

# Global Positioning System (GPS) Shield for Arduino<sup>™</sup> and Raspberry-PI<sup>™</sup>

# Technical Data

# Features

- Arduino<sup>TM</sup> UNO Shield standard form factor for simple integration into any Arduino project
- I<sup>2</sup>C interface for simple connection to Arduino or Raspberry-PI
- Give your robot the ability to know where it is, how fast its moving and in what direction\*
- Fast <u>65-channel</u> position acquisition with battery backup for fast < 1 second hot start and < 30 second warm start
- Simple register based data retrieval of latitude, longitude, heading, altitude, speed, time, date & satellites in view
- Integral low power antenna
- Built in fully programmable 4 line IO and 8 bit ADC input port for local sensors
- LVD, RoHS and WEEE compliant product

# Description

The Designer Systems DS-GPM.S is a highly integrated Global Positioning System allowing your robotic application to determine its location on the earth's surface. Specifically targeted at the Arduino UNO board user [MEGA and NANO boards also supported] and the Raspberry-PI the GPM.S features I<sup>2</sup>C communication to leave the serial [TX/RX] port free for other functions eg. wireless communication.

GPS data received by the DS-GPM.S is stored within internal registers which are updated once per second and include:

- Latitude (i.e. vertical)
- Longitude (i.e. horizontal)
- Altitude (metres)
- Time & date (UTC)
- Heading (True)
- Speed (kilometres per hour)
- Satellites detected

In addition the DS-GPM.S features an on-board fully configurable four line programmable IO and analogue input port with automatic measurement.

**DS-GPM.S** Firmware version 1

# Applications

The DS-GPM.S has many applications in robotics, security and timing. For example the module could be used to send a rover to a particular position or be used to form a vehicle security solution in-conjunction with an embedded controller and GSM modem. Application notes for the UNO controller are provided.

# Selection Guide

Description	Part Number
Global Position System Shield	DS-GPM.S

\* Note: GPS information cannot be collected without a clear view of the sky. Raspberry-PI, Arduino, UNO, NANO, UNO & MEGA are trademarks

# **GPS** basics

The heart of the DS-GPM.S is a Global Positioning System receiver module and antenna that receive signals from satellites orbiting the earth.

There are 32 of these satellites, each sending its own unique signal to the earth's surface for pickup by any GPS receiver, which searches the sky for available satellites.

Upon detecting the satellites in view and their current position the receiver uses the satellites with highest signal strength to calculate, using triangulation, the receiver's latitude, longitude & altitude\*\* (position).

Latitude is measured in degrees and minutes either North or South of the equator.

Longitude is measured in degrees and minutes either West or East of an imaginary line drawn vertically through Greenwich in the UK.

Altitude is measured in metres above sea level.

For example the offices of Designer Systems in Truro, UK are located 50 degrees, 15.817 minutes North latitude and 5 degrees, 3.549 minutes West longitude.

Should the receiver also be moving, speed in kilometres per hour, and heading, in degrees true north and magnetic north, can also be determined.

To gain the best reception the GPM should be used outside with a good view of the sky. Trees and buildings will cause the GPS signals being received to degrade and positional/speed information may be lost. To greatly improve reception the GPM should be mounted above a metal base.

\*\* LLA format to WGS-84 ellipsoid.

# Operation

When power is applied to the GPM the unit immediately starts to search for satellites. The GPM can start in one of three (3) modes, as follows:

## Cold start mode:

This mode only applies when the GPM has been powered-up for the first time after being removed from its packaging. As the GPM does not know where it is on the earth's surface, it starts to hunt for groups of satellites to determine its location. This process may take up to 30 minutes before positional information is available; it is suggested that a battery be connected and the unit left in the open air until the STATUS indicator starts to flash.

## Warm start mode:

This mode applies to a GPM that has already been 'cold-started' and whose location has not changed significantly when powered up again or has been powered down for at least one (1) hour. Positional information is normally available again within 45 seconds of power re-application.

## Hot start mode:

This mode applies when the GPM has been powered off for less than 60 minutes. Positional information is normally available again within 1-10 seconds of power re-application.

The warm and hot start power-up modes are possible due to an internal backup battery which powers the Real Time Clock (RTC) and almanac memory when external power is removed.

# STATUS indication...

The STATUS indicator is used to provide visual feedback of the current GPM condition. There are three (3) conditions as follows:

ON Steady	Power applied and no positional infor-
Flashing slowly	mation. Positional infor-
Flashing fast	mation received. GPM in motion.

These conditions will change as the GPM moves around its location and under objects that may block the satellite signals.

# **Power requirements**

The DS-GPM.S takes the power necessary for operation (approx. 30-90mA) from an external battery or power adaptor or power from the Arduino UNO board. The GPM provides three PCB pads, two marked 'GND' and one marked 'Vin' in the same format as that present on the UNO board, which should be connected to negative and positive battery/power supply terminals respectively. The input voltage range is 7 - 16VDC with the internal circuitry being protected against power supply reversal.

# IO port

The DS-GPM.S features a fully programmable four line CMOS input/output or 8bit Analogue to Digital Converter port 'I/O' '1' to '4'. Each IO is configurable as an output, an input or an analogue input by configuring the registers R0-3. When an IO is configured for a normal input the applied voltage 0 or 5V is read and stored in an input register which can be read by the connected I<sup>2</sup>C device. When an IO is configured as an output the output state will be 0 or 5V dependant on the output register contents written by the connected I<sup>2</sup>C device. When an IO is configured for analogue input\*\* it is automatically updated every 100mS from an external input voltage of 0 - 5V and the result stored in internal registers which can be read by the connected I<sup>2</sup>C device (see register details further on in this datasheet). The port also incorporates a ground and Vin bus that allows sensors to be directly connected (see Fig. 3.0) Warning: These inputs are not overvoltage protected and should not be subjected to voltages over 5V.

# I<sup>2</sup>C connection

The I<sup>2</sup>C connections are marked 'SDA' and 'SCL' and allow connection to the Arduino UNO board 'ANALOG IN' pins 4 and 5 or the Rasperberry-PI GPIO port pins 3 and 5 (see Fig. 2.0) or another I<sup>2</sup>C Master device.

The DS-GPM.S is fitted with pullup jumpers that can be configured to provide the source current necessary for  $I^2C$  communication. The following jumpers should normally be set when using the UNO board, as long as the  $I^2C$  bus does not have existing pull-up's provided by another device. These jumpers <u>MUST</u> be removed when using the Raspberry-PI:

# I<sup>2</sup>C communication

Up to four DS-GPM.S modules may be connected to the same UNO / Raspberry-PI board or  $I^2C$  bus and

accessed individually using their own individual address. The address is configured with the following jumpers:

The following table shows how the jumpers are placed for the different binary addresses:

Address xx	A0	A1
00 (default)	ON	ON
01	OFF	ON
10	ON	OFF
11	OFF	OFF

The binary address (xx) above is used in conjunction with the device ID 11010xxD to form the complete device address i.e. if both jumpers are left connected (default) then the device address would be 1101000D<sub>binary</sub>.

The 'D' bit determines if a read or a

write to the GPM is to be performed. If the 'D' bit is set '1' then a register read is performed or if clear '0' a register write.

To access individual registers a device write must be undertaken by the I<sup>2</sup>C Master which consists of a Start condition, device ID ('D' bit cleared), register to start write, one or more bytes of data to be written and a stop condition (see Figure 1.0 for  $I^2C$  write protocol).

There are 3 individual registers that can be written within the GPM that control local IO port setup and output as follows:

> N<sub>7</sub> N<sub>6</sub> N<sub>5</sub> N<sub>3</sub>  $N_4$ N<sub>2</sub> N<sub>1</sub>  $N_0$

© 1997-2013 Designer Systems COMMS23.04.11 Revision 1.05 To read individual data and status registers a device write then read must be undertaken by the OOPic / I<sup>2</sup>C Master.

The write consists of a Start condition, device ID ('D' bit clear), register to start read and a Stop condition. This is followed by a read, which consists of a Start condition, device ID ('D' bit set), followed by data from the register specified and terminated with a Stop condition. The GPM also auto increments the register specified for every additional read requested by the Master I<sup>2</sup>C device, which allows more than one register to be read in one transaction. This allows for example Register 0 to Register 5, current UTC time, to be read in one transaction (see Figure 1.1 for  $I^2C$  read protocol). There are 112 individual registers that can be read within the GPM as follows:

GPM Address 1. 1 1 0 1 0 X X 1 XX = Address select pins

 D = 0 if IO line is configured for analogue input

### DS-GPM.S Status

R112 U U B A V V V V V.,V = Firmware version number 1-15 A = Position found bit (0 = Not found, 1 = Found) B = Motion bit (0 = Standstill, 1 = Moving)

# Registers R0 to R106 may contain invalid data until satellite information has been gained and stored.

\*\* Note: Analogue inputs can only be configured in pairs IO1&2 and IO3&4.

\*\*\* Note: Magnetic heading not supported, returns true heading only.

### Register restoration...

All received data is formatted into decimal units (i.e. hundreds, tens & units) and stored in individual registers to facilitate either value or character restoration.

Value restoration can be undertaken by multiplying the required register by its multiplier e.g. to restore the value of register R0 'Hours tens' the register contents are multiplied by ten (10).

Character restoration, to allow the output to a PC via. RS232 or display of data on a LCD panel etc., can be undertaken by the addition of the constant value 48<sub>decimal</sub>, 30<sub>hex</sub>.

### UTC Time format...

The standard GPS time coordinate system is called Universal Coordinated Time or UTC.

This time format replaced Greenwich Mean Time (GMT) in 1986 and is of the same value. Time zones relative to GMT should add or subtract a standard value to gain the correct time.

### Example.

To read the complete time from registers 0 to 5 (Current time = 14:32:56, Device address = default) write:

'Point to register 0	
Byte 1 (GPM Adr)	11010000 <sub>binary</sub>
Byte 2 (Set register)	$0_{decimal}, 00_{hex}$

'Read register 0 - 5	
Byte 1 (GPM Adr)	11010001 <sub>binary</sub>
Byte 2 Hours tens	$1_{\text{decimal}}, 01_{\text{hex}}$
Byte 3 Hours units	$4_{\text{decimal}}, 04_{\text{hex}}$
Byte 4 Minutes tens	$3_{decimal}, 03_{hex}$
Byte 5 Minutes units	$2_{\text{decimal}}, 02_{\text{hex}}$
Byte 6 Seconds tens	$5_{decimal}, 05_{hex}$
Byte 7 Seconds units	$6_{\text{decimal}}, 06_{\text{hex}}$

### **Battery replacement**

The DS-GPM.S backup battery needs replacing if the real time clock resets to the year 2006 or time to first fix is significantly long. The CR1220 type lithium battery can be replaced by removing the four screws in the base of the module, removing the cover, sliding out the old battery, sliding in a new battery [positive uppermost] and replacing the cover and screws. Please dispose of the exhausted battery responsibly.

### See the website at

www.designersystems.co.uk for sample Arduino and Raspberry-PI applications.

$= 25^{\circ}C$ Typical)

Parameter	Minimum	Maximum	Units	Notes
Supply Voltage (7-16V)	7	16	V	1
Supply Current	30	90	mA	4
I <sup>2</sup> C speed	-	400	kHz	
I <sup>2</sup> C pull-up resistance	-	4700	Ω	3
GPS positional accuracy	1	2.5	Metres	
GPS frequency band	-	1575.42	MHz	2
GPS channels	-	56		
ADC input voltage	0	Vcc	V	
ADC measurement cycle	-	100	mS	
IO line output voltage	0.3	Vcc-0.8V	V	
IO line output current	-	20	mA	
IO line input voltage	0	Vcc+0.3V	V	

## **Absolute Maximum Ratings**

Parameter	Minimum	Maximum	Units
Supply Voltage (7-16V)	-0.5	+18	V

# Environmental

Parameter	Minimum	Maximum	Units
Operating Temperature	0	70	°C
Storage Temperature	-10	80	°C
Humidity	0	80	%
Dimensions	Length 56.25mm, Width 53.5mm, Height 20mm		
Weight	28g		
Immunity & emissions	See statement on page 11		

### Notes:

1. Supply voltage is supply rail from Arduino board or any other 7-16V supply.

2. L1 frequency, C/A code (Standard Positioning Service)

3. Value given is to Vcc when activated with appropriate jumpers.

4. Maximum value is only during initial acquisition.

### Figure 1.0 (I<sup>2</sup>C write protocol)

Multiple bytes may be written before the 'STOP' condition. Data is written into registers starting at 'REGISTER ADDRESS', then 'REGISTER ADDRESS' +1, then 'REGISTER ADDRESS' +2 etc.

Each byte transfer is acknowledged 'ACK' by the GPM until the 'STOP' condition.

### Figure 1.1 (I<sup>2</sup>C read protocol)

'DATA BYTE 1 & 2' are register values returned from the GPM. Each byte written is acknowledged 'ACK' by the GPM, every byte read is acknowledged 'ACK' by the I<sup>2</sup>C Master. A Not-acknowledge 'NACK' condition is generated by the I<sup>2</sup>C Master when it has finished reading.

### Figure 2.0 (Connection Schematic for Arduino UNO or Raspberry-Pi I<sup>2</sup>C communication)

# **Mechanical Specifications – Units millimetres**

Revision History:

1.00 Release version

- 1.01 Release version (Updated IO registers and HDOP registers, added battery recycling statement)
- 1.02 Release version (Added UNO board)

# **WEEE Consumer Notice**

This product is subject to Directive 2002/96/EC of the European Parliament and the Council of the European Union on Waste of Electrical and Electronic Equipment (WEEE) and, in jurisdictions adopting that Directive, is marked as being put on the market after August 13, 2005, and should not be disposed of as unsorted municipal/public waste. Please utilise your local WEEE collection facilities in the disposition and

otherwise observe all applicable requirements. For further information on the requirements regarding the disposition of this product in other languages please visit www.designersystems.co.uk

# **RoHS Compliance**

This product complies with Directive 2002/95/EC of the European Parliament and the Council of the European Union on the Restriction of Hazardous Substances (RoHS) which prohibits the use of various heavy metals (lead, mercury, cadmium, and hexavalent chromium), polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE).

## **Battery Recycling**

The DS-GPM features an internal lithium coin cell that must be recycled at end of life. To access the cell remove the four (4) screws in the bottom of the product and lift off the plastic cover. Using the end of a paper clip, screw driver or other form of pointed tool slide the coin cell from its holder. To preserve natural resources, please recycle the battery properly.
