RF Transceiver

Features
- Intelligent RF Modem Module
- RF Data Rates to 19200bps
- Up to 300 metres Range
- Programmable to 433, 868, or 915MHz
- Selectable ‘Narrowband’ RF Channels
- Crystal Controlled RF Design
- Supply Voltage 3.3V
- Serial Data Interface with Handshake
- Host Data Rates up to 38,400 Baud
- Very Stable Operating Frequency
- Low Profile Ceramic DIL Package
- Operates from -20 to +70 OC
- Evaluation Board for Rapid Development
- Software Configurable

Operating Modes
- Point to Point
- Broadcast
- One to Many Network
- Many to One Network

Applications
- Wireless Security Systems
- EPOS Terminals
- Sensor Data logging
- Remote Telemetry & Telecommand
- Remote Meter Reading

Description
The SMARTALPHA Radio Modem module provides a simple interface wireless communications module for the transfer of data at up to 19200bps. Its unique features of narrow band operation and user channel selection combined with excellent interference rejection make them an ideal choice for next generation applications.

The transceivers have the functions of a complete radio modem and simply require CMOS/TTL data at the transmit input and the corresponding transceiver(s) output the same data. Preamble and CRC are automatically generated and added to the RF signal

Possible applications include one-to-one and multi-node wireless links in applications including car and building security, EPOS, inventory tracking, remote industrial process monitoring and computer networking. Because of their small size and low power requirements, both modules are ideal for use in portable, battery-powered applications such as hand-held terminals.

2. Operation

The Host Data Rate pins are read when the PD pin goes high. The SmartALPHA must be put into standby mode by taking the PD pin low in order to change the selection.

The SmartALPHA contains an on-board data buffer equal to two data packets. Therefore if RTS is asserted (then the host is unable to receive data) the SmartALPHA will store a max of two data packets, all further data packets received will be discarded.

No RF packets will be received by the module when it is in power down standby mode.

Each SmartALPHA has its own pre-set address. This is set during configuration. Any data received is examined and the address header embedded within the data packet is compared with the RF60 address. Only data received with matching address will be processed and output to the host, all other data will be discarded. All SmartALPHA modules are shipped with a default address of 7E7E7E7E.

Operation Modes
The addressing protocol employed enables many different configurations such including:
- **one-to-one operation:** for point to point data communication
- **broadcast operation:** where a single master address many SmartALPHA modules concurrently. (using many SmartALPHA modules set to the same address)
- **one-to-many:** A network consisting a master and many slaves (the receivers all have the same address)
- **many-to-one:** where the transmitters all send to a single receiver address.

Because each SmartALPHA can contain a unique address, multiple SmartALPHA networks can co-exist in the same area.

Serial Data Format
The SmartALPHA serial format settings are:
- **Baud Rate:** Defined by DR1 and DR2 Pins
- **Data Bits:** 8
- **Parity:** None
- **Stop Bits:** 1
- **Flow Control:** Hardware

CTS Timing
With a standard buffer size of 64 bytes, CTS is asserted 20μS after the buffer is full. In cases where less than 64 bytes are sent CTS is asserted after a timeout of 6μS.
3. Configuration

The configuration of the SmartALPHA module may be changed by placing the SmartALPHA in Configuration mode, then sending a set of configuration data bytes to the module on the Tx pin.

To place the SmartALPHA in Configuration mode the user needs to send "+++" (three plus characters) within the 10mS timeout for each character. The SmartALPHA responds by returning the Configuration data bytes. The SmartALPHA is now on Configuration mode.

To exit Configuration mode the user needs to send "---" (three minus characters) within the 10mS timeout for each character. The SmartALPHA will not return a response. The SmartALPHA is now in data mode.

|      |                           | 7 = -21 dBm       |                        |

| 11   | RF transmission speed     | A3 hex = 1200 bps | 23 hex                 |
|      |                           | 91 hex = 2400 bps |                        |
|      |                           | 47 hex = 4800 bps |                        |
|      |                           | 23 hex = 9600 bps |                        |
|      |                           | 11 hex = 19200 bps|                        |
|      |                           | 08 hex = 38400 bps|                        |
|      |                           | 05 hex = 57600 bps|                        |

The RF Channel is calculated as:
433 MHz working frequency: Config value (decimal) = ((Fo/10)-43)*4000
868 MHz working frequency: Config value (decimal) = ((Fo/20)-43)*4000
915 MHz working frequency: Config value (decimal) = ((Fo/30)-30)*4000
(Fo = Required Frequency)

Please Note, the calculated value must be converted into binary. The high byte is placed in byte 8 and the low byte in byte 9. The Config value MUST be in the range 96 to 3903 (decimal). Both bytes must be present for the channel to be accepted.

While the SmartALPHA is in configuration mode, then the module will send the current configuration back to the host each time a data packet is received. To retrieve the current configuration without changing any options the host can send a single byte to the module and wait for the response.
It is not necessary to send all configuration bytes to the module, but all data sent must be valid. For example to change the destination address the host may just send four bytes. Configuration data excluded from the end of the data stream will be unchanged. The SmartALPHA module will accept a short configuration after a 10ms timeout after the last byte sent to the module, or when the RTS pin goes high. This allows for the host to easily change the destination address of the RF data packet, thus enabling one SmartALPHA to send individual data to several different recipient modules.

A destination address of 00000000 will reset the SmartALPHA to the default settings shown above. RF data packets received by the SmartALPHA with the embedded destination address which matches the SmartALPHA address will be accepted, processed and passed to the host, all of the RF data packets will be ignored.

When configuring the destination or SmartALPHA address an incorrect number of bytes for an address will leave the current address unchanged.
An invalid Transmitter Power or Packet Size setting will leave the current setting unchanged.

4. Application Information

Connection of the SmartALPHA to an RS232 host terminal device such as a PC serial port may easily be achieved using the Application Schematic at the back of this datasheet.
The 9 way 'D' socket (J1) provides the standard pinout required to connect directly to the serial port of any std PC using a 9 way male/female cable. The MAX3232 (a low voltage RS232 line driver) provides level conversion between the RS232 levels on the serial port and the logic levels pins of the SmartALPHA module.
If two such circuits are constructed then it will be possible to interconnect two PC's and test out the performance of the SMARTALPHA. When both circuits are powered up it will be necessary for them to have each others address in the "Destination Address" register.
Antenna Design
The design and positioning of the aerial is as crucial as the module performance itself in achieving a good wireless system range. The following will assist the designer in maximising system performance. The RF ground pin should be connected to a ground plane which should shield the aerial connection and the PCB layout around the aerial track itself should be such as to give a 50 Ohm impedance. The aerial should be kept as far away from sources of electrical interference as physically possible. The specified power supply decoupling capacitors should be placed close to the module as possible and have direct connections to the relevant pins.
The antenna 'hot end' should be kept clear of any objects, especially any metal as this can severely restrict the efficiency of the antenna to receive power. Earth planes restricting the radiation path of the antenna will also have the same effect.
The best range will be achieved with either a straight piece of wire, rod or PCB track @ ¼ wavelength (17.3cm @ 433.92MHz). Increased range may be achieved if this ¼ wave antenna is placed perpendicular to and in the middle of a solid earth plane measuring at least 16cm radius. In this case, the antenna should be connected to the module using 50 Ohm coaxial cable and the PCB track layout tips given above should be observed.

6. Evaluation Board SMARTALPHA-EVAL

- Selectable Host Baud Rate 1200bps – 38.4Kbps
- USB or RS232 Cable Replacement
- Range up to 150 Metres
- European Operation 433 or 868MHz
- Narrow Band RF
- RF Data Rates to 100 kbps
- One to Many, Many to One
- 12V or USB Power
- Conforms to ETSI 300-220
- Requires no radio licence to operate
- ABS enclosure

Description

The RF Solutions SMARTALPHA-EVAL radio Modem is a simple to use and very versatile device. It can operate as a one to one cable replacement link, in multiple master/slave arrangements or in broadcast modes. The small modem will easily achieve a range of 150m with an antenna.

Multiple connection options allow it connect to a PC or act as an M2M link via USB or RS232 with power though the data cable or via an external 12V DC supply.
Connections and Set-up
USB Connector
The SMARTALPHA-EVAL interfaces to the host computer via a USB Type A connector.

RS232 Connector
The RF SMARTALPHA-EVAL interfaces to the host computer via an RS232 connection using a standard DB9 connector with pin out as shown in the diagram below.

Power Supply
For USB comms, power is automatically obtained from the USB connection. (No external power required)
For RS232 comms external power is required. Power is provided by either J3 (as shown below) or through a modified RS232 cable.

Status LED's
The SMARTALPHA-EVAL circuit board has three LED's, representing the following signals:
- PWR – Power on
- Tx – Transmitting data
- Rx – Receiving data
The SMARTALPHA-EVAL modem can be easily configured using the 666-EVAL Configuration Utility available from the RF Solutions Website.
SmartALPHA Application Example
LOW LEVEL RS232 TO STANDARD RS232 CONVERTER

'D' pin 9 feeds 5 volt power via 'Y' lead
RF Solutions Ltd. Recycling Notice
Meets the following EC Directives:

DO NOT
Discard with normal waste, please recycle.

ROHS Directive 2002/95/EC
Specifies certain limits for hazardous substances.

WEEE Directive 2002/96/EC
Waste electrical & electronic equipment. This product must be disposed of through a licensed WEEE collection point. RF Solutions Ltd., fulfills its WEEE obligations by membership of an approved compliance scheme.

Waste Batteries and Accumulators
Directive 2006/66/EC
Where batteries are fitted, before recycling the product, the batteries must be removed and disposed of at a licensed collection point.

Environment Agency producer registration number: WEE/JBO104WV.
