reset	Y	Y
Warm Reset	Y	Y
System Reset	Y	Y
CPU Reset	N	Y

For more detailed information on the global and local megamodule resets, see the *TMS320C64x+ Megamodule Reference Guide* (literature number [SPRU871](#)) and for more detailed information on device resets, see [Section 7.6, Reset Controller](#).

5.6 Megamodule Revision

The version and revision of the C64x+ Megamodule can be read from the Megamodule Revision ID Register (MM_REVID) located at address 0181 2000h. The MM_REVID register is shown in [Figure 5-5](#) and described in [Table 5-3](#). The C64x+ Megamodule revision is dependant on the silicon revision being used. For more information, see the *TMS320C6455/54 Digital Signal Processor Silicon Errata* (literature number [SPRZ234](#)).

LEGEND: R = Read only; -n = value after reset

A. The C64x+ Megamodule revision is dependant on the silicon revision being used. For more information, see the *TMS320C6455/54 Digital Signal Processor Silicon Errata* (literature number [SPRZ234](#)).

Figure 5-5. Megamodule Revision ID Register (MM_REVID) [Hex Address: 0181 2000h]

Table 5-3. Megamodule Revision ID Register (MM_REVID) Field Descriptions

Bit	Field	Value	Description
31:16	VERSION	1h	Version of the C64x+ Megamodule implemented on the device. This field is always read as 1h.
15:0	REVISION		Revision of the C64x+ Megamodule version implemented on the device. The C64x+ Megamodule revision is dependant on the silicon revision being used. For more information, see the <i>TMS320C6455/54 Digital Signal Processor Silicon Errata</i> (literature number SPRZ234).

6 Device Operating Conditions

6.1 Absolute Maximum Ratings Over Operating Case Temperature Range (Unless Otherwise Noted)⁽¹⁾

Supply voltage range:	CV_{DD} ⁽²⁾	-0.5 V to 1.5 V
	DV_{DD33} ⁽²⁾	-0.5 V to 4.2 V
	DV_{DD15} , DV_{DD18} , AV_{DLL1} , AV_{DLL2} ⁽²⁾	-0.5 V to 2.5 V
	$PLLV1$, $PLLV2$ ⁽²⁾	-0.5 V to 2.5 V
Input voltage (V_I) range:	3.3-V pins (except PCI-capable pins)	-0.5 V to $DV_{DD33} + 0.5$ V
	PCI-capable pins	-0.5 V to $DV_{DD33} + 0.5$ V
	RGMI pins	-0.5 V to 2.5 V
	DDR2 memory controller pins	-0.5 V to 2.5 V
Output voltage (V_O) range:	3.3-V pins (except PCI-capable pins)	-0.5 V to $DV_{DD33} + 0.5$ V
	PCI-capable pins	-0.5 V to $DV_{DD33} + 0.5$ V
	RGMI pins	-0.5 V to 2.5 V
	DDR2 memory controller pins	-0.5 V to 2.5 V
Operating case temperature range, T_C :	(default)	0°C to 90°C
	(A version) [A-1000 device]	-40°C to 105°C
Storage temperature range, T_{stg}		-65°C to 150°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS} .

6.2 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
CV_{DD}	Supply voltage, Core	A-1000/-1000	1.2125	1.25	1.2875	V
		-850 -720	1.1640	1.20	1.2360	V
DV_{DD33}	Supply voltage, I/O		3.14	3.3	3.46	V
DV_{DD18}	Supply voltage, I/O		1.71	1.8	1.89	V
AV_{DLL1}	Supply voltage, I/O		1.71	1.8	1.89	V
AV_{DLL2}	Supply voltage, I/O		1.71	1.8	1.89	V
$V_{REFSSTL}$	Reference voltage		0.49 DV_{DD18}	0.50 DV_{DD18}	0.51 DV_{DD18}	V
DV_{DD15}	Supply voltage, I/O [required only for EMAC RGMI]	1.8-V operation	1.71	1.8	1.89	V
		1.5-V operation	1.43	1.5	1.57	V
$V_{REFHSTL}$	Reference voltage	1.8-V operation	0.855	0.9	0.945	V
		1.5-V operation	0.713	0.75	0.787	V
$PLLV1$, $PLLV2$	Supply voltage, PLL		1.71	1.8	1.89	V
V_{SS}	Supply ground		0	0	0	V

Recommended Operating Conditions (continued)

		MIN	NOM	MAX	UNIT
V _{IH}	High-level input voltage	3.3 V pins (except PCI-capable and I2C pins)	2		V
		PCI-capable pins ⁽¹⁾	0.5DV _{DD33}	DV _{DD33} + 0.5	V
		I2C pins	0.7DV _{DD33}		V
		RGMII pins	V _{REFHSTL} + 0.10	DV _{DD15} + 0.30	V
		DDR2 memory controller pins (DC)	V _{REFSSTL} + 0.125	DV _{DD18} + 0.3	V
V _{IL}	Low-level input voltage	3.3 V pins (except PCI-capable and I2C pins)		0.8	V
		PCI-capable pins ⁽¹⁾	-0.5	0.3DV _{DD33}	V
		I2C pins	0	0.3DV _{DD33}	V
		RGMII pins	-0.3	V _{REFHSTL} - 0.1	V
		DDR2 memory controller pins (DC)	-0.3	V _{REFSSTL} - 0.125	V
V _{OS}	Maximum voltage during overshoot/undershoot (PCI-capable pins) ^{(2) (3)}	I/O V _{DD} = 1.5 V (EMAC RGMII)	-0.450	1.950	V
		I/O V _{DD} = 1.8 V (EMAC RGMII, DDR2)	-0.540	2.340	
		I/O V _{DD} = 3.3 V (except PCI-capable pins)	-1.000	4.300	
T _C	Operating case temperature	commercial temperature	0	90	°C
		extended temperature	-40	105	

(1) These rated numbers are from the *PCI Local Bus Specification* (version 2.3). The DC specifications and AC specifications are defined in Table 4-3 and Table 4-4, respectively, of the *PCI Local Bus Specification*.

(2) PCI-capable pins can withstand a maximum overshoot/undershoot for up to 11 ns as required by the *PCI Local Bus Specification* (version 2.3).

(3) Duration of overshoot/undershoot must not exceed 30% of the cycle period.

6.3 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Case Temperature (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS ⁽¹⁾	MIN	TYP	MAX	UNIT		
V _{OH}	High-level output voltage	3.3-V pins (except PCI-capable and I2C pins)	DV _{DD33} = MIN, I _{OH} = MAX		0.8DV _{DD33}	V		
		PCI-capable pins ⁽²⁾	I _{OH} = -0.5 mA, DV _{DD33} = 3.3 V		0.9DV _{DD33}	V		
		RGMII pins			DV _{DD15} - 0.4	V		
		DDR2 memory controller pins			1.4	V		
V _{OL}	Low-level output voltage	3.3-V pins (except PCI-capable and I2C pins)	DV _{DD33} = MIN, I _{OL} = MAX		0.22DV _{DD33}	V		
		PCI-capable pins ⁽²⁾	I _{OL} = 1.5 mA, DV _{DD33} = 3.3 V		0.1DV _{DD33}	V		
		I2C pins	Pulled up to 3.3 V, 3 mA sink current		0.4	V		
		RGMII pins			0.4	V		
		DDR2 memory controller pins			0.4	V		
I _I ⁽³⁾	Input current [DC]	3.3-V pins (except PCI-capable and I2C pins)	V _I = V _{SS} to DV _{DD33} , pins without internal pullup or pulldown resistor		-1	1	μA	
			V _I = V _{SS} to DV _{DD33} , pins with internal pullup resistor		50	100	400	μA
			V _I = V _{SS} to DV _{DD33} , pins with internal pulldown resistor		-400	-100	-50	μA
		I2C pins	0.1DV _{DD33} ≤ V _I ≤ 0.9DV _{DD33}		-10	10	μA	
		PCI-capable pins ⁽⁴⁾			-1000	1000	μA	
		RGMII pins				0.4	V	
I _{OH}	High-level output current [DC]	AECLKOUT, CLKR1/GP[0], CLKX1/GP[3], SYSCLK4/GP[1], EMU[18:0], CLKR0, CLKX0			-8	mA		
		EMIF pins (except AECLKOUT), NMI, TOUT0L, TINP0L, TOUT1L, TINP1L, PCI_EN, EMAC-capable pins (except RGMII pins), RESETSTAT, McBSP-capable pins (except CLKR1/GP[0], CLKX1/GP[3], CLKR0, CLKX0), GP[7:4], and TDO			-4	mA		
		PCI-capable pins ⁽²⁾			-0.5	mA		
		RGMII pins			-8	mA		
		DDR2 memory controller pins			4	mA		

- (1) For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.
- (2) These rated numbers are from the *PCI Local Bus Specification* (version 2.3). The DC specifications and AC specifications are defined in Table 4-3 and Table 4-4, respectively, of the *PCI Local Bus Specification*.
- (3) I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I includes input leakage current and off-state (hi-Z) output leakage current.
- (4) PCI input leakage currents include Hi-Z output leakage for all bidirectional buffers with 3-state outputs.

Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Case Temperature (Unless Otherwise Noted) (continued)

PARAMETER		TEST CONDITIONS ⁽¹⁾	MIN	TYP	MAX	UNIT
I _{OL}	Low-level output current [DC]	AECLKOUT, CLKR1/GP[0], CLKX1/GP[3], SYSCLK4/GP[1], EMU[18:0], CLKR0, CLKX0			8	mA
		EMIF pins (except AECLKOUT), NMI, TOUT0L, TINP0L, TOUTP1L, TINP1L, PCI_EN, EMAC-capable pins (except RGMII pins), RESETSTAT, McBSP-capable pins (except CLKR1/GP[0], CLKX1/GP[3], CLKR0, CLKX0), GP[7:4], and TDO			4	mA
		PCI-capable pins ⁽²⁾			1.5	mA
		RGMII pins			8	mA
		DDR2 memory controller pins			-4	mA
I _{OZ} ⁽⁵⁾	Off-state output current [DC]	3.3-V pins	V _O = DV _{DD33} or 0 V	-20	20	µA
P _{CDD}	Core supply power ⁽⁶⁾		CV _{DD} = 1.25 V, CPU frequency = 1000 MHz	1.66		W
			CV _{DD} = 1.2 V, CPU frequency = 850 MHz	1.41		W
			CV _{DD} = 1.2 V, CPU frequency = 720 MHz	1.29		W
P _{DDD}	I/O supply power ⁽⁶⁾		DV _{DD33} = 3.3 V, DV _{DD18} = 1.8 V, PLLV1 = PLLV2 = AV _{DLL1} = AV _{DLL2} = 1.8 V, CPU frequency = 1000 MHz	0.53		W
			DV _{DD33} = 3.3 V, DV _{DD18} = 1.8 V, PLLV1 = PLLV2 = AV _{DLL1} = AV _{DLL2} = 1.8 V, CPU frequency = 850 MHz	0.53		W
			DV _{DD33} = 3.3 V, DV _{DD18} = 1.8 V, PLLV1 = PLLV2 = AV _{DLL1} = AV _{DLL2} = 1.8 V, CPU frequency = 720 MHz	0.52		W
C _i	Input capacitance				10	pF
C _o	Output capacitance				10	pF

(5) I_{OZ} applies to output-only pins, indicating off-state (hi-Z) output leakage current.

(6) Assumes the following conditions: 60% CPU utilization; DDR2 at 50% utilization (250 MHz), 50% writes, 32 bits, 50% bit switching; two 2-MHz McBSPs at 100% utilization, 50% switching; two 75-MHz Timers at 100% utilization; device configured for HPI32 mode with pull-up resistors on HPI pins; room temperature (25°C). The actual current draw is highly application-dependent. For more details on core and I/O activity, see the *TMS320C6455/54 Power Consumption Summary* application report (literature number [SPRAAE8](#)).

7 C64x+ Peripheral Information and Electrical Specifications

7.1 Parameter Information

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 7-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

7.1.1 3.3-V Signal Transition Levels

All input and output timing parameters are referenced to 1.5 V for both "0" and "1" logic levels.

Figure 7-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to $V_{IL\ MAX}$ and $V_{IH\ MIN}$ for input clocks, $V_{OL\ MAX}$ and $V_{OH\ MIN}$ for output clocks.

Figure 7-3. Rise and Fall Transition Time Voltage Reference Levels

7.1.2 3.3-V Signal Transition Rates

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

7.1.3 Timing Parameters and Board Routing Analysis

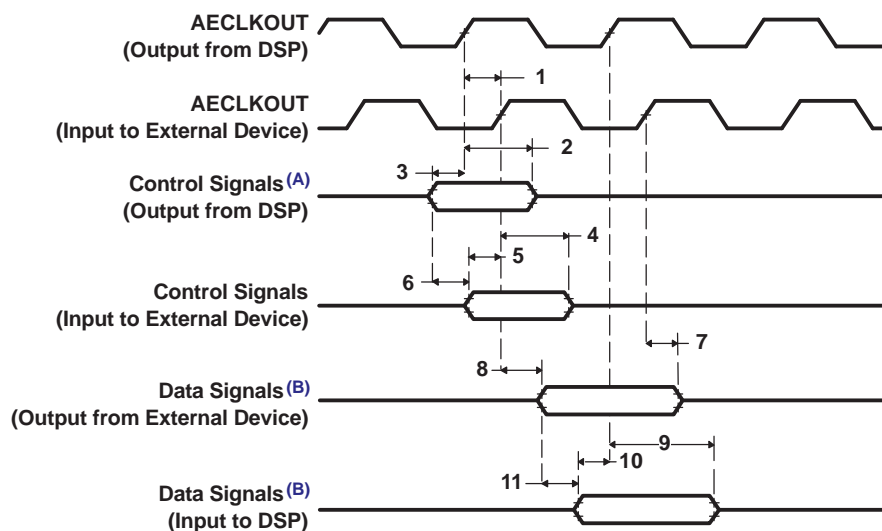

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number [SPRA839](#)). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see [Table 7-1](#) and [Figure 7-4](#)).

[Figure 7-4](#) represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

Table 7-1. Board-Level Timing Example
(see [Figure 7-4](#))

NO.	DESCRIPTION
1	Clock route delay
2	Minimum DSP hold time
3	Minimum DSP setup time
4	External device hold time requirement
5	External device setup time requirement
6	Control signal route delay
7	External device hold time
8	External device access time
9	DSP hold time requirement
10	DSP setup time requirement
11	Data route delay

- A. Control signals include data for Writes.
B. Data signals are generated during Reads from an external device.

Figure 7-4. Board-Level Input/Output Timings

7.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals **must** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

7.3 Power Supplies

7.3.1 Power-Supply Sequencing

TI recommends the power-supply sequence shown in Figure 7-5. After the DV_{DD33} supply is stable, the remaining power supplies can be powered up at the same time as CV_{DD} as long as their supply voltage never exceeds the CV_{DD} voltage during powerup. Some TI power-supply devices include features that facilitate power sequencing; for example, Auto-Track or Slow-Start/Enable features. For more information, visit www.ti.com/dsppower.

Figure 7-5. Power-Supply Sequence

Table 7-2. Timing Requirements for Power-Supply Sequence

NO.		-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
1	$t_{su}(DVDD33-CVDD12)$ Setup time, DV_{DD33} supply stable before CV_{DD12} supply stable	0.5	200	ms
2	$t_{su}(CVDD12-ALLSUP)$ Setup time, CV_{DD12} supply stable before all other supplies stable	0	200	ms

7.3.2 Power-Supply Decoupling

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. These caps need to be close to the DSP, no more than 1.25 cm maximum distance to be effective. Physically smaller caps are better, such as 0402, but need to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value. As with the selection of any component, verification of capacitor availability over the product's production lifetime should be considered.

7.3.3 Power-Down Operation

One of the power goals for the C6454 device is to reduce power dissipation due to unused peripherals. There are different ways to power down peripherals on the C6454 device.

Some peripherals can be statically powered down at device reset through the device configuration pins (see Section 3.1, *Device Configuration at Device Reset*). Once in a static power-down state, the peripheral is held in reset and its clock is turned off. Peripherals cannot be enabled once they are in a static power-down state. To take a peripheral out of the static power-down state, a device reset must be executed with a different configuration pin setting.

After device reset, all peripherals on the C6454 device are in a disabled state and must be enabled by software before being used. It is possible to enable only the peripherals needed by the application while keeping the rest disabled. Note that peripherals in a disabled state are held in reset with their clocks gated. For more information on how to enable peripherals, see Section 3.3, *Peripheral Selection After Device Reset*.

Peripherals used for booting, like I2C and HPI, are automatically enabled after device reset. It is not possible to disable these peripherals after the boot process is complete.

The C64x+ Megamodule also allows for software-driven power-down management for all of the C64x+ megamodule components through its Power-Down Controller (PDC). The CPU can power-down part or the entire C64x+ megamodule through the power-down controller based on its own execution thread or in response to an external stimulus from a host or global controller. More information on the power-down features of the C64x+ Megamodule can be found in the *TMS320C64x+ Megamodule Reference Guide* (literature number [SPRU871](#)).

7.3.4 Preserving Boundary-Scan Functionality on RGMII and DDR2 Memory Pins

When the RGMII mode of the EMAC is not used, the DV_{DD15} , $DV_{DD15MON}$, $V_{REFHSTL}$, RSV13, and RSV14 pins can be connected directly to ground (V_{SS}) to save power. However, this will prevent boundary-scan from functioning on the RGMII pins of the EMAC. To preserve boundary-scan functionality on the RGMII pins, DV_{DD15} , $V_{REFHSTL}$, RSV14, and RSV13 should be connected as follows:

- DV_{DD15} and $DV_{DD15MON}$ - connect these pins to the 1.8-V I/O supply (DV_{DD18}).
- $V_{REFHSTL}$ - connect to a voltage of $DV_{DD18}/2$. The $DV_{DD18}/2$ voltage can be generated directly from the DV_{DD18} supply using two 1-k Ω resistors to form a resistor divider circuit.
- RSV13 - connect this pin to ground (V_{SS}) via a 200- Ω resistor.
- RSV14 - connect this pin to the 1.8-V I/O supply (DV_{DD18}) via a 200- Ω resistor.

Similarly, when the DDR2 Memory Controller is not used, the $V_{REFSSTL}$, RSV11, and RSV12 pins can be connected directly to ground (V_{SS}) to save power. However, this will prevent boundary-scan from functioning on the DDR2 Memory Controller pins. To preserve boundary-scan functionality on the DDR2 Memory Controller pins, $V_{REFSSTL}$, RSV11, and RSV12 should be connected as follows:

- $V_{REFSSTL}$ - connect to a voltage of $DV_{DD18}/2$. The $DV_{DD18}/2$ voltage can be generated directly from the DV_{DD18} supply using two 1-k Ω resistors to form a resistor divider circuit.
- RSV11 - connect this pin to ground (V_{SS}) via a 200- Ω resistor.
- RSV12 - connect this pin to the 1.8-V I/O supply (DV_{DD18}) via a 200- Ω resistor.

7.4 Enhanced Direct Memory Access (EDMA3) Controller

The primary purpose of the EDMA3 is to service user-programmed data transfers between two memory-mapped slave endpoints on the device. The EDMA3 services software-driven paging transfers (e.g., data movement between external memory and internal memory), performs sorting or subframe extraction of various data structures, services event driven peripherals such as the McBSP, and offloads data transfers from the device CPU.

The EDMA3 includes the following features:

- Fully orthogonal transfer description
 - 3 transfer dimensions: array (multiple bytes), frame (multiple arrays), and block (multiple frames)
 - Single event can trigger transfer of array, frame, or entire block
 - Independent indexes on source and destination
- Flexible transfer definition:
 - Increment or FIFO transfer addressing modes
 - Linking mechanism allows for ping-pong buffering, circular buffering, and repetitive/continuous transfers, all with no CPU intervention
 - Chaining allows multiple transfers to execute with one event
- 256 PaRAM entries
 - Used to define transfer context for channels
 - Each PaRAM entry can be used as a DMA entry, QDMA entry, or link entry
- 64 DMA channels
 - Manually triggered (CPU writes to channel controller register), external event triggered, and chain triggered (completion of one transfer triggers another)
- 4 Quick DMA (QDMA) channels
 - Used for software-driven transfers
 - Triggered upon writing to a single PaRAM set entry
- 4 transfer controllers/event queues with programmable system-level priority
- Interrupt generation for transfer completion and error conditions
- Memory protection support
 - Active memory protection for accesses to PaRAM and registers
- Debug visibility
 - Queue watermarking/threshold allows detection of maximum usage of event queues
 - Error and status recording to facilitate debug

Each of the transfer controllers has a direct connection to the switched central resource (SCR).

NOTE

Although the transfer controllers are directly connected to the SCR, they can only access certain device resources. For example, only transfer controller 1 (TC1) can access the McBSPs. lists the device resources that can be accessed by each of the transfer controllers.

7.4.1 EDMA3 Device-Specific Information

The EDMA supports two addressing modes: constant addressing and increment addressing mode. On the C6454 DSP, constant addressing mode is not supported by any peripheral or internal memory. For more information on these two addressing modes, see the *TMS320C645x DSP Enhanced DMA (EDMA3) Controller User's Guide* (literature number [SPRU966](#)).

A DSP interrupt must be generated at the end of an HPI or PCI boot operation to begin execution of the loaded application. Since the DSP interrupt generated by the HPI and PCI is mapped to the EDMA event DSP_EVT (DMA channel 0), it will get recorded in bit 0 of the EDMA Event Register (ER). This event must be cleared by software before triggering transfers on DMA channel 0. The EDMA3 on the C6454 DSP supports active memory protection, but it does not support proxied memory protection.

7.4.2 EDMA3 Channel Synchronization Events

The EDMA3 supports up to 64 DMA channels that can be used to service system peripherals and to move data between system memories. DMA channels can be triggered by synchronization events generated by system peripherals. [Table 7-3](#) lists the source of the synchronization event associated with each of the DMA channels. On the C6454 device, the association of each synchronization event and DMA channel is fixed and cannot be reprogrammed.

For more detailed information on the EDMA3 module and how EDMA3 events are enabled, captured, processed, prioritized, linked, chained, and cleared, etc., see the *TMS320C645x DSP Enhanced DMA (EDMA3) Controller User's Guide* (literature number [SPRU966](#)).

Table 7-3. C6454 EDMA3 Channel Synchronization Events⁽¹⁾

EDMA CHANNEL	BINARY	EVENT NAME	EVENT DESCRIPTION
0 ⁽²⁾	000 0000	DSP_EVT	HPI/PCI-to-DSP event
1	000 0001	TEVTLO0	Timer 0 lower counter event
2	000 0010	TEVTHI0	Timer 0 high counter event
3	000 0011	-	None
4	000 0100	-	None
5	000 0101	-	None
6	000 0110	-	None
7	000 0111	-	None
8	000 1000	-	None
9	000 1001	-	None
10	000 1010	-	None
11	000 1011	-	None
12	000 1100	XEVT0	McBSP0 transmit event
13	000 1101	REVT0	McBSP0 receive event
14	000 1110	XEVT1	McBSP1 transmit event
15	000 1111	REVT1	McBSP1 receive event
16	001 0000	TEVTLO1	Timer 1 lower counter event
17	001 0001	TEVTHI1	Timer 1 high counter event
18-43	-	-	None
44	010 1100	ICREVT	I2C receive event
45	010 1101	ICXEVT	I2C transmit event
46-47	-	-	None

- (1) In addition to the events shown in this table, each of the 64 channels can also be synchronized with the transfer completion or alternate transfer completion events. For more detailed information on EDMA event-transfer chaining, see the *TMS320C645x DSP Enhanced DMA (EDMA3) Controller User's Guide* (literature number [SPRU966](#)).
- (2) HPI boot and PCI boot are terminated using a DSP interrupt. The DSP interrupt is registered in bit 0 (channel 0) of the EDMA Event Register (ER). This event must be cleared by software before triggering transfers on DMA channel 0.

Table 7-3. C6454 EDMA3 Channel Synchronization Events⁽¹⁾ (continued)

EDMA CHANNEL	BINARY	EVENT NAME	EVENT DESCRIPTION

7.5 Interrupts

7.5.1 Interrupt Sources and Interrupt Controller

The CPU interrupts on the C6454 device are configured through the C64x+ Megamodule Interrupt Controller. The interrupt controller allows for up to 128 system events to be programmed to any of the twelve CPU interrupt inputs (CPUINT4 - CPUINT15), the CPU exception input (EXCEP), or the advanced emulation logic. The 128 system events consist of both internally-generated events (within the megamodule) and chip-level events. [Table 7-10](#) shows the mapping of system events. For more information on the Interrupt Controller, see the *TMS320C64x+ Megamodule Reference Guide* (literature number [SPRU871](#)).

Table 7-10. C6454 System Event Mapping

EVENT NUMBER	INTERRUPT EVENT	DESCRIPTION
0 ⁽¹⁾	EVT0	Output of event combiner 0 in interrupt controller, for events 1 - 31.
1 ⁽¹⁾	EVT1	Output of event combiner 1 in interrupt controller, for events 32 - 63.
2 ⁽¹⁾	EVT2	Output of event combiner 2 in interrupt controller, for events 64 - 95.
3 ⁽¹⁾	EVT3	Output of event combiner 3 in interrupt controller, for events 96 - 127.
4 - 8	Reserved	Reserved. These system events are not connected and, therefore, not used.
9 ⁽¹⁾	EMU_DTDMA	EMU interrupt for: <ol style="list-style-type: none"> Host scan access DTDMA transfer complete AET interrupt
10	None	This system event is not connected and, therefore, not used.
11 ⁽¹⁾	EMU_RTDXRX	EMU real-time data exchange (RTDX) receive complete
12 ⁽¹⁾	EMU_RTDXTX	EMU RTDX transmit complete
13 ⁽¹⁾	IDMA0	IDMA channel 0 interrupt
14 ⁽¹⁾	IDMA1	IDMA channel 1 interrupt
15	DSPINT	HPI/PCI-to-DSP interrupt
16	I2CINT	I2C interrupt
17	MACINT	Ethernet MAC interrupt
18	AEASYNCERR	EMIFA error interrupt
19 - 23	Reserved	Reserved. This system event is not connected and, therefore, not used.
24	EDMA3CC_GINT	EDMA3 channel global completion interrupt
25 - 39	Reserved	Reserved. These system events are not connected and, therefore, not used.
40	RINT0	McBSP0 receive interrupt
41	XINT0	McBSP0 transmit interrupt
42	RINT1	McBSP1 receive interrupt
43	XINT1	McBSP1 transmit interrupt
44 - 50	Reserved	Reserved. These system events are not connected and, therefore, not used.
51	GPINT0	GPIO interrupt
52	GPINT1	GPIO interrupt
53	GPINT2	GPIO interrupt
54	GPINT3	GPIO interrupt
55	GPINT4	GPIO interrupt
56	GPINT5	GPIO interrupt
57	GPINT6	GPIO interrupt

(1) This system event is generated from within the C64x+ megamodule.

Table 7-10. C6454 System Event Mapping (continued)

EVENT NUMBER	INTERRUPT EVENT	DESCRIPTION
58	GPINT7	GPIO interrupt
59	GPINT8	GPIO interrupt
60	GPINT9	GPIO interrupt
61	GPINT10	GPIO interrupt
62	GPINT11	GPIO interrupt
63	GPINT12	GPIO interrupt
64	GPINT13	GPIO interrupt
65	GPINT14	GPIO interrupt
66	GPINT15	GPIO interrupt
67	TINTLO0	Timer 0 lower counter interrupt
68	TINTHI0	Timer 0 higher counter interrupt
69	TINTLO1	Timer 1 lower counter interrupt
70	TINTHI1	Timer 1 higher counter interrupt
71	EDMA3CC_INT0	EDMA3CC completion interrupt - Mask0

73	EDMA3CC_INT2	EDMA3CC completion interrupt - Mask2
74	EDMA3CC_INT3	EDMA3CC completion interrupt - Mask3
75	EDMA3CC_INT4	EDMA3CC completion interrupt - Mask4
76	EDMA3CC_INT5	EDMA3CC completion interrupt - Mask5
77	EDMA3CC_INT6	EDMA3CC completion interrupt - Mask6
78	EDMA3CC_INT7	EDMA3CC completion interrupt - Mask7
79	EDMA3CC_ERRINT	EDMA3CC error interrupt
80	Reserved	Reserved. This system event is not connected and, therefore, not used.
81	EDMA3TC0_ERRINT	EDMA3TC0 error interrupt
82	EDMA3TC1_ERRINT	EDMA3TC1 error interrupt
83	EDMA3TC2_ERRINT	EDMA3TC2 error interrupt
84	EDMA3TC3_ERRINT	EDMA3TC3 error interrupt
85 - 95	Reserved	Reserved. These system events are not connected and, therefore, not used.
96 ⁽²⁾	INTERR	Interrupt Controller dropped CPU interrupt event
97 ⁽²⁾	EMC_IDMAERR	EMC invalid IDMA parameters
98 - 99	Reserved	Reserved. These system events are not connected and, therefore, not used.
100 ⁽²⁾	EFIINTA	EFI interrupt from side A
101 ⁽²⁾	EFIINTB	EFI interrupt from side B
102 - 112	Reserved	Reserved. These system events are not connected and, therefore, not used.
113 ⁽²⁾	L1P_ED1	L1P single bit error detected during DMA read
114 - 115	Reserved	Reserved. These system events are not connected and, therefore, not used.
116 ⁽²⁾	L2_ED1	L2 single bit error detected
117 ⁽²⁾	L2_ED2	L2 two bit error detected
118 ⁽²⁾	PDC_INT	Powerdown sleep interrupt
119	Reserved	Reserved. This system event is not connected and, therefore, not used.
120 ⁽²⁾	L1P_CMPA	L1P CPU memory protection fault
121 ⁽²⁾	L1P_DMPA	L1P DMA memory protection fault

(2) This system event is generated from within the C64x+ megamodule.

Table 7-10. C6454 System Event Mapping (continued)

EVENT NUMBER	INTERRUPT EVENT	DESCRIPTION
122 ⁽²⁾	L1D_CMPA	L1D CPU memory protection fault
123 ⁽²⁾	L1D_DMPA	L1D DMA memory protection fault
124 ⁽²⁾	L2_CMPA	L2 CPU memory protection fault
125 ⁽²⁾	L2_DMPA	L2 DMA memory protection fault
126 ⁽²⁾	IDMA_CMPA	IDMA CPU memory protection fault
127 ⁽²⁾	IDMA_BUSERR	IDMA bus error interrupt

7.5.2 External Interrupts Electrical Data/Timing

Table 7-11. Timing Requirements for External Interrupts⁽¹⁾

(see Figure 7-6)

NO.		-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
1	$t_{w(NMIL)}$ Width of the NMI interrupt pulse low	6P		ns
2	$t_{w(NMIH)}$ Width of the NMI interrupt pulse high	6P		ns

(1) P = 1/CPU clock frequency in ns. For example, when running parts at 1000 MHz, use P = 1 ns.

Figure 7-6. NMI Interrupt Timing

7.6 Reset Controller

The reset controller detects the different type of resets supported on the C6454 device and manages the distribution of those resets throughout the device.

The C6454 device has several types of resets: power-on reset, warm reset, system reset, and CPU reset. [Table 7-12](#) explains further the types of reset, the reset initiator, and the effects of each reset on the chip. For more information on the effects of each reset on the PLL controllers and their clocks, see [Section 7.6.7, Reset Electrical Data/Timing](#).

Table 7-12. Reset Types

TYPE	INITIATOR	EFFECT(s)
Power-on Reset	$\overline{\text{POR}}$ pin	Resets the entire chip including the test and emulation logic.
Warm Reset	$\overline{\text{RESET}}$ pin	Resets everything except for the test and emulation logic and PLL2. Emulator stays alive during Warm Reset.
System Reset	Emulator	A system reset maintains memory contents and does not reset the test and emulation circuitry. The device configuration pins are also not re-latched and the state of the peripherals is also not affected. ⁽¹⁾
CPU Local Reset	HPI/PCI	CPU local reset.

(1) On the C6454 device, peripherals can be in one of several states. These states are listed in [Table 3-4](#).

7.6.1 Power-on Reset ($\overline{\text{POR}}$ Pin)

Power-on Reset is initiated by the $\overline{\text{POR}}$ pin and is used to reset the entire chip, including the test and emulation logic. Power-on Reset is also referred to as a cold reset since the device usually goes through a power-up cycle. During power-up, the $\overline{\text{POR}}$ pin must be asserted (driven low) until the power supplies have reached their normal operating conditions. Note that a device power-up cycle is not required to initiate a Power-on Reset.

The following sequence must be followed during a Power-on Reset:

1. Wait for all power supplies to reach normal operating conditions while keeping the $\overline{\text{POR}}$ pin asserted (driven low).

While $\overline{\text{POR}}$ is asserted, all pins will be set to high-impedance. After the $\overline{\text{POR}}$ pin is deasserted (driven high), all Z group pins, low group pins, and high group pins are set to their reset state and will remain at their reset state until the otherwise configured by their respective peripheral. All peripherals, except those selected for boot purposes, are disabled after a Power-on Reset and must be enabled through the Device State Control registers; for more details, see [Section 3.3, Peripheral Selection After Device Reset](#).

2. Once all the power supplies are within valid operating conditions, the $\overline{\text{POR}}$ pin must remain asserted (low) for a minimum of 256 CLKIN2 cycles. The PLL1 controller input clock, CLKIN1, and the PCI input clock, PCLK, must also be valid during this time. PCLK is only needed if the PCI module is being used. If the DDR2 memory controller and the EMAC peripheral are not needed, CLKIN2 can be tied low and, in this case, the $\overline{\text{POR}}$ pin must remain asserted (low) for a minimum of 256 CLKIN1 cycles after all power supplies have reached valid operating conditions.

Within the low period of the $\overline{\text{POR}}$ pin, the following happens:

- The reset signals flow to the entire chip (including the test and emulation logic), resetting modules that use reset asynchronously.
- The PLL1 controller clocks are started at the frequency of the system reference clock. The clocks are propagated throughout the chip to reset modules that use reset synchronously. By default, PLL1 is in reset and unlocked.
- The PLL2 controller clocks are started at the frequency of the system reference clock. PLL2 is held in reset. Since the PLL2 controller always operates in PLL mode, the system reference clock and all the system clocks are invalid at this point.
- The $\overline{\text{RESETSTAT}}$ pin stays asserted (low), indicating the device is in reset.

3. The $\overline{\text{POR}}$ pin may now be deasserted (driven high).

When the $\overline{\text{POR}}$ pin is deasserted, the configuration pin values are latched and the PLL controllers change their system clocks to their default divide-down values. PLL2 is taken out of reset and automatically starts its locking sequence. Other device initialization is also started.

4. After device initialization is complete, the $\overline{\text{RESETSTAT}}$ pin is deasserted (driven high). By this time, PLL2 has already completed its locking sequence and is outputting a valid clock. The system clocks of both PLL controllers are allowed to finish their current cycles and then paused for 10 cycles of their respective system reference clocks. After the pause the system clocks are restarted at their default divide-by settings.
5. The device is now out of reset, device execution begins as dictated by the selected boot mode (see [Section 2.4, Boot Sequence](#)).

NOTE

To most of the device, reset is de-asserted only when the $\overline{\text{POR}}$ and $\overline{\text{RESET}}$ pins are both de-asserted (driven high). Therefore, in the sequence described above, if the $\overline{\text{RESET}}$ pin is held low past the low period of the $\overline{\text{POR}}$ pin, most of the device will remain in reset. The only exception being that PLL2 is taken out of reset as soon as $\overline{\text{POR}}$ is de-asserted (driven high), regardless of the state of the $\overline{\text{RESET}}$ pin. The $\overline{\text{RESET}}$ pin should not be tied together with the $\overline{\text{POR}}$ pin.

7.6.2 Warm Reset ($\overline{\text{RESET}}$ Pin)

A Warm Reset has the same effects as a Power-on Reset, except that in this case, the test and emulation logic and PLL2 are not reset.

The following sequence must be followed during a Warm Reset:

1. Hold the $\overline{\text{RESET}}$ pin low for a minimum of 24 CLKIN1 cycles. Within the minimum 24 CLKIN1 cycles.

Within the low period of the $\overline{\text{RESET}}$ pin, the following happens:

- The Z group pins, low group pins, and the high group pins are set to their reset state with one exception:

The PCI pins are not affected by warm reset if the PCI module was enabled before $\overline{\text{RESET}}$ went low. In this case, PCI pins stay at whatever their value was before $\overline{\text{RESET}}$ went low.

- The reset signals flow to the entire chip (excluding the test and emulation logic), resetting modules that use reset asynchronously.
- The PLL1 controller is reset thereby switching back to bypass mode and resetting all its registers to their default values. PLL1 is placed in reset and loses lock. The PLL1 controller clocks start running at the frequency of the system reference clock. The clocks are propagated throughout the chip to reset modules that use reset synchronously.
- The PLL2 controller is reset thereby resetting all its registers to their default values. The PLL2 controller clocks start running at the frequency of the system reference clock. PLL2 is not reset, therefore it remains locked.
- The $\overline{\text{RESETSTAT}}$ pin becomes active (low), indicating the device is in reset.

2. The $\overline{\text{RESET}}$ pin may now be released (driven inactive high).

When the $\overline{\text{RESET}}$ pin is released, the configuration pin values are latched and the PLL controllers immediately change their system clocks to their default divide-down values. Other device initialization is also started.

3. After device initialization is complete, the $\overline{\text{RESETSTAT}}$ pin goes inactive (high). All system clocks are allowed to finish their current cycles and then paused for 10 cycles of their respective system reference clocks. After the pause the system clocks are restarted at their default divide-by settings.
4. The device is now out of reset, device execution begins as dictated by the selected boot mode (see [Section 2.4, Boot Sequence](#)).

NOTE

The $\overline{\text{POR}}$ pin should be held inactive (high) throughout the Warm Reset sequence. Otherwise, if $\overline{\text{POR}}$ is activated (brought low), the minimum $\overline{\text{POR}}$ pulse width must be met. The $\overline{\text{RESET}}$ pin should not be tied together with the $\overline{\text{POR}}$ pin.

7.6.3 System Reset

The emulator initiates a System Reset via the ICEPick module. This ICEPick-initiated reset is non-maskable. To invoke the maximum reset via the ICEPick module, the user can perform the following from the Code Composer Studio™ menu: Debug → Advanced Resets → System Reset.

The following memory contents are maintained during a System Reset:

- DDR2 Memory Controller: The DDR2 Memory Controller registers are **not** reset. In addition, the DDR2 SDRAM memory content is retained if the user places the DDR2 SDRAM in self-refresh mode before invoking the System Reset.
- EMIFA: The contents of the memory connected to the EMIFA are retained. The EMIFA registers are **not** reset.

Test, emulation, and clock logic are unaffected. The device configuration pins are also not re-latched and the state of the peripherals (see Table 3-4) is not affected.

During a System Reset, the following happens:

1. The System Reset is initiated by the emulator.

During this time, the following happens:

- The reset signals flow to the entire chip resetting all the modules on chip except the test and emulation logic.
- The PLL controllers are **not** reset. Internal system clocks are unaffected. If PLL1/PLL2 were locked before the System Reset, they remain locked.
- The $\overline{\text{RESETSTAT}}$ pin goes low to indicate an internal reset is being generated.

2. After device initialization is complete, the $\overline{\text{RESETSTAT}}$ pin is deasserted (driven high). In addition, the PLL controllers pause their system clocks for about 10 cycles.

At this point:

- The state of the peripherals before the System Reset is not changed. For example, if McBSP0 was in the enabled state before System Reset, it will remain in the enabled state after System Reset.
- The I/O pins are controlled as dictated by the DEVSTAT register.
- The DDR2 Memory Controller and EMIFA registers retain their previous values. Only the DDR2 Memory Controller and EMIFA state machines are reset by the System Reset.
- The PLL controllers are operating in the mode prior to System Reset. System clocks are unaffected.

The boot sequence is started after the system clocks are restarted. Since the configuration pins (including the BOOTMODE[3:0] pins) are not latched with a System Reset, the previous values, as shown in the DEVSTAT register, are used to select the boot mode.

7.6.4 CPU Reset

A CPU Reset is initiated by the HPI or PCI peripheral. This reset only affects the CPU. During a PCI-initiated CPU Reset, the PCI pins are set to their reset state. With the exception of the $\overline{\text{HRDY/PIRDY}}$ pin, the PCI pins have a reset state of high-impedance; the $\overline{\text{HRDY/PIRDY}}$ pin goes high during reset.

7.6.5 Reset Priority

If any of the above reset sources occur simultaneously, the PLLCTRL only processes the highest priority reset request. The reset request priorities are as follows (high to low):

- Power-on Reset

- Warm Reset
- System Reset
- CPU Reset

7.6.6 Reset Controller Register

The reset type status (RSTYPE) register (029A 00E4) is the only register for the reset controller. This register falls in the same memory range as the PLL1 controller registers [029A 0000 - 029A 01FF] (see [Table 7-18](#)).

7.6.6.1 Reset Type Status Register Description

The reset type status (RSTYPE) register latches the cause of the last reset. If multiple reset sources occur simultaneously, this register latches the highest priority reset source. The reset type status register is shown in [Figure 7-7](#) and described in [Table 7-13](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-7. Reset Type Status Register (RSTYPE) [Hex Address: 029A 00E4]

Table 7-13. Reset Type Status Register (RSTYPE) Field Descriptions

Bit	Field	Value	Description
31:4	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
3	SRST	0 1	System reset. 0 System Reset was not the last reset to occur. 1 System Reset was the last reset to occur.
2	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	WRST	0 1	Warm reset. 0 Warm Reset was not the last reset to occur. 1 Warm Reset was the last reset to occur.
0	POR	0 1	Power-on reset. 0 Power-on Reset was not the last reset to occur. 1 Power-on Reset was the last reset to occur.

7.6.7 Reset Electrical Data/Timing

Table 7-14. Timing Requirements for Reset⁽¹⁾ (2) (3)

(see [Figure 7-8](#) and [Figure 7-9](#))

NO.			-720 -850 A-1000/-1000		UNIT
			MIN	MAX	
5	$t_{w(POR)}$	Pulse duration, \overline{POR} low	256D ⁽⁴⁾		ns
6	$t_{w(RESET)}$	Pulse duration, \overline{RESET} low	24C		ns
7	$t_{su(boot)}$	Setup time, boot mode and configuration pins valid before \overline{POR} high or \overline{RESET} high ⁽⁵⁾	6P		ns
8	$t_{h(boot)}$	Hold time, boot mode and configuration pins valid after \overline{POR} high or \overline{RESET} high ⁽⁵⁾	6P		ns

(1) C = 1/CLKIN1 clock frequency in ns.

(2) D = 1/CLKIN2 clock frequency in ns.

(3) P = 1/CPU clock frequency in nanoseconds (ns). Note that after power-on reset and warm reset the CPU frequency is equal to the CLKIN1 frequency divided by three due to the PLL1 controller being reset (see [Section 7.6, Reset Controller](#)).

(4) If CLKIN2 is not used, $t_{w(POR)}$ must be measured in terms of CLKIN1 cycles; otherwise, use CLKIN2 cycles.

(5) AEA[19:0], ABA[1:0], and PCI_EN are the boot configuration pins during device reset. **Note:** If a configuration pin must be routed out from the device and 3-stated (not driven), the internal pullup/pulldown (IPU/IPD) resistor should not be relied upon; TI recommends the use of an external pullup/pulldown resistor. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see [Section 3.7, Pullup/Pulldown Resistors](#).

Table 7-15. Switching Characteristics Over Recommended Operating Conditions During Reset⁽¹⁾

(see [Figure 7-9](#))

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
9	$t_{d(PORH-RSTATH)}$ Delay time, \overline{POR} high AND \overline{RESET} high to $\overline{RESETSTAT}$ high	15000C		ns

(1) C = 1/CLKIN1 clock frequency in ns.

For [Figure 7-8](#), note the following:

- Z group consists of: all I/O/Z and O/Z pins, except for Low and High group pins. Pins become high impedance as soon as their respective power supply has reached normal operating conditions. Pins remain in high impedance until configured otherwise by their respective peripheral.
- Low group consists of: MTXD0/RMTXD0, MTXD1/RMTXD1, MTXD2/RMTXD2, MTXD3/RMTXD3, MTXD4/RMTXD4, and MTXEN/RMTXEN. Pins become low as soon as their respective power supply has reached normal operating conditions. Pins remain low until configured otherwise by their respective peripheral.
- High group consists of: \overline{AHOLD} , $\overline{ABUSREQ}$, and $\overline{HRDY/PIRDY}$. Pins become high as soon as their respective power supply has reached normal operating conditions. Pins remain high until configured otherwise by their respective peripheral. The $\overline{ABUSREQ}$ pin remains high until the EMIFA is enabled through the PERCFG1 register. Once the EMIFA is enabled, the $\overline{ABUSREQ}$ pin is driven to its inactive state (driven low).
- All peripherals must be enable through software following a Power-on Reset; for more details, see [Section 7.6.1, Power-on Reset](#).
- For power-supply sequence requirements, see [Section 7.3.1, Power-Supply Sequencing](#).

- A. SYSREFCLK of the PLL2 controller runs at CLKIN2 ×10.
- B. SYSCLK1 of PLL2 controller runs at SYSREFCLK/2 (default).
- C. Power supplies, CLKIN1, CLKIN2 (if used), and PCLK (if used) must be stable before the start of $t_{w(POR)}$.
- D. Do not tie the \overline{RESET} and POR pins together.
- E. The \overline{RESET} pin can be brought high after the \overline{POR} pin has been brought high. In this case, the \overline{RESET} pin must be held low for a minimum of $t_{w(RESET)}$ after the \overline{POR} pin has been brought high.

Figure 7-8. Power-Up Timing

- RESET should only be used after device has been powered up. For more details on the use of the RESET pin, see [Section 7.6, Reset Controller](#).
- A reset signal is generated internally during a Warm Reset. This internal reset signal has the same effect as the RESET pin during a Warm Reset.
- Boot and Device Configurations Inputs (during reset) include: AEA[19:0], ABA[1:0], and PCI_EN.

Figure 7-9. Warm Reset Timing

7.7 PLL1 and PLL1 Controller

The primary PLL controller generates the input clock to the C64x+ megamodule (including the CPU) as well as most of the system peripherals such as the multichannel buffered serial ports (McBSPs) and the external memory interface (EMIF).

As shown in [Figure 7-10](#), the PLL1 controller features a software-programmable PLL multiplier controller (PLLM) and five dividers (PREDIV, D2, D3, D4, and D5). The PLL1 controller uses the device input clock CLKIN1 to generate a system reference clock (SYSREFCLK) and four system clocks (SYSCLK2, SYSCLK3, SYSCLK4, and SYSCLK5).

PLL1 power is supplied externally via the PLL1 power-supply pin (PLLV1). An external EMI filter circuit must be added to PLLV1, as shown in [Figure 7-10](#). The 1.8-V supply of the EMI filter must be from the same 1.8-V power plane supplying the I/O power-supply pin, DV_{DD18}. TI requires EMI filter manufacturer Murata, part number NFM18CC222R1C3 or NFM18CC223R1C3.

All PLL external components (C1, C2, and the EMI Filter) must be placed as close to the C64x+ DSP device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C1, C2, and the EMI Filter).

The minimum CLKIN1 rise and fall times should also be observed. For the input clock timing requirements, see [Section 7.7.4, PLL1 Controller Input and Output Clock Electrical Data/Timing](#).

CAUTION

The PLL controller module as described in the *TMS320C645x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number [SPRUE56](#)) includes a superset of features, some of which are not supported on the C6454 DSP. The following sections describe the features that are supported; it should be assumed that any feature not included in these sections is not supported by the C6454 DSP.

- A. DIVIDER D2 and DIVIDER D3 are always enabled.
- B. CLKIN1 is a 3.3-V signal.

Figure 7-10. PLL1 and PLL1 Controller

7.7.1 PLL1 Controller Device-Specific Information

7.7.1.1 Internal Clocks and Maximum Operating Frequencies

As shown in Figure 7-10, the PLL1 controller generates several internal clocks including the system reference clock (SYSREFCLK), and the system clocks (SYSCLK2/3/4/5). The high-frequency clock signal SYSREFCLK is directly used to clock the C64x+ megamodule (including the CPU) and also serves as a reference clock for the rest of the DSP system.

Dividers D2, D3, D4, and D5 divide the high-frequency clock SYSREFCLK to generate SYSCLK2, SYSCLK3, SYSCLK4, and SYSCLK5, respectively. The system clocks are used to clock different portions of the DSP:

- SYSCLK2 is used to clock the switched central resources (SCRs), EDMA3, as well as the data bus interfaces of the EMIFA and DDR2 Memory Controller.
- SYSCLK3 clocks the PCI, HPI, McBSP, GPIO, TIMER, and I2C peripherals, as well as the configuration bus of the PLL2 Controller.

- SYSCLK4 is used as the internal clock for the EMIFA. It is also used to clock other logic within the DSP.
- SYSCLK5 clocks the emulation and trace logic of the DSP.

The divider ratio bits of dividers D2 and D3 are fixed at $\div 3$ and $\div 6$, respectively. The divider ratio bits of dividers D4 and D5 are programmable through the PLL controller divider registers PLLDIV4 and PLLDIV5, respectively.

The PLL multiplier controller (PLLM) and the dividers (D4 and D5) must be programmed after reset. **There is no hardware CLKMODE selection on the C6454 device.**

Since the divider ratio bits for dividers D2 and D3 are fixed, the frequency of SYSCLK2 and SYSCLK3 is tied to the frequency of SYSREFCLK. However, the frequency of SYSCLK4 and SYSCLK5 depends on the configuration of dividers D4 and D5. For example, with PLLM in the PLL1 multiply control register set to 10011b (x20 mode) and a 50-MHz CLKIN1 input, the PLL output PLOUT is set to 1000 MHz and SYSCLK2 and SYSCLK3 run at 333 MHz and 166 MHz, respectively. Divider D4 can be programmed through the PLLDIV4 register to divide SYSREFCLK by 10 such that SYSCLK4 and, hence, the EMIF internal clock, runs at 120 MHz.

All hosts (HPI, PCI, etc.) must hold off accesses to the DSP while the frequency of its internal clocks is changing. A mechanism must be in place such that the DSP notifies the host when the PLL configuration has completed.

Note that there is a minimum and maximum operating frequency for PLLREF, PLOUT, SYSCLK4, and SYSCLK5. The PLL1 Controller must not be configured to exceed any of these constraints (certain combinations of external clock input, internal dividers, and PLL multiply ratios might not be supported). For the PLL clocks input and output frequency ranges, see [Table 7-16](#).

Table 7-16. PLL1 Clock Frequency Ranges

CLOCK SIGNAL	MIN	MAX	UNIT
CLKIN1		66.6	MHz
PLLREF (PLLEN = 1) ⁽¹⁾	33.3	66.6	MHz
PLOUT ⁽¹⁾	400	1000	MHz
SYSCLK4	25	166	MHz
SYSCLK5		333	MHz

(1) Only applies when the PLL1 Controller is set to PLL mode (PLLEN = 1 in the PLLCTL register).

7.7.1.2 PLL1 Controller Operating Modes

The PLL1 controller has two modes of operation: bypass mode and PLL mode. The mode of operation is determined by the PLLEN bit of the PLL control register (PLLCTL). In PLL mode, SYSREFCLK is generated from the device input clock CLKIN1 using the divider PREDIV and the PLL multiplier PLLM. In bypass mode, CLKIN1 is fed directly to SYSREFCLK.

All hosts (HPI, PCI, etc.) must hold off accesses to the DSP while the frequency of its internal clocks is changing. A mechanism must be in place such that the DSP notifies the host when the PLL configuration has completed.

7.7.1.3 PLL1 Stabilization, Lock, and Reset Times

The PLL stabilization time is the amount of time that must be allotted for the internal PLL regulators to become stable after device powerup. The PLL should not be operated until this stabilization time has expired.

The PLL reset time is the amount of wait time needed when resetting the PLL (writing PLLRST = 1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the PLL1 reset time value, see [Table 7-17](#).

The PLL lock time is the amount of time needed from when the PLL is taken out of reset (PLLRST = 1 with PLEN = 0) to when the PLL controller can be switched to PLL mode (PLEN = 1). The PLL1 lock time is given in [Table 7-17](#).

Table 7-17. PLL1 Stabilization, Lock, and Reset Times

	MIN	TYP	MAX	UNIT
PLL stabilization time	150			μs
PLL lock time			2000°C ⁽¹⁾	ns
PLL reset time	128°C ⁽¹⁾			ns

(1) C = CLKIN1 cycle time in ns. For example, when CLKIN1 frequency is 50 MHz, use C = 20 ns.

7.7.2 PLL1 Controller Memory Map

The memory map of the PLL1 controller is shown in [Table 7-18](#). Note that only registers documented here are accessible on the TMS320C6454 device. Other addresses in the PLL1 controller memory map should not be modified.

Table 7-18. PLL1 Controller Registers (Including Reset Controller)

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
029A 0000 - 029A 00E3	-	Reserved
029A 00E4	RSTYPE	Reset Type Status Register (Reset Controller)
029A 00E8 - 029A 00FF	-	Reserved
029A 0100	PLLCTL	PLL Control Register

7.7.3 PLL1 Controller Register Descriptions

This section provides a description of the PLL1 controller registers. For details on the operation of the PLL controller module, see the *TMS320C645x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number [SPRUE56](#)).

NOTE: The PLL1 controller registers can only be accessed using the CPU or the emulator.

Not all of the registers documented in the *TMS320C645x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number [SPRUE56](#)) are supported on the TMS320C6454 DSP. Only those registers documented in this section are supported. Furthermore, only the bits within the registers described here are supported. You should not write to any reserved memory location or change the value of reserved bits.

7.7.3.1 PLL1 Control Register

The PLL control register (PLLCTL) is shown in [Figure 7-11](#) and described in [Table 7-19](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-11. PLL1 Control Register (PLLCTL) [Hex Address: 029A 0100]

Table 7-19. PLL1 Control Register (PLLCTL) Field Descriptions

Bit	Field	Value	Description
31:8	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
7	Reserved		Reserved. Writes to this register must keep this bit as 0.
6	Reserved		Reserved. The reserved bit location is always read as 1. A value written to this field has no effect.
5:4	Reserved		Reserved. Writes to this register must keep this bit as 0.
3	PLLRST	0 1	PLL reset bit PLL reset is released PLL reset is asserted
2	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	PLLPWRDN	0 1	PLL power-down mode select bit PLL is operational PLL is placed in power-down state, i.e., all analog circuitry in the PLL is turned-off
0	PLEN	0 1	PLL enable bit Bypass mode. Divider PREDIV and PLL are bypassed. All the system clocks (SYSCLKn) are divided down directly from input reference clock. PLL mode. Divider PREDIV and PLL are not bypassed. PLL output path is enabled. All the system clocks (SYSCLKn) are divided down from PLL output.

7.7.3.2 PLL Multiplier Control Register

The PLL multiplier control register (PLLM) is shown in [Figure 7-12](#) and described in [Table 7-20](#). The PLLM register defines the input reference clock frequency multiplier in conjunction with the PLL divider ratio bits (RATIO) in the PLL controller pre-divider register (PREDIV).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-12. PLL Multiplier Control Register (PLLM) [Hex Address: 029A 0110]

Table 7-20. PLL Multiplier Control Register (PLLM) Field Descriptions

Bit	Field	Value	Description
31:5	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
4:0	PLLM	0h Eh 13h 18h 1Dh 1Fh	PLL multiplier bits. Defines the frequency multiplier of the input reference clock in conjunction with the PLL divider ratio bits (RATIO) in PREDIV. x1 multiplier rate x15 multiplier rate x20 multiplier rate x25 multiplier rate x30 multiplier rate x32 multiplier rate

7.7.3.3 PLL Pre-Divider Control Register

The PLL pre-divider control register (PREDIV) is shown in [Figure 7-13](#) and described in [Table 7-21](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-13. PLL Pre-Divider Control Register (PREDIV) [Hex Address: 029A 0114]

Table 7-21. PLL Pre-Divider Control Register (PREDIV) Field Descriptions

Bit	Field	Value	Description
31:16	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
15	PREDEN	0 1	Pre-divider enable bit. Pre-divider is disabled. No clock output. Pre-divider is enabled.
14:5	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
4:0	RATIO	0-1Fh 0 1h 2h 3h-1Fh	Divider ratio bits. ÷1. Divide frequency by 1. ÷2. Divide frequency by 2. ÷3. Divide frequency by 3. Reserved, do not use.

7.7.3.4 PLL Controller Divider 4 Register

The PLL controller divider 4 register (PLLDIV4) is shown in [Figure 7-14](#) and described in [Table 7-22](#).

Besides being used as the EMIFA internal clock, SYSCLK4 is also used in other parts of the system. Disabling this clock will cause unpredictable system behavior. Therefore, the PLLDIV4 register should never be used to disable SYSCLK4.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Bit	Field	Value	Description
31:16	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
15	D5EN	0 1	Divider 5 enable bit. 0 Divider 5 is disabled. No clock output. 1 Divider 5 is enabled.
14:5	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
4:0	RATIO	0-1Fh 0 1h 2h 3h 4h-7h 8h-1Fh	Divider ratio bits. 0 ÷1. Divide frequency by 1. 1h ÷2. Divide frequency by 2. 2h ÷3. Divide frequency by 3. 3h ÷4. Divide frequency by 4. 4h-7h ÷5 to ÷8. Divide frequency by 5 to divide frequency by 8. 8h-1Fh Reserved, do not use.

7.7.3.6 PLL Controller Command Register

The PLL controller command register (PLLCMD) contains the command bit for GO operation. PLLCMD is shown in [Figure 7-16](#) and described in [Table 7-24](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-16. PLL Controller Command Register (PLLCMD) [Hex Address: 029A 0138]

Table 7-24. PLL Controller Command Register (PLLCMD) Field Descriptions

Bit	Field	Value	Description
31:2	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GOSET	0	GO operation command for SYSCLK rate change and phase alignment. Before setting this bit to 1 to initiate a GO operation, check the GOSTAT bit in the PLLSTAT register to ensure all previous GO operations have completed.
		0	No effect. Write of 0 clears bit to 0.
		1	Initiates GO operation. Write of 1 initiates GO operation. Once set, GOSET remains set but further writes of 1 can initiate the GO operation.

7.7.3.7 PLL Controller Status Register

The PLL controller status register (PLLSTAT) shows the PLL controller status. PLLSTAT is shown in [Figure 7-17](#) and described in [Table 7-25](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-17. PLL Controller Status Register (PLLSTAT) [Hex Address: 029A 013C]

Table 7-25. PLL Controller Status Register (PLLSTAT) Field Descriptions

Bit	Field	Value	Description
31:1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GOSTAT	0	GO operation is not in progress. SYSCLK divide ratios are not being changed.
		1	GO operation is in progress. SYSCLK divide ratios are being changed.

7.7.3.8 PLL Controller Clock Align Control Register

The PLL controller clock align control register (ALNCTL) is shown in [Figure 7-18](#) and described in [Table 7-26](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-18. PLL Controller Clock Align Control Register (ALNCTL) [Hex Address: 029A 0140]

Table 7-26. PLL Controller Clock Align Control Register (ALNCTL) Field Descriptions

Bit	Field	Value	Description
31:5	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
4:3	ALNn	0	Do not align SYSCLKn to other SYSCLKs during GO operation. If SYSn in DCHANGE is set to 1, SYSCLKn switches to the new ratio immediately after the GOSET bit in PLLCMD is set.
		1	Align SYSCLKn to other SYSCLKs selected in ALNCTL when the GOSET bit in PLLCMD is set. The SYSCLKn ratio is set to the ratio programmed in the RATIO bit in PLLDIVn.
2:0	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.

7.7.3.9 PLLDIV Ratio Change Status Register

Whenever a different ratio is written to the PLLDIV n registers, the PLLCTRL flags the change in the PLLDIV ratio change status registers (DCHANGE). During the GO operation, the PLL controller will only change the divide ratio of the SYSCLKs with the bit set in DCHANGE. Note that changed clocks will be automatically aligned to other clocks. The PLLDIV divider ratio change status register is shown in Figure 7-19 and described in Table 7-27.

LEGEND: R/W = Read/Write; R = Read only; - n = value after reset

Figure 7-19. PLLDIV Divider Ratio Change Status Register (DCHANGE) [Hex Address: 029A 0144]

Table 7-27. PLLDIV Divider Ratio Change Status Register (DCHANGE) Field Descriptions

Bit	Field	Value	Description
31:5	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
4	SYS5	0	Identifies when the SYSCLK5 divide ratio has been modified. SYSCLK5 ratio has not been modified. When GOSET is set, SYSCLK5 will not be affected.
		1	SYSCLK5 ratio has been modified. When GOSET is set, SYSCLK5 will change to the new ratio.
3	SYS4	0	Identifies when the SYSCLK4 divide ratio has been modified. SYSCLK4 ratio has not been modified. When GOSET is set, SYSCLK4 will not be affected.
		1	SYSCLK4 ratio has been modified. When GOSET is set, SYSCLK4 will change to the new ratio.
2:0	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.

7.7.3.10 SYSCLK Status Register

The SYSCLK status register (SYSTAT) shows the status of the system clocks (SYSCLK n). SYSTAT is shown in Figure 7-20 and described in Table 7-28.

LEGEND: R = Read only; -n = value after reset

Figure 7-20. SYSCLK Status Register (SYSTAT) [Hex Address: 029A 0150]

Table 7-28. SYSCLK Status Register (SYSTAT) Field Descriptions

Bit	Field	Value	Description
31:4	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
4:1	SYS n ON	0	SYSCLK n on status.
		0	SYSCLK n is gated.
		1	SYSCLK n is on.
0	Reserved	1	Reserved. The reserved bit location is always read as 1. A value written to this field has no effect.

7.7.4 PLL1 Controller Input and Output Clock Electrical Data/Timing

Table 7-29. Timing Requirements for CLKIN1 Devices^{(1) (2) (3)}

(see [Figure 7-21](#))

NO.			-720 -850 A-1000/1000		UNIT
			PLL MODES x1 (Bypass), x15, x20, x25, x30, x32		
			MIN	MAX	
1	$t_{c(CLKIN1)}$	Cycle time, CLKIN1 ⁽⁴⁾	15	30.3	ns
2	$t_{w(CLKIN1H)}$	Pulse duration, CLKIN1 high	0.4C		ns
3	$t_{w(CLKIN1L)}$	Pulse duration, CLKIN1 low	0.4C		ns
4	$t_t(CLKIN1)$	Transition time, CLKIN1			1.2
5	$t_j(CLKIN1)$	Period jitter (peak-to-peak), CLKIN1			100

- (1) The reference points for the rise and fall transitions are measured at 3.3 V V_{IL} MAX and V_{IH} MIN.
- (2) For more details on the PLL multiplier factors (x1 [BYPASS], x 15, x20, x25, x30, x32), see [Section 7.7.1.2, PLL1 Controller Operating Modes](#).
- (3) C = **CLKIN1** cycle time in ns. For example, when CLKIN1 frequency is 50 MHz, use C = 20 ns.
- (4) The PLL1 multiplier factors (x1 [BYPASS], x 15, x20, x25, x30, x32) further limit the MIN and MAX values for $t_{c(CLKIN1)}$. For more detailed information on these limitations, see [Section 7.7.1.1, Internal Clocks and Maximum Operating Frequencies](#).

4	$t_t(CKO3)$			1

- (1) The reference points for the rise and fall transitions are measured at 3.3 V V_{OL} MAX and V_{OH} MIN.
- (2) P = 1/CPU clock frequency in nanoseconds (ns)

Figure 7-22. SYSCLK4 Timing

7.8 PLL2 and PLL2 Controller

The secondary PLL controller generates interface clocks for the Ethernet media access controller (EMAC) and the DDR2 memory controller.

As shown in [Figure 7-23](#), the PLL2 controller features a PLL multiplier controller and one divider (D1). The PLL multiplier is fixed to a x20 multiplier rate and the divider D1 can be programmed to a ÷2 or ÷5 mode.

PLL2 power is supplied externally via the PLL2 power supply (PLLV2). An external PLL filter circuit must be added to PLLV2 as shown in [Figure 7-23](#). The 1.8-V supply for the EMI filter must be from the same 1.8-V power plane supplying the I/O power-supply pin, DV_{DD18}. TI requires EMI filter manufacturer Murata, part number NFM18CC222R1C3 or NFM18CC223R1C3.

All PLL external components (C161, C162, and the EMI Filter) should be placed as close to the C64x+ DSP device as possible. For the best performance, TI requires that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (C161, C162, and the EMI Filter). The minimum CLKIN2 rise and fall times should also be observed. For the input clock timing requirements, see [Section 7.8.4, PLL2 Controller Input Clock Electrical Data/Timing](#).

CAUTION

The PLL controller module as described in the *TMS320C645x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number [SPRUE56](#)) includes a superset of features, some of which are not supported on the C6454 DSP. The following sections describe the features that are supported; it should be assumed that any feature not included in these sections is not supported by the C6454 DSP.

Figure 7-23. PLL2 Block Diagram

7.8.1 PLL2 Controller Device-Specific Information

7.8.1.1 Internal Clocks and Maximum Operating Frequencies

As shown in [Figure 7-23](#), the output of PLL2, PLLOUT, is divided by 2 and directly fed to the DDR2 memory controller. This clock is used by the DDR2 memory controller to generate DDR2CLKOUT and DDR2CLKOUT. Note that, internally, the data bus interface of the DDR2 memory controller is clocked by SYSCLK2 of the PLL1 controller.

The PLLOUT/2 clock is also fed back into the PLL2 controller where it becomes SYSREFCLK. Divider D1 of the PLL2 controller generates SYSCLK1 for the Ethernet media access controller (EMAC). The EMAC uses SYSCLK1 to generate the necessary clock for each of its interfaces. Divider D1 should be programmed to ÷2 mode [default] when using the Gigabit Media Independent Interface (GMII) mode and to ÷5 mode when using the Reduce Gigabit Media Independent Interface (RGMII). Divider D1 is software programmable and, if necessary, must be programmed after device reset to ÷5 when the RGMII mode of the EMAC is used. Note that, internally, the data bus interface of the EMAC is clocked by SYSCLK3 of the PLL2 controller.

Note that there is a minimum and maximum operating frequency for PLLREF, PLLOUT, and SYSCLK1. The clock generator must not be configured to exceed any of these constraints. For the PLL clocks input and output frequency ranges, see [Table 7-31](#). Also, when EMAC is enabled with RGMII or GMII, CLKIN2 must be 25 MHz.

Table 7-31. PLL2 Clock Frequency Ranges

CLOCK SIGNAL	MIN	MAX	UNIT
PLLREF (PLLEN = 1)	12.5	26.7	MHz
PLLOUT	250	533	MHz
SYSCLK1 ⁽¹⁾	50	125	MHz

(1) SYSCLK1 restriction applies only when the EMAC is enabled and the RGMII or GMII modes are used. SYSCLK1 must be programmed to 125 MHz when the GMII mode is used and to 50 MHz when the RGMII mode is used.

7.8.1.2 PLL2 Controller Operating Modes

Unlike the PLL1 controller which can operate in bypass and a PLL mode, the PLL2 controller only operates in PLL mode. In this mode, SYSREFCLK is generated outside the PLL2 controller by dividing the output of PLL2 by two.

The PLL2 controller is affected by power-on reset and warm reset. During these resets the PLL2 controller registers get reset to their default values. The internal clocks of the PLL2 controller are also affected as described in [Section 7.6, Reset Controller](#).

PLL2 is only unlocked during the power-up sequence (see [Section 7.6, Reset Controller](#)) and is locked by the time the RESETSTAT pin goes high. It does not lose lock during any of the other resets.

7.8.2 PLL2 Controller Memory Map

The memory map of the PLL2 controller is shown in [Table 7-32](#). Note that only registers documented here are accessible on the TMS320C6454 device. Other addresses in the PLL2 controller memory map should not be modified.

Table 7-32. PLL2 Controller Registers

HEX ADDRESS RANGE	ACRONYM	DESCRIPTION
029C 0000 - 029C 0114	-	Reserved
029C 0118	PLLDIV1	PLL Controller Divider 1 Register
029C 011C - 029C 0134	-	Reserved
029C 0138	PLLCMD	PLL Controller Command Register
029C 013C	PLLSTAT	PLL Controller Status Register
029C 0140	ALNCTL	PLL Controller Clock Align Control Register
029C 0144	DCHANGE	PLLDIV Ratio Change Status Register
029C 0148	-	Reserved

029C 0154 - 029C 0190	-	Reserved
029C 0194 - 029C 01FF	-	Reserved
029C 0200 - 029C FFFF	-	Reserved

7.8.3 PLL2 Controller Register Descriptions

This section provides a description of the PLL2 controller registers. For details on the operation of the PLL controller module, see the *TMS320C645x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number [SPRUE56](#)).

NOTE: The PLL2 controller registers can only be accessed using the CPU or the emulator.

Not all of the registers documented in the *TMS320C645x DSP Software-Programmable Phase-Locked Loop (PLL) Controller User's Guide* (literature number [SPRUE56](#)) are supported on the TMS320C6454 device. Only those registers documented in this section are supported. Furthermore, only the bits within the registers described here are supported. You should not write to any reserved memory location or change the value of reserved bits.

7.8.3.1 PLL Controller Divider 1 Register

The PLL controller divider 1 register (PLLDIV1) is shown in [Figure 7-24](#) and described in [Table 7-33](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-24. PLL Controller Divider 1 Register (PLLDIV1) [Hex Address: 029C 0118]

Table 7-33. PLL Controller Divider 1 Register (PLLDIV1) Field Descriptions

Bit	Field	Value	Description
31:16	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
15	D1EN	0	Divider D1 enable bit. Divider D1 is disabled. No clock output.
		1	Divider D1 is enabled.
14:5	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
4:0	RATIO	0-1Fh	Divider ratio bits.
		1h	÷2. Divide frequency by 2.
		4h	÷5. Divide frequency by 5.
		Others	Reserved

7.8.3.2 PLL Controller Command Register

The PLL controller command register (PLLCMD) contains the command bit for GO operation. PLLCMD is shown in [Figure 7-25](#) and described in [Table 7-34](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-25. PLL Controller Command Register (PLLCMD) [Hex Address: 029C 0138]

Table 7-34. PLL Controller Command Register (PLLCMD) Field Descriptions

Bit	Field	Value	Description
31:2	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
1	Reserved		Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GOSET	0 1	GO operation command for SYSCLK rate change and phase alignment. Before setting this bit to 1 to initiate a GO operation, check the GOSTAT bit in the PLLSTAT register to ensure all previous GO operations have completed. 0 No effect. Write of 0 clears bit to 0. 1 Initiates GO operation. Write of 1 initiates GO operation. Once set, GOSET remains set but further writes of 1 can initiate the GO operation.

7.8.3.3 PLL Controller Status Register

The PLL controller status register (PLLSTAT) shows the PLL controller status. PLLSTAT is shown in Figure 7-26 and described in Table 7-35.

31	Reserved	16
R-0		
15	Reserved	1 0
		GOSTAT
R-0		R-0

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-26. PLL Controller Status Register (PLLSTAT) [Hex Address: 029C 013C]

Table 7-35. PLL Controller Status Register (PLLSTAT) Field Descriptions

Bit	Field	Value	Description
31:1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	GOSTAT	0	Go operation is not in progress. SYSCLK divide ratios are not being changed.
		1	Go operation is in progress. SYSCLK divide ratios are being changed.

7.8.3.4 PLL Controller Clock Align Control Register

The PLL controller clock align control register (ALNCTL) is shown in Figure 7-27 and described in Table 7-36.

31	Reserved	16
R-0		
15	Reserved	1 0
		ALN1
R-0		R/W-1

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-27. PLL Controller Clock Align Control Register (ALNCTL) [Hex Address: 029C 0140]

Table 7-36. PLL Controller Clock Align Control Register (ALNCTL) Field Descriptions

Bit	Field	Value	Description
31:1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	ALN1	0	Do not align SYSCLK1 during GO operation. If SYS1 in DCHANGE is set to 1, SYSCLK1 switches to the new ratio immediately after the GOSET bit in PLLCMD is set.
		1	Align SYSCLK1 when the GOSET bit in PLLCMD is set. The SYSCLK1 ratio is set to the ratio programmed in the RATIO bit in PLLDIV1.

7.8.3.5 PLLDIV Ratio Change Status Register

Whenever a different ratio is written to the PLLDIV1 register, the PLLCTRL flags the change in the DCHANGE status register. During the GO operation, the PLL controller will only change the divide ratio SYSCLK1 if SYS1 in DCHANGE is 1. The PLLDIV divider ratio change status register is shown in Figure 7-28 and described in Table 7-37.

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-28. PLLDIV Divider Ratio Change Status Register (DCHANGE) [Hex Address: 029C 0144]

Table 7-37. PLLDIV Divider Ratio Change Status Register (DCHANGE) Field Descriptions

Bit	Field	Value	Description
31:1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	SYS1	0	SYSCLK1 divide ratio has been modified. SYSCLK1 ratio will be modified during GO operation.
		0	SYSCLK1 ratio has not been modified. When GOSET is set, SYSCLK1 will not be affected.
		1	SYSCLK1 ratio has been modified. When GOSET is set, SYSCLK1 will change to the new ratio.

7.8.3.6 SYSCLK Status Register

The SYSCLK status register (SYSTAT) shows the status of the system clock (SYSCLK1). SYSTAT is shown in [Figure 7-29](#) and described in [Table 7-38](#).

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

Figure 7-29. SYSCLK Status Register [Hex Address: 029C 0150]

Table 7-38. SYSCLK Status Register Field Descriptions

Bit	Field	Value	Description
31:1	Reserved	0	Reserved. The reserved bit location is always read as 0. A value written to this field has no effect.
0	SYS1ON	0	SYSCLK1 on status. SYSCLK1 is gated.
		1	SYSCLK1 is on.

7.8.4 PLL2 Controller Input Clock Electrical Data/Timing

Table 7-39. Timing Requirements for CLKIN2^{(1) (2) (3)}

(see Figure 7-30)

NO.			-720 -850 A-1000/-1000		UNIT
			MIN	MAX	
1	$t_{c(CLKIN2)}$	Cycle time, CLKIN2	37.5	80	ns
2	$t_{w(CLKIN2H)}$	Pulse duration, CLKIN2 high	0.4C		ns
3	$t_{w(CLKIN2L)}$	Pulse duration, CLKIN2 low	0.4C		ns
4	$t_{t(CLKIN2)}$	Transition time, CLKIN2		1.2	ns
5	$t_{j(CLKIN2)}$	Period jitter (peak-to-peak), CLKIN2		100	ps

- (1) The reference points for the rise and fall transitions are measured at 3.3 V V_{IL} MAX and V_{IH} MIN.
 (2) C = CLKIN2 cycle time in ns. For example, when CLKIN2 frequency is 25 MHz, use C = 40 ns.
 (3) If EMAC is enabled with RGMII or GMII, CLKIN2 cycle time must be 40 ns (25 MHz).

Figure 7-30. CLKIN2 Timing

7.9 DDR2 Memory Controller

The 32-bit, 533-MHz (data rate) DDR2 Memory Controller bus of the C6454 device is used to interface to JESD79-2A standard-compliant DDR2 SDRAM devices. The DDR2 external bus only interfaces to DDR2 SDRAM devices (up to 512 MB); it does not share the bus with any other types of peripherals. The decoupling of DDR2 memories from other devices both simplifies board design and provides I/O concurrency from a second external memory interface, EMIFA.

The internal data bus clock frequency and DDR2 bus clock frequency directly affect the maximum throughput of the DDR2 bus. The clock frequency of the DDR2 bus is equal to the CLKIN2 frequency multiplied by 10. The internal data bus clock frequency of the DDR2 Memory Controller is fixed at a divide-by-three ratio of the CPU frequency. The maximum DDR2 throughput is determined by the smaller of the two bus frequencies. For example, if the internal data bus frequency is 333 MHz (CPU frequency is 1 GHz) and the DDR2 bus frequency is 267 MHz (CLKIN2 frequency is 26.7 MHz), the maximum data rate achievable by the DDR2 memory controller is 2.1 Gbytes/sec. The DDR2 bus is designed to sustain a maximum throughput of up to 2.1 Gbytes/sec at a 533-MHz data rate (267-MHz clock rate), as long as data requests are pending in the DDR2 Memory Controller.

7.9.1 DDR2 Memory Controller Device-Specific Information

The approach to specifying interface timing for the DDR2 memory bus is different than on other interfaces such as EMIF, HPI, and McBSP. For these other interfaces the device timing was specified in terms of data manual specifications and I/O buffer information specification (IBIS) models.

For the C6454 DDR2 memory bus, the approach is to specify compatible DDR2 devices and provide the printed circuit board (PCB) solution and guidelines directly to the user. Texas Instruments (TI) has performed the simulation and system characterization to ensure all DDR2 interface timings in this solution are met. The complete DDR2 system solution is documented in the *Implementing DDR2 PCB Layout on the TMS320C6455/C6454* application report (literature number [SPRAAA7](#)).

TI only supports designs that follow the board design guidelines outlined in the SPRAAA7 application report.

The DDR2 Memory Controller pins must be enabled by setting the DDR2_EN configuration pin (ABA0) high during device reset. For more details, see [Section 3.1, Device Configuration at Device Reset](#).

The ODT[1:0] pins of the memory controller must be left unconnected. The ODT pins on the DDR2 memory device(s) must be connected to ground.

The DDR2 memory controller on the C6454 device supports the following memory topologies:

- A 32-bit wide configuration interfacing to two 16-bit wide DDR2 SDRAM devices.
- A 16-bit wide configuration interfacing to a single 16-bit wide DDR2 SDRAM device.

A race condition may exist when certain masters write data to the DDR2 memory controller. For example, if master A passes a software message via a buffer in external memory and does not wait for indication that the write completes, when master B attempts to read the software message, then the master B read may bypass the master A write and, thus, master B may read stale data and, therefore, receive an incorrect message.

Some master peripherals (e.g., EDMA3 transfer controllers) will always wait for the write to complete before signaling an interrupt to the system, thus avoiding this race condition. For masters that do not have hardware guarantee of write-read ordering, it may be necessary to guarantee data ordering via software.

If master A does not wait for indication that a write is complete, it must perform the following workaround:

1. Perform the required write.
2. Perform a dummy write to the DDR2 memory controller module ID and revision register.
3. Perform a dummy read to the DDR2 memory controller module ID and revision register.
4. Indicate to master B that the data is ready to be read after completion of the read in step 3. The completion of the read in step 3 ensures that the previous write was done.

7.9.2 DDR2 Memory Controller Peripheral Register Descriptions

Table 7-40. DDR2 Memory Controller Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME
7800 0000	MIDR	DDR2 Memory Controller Module and Revision Register

7.9.3 DDR2 Memory Controller Electrical Data/Timing

The *Implementing DDR2 PCB Layout on the TMS320C6455/C6454* application report (literature number [SPRAAA7](#)) specifies a complete DDR2 interface solution for the C6454 device as well as a list of compatible DDR2 devices. TI has performed the simulation and system characterization to ensure all DDR2 interface timings in this solution are met; therefore, no electrical data/timing information is supplied here for this interface.

TI *only* supports designs that follow the board design guidelines outlined in the SPRAAA7 application report.

7.10 External Memory Interface A (EMIFA)

The EMIFA can interface to a variety of external devices or ASICs, including:

- Pipelined and flow-through Synchronous-Burst SRAM (SBSRAM)
- ZBT (Zero Bus Turnaround) SRAM and Late Write SRAM
- Synchronous FIFOs
- Asynchronous memory, including SRAM, ROM, and Flash

7.10.1 EMIFA Device-Specific Information

Timing analysis must be done to verify all AC timings are met. TI recommends utilizing I/O buffer information specification (IBIS) to analyze all AC timings.

To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number [SPRA839](#)).

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (for the EMIF output signals, see [Table 2-3, Terminal Functions](#)).

A race condition may exist when certain masters write data to the EMIFA. For example, if master A passes a software message via a buffer in external memory and does not wait for indication that the write completes, when master B attempts to read the software message, then the master B read may bypass the master A write and, thus, master B may read stale data and, therefore, receive an incorrect message.

Some master peripherals (e.g., EDMA3 transfer controllers) will always wait for the write to complete before signaling an interrupt to the system, thus avoiding this race condition. For masters that do not have hardware guarantee of write-read ordering, it may be necessary to guarantee data ordering via software.

If master A does not wait for indication that a write is complete, it must perform the following workaround:

1. Perform the required write.
2. Perform a dummy write to the EMIFA module ID and revision register.
3. Perform a dummy read to the EMIFA module ID and revision register.
4. Indicate to master B that the data is ready to be read after completion of the read in step 3. The completion of the read in step 3 ensures that the previous write was done.

7.10.2 EMIFA Peripheral Register Descriptions

Table 7-41. EMIFA Registers

7.10.3 EMIFA Electrical Data/Timing

Table 7-42. Timing Requirements for AECLKIN for EMIFA^{(1) (2)}

(see Figure 7-31)

NO.			-720 -850 A-1000/-1000		UNIT
			MIN	MAX	
1	$t_{c(EKI)}$	Cycle time, AECLKIN	6 ⁽³⁾	40	ns
2	$t_{w(EKIH)}$	Pulse duration, AECLKIN high	2.7		ns
3	$t_{w(EKIL)}$	Pulse duration, AECLKIN low	2.7		ns
4	$t_{t(EKI)}$	Transition time, AECLKIN		2	ns
5	$t_{J(EKI)}$	Period Jitter, AECLKIN		0.02E ⁽⁴⁾	ns

- (1) The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.
- (2) E = the EMIF input clock (AECLKIN or SYSCLK4) period in ns for EMIFA.
- (3) Minimum AECLKIN cycle times *must* be met, even when AECLKIN is generated by an internal clock source. Minimum AECLKIN times are based on internal logic speed; the maximum useable speed of the EMIF may be lower due to AC timing requirements.
- (4) This timing only applies when AECLKIN is used for EMIFA.

Figure 7-31. AECLKIN Timing for EMIFA

Table 7-43. Switching Characteristics Over Recommended Operating Conditions for AECLKOUT for the EMIFA Module^{(1) (2) (3)}

(see Figure 7-32)

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
1	$t_{c(EKO)}$ Cycle time, AECLKOUT	E - 0.7	E + 0.7	ns
2	$t_{w(EKOH)}$ Pulse duration, AECLKOUT high	EH - 0.7	EH + 0.7	ns
3	$t_{w(EKOL)}$ Pulse duration, AECLKOUT low	EL - 0.7	EL + 0.7	ns
4	$t_{t(EKO)}$ Transition time, AECLKOUT		1	ns
5	$t_{d(EKIH-EKOH)}$ Delay time, AECLKIN high to AECLKOUT high	1	8	ns
6	$t_{d(EKIL-EKOL)}$ Delay time, AECLKIN low to AECLKOUT low	1	8	ns

- (1) E = the EMIF input clock (AECLKIN or SYSCLK4) period in ns for EMIFA.
- (2) The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.
- (3) EH is the high period of E (EMIF input clock period) in ns and EL is the low period of E (EMIF input clock period) in ns for EMIFA.

Figure 7-32. AECLKOUT Timing for the EMIFA Module

7.10.3.1 Asynchronous Memory Timing

Table 7-44. Timing Requirements for Asynchronous Memory Cycles for EMIFA Module^{(1) (2) (3)}

(see Figure 7-33 and Figure 7-34)

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
3	$t_{su(EDV-A\ OEH)}$ Setup time, AEDx valid before \overline{AAOE} high	6.5		ns
4	$t_{h(AOEH-EDV)}$ Hold time, AEDx valid after \overline{AAOE} high	0		ns
5	$t_{su(ARDY-EKOH)}$ Setup time, AARDY valid before AECLKOUT low	1		ns
6	$t_{h(EKOH-ARDY)}$ Hold time, AARDY valid after AECLKOUT low	2		ns
7	$t_{w(ARDY)}$ Pulse width, AARDY assertion and deassertion	2E + 5		ns
8	$t_{d(ARDY-HOLD)}$ Delay time, from AARDY sampled deasserted on AECLKOUT falling to beginning of programmed hold period		4E	ns
9	$t_{su(ARDY-HOLD)}$ Setup time, before end of programmed strobe period by which AARDY should be asserted in order to insert extended strobe wait states.	2E		ns

- (1) E = AECLKOUT period in ns for EMIFA
- (2) To ensure data setup time, simply program the strobe width wide enough.
- (3) AARDY is internally synchronized. To use AARDY as an asynchronous input, the pulse width of the AARDY signal should be at least 2E to ensure setup and hold time is met.

Table 7-45. Switching Characteristics Over Recommended Operating Conditions for Asynchronous Memory Cycles for EMIFA Module^{(1) (2) (3)}

(see Figure 7-33 and Figure 7-34)

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
1	$t_{osu}(\text{SELV-AOEL})$ Output setup time, select signals valid to $\overline{\text{AAOE}}$ low	RS * E - 1.5		ns
2	$t_{oh}(\text{AOEH-SELIV})$ Output hold time, $\overline{\text{AAOE}}$ high to select signals invalid	RS * E - 1.9		ns
10	$t_d(\text{EKOH-AOEV})$ Delay time, AECLKOUT high to $\overline{\text{AAOE}}$ valid	1	7	ns
11	$t_{osu}(\text{SELV-AWEL})$ Output setup time, select signals valid to $\overline{\text{AAWE}}$ low	WS * E - 1.7		ns
12	$t_{oh}(\text{AWEH-SELIV})$ Output hold time, $\overline{\text{AAWE}}$ high to select signals invalid	WH * E - 1.8		ns
13	$t_d(\text{EKOH-AWEV})$ Delay time, AECLKOUT high to $\overline{\text{AAWE}}$ valid	1.3	7.1	ns

- (1) E = AECLKOUT period in ns for EMIFA
- (2) RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIFA CE Configuration registers (CEnCFG).
- (3) Select signals for EMIFA include: $\overline{\text{ACEx}}$, $\overline{\text{ABE}}[7:0]$, $\overline{\text{AEA}}[19:0]$, $\overline{\text{ABA}}[1:0]$; and for EMIFA writes, also include $\overline{\text{AR}}/\overline{\text{W}}$, $\overline{\text{AED}}[63:0]$.

- A $\overline{\text{AAOE}}/\overline{\text{ASOE}}$ and $\overline{\text{AAWE}}/\overline{\text{ASWE}}$ operate as $\overline{\text{AAOE}}$ (identified under select signals) and $\overline{\text{AAWE}}$, respectively, during asynchronous memory accesses.
- B Polarity of the AARDY signal is programmable through the AP field of the EMIFA Async Wait Cycle Configuration register (AWCC).

Figure 7-33. Asynchronous Memory Read Timing for EMIFA

- A AAOE/ASOE and AAWE/ASWE operate as AAOE (identified under select signals) and AAWE, respectively, during asynchronous memory accesses.
- B Polarity of the AARDY signal is programmable through the AP field of the EMIFA Async Wait Cycle Configuration register (AWCC).

Figure 7-34. Asynchronous Memory Write Timing for EMIFA

3	$t_d(EKOH-BEIV)$	Delay time, AECLKOUT high to \overline{ABEX} invalid	1.3		ns
4	$t_d(EKOH-EAV)$	Delay time, AECLKOUT high to AEAx valid		4.9	ns
5	$t_d(EKOH-EAIV)$	Delay time, AECLKOUT high to AEAx invalid	1.3		ns
8	$t_d(EKOH-ADSV)$	Delay time, AECLKOUT high to $\overline{ASADS}/\overline{ASRE}$ valid	1.3	4.9	ns
9	$t_d(EKOH-OEV)$	Delay time, AECLKOUT high to \overline{ASOE} valid	1.3	4.9	ns
10	$t_d(EKOH-EDV)$	Delay time, AECLKOUT high to AEDx valid		4.9	ns
11	$t_d(EKOH-EDIV)$	Delay time, AECLKOUT high to AEDx invalid	1.3		ns
12	$t_d(EKOH-WEV)$	Delay time, AECLKOUT high to \overline{ASWE} valid	1.3	4.9	ns

(1) The following parameters are programmable via the EMIFA CE Configuration registers (CEnCFG):

- Read latency (R_LTNCY): 0-, 1-, 2-, or 3-cycle read latency
- Write latency (W_LTNCY): 0-, 1-, 2-, or 3-cycle write latency
- \overline{ACEX} assertion length (CE_EXT): For standard SBSRAM or ZBT SRAM interface, \overline{ACEX} goes inactive after the final command has been issued (CE_EXT = 0). For synchronous FIFO interface with glue, \overline{ACEX} is active when \overline{ASOE} is active (CE_EXT = 1).
- Function of $\overline{ASADS}/\overline{ASRE}$ (R_ENABLE): For standard SBSRAM or ZBT SRAM interface, $\overline{ASADS}/\overline{ASRE}$ acts as \overline{ASADS} with deselect cycles (R_ENABLE = 0). For FIFO interface, $\overline{ASADS}/\overline{ASRE}$ acts as \overline{ASRE} with NO deselect cycles (R_ENABLE = 1).

- A The following parameters are programmable via the EMIFA Chip Select n Configuration Register (CESECN):
- Read latency (R_LTNCY): 1-, 2-, or 3-cycle read latency
 - Write latency (W_LTNCY): 0-, 1-, 2-, or 3-cycle write latency
 - ACEx assertion length (CE_EXT): For standard SBSRAM or ZBT SRAM interface, ACEx goes inactive after the final command has been issued (CE_EXT = 0). For synchronous FIFO interface, ACEx is active when ASOE is active (CE_EXT = 1).
 - Function of ASADS/ASRE (R_ENABLE): For standard SBSRAM or ZBT SRAM interface, ASADS/ASRE acts as ASADS with deselect cycles (R_ENABLE = 0). For FIFO interface, ASADS/ASRE acts as SRE with NO deselect cycles (R_ENABLE = 1).
 - In this figure R_LTNCY = 2, CE_EXT = 0, R_ENABLE = 0, and SSEL = 1.
- B AAOE/ASOE, and AAWE/ASWE operate as ASOE, and ASWE, respectively, during programmable synchronous interface accesses.

Figure 7-36. Programmable Synchronous Interface Read Timing for EMIFA (With Read Latency = 2)^(A)

7.11 I2C Peripheral

The inter-integrated circuit (I2C) module provides an interface between a C64x+ DSP and other devices compliant with Philips Semiconductors Inter-IC bus (I2C bus™) specification version 2.1 and connected by way of an I2C bus. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the DSP through the I2C module.

7.11.1 I2C Device-Specific Information

The C6454 device includes an I2C peripheral module (I2C). NOTE: when using the I2C module, ensure there are external pullup resistors on the SDA and SCL pins.

The I2C modules on the C6454 device may be used by the DSP to control local peripherals ICs (DACs, ADCs, etc.) or may be used to communicate with other controllers in a system or to implement a user interface.

The I2C port supports:

- Compatible with Philips I2C Specification Revision 2.1 (January 2000)
- Fast Mode up to 400 Kbps (no fail-safe I/O buffers)
- Noise Filter to remove noise 50 ns or less
- 7- and 10-Bit Device Addressing Modes
- Multi-Master (Transmit/Receive) and Slave (Transmit/Receive) Functionality
- Events: DMA, Interrupt, or Polling
- Slew-Rate Limited Open-Drain Output Buffers

[Figure 7-41](#) is a block diagram of the I2C module.

Figure 7-41. I2C Module Block Diagram

7.11.2 I2C Peripheral Register Descriptions

Table 7-51. I2C Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME

7.11.3 I2C Electrical Data/Timing

Table 7-52. Timing Requirements for I2C Timings⁽¹⁾

(see Figure 7-42)

NO.			-720 -850 A-1000/-1000				UNIT
			STANDARD MODE		FAST MODE		
			MIN	MAX	MIN	MAX	
1	$t_{c(SCL)}$	Cycle time, SCL	10		2.5	μ s	
2	$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6	μ s	
3	$t_{h(SCLL-SDAL)}$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6	μ s	
4	$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3	μ s	
5	$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6	μ s	
6	$t_{su(SDAV-SDLH)}$	Setup time, SDA valid before SCL high	250		100 ⁽²⁾	ns	
7	$t_{h(SDA-SDLL)}$	Hold time, SDA valid after SCL low (For I ² C bus™ devices)	0 ⁽³⁾		0 ⁽³⁾ 0.9 ⁽⁴⁾	μ s	
8	$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3	μ s	
9	$t_{r(SDA)}$	Rise time, SDA		1000	20 + 0.1C _b ⁽⁵⁾	300 ns	
10	$t_{r(SCL)}$	Rise time, SCL		1000	20 + 0.1C _b ⁽⁵⁾	300 ns	
11	$t_{f(SDA)}$	Fall time, SDA		300	20 + 0.1C _b ⁽⁵⁾	300 ns	
12	$t_{f(SCL)}$	Fall time, SCL		300	20 + 0.1C _b ⁽⁵⁾	300 ns	
13	$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6	μ s	
14	$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0 50	ns	
15	C _b ⁽⁵⁾	Capacitive load for each bus line		400		400 pF	

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) A Fast-mode I²C-bus™ device can be used in a Standard-mode I²C-bus™ system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_r max + $t_{su(SDA-SCLH)} = 1000 + 250 = 1250$ ns (according to the Standard-mode I²C-Bus Specification) before the SCL line is released.
- (3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (4) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period [$t_{w(SCLL)}$] of the SCL signal.
- (5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

- (1) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.
 (2) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

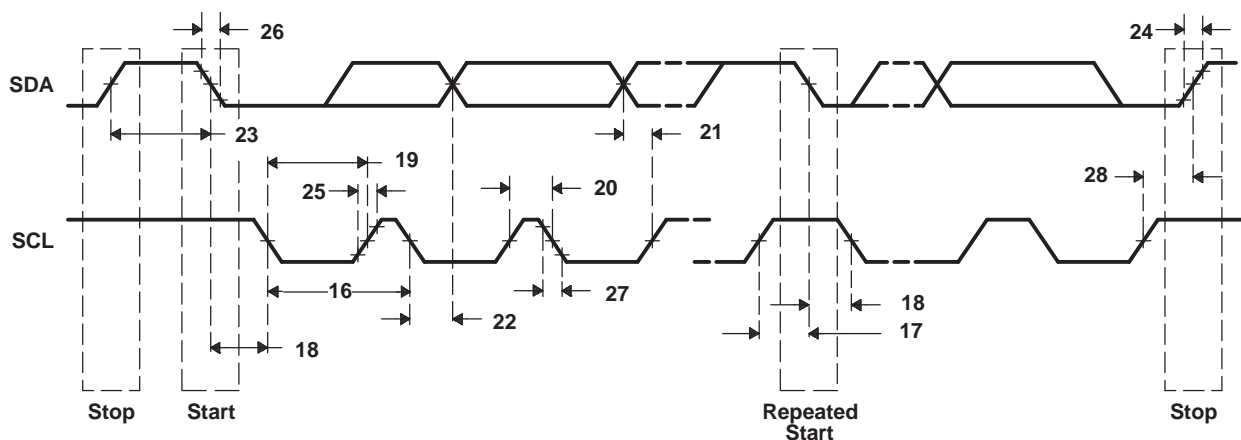

Figure 7-43. I2C Transmit Timings

7.12 Host-Port Interface (HPI) Peripheral

7.12.1 HPI Device-Specific Information

The C6454 device includes a user-configurable 16-bit or 32-bit Host-port interface (HPI16/HPI32). The AEA14 pin controls the HPI_WIDTH, allowing the user to configure the HPI as a 16-bit or 32-bit peripheral.

Software handshaking via the HRDY bit of the Host Port Control Register (HPIC) is not supported on the C6454 device.

An HPI boot is terminated using a DSP interrupt. The DSP interrupt is registered in bit 0 (channel 0) of the EDMA Event Register (ER). This event must be cleared by software before triggering transfers on DMA channel 0.

7.12.2 HPI Peripheral Register Descriptions

Table 7-54. HPI Control Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME	COMMENTS
0288 0000	-	Reserved	
0288 0004	PWREMU_MGMT	HPI power and emulation management register	The CPU has read/write access to the PWREMU_MGMT register; the Host does not have any access to this register.
0288 0008 - 0288 0024	-	Reserved	
0288 0028	-	Reserved	
0288 002C	-	Reserved	
0288 0030	HPIC	HPI control register	The Host and the CPU have read/write access to the HPIC register. ⁽¹⁾
0288 0034	HPIA (HPIAW) ⁽²⁾	HPI address register (Write)	The Host has read/write access to the HPIA registers. The CPU has only read access to the HPIA registers.
0288 0038	HPIA (HPIAR) ⁽²⁾	HPI address register (Read)	
0288 000C - 028B 007F	-	Reserved	
0288 0080 - 028B FFFF	-	Reserved	

- (1) The CPU can write 1 to the $\overline{\text{HINT}}$ bit to generate an interrupt to the host and it can write 1 to the DSPINT bit to clear/acknowledge an interrupt from the host.
- (2) There are two 32-bit HPIA registers: HPIAR for read operations and HPIAW for write operations. The HPI can be configured such that HPIAR and HPIAW act as a single 32-bit HPIA (single-HPIA mode) or as two separate 32-bit HPIAs (dual-HPIA mode) from the perspective of the host. The CPU can access HPIAW and HPIAR independently. For details about the HPIA registers and their modes, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).

7.12.3 HPI Electrical Data/Timing

Table 7-55. Timing Requirements for Host-Port Interface Cycles^{(1) (2)}

(see [Figure 7-44](#) through [Figure 7-51](#))

NO.			-720 -850 A-1000/-1000		UNIT
			MIN	MAX	
9	$t_{su}(HASL-HSTBL)$	Setup time, \overline{HAS} low before $\overline{HSTROBE}$ low	5		ns
10	$t_h(HSTBL-HASL)$	Hold time, \overline{HAS} low after $\overline{HSTROBE}$ low	2		ns
11	$t_{su}(SELV-HASL)$	Setup time, select signals ⁽³⁾ valid before \overline{HAS} low	5		ns
12	$t_h(HASL-SELV)$	Hold time, select signals ⁽³⁾ valid after \overline{HAS} low	5		ns
13	$t_w(HSTBL)$	Pulse duration, $\overline{HSTROBE}$ low	15		ns
14	$t_w(HSTBH)$	Pulse duration, $\overline{HSTROBE}$ high between consecutive accesses	2M		ns
15	$t_{su}(SELV-HSTBL)$	Setup time, select signals ⁽³⁾ valid before $\overline{HSTROBE}$ low	5		ns
16	$t_h(HSTBL-SELV)$	Hold time, select signals ⁽³⁾ valid after $\overline{HSTROBE}$ low	5		ns
17	$t_{su}(HDV-HSTBH)$	Setup time, host data valid before $\overline{HSTROBE}$ high	5		ns
18	$t_h(HSTBH-HDV)$	Hold time, host data valid after $\overline{HSTROBE}$ high	1		ns
37	$t_{su}(HCSL-HSTBL)$	Setup time, \overline{HCS} low before $\overline{HSTROBE}$ low	0		ns
38	$t_h(HRDYL-HSTBL)$	Hold time, $\overline{HSTROBE}$ low after \overline{HRDY} low. $\overline{HSTROBE}$ should not be inactivated until \overline{HRDY} is active (low); otherwise, HPI writes will not complete properly.	1.1		ns

(1) $\overline{HSTROBE}$ refers to the following logical operation on \overline{HCS} , $\overline{HDS1}$, and $\overline{HDS2}$: $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$.

(2) $M = \text{SYSCLK3 period} = 6/\text{CPU clock frequency in ns}$. For example, when running parts at 1000 MHz, use $M = 6$ ns.

(3) Select signals include: $\text{HCNTL}[1:0]$ and $\overline{HR/W}$. For HPI16 mode only, select signals also include \overline{HHWIL} .

Table 7-56. Switching Characteristics for Host-Port Interface Cycles^{(1) (2)}

(see Figure 7-44 through Figure 7-51)

NO.	PARAMETER		-720 -850 A-1000/1000		UNIT	
			MIN	MAX		
1	$t_{d(HSTBL-HDV)}$	Delay time, $\overline{HSTROBE}$ low to DSP data valid	Case 1. HPIC or HPIA read	5	15	ns
			Case 2. HPID read with no auto-increment ⁽³⁾	9 * M + 20		
			Case 3. HPID read with auto-increment and read FIFO initially empty ⁽³⁾	9 * M + 20		
			Case 4. HPID read with auto-increment and data previously prefetched into the read FIFO	5	15	
2	$t_{dis(HSTBH-HDV)}$	Disable time, HD high-impedance from $\overline{HSTROBE}$ high	1	4	ns	
3	$t_{en(HSTBL-HD)}$	Enable time, HD driven from $\overline{HSTROBE}$ low	3	15	ns	
4	$t_{d(HSTBL-HRDYH)}$	Delay time, $\overline{HSTROBE}$ low to \overline{HRDY} high	12		ns	
5	$t_{d(HSTBH-HRDYH)}$	Delay time, $\overline{HSTROBE}$ high to \overline{HRDY} high	12		ns	
6	$t_{d(HSTBL-HRDYL)}$	Delay time, $\overline{HSTROBE}$ low to \overline{HRDY} low	Case 1. HPID read with no auto-increment ⁽³⁾	10 * M + 20		ns
			Case 2. HPID read with auto-increment and read FIFO initially empty ⁽³⁾	10 * M + 20		
7	$t_{d(HDV-HRDYL)}$	Delay time, HD valid to \overline{HRDY} low	0		ns	
34	$t_{d(DSH-HRDYL)}$	Delay time, $\overline{HSTROBE}$ high to \overline{HRDY} low	Case 1. HPIA write ⁽³⁾	5 * M + 20		ns
			Case 2. HPID write with no auto-increment ⁽³⁾	5 * M + 20		
35	$t_{d(HSTBL-HRDYL)}$	Delay time, $\overline{HSTROBE}$ low to \overline{HRDY} low for HPIA write and FIFO not empty ⁽³⁾	40 * M + 20		ns	
36	$t_{d(HASL-HRDYH)}$	Delay time, \overline{HAS} low to \overline{HRDY} high	12		ns	

(1) M = SYSCLK3 period = 6/CPU clock frequency in ns. For example, when running parts at 1000 MHz, use M = 6 ns.
 (2) $\overline{HSTROBE}$ refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.
 (3) Assumes the HPI is accessing L2/L1 memory and no other master is accessing the same memory location.

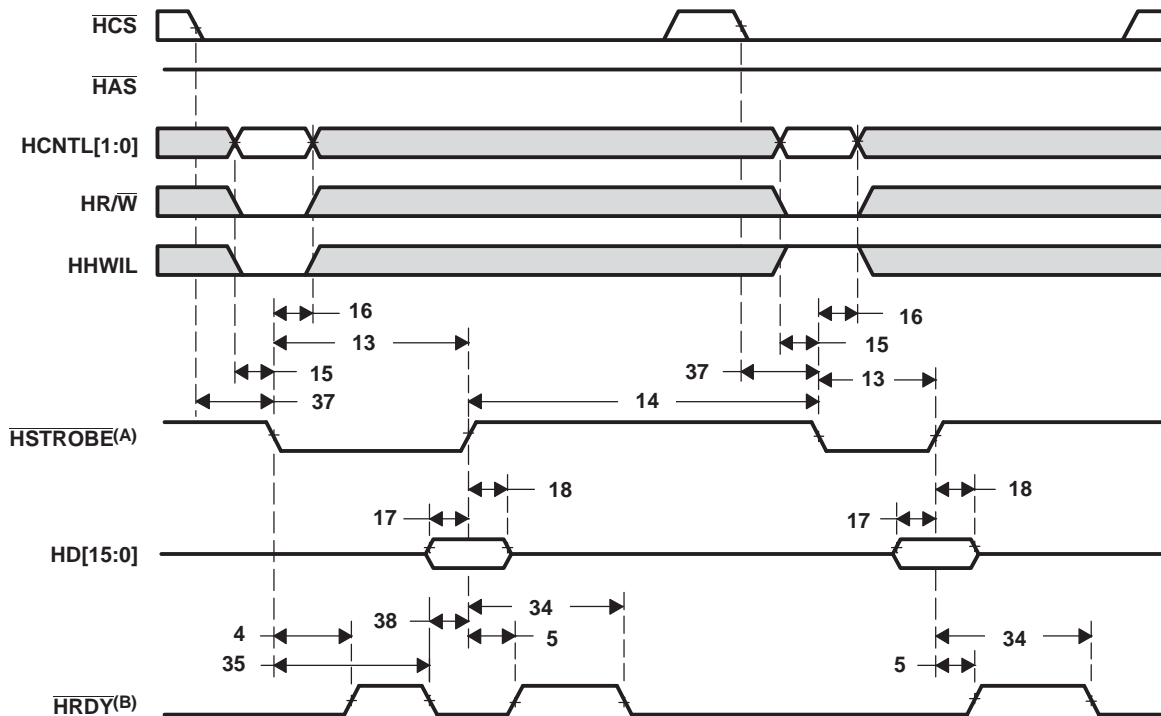

- A. $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on $\overline{\text{HRDY}}$ may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).

Figure 7-44. HPI16 Read Timing ($\overline{\text{HAS}}$ Not Used, Tied High)

- A. $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on $\overline{\text{HRDY}}$ may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).

Figure 7-45. HPI16 Read Timing ($\overline{\text{HAS}}$ Used)

- A. $\overline{HSTROBE}$ refers to the following logical operation on \overline{HCS} , $\overline{HDS1}$, and $\overline{HDS2}$: $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on \overline{HRDY} may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).

Figure 7-46. HPI16 Write Timing (\overline{HAS} Not Used, Tied High)

- A. $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on $\overline{\text{HRDY}}$ may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).

Figure 7-47. HPI16 Write Timing ($\overline{\text{HAS}}$ Used)

- A. $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on $\overline{\text{HRDY}}$ may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).
- C. The timing $t_{w(\text{HSTBH})}$, $\overline{\text{HSTROBE}}$ high pulse duration, must be met between consecutive HPI accesses in HPI32 mode.

Figure 7-48. HPI32 Read Timing ($\overline{\text{HAS}}$ Not Used, Tied High)

- A. $\overline{\text{HSTROBE}}$ refers to the following logical operation on $\overline{\text{HCS}}$, $\overline{\text{HDS1}}$, and $\overline{\text{HDS2}}$: $[\text{NOT}(\overline{\text{HDS1}} \text{ XOR } \overline{\text{HDS2}})] \text{ OR } \overline{\text{HCS}}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on $\overline{\text{HRDY}}$ may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).
- C. The timing $t_{\text{w}(\overline{\text{HSTROBE}})}$, $\overline{\text{HSTROBE}}$ high pulse duration, must be met between consecutive HPI accesses in HPI32 mode.

Figure 7-49. HPI32 Read Timing ($\overline{\text{HAS}}$ Used)

- $\overline{HSTROBE}$ refers to the following logical operation on \overline{HCS} , $\overline{HDS1}$, and $\overline{HDS2}$: $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$.
- Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on \overline{HRDY} may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).
- The timing $t_{w(HSTBH)}$, $\overline{HSTROBE}$ high pulse duration, must be met between consecutive HPI accesses in HPI32 mode.

Figure 7-50. HPI32 Write Timing (\overline{HAS} Not Used, Tied High)

- A. $\overline{HSTROBE}$ refers to the following logical operation on \overline{HCS} , $\overline{HDS1}$, and $\overline{HDS2}$: $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$.
- B. Depending on the type of write or read operation (HPID without auto-incrementing; HPIA, HPIC, or HPID with auto-incrementing) and the state of the FIFO, transitions on \overline{HRDY} may or may not occur. For more detailed information on the HPI peripheral, see the *TMS320C645x DSP Host Port Interface (HPI) User's Guide* (literature number [SPRU969](#)).
- C. The timing $t_{w(\overline{HSTBH})}$, $\overline{HSTROBE}$ high pulse duration, must be met between consecutive HPI accesses in HPI32 mode.

Figure 7-51. HPI32 Write Timing (\overline{HAS} Used)

7.13 Multichannel Buffered Serial Port (McBSP)

The McBSP provides these functions:

- Full-duplex communication
- Double-buffered data registers, which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- External shift clock or an internal, programmable frequency shift clock for data transfer

For more detailed information on the McBSP peripheral, see the *TMS320C6000 DSP Multichannel Buffered Serial Port (McBSP) Reference Guide* (literature number [SPRU580](#)).

7.13.1 McBSP Device-Specific Information

The CLKS signal is shared by both McBSP0 and McBSP1 on this device. Also, the CLKGDV field of the Sample Rate Generator Register (SRGR) must always be set to a value of 1 or greater.

The McBSP Data Receive Register (DRR) and Data Transmit Register (DXR) can be accessed through two separate busses: a configuration bus and a data bus. Both paths can be used by the CPU and the EDMA. The data bus should be used to service the McBSP as this path provides better performance. However, since the data path shares a bridge with the PCI peripheral (see [Figure 4-1](#)), the configuration path should be used in cases where this peripheral is being used to avoid any performance degradation. Note that the PCI peripheral consists of an independent master and slave. Performance degradation is only a concern when this peripheral is used to initiate transactions on the external bus.

7.13.3 McBSP Electrical Data/Timing

Table 7-59. Timing Requirements for McBSP⁽¹⁾

(see [Figure 7-52](#))

NO.				-720 -850 A-1000/1000		UNIT
				MIN	MAX	
2	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X ext	6P or 10 ⁽²⁾ ⁽³⁾		ns
3	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X ext	0.5 $t_{c(CKRX)}$ - 1 ⁽⁴⁾		ns
5	$t_{su(FRH-CKRL)}$	Setup time, external FSR high before CLKR low	CLKR int	9		ns
			CLKR ext	1.3		
6	$t_{h(CKRL-FRH)}$	Hold time, external FSR high after CLKR low	CLKR int	6		ns
			CLKR ext	3		
7	$t_{su(DRV-CKRL)}$	Setup time, DR valid before CLKR low	CLKR int	8		ns
			CLKR ext	0.9		
8	$t_{h(CKRL-DRV)}$	Hold time, DR valid after CLKR low	CLKR int	3		ns
			CLKR ext	3.1		
10	$t_{su(FXH-CKXL)}$	Setup time, external FSX high before CLKX low	CLKX int	9		ns
			CLKX ext	1.3		
11	$t_{h(CKXL-FXH)}$	Hold time, external FSX high after CLKX low	CLKX int	6		ns
			CLKX ext	3		

- (1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) P = 1/CPU clock frequency in ns. For example, when running parts at 1000 MHz, use P = 1 ns.
- (3) Use whichever value is greater. Minimum CLKR/X cycle times *must* be met, even when CLKR/X is generated by an internal clock source. The minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
- (4) This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

Table 7-60. Switching Characteristics Over Recommended Operating Conditions for McBSP⁽¹⁾ (2)

(see Figure 7-52)

NO.	PARAMETER		-720 -850 A-1000/1000		UNIT	
			MIN	MAX		
1	$t_{d(CKSH-CKRXH)}$	Delay time, CLKS high to CLKR/X high for internal CLKR/X generated from CLKS input ⁽³⁾		1.4	10	ns
2	$t_{c(CKRX)}$	Cycle time, CLKR/X	CLKR/X int	6P or 10 ⁽⁴⁾ ⁽⁵⁾ ⁽⁶⁾		ns
3	$t_{w(CKRX)}$	Pulse duration, CLKR/X high or CLKR/X low	CLKR/X int	C - 1 ⁽⁷⁾	C + 1 ⁽⁷⁾	ns
4	$t_{d(CKRH-FRV)}$	Delay time, CLKR high to internal FSR valid	CLKR int	-2.1	3.3	ns
9	$t_{d(CKXH-FXV)}$	Delay time, CLKX high to internal FSX valid	CLKX int	-1.7	3	ns
			CLKX ext	1.7	9	
12	$t_{dis(CKXH-DXHZ)}$	Disable time, DX high impedance following last data bit from CLKX high	CLKX int	-3.9	4	ns
			CLKX ext	2.1	9

			CLKX ext	2.1 + D1 ⁽⁸⁾	9 + D2 ⁽⁸⁾	
14	$t_{d(FXH-DXV)}$	Delay time, FSX high to DX valid ONLY applies when in data delay 0 (XDATDLY = 00b) mode	FSX int	-2.3 + D1 ⁽⁹⁾	5.6 + D2 ⁽⁹⁾	ns
			FSX ext	1.9 + D1 ⁽⁹⁾	9 + D2 ⁽⁹⁾	

- (1) CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.
- (2) Minimum delay times also represent minimum output hold times.
- (3) The CLKS signal is shared by both McBSP0 and McBSP1 on this device.
- (4) Minimum CLKR/X cycle times must be met, even when CLKR/X is generated by an internal clock source. Minimum CLKR/X cycle times are based on internal logic speed; the maximum usable speed may be lower due to EDMA limitations and AC timing requirements.
- (5) P = 1/CPU clock frequency in ns. For example, when running parts at 1000 MHz, use P = 1 ns.
- (6) Use whichever value is greater.
- (7) C = H or L
S = sample rate generator input clock = 6P if CLKSM = 1 (P = 1/CPU clock frequency)
S = sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)
H = CLKX high pulse width = (CLKGDV/2 + 1) * S if CLKGDV is even
H = (CLKGDV + 1)/2 * S if CLKGDV is odd
L = CLKX low pulse width = (CLKGDV/2) * S if CLKGDV is even
L = (CLKGDV + 1)/2 * S if CLKGDV is odd
CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see (4) above).
- (8) Extra delay from CLKX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P
- (9) Extra delay from FSX high to DX valid **applies only to the first data bit of a device**, if and only if DXENA = 1 in SPCR.
if DXENA = 0, then D1 = D2 = 0
if DXENA = 1, then D1 = 6P, D2 = 12P

- A. Parameter No. 13 applies to the first data bit *only* when XDATDLY ≠ 0.
- B. The CLKS signal is shared by both McBSP0 and McBSP1 on this device.

7.14 Ethernet MAC (EMAC)

The Ethernet Media Access Controller (EMAC) module provides an efficient interface between the C6454 DSP core processor and the networked community. The EMAC supports 10Base-T (10 Mbps/second [Mbps]), and 100BaseTX (100 Mbps), in either half- or full-duplex mode, and 1000BaseT (1000 Mbps) in full-duplex mode, with hardware flow control and quality-of-service (QOS) support.

The EMAC module conforms to the IEEE 802.3-2002 standard, describing the “Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer” specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E).

Deviation from this standard, the EMAC module does not use the Transmit Coding Error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network.

The EMAC control module is the main interface between the device core processor, the MDIO module, and the EMAC module. The relationship between these three components is shown in [Figure 7-58](#). The EMAC control module contains the necessary components to allow the EMAC to make efficient use of device memory, plus it controls device interrupts. The EMAC control module incorporates 8K-bytes of internal RAM to hold EMAC buffer descriptors. The relationship between these three components is shown in [Figure 7-58](#).

Figure 7-58. EMAC, MDIO, and EMAC Control Modules

For more detailed information on the EMAC/MDIO, see the *TMS320C645x DSP EMAC/MDIO Module Reference Guide* (literature number [SPRU975](#)).

7.14.1 EMAC Device-Specific Information

Interface Modes

The EMAC module on the TMS320C6454 device supports four interface modes: Media Independent Interface (MII), Reduced Media Independent Interface (RMII), Gigabit Media Independent Interface (GMII), and Reduced Gigabit Media Independent Interface (RGMII). The MII and GMII interface modes are defined in the IEEE 802.3-2002 standard.

The RGMII mode of the EMAC conforms to the Reduced Gigabit Media Independent Interface (RGMII) Specification (version 2.0). The RGMII mode implements the same functionality as the GMII mode, but with a reduced number of pins. Data and control information is transmitted and received using both edges of the transmit and receive clocks (TXC and RXC).

Note: The EMAC internally delays the transmit clock (TXC) with respect to the transmit data and control pins. Therefore, the EMAC conforms to the RGMII-ID operation of the RGMII specification. However, the EMAC does not delay the receive clock (RXC); this signal must be delayed with respect to the receive data and control pins outside of the DSP.

The RMII mode of the EMAC conforms to the RMII Specification (revision 1.2), as written by the RMII Consortium. As the name implies, the Reduced Media Independent Interface (RMII) mode is a reduced pin count version of the MII mode.

Interface Mode Select

The EMAC uses the same pins for the MII, GMII, and RMII modes. Standalone pins are included for the RGMII mode due to specific voltage requirements. Only one mode can be used at a time. The mode used is selected at device reset based on the MACSEL[1:0] configuration pins (for more detailed information, see [Section 3, Device Configuration](#)). [Table 7-70](#) shows which multiplexed pins are used in the MII, GMII, and RMII modes on the EMAC. For a detailed description of these pin functions, see [Table 2-3, Terminal Functions](#).

Table 7-70. EMAC/MDIO Multiplexed Pins (MII, RMII, and GMII Modes)

Using the RMII Mode of the EMAC

The Ethernet Media Access Controller (EMAC) contains logic that allows it to communicate using the Reduced Media Independent Interface (RMII) protocol. This logic must be taken out of reset before being used. To use the RMII mode of the EMAC follow these steps:

1. Enable the EMAC/MDIO through the Device State Control Registers.
 - Unlock the PERCFG0 register by writing 0x0F0A 0B00 to the PERLOCK register.
 - Set bit 4 in the PERCFG0 register within 16 SYSCLK3 clock cycles to enable the EMAC/MDIO.
 - Poll the PERSTAT0 register to verify state change.
2. Initialize the EMAC/MDIO as needed.
3. Release the RMII logic from reset by clearing the RMII_RST bit of the EMAC Configuration Register (see [Section 3.4.5](#)).

As described in the previous section, the RMII mode of the EMAC must be selected by setting MACSEL[1:0] = 01b at device reset.

Interface Mode Clocking

The on-chip PLL2 and PLL2 Controller generate the clocks to the EMAC module in RGMII or GMII mode. When the EMAC is enabled with these modes, the input clock to the PLL2 Controller (CLKIN2) must have a 25-MHz frequency. For more information, see [Section 7.8, PLL2 and PLL2 Controller](#).

The EMAC uses SYSCLK1 of the PLL2 Controller to generate the necessary clocks for the GMII and RGMII modes. When these modes are used, the frequency of CLKIN2 must be 25 MHz. Also, divider D1 should be programmed to $\div 2$ mode [default] when using the GMII mode and to $\div 5$ mode when using the RGMII mode. Divider D1 is software programmable and, if necessary, must be programmed after device reset to $\div 5$ when the RGMII mode of the EMAC is used.

7.14.2 EMAC Peripheral Register Descriptions

Figure 7-68. RGREFCLK Timing

Table 7-85. Timing Requirements for RGRXC - RGMII Operation

(see Figure 7-69)

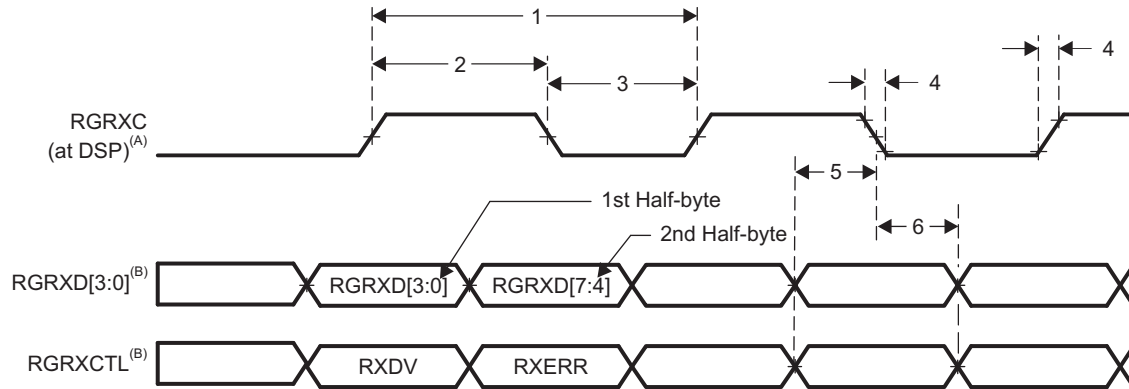

NO.			-720 -850 A-1000/1000		UNIT	
			MIN	MAX		
1	$t_c(\text{RGRXC})$	Cycle time, RGRXC	10 Mbps	360	440	ns
			100 Mbps	36	44	
			1000 Mbps	7.2	8.8	
2	$t_w(\text{RGRXCH})$	Pulse duration, RGRXC high	10 Mbps	$0.40 \cdot t_c(\text{RGRXC})$	$0.60 \cdot t_c(\text{RGRXC})$	ns
			100 Mbps	$0.40 \cdot t_c(\text{RGRXC})$	$0.60 \cdot t_c(\text{RGRXC})$	
			1000 Mbps	$0.45 \cdot t_c(\text{RGRXC})$	$0.55 \cdot t_c(\text{RGRXC})$	
3	$t_w(\text{RGRXCL})$	Pulse duration, RGRXC low	10 Mbps	$0.40 \cdot t_c(\text{RGRXC})$	$0.60 \cdot t_c(\text{RGRXC})$	ns
			100 Mbps	$0.40 \cdot t_c(\text{RGRXC})$	$0.60 \cdot t_c(\text{RGRXC})$	
			1000 Mbps	$0.45 \cdot t_c(\text{RGRXC})$	$0.55 \cdot t_c(\text{RGRXC})$	
4	$t_t(\text{RGRXC})$	Transition time, RGRXC	10 Mbps		0.75	ns
			100 Mbps		0.75	
			1000 Mbps		0.75	

Table 7-86. Timing Requirements for EMAC RGMII Input Receive for 10/100/1000 Mbps⁽¹⁾

(see Figure 7-69)

NO.		-720 -850 A-1000/1000		UNIT
		MIN	MAX	
5	$t_{su}(RGRXD-RGRXCH)$ Setup time, receive selected signals valid before RGRXC (at DSP) high/low	1.0		ns
6	$t_h(RGRXCH-RGRXD)$ Hold time, receive selected signals valid after RGRXC (at DSP) high/low	1.0		ns

(1) For RGMII, receive selected signals include: RGRXD[3:0] and RGRXCTL.

- A. RGRXC must be externally delayed relative to the data and control pins.
- B. Data and control information is received using both edges of the clocks. RGRXD[3:0] carries data bits 3-0 on the rising edge of RGRXC and data bits 7-4 on the falling edge of RGRXC. Similarly, RGRXCTL carries RXDV on rising edge of RGRXC and RXERR on falling edge.

Figure 7-69. EMAC Receive Interface Timing [RGMII Operation]

Table 7-87. Switching Characteristics Over Recommended Operating Conditions for RGTXC - RGMII Operation for 10/100/1000 Mbit/s

(see Figure 7-70)

NO.			-720 -850 A-1000/1000		UNIT	
			MIN	MAX		
1	$t_{c}(RGTXC)$	Cycle time, RGTXC	10 Mbps	360	440	ns
			100 Mbps	36	44	
			1000 Mbps	7.2	8.8	
2	$t_w(RGTXCH)$	Pulse duration, RGTXC high	10 Mbps	$0.40 \cdot t_c(RGTXC)$	$0.60 \cdot t_c(RGTXC)$	ns
			100 Mbps	$0.40 \cdot t_c(RGTXC)$	$0.60 \cdot t_c(RGTXC)$	
			1000 Mbps	$0.45 \cdot t_c(RGTXC)$	$0.55 \cdot t_c(RGTXC)$	
3	$t_w(RGTXCL)$	Pulse duration, RGTXC low	10 Mbps	$0.40 \cdot t_c(RGTXC)$	$0.60 \cdot t_c(RGTXC)$	ns
			100 Mbps	$0.40 \cdot t_c(RGTXC)$	$0.60 \cdot t_c(RGTXC)$	
			1000 Mbps	$0.45 \cdot t_c(RGTXC)$	$0.55 \cdot t_c(RGTXC)$	
4	$t_t(RGTXC)$	Transition time, RGTXC	10 Mbps		0.75	ns
			100 Mbps		0.75	
			1000 Mbps		0.75	

Table 7-88. Switching Characteristics Over Recommended Operating Conditions for EMAC RGMII Transmit⁽¹⁾

(see Figure 7-70)

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
5	$t_{su}(RGTXD-RGTXCH)$ Setup time, transmit selected signals valid before RGTXC (at DSP) high/low	1.2		ns
6	$t_h(RGTXCH-RGTXD)$ Hold time, transmit selected signals valid after RGTXC (at DSP) high/low	1.2		

(1) For RGMII, transmit selected signals include: RGTXD[3:0] and RGTXCTL.

- A. RGTXC is delayed internally before being driven to the RGTXC pin.
- B. Data and control information is transmitted using both edges of the clocks. RGTXD[3:0] carries data bits 3-0 on the rising edge of RGTXC and data bits 7-4 on the falling edge of RGTXC. Similarly, RGTXCTL carries TXEN on rising edge of RGTXC and TXERR of falling edge.

Figure 7-70. EMAC Transmit Interface Timing [RGMII Operation]

7.14.4 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module implements the 802.3 serial management interface to interrogate and controls up to 32 Ethernet PHY(s) connected to the device, using a shared two-wire bus. Application software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC, retrieve the negotiation results, and configure required parameters in the EMAC module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor.

The EMAC control module is the main interface between the device core processor, the MDIO module, and the EMAC module. The relationship between these three components is shown in [Figure 7-58](#).

The MDIO uses the same pins for the MII, GMII, and RMII modes. Standalone pins are included for the RGMII mode due to specific voltage requirements. Only one mode can be used at a time. The mode used is selected at device reset based on the MACSEL[1:0] configuration pins (for more detailed information, see [Section 3, Device Configuration](#)). [Table 7-70](#) above shows which multiplexed pin are used in the MII, GMII, and RMII modes on the MDIO.

For more detailed information on the EMAC/MDIO, see the *TMS320C645x DSP EMAC/MDIO Module Reference Guide* (literature number [SPRU975](#)).

7.14.4.1 MDIO Device-Specific Information

Clocking Information

The MDIO clock is based on a divide-down of the SYCLK3 (from the PLL1 controller) and is specified to run up to 2.5 MHz, although typical operation is 1.0 MHz. Since the peripheral clock frequency is variable, the application software or driver controls the divide-down amount.

7.14.4.2 MDIO Peripheral Register Descriptions

7.15 Timers

The timers can be used to: time events, count events, generate pulses, interrupt the CPU, and send synchronization events to the EDMA3 channel controller.

7.15.1 Timers Device-Specific Information

The C6454 device has two general-purpose timers, Timer0 and Timer1, each of which can be configured as a general-purpose timer or a watchdog timer. When configured as a general-purpose timer, each timer can be programmed as a 64-bit timer or as two separate 32-bit timers.

Each timer is made up of two 32-bit counters: a high counter and a low counter. The timer pins, TINPLx and TOUTLx are connected to the low counter. The high counter does not have any external device pins.

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT	
		MIN	MAX		
3	$t_{w(TOUTH)}$	Pulse duration, TOUTLx high	12P - 3		ns
4	$t_{w(TOURL)}$	Pulse duration, TOUTLx low	12P - 3		ns

(1) P = 1/CPU clock frequency in ns. For example, when running parts at 1000 MHz, use P = 1 ns.

Figure 7-73. Timer Timing

7.16 Peripheral Component Interconnect (PCI)

The C6454 DSP supports connections to a PCI backplane via the integrated PCI master/slave bus interface. The PCI port interfaces to DSP internal resources via the data switched central resource. The data switched central resource is described in more detail in [Section 4](#).

For more detailed information on the PCI port peripheral module, see the *TMS320C645x DSP Peripheral Component Interconnect (PCI) User's Guide* (literature number [SPRUE60](#)).

7.16.1 PCI Device-Specific Information

The PCI peripheral on the C6454 DSP conforms to the *PCI Local Bus Specification* (version 2.3). The PCI peripheral can act both as a PCI bus master and as a target. It supports PCI bus operation of speeds up to 66 MHz and uses a 32-bit data/address bus.

On the C6454 device, the pins of the PCI peripheral are multiplexed with the pins of the HPI and GPIO peripherals. PCI functionality for these pins is controlled (enabled/disabled) by the PCI_EN pin (Y29). The maximum speed of the PCI, 33 MHz or 66 MHz, is controlled through the PCI66 pin (U27). For more detailed information on the peripheral control, see [Section 3, Device Configuration](#).

The C6454 device provides an initialization mechanism through which the default values for some of the PCI configuration registers can be read from an I2C EEPROM. [Table 7-96](#) shows the registers which can be initialized through the PCI auto-initialization. Also shown is the default value of these registers when PCI auto-initialization is not used. PCI auto-initialization is controlled (enabled/disabled) through the PCI_EEAI pin (P25). For more information on this feature, see the *TMS320C645x DSP Peripheral Component Interconnect (PCI) User's Guide* (literature number [SPRUE60](#)) and the *TMS320C645x Bootloader User's Guide* (literature number [SPRUEC6](#)).

Table 7-96. Default Values for PCI Configuration Registers

REGISTER	DEFAULT VALUE
Vendor ID/Device ID Register (PCIVENDEV)	104C B000h
Class Code/Revision ID Register (PCICLREV)	0000 0001h
Subsystem Vendor ID/Subsystem ID Register (PCISUBID)	0000 0000h
Max Latency/Min Grant/Interrupt Pin/Interrupt Line Register (PCILGINT)	0000 0100h

The on-chip Bootloader supports a host boot which allows an external PCI device to load application code into the DSP's memory space. The PCI boot is terminated when the Host generates a DSP interrupt. The Host can generate a DSP interrupt through the PCI peripheral by setting the DSPINT bit in the Back-End Application Interrupt Enable Set Register (PCIBINTSET) and the Status Set Register (PCISTATSET). For more information on the boot sequence of the C6454 DSP, see [Section 2.4](#).

NOTE

After the host boot is complete, the DSP interrupt is registered in bit 0 (channel 0) of the EDMA Event Register (ER). This event must be cleared by software before triggering transfers on DMA channel 0.

7.16.3 PCI Electrical Data/Timing

Texas Instruments (TI) has performed the simulation and system characterization to ensure that the PCI peripheral meets all AC timing specifications as required by the *PCI Local Bus Specification* (version 2.3). The AC timing specifications are not reproduced here. For more information on the AC timing specifications, see section 4.2.3, Timing Specification (33 MHz timing), and section 7.6.4, Timing Specification (66 MHz timing), of the *PCI Local Bus Specification* (version 2.3). Note that the C6454 PCI peripheral only supports 3.3-V signaling.

7.17 General-Purpose Input/Output (GPIO)

7.17.1 GPIO Device-Specific Information

On the C6454 device, the GPIO peripheral pins GP[15:8] and GP[3:0] are muxed with the PCI and McBSP1 peripheral pins and the SYSCLK4 signal. For more detailed information on device/peripheral configuration and the C6454 device pin muxing, see [Section 3, Device Configuration](#).

7.17.2 GPIO Peripheral Register Descriptions

Table 7-102. GPIO Registers

HEX ADDRESS RANGE	ACRONYM	REGISTER NAME

02B0 0100 - 02B0 3FFF	-	Reserved

7.17.3 GPIO Electrical Data/Timing

Table 7-103. Timing Requirements for GPIO Inputs^{(1) (2)}

(see [Figure 7-74](#))

NO.			-720 -850 A-1000/-1000		UNIT
			MIN	MAX	
1	$t_{w(GPIH)}$	Pulse duration, GPIx high	12P		ns
2	$t_{w(GPIL)}$	Pulse duration, GPIx low	12P		ns

- (1) P = 1/CPU clock frequency in ns. For example, when running parts at 1000 MHz, use P = 1 ns.
- (2) The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the DSP recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to at least 24P to allow the DSP enough time to access the GPIO register through the CFGBUS.

Table 7-104. Switching Characteristics Over Recommended Operating Conditions for GPIO Outputs⁽¹⁾

(see [Figure 7-74](#))

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
3	$t_{w(GPOH)}$	Pulse duration, GPOx high	36P - 8 ⁽²⁾	ns
4	$t_{w(GPOL)}$	Pulse duration, GPOx low	36P - 8 ⁽²⁾	ns

- (1) P = 1/CPU clock frequency in ns. For example, when running parts at 1000 MHz, use P = 1 ns.
- (2) This parameter value should not be used as a maximum performance specification. Actual performance of back-to-back accesses of the GPIO is dependent upon internal bus activity.

Figure 7-74. GPIO Port Timing

7.18 Emulation Features and Capability

7.18.1 Advanced Event Triggering (AET)

The C6454 device supports Advanced Event Triggering (AET). This capability can be used to debug complex problems as well as understand performance characteristics of user applications. AET provides the following capabilities:

- **Hardware Program Breakpoints:** specify addresses or address ranges that can generate events such as halting the processor or triggering the trace capture.
- **Data Watchpoints:** specify data variable addresses, address ranges, or data values that can generate events such as halting the processor or triggering the trace capture.
- **Counters:** count the occurrence of an event or cycles for performance monitoring.
- **State Sequencing:** allows combinations of hardware program breakpoints and data watchpoints to precisely generate events for complex sequences.

For more information on AET, see the following documents:

Using Advanced Event Triggering to Find and Fix Intermittent Real-Time Bugs application report (literature number [SPRA753](#))

Using Advanced Event Triggering to Debug Real-Time Problems in High Speed Embedded Microprocessor Systems application report (literature number [SPRA387](#))

7.18.2 Trace

The C6454 device supports Trace. Trace is a debug technology that provides a detailed, historical account of application code execution, timing, and data accesses. Trace collects, compresses, and exports debug information for analysis. Trace works in real-time and does not impact the execution of the system.

For more information on board design guidelines for Trace Advanced Emulation, see the *Emulation and Trace Headers Technical Reference Manual* (literature number [SPRU655](#)).

7.18.3.1 JTAG Device-Specific Information

7.18.3.1.1 IEEE 1149.1 JTAG Compatibility Statement

For maximum reliability, the C6454 DSP includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized when this pin is not routed out. JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of an external pullup resistor on $\overline{\text{TRST}}$. When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the DSP after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations.

7.18.4 JTAG Peripheral Register Descriptions

7.18.5 JTAG Electrical Data/Timing

Table 7-105. Timing Requirements for JTAG Test Port

(see Figure 7-75)

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
1	$t_c(\text{TCK})$ Cycle time, TCK	35		ns
3	$t_{su}(\text{TDIV-TCKH})$ Setup time, TDI/TMS/ $\overline{\text{TRST}}$ valid before TCK high	6		ns
4	$t_h(\text{TCKH-TDIV})$ Hold time, TDI/TMS/ $\overline{\text{TRST}}$ valid after TCK high	9		ns

Table 7-106. Switching Characteristics Over Recommended Operating Conditions for JTAG Test Port

(see Figure 7-75)

NO.	PARAMETER	-720 -850 A-1000/-1000		UNIT
		MIN	MAX	
2	$t_d(\text{TCKL-TDOV})$ Delay time, TCK low to TDO valid	-3	11	ns

Figure 7-75. JTAG Test-Port Timing

8 Mechanical Data

8.1 Thermal Data

Table 8-1 shows the thermal resistance characteristics for the PBGA - CTZ/GTZ/ZTZ mechanical package.

Table 8-1. Thermal Resistance Characteristics (S-PBGA Package) [CTZ/GTZ/ZTZ]

NO.			°C/W	AIR FLOW (m/s) ⁽¹⁾
1	R θ _{JC}	Junction-to-case	1.45	N/A
2	R θ _{JB}	Junction-to-board	8.34	N/A
3	R θ _{JA}	Junction-to-free air	16.1	0.00
4			13.0	1.0
5			11.9	2.0
6			10.7	3.0
7			Psi _{JT}	Junction-to-package top
	0.89	1.0		
	1.01	1.5		
	1.17	3.00		
8	Psi _{JB}	Junction-to-board	7.6	0.00
			6.7	1.0
			6.4	1.5
			5.8	3.00

(1) m/s = meters per second

8.2 Packaging Information

The following packaging information reflects the most current released data available for the designated device(s). This data is subject to change without notice and without revision of this document.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
