

## bq2022A 1K-Bit Serial EPROM with SDQ Interface

### 1 Features

- 1024 Bits of One-Time Programmable (OTP) EPROM For Storage Of User-Programmable Configuration Data
- Factory-Programmed Unique 64-Bit Identification Number
- Single-Wire Interface to Reduce Circuit Board Routing
- Synchronous Communication Reduces Host Interrupt Overhead
- 15KV IEC 61000-4-2 ESD Compliance on Data Pin
- No Standby Power Required
- Available in a 3-Pin SOT-23 Package and TO-92 Package

### 2 Applications

- Security Encoding
- Inventory Tracking
- Product-Revision Maintenance
- Battery-Pack Identification

### 3 Description

The bq2022A is a 1K-bit serial EPROM containing a factory-programmed, unique 48-bit identification number, 8-bit CRC generation, and the 8-bit family code (09h). A 64-bit status register controls write protection and page redirection.

The bq2022A SDQ™ interface requires only a single connection and a ground return. The DATA pin is also the sole power source for the bq2022A.

The small surface-mount package options saves printed-circuit-board space, while the low cost makes it ideal for applications such as battery pack configuration parameters, record maintenance, asset tracking, product-revision status, and access-code security.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
bq2022A	SOT-23 (3)	2.92 mm x 1.30 mm
	TO-92 (3)	4.30 mm x 4.30 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision History

### Changes from Revision D (December 2014) to Revision E

**Page**

• Added text: "No additional capacitance..." to the <a href="#">Typical Application</a> section .....	<b>19</b>
• Added the <a href="#">SDQ Master Best Practices</a> section .....	<b>20</b>
• Added text and <a href="#">Figure 21</a> to the <a href="#">Power Supply Recommendations</a> section .....	<b>22</b>

### Changes from Revision C (August 2007) to Revision D

**Page**

• Added <a href="#">ESD Ratings</a> table, <a href="#">Feature Description</a> section, <a href="#">Device Functional Modes</a> , <a href="#">Application and Implementation</a> section, <a href="#">Power Supply Recommendations</a> section, <a href="#">Layout</a> section, <a href="#">Device and Documentation Support</a> section, and <a href="#">Mechanical, Packaging, and Orderable Information</a> section. ....	<b>1</b>
• Deleted Bus-Interface Architecture Allowing Multiple bq2022As Attached to a Single Host from Features.....	<b>1</b>
• Deleted last sentence from second paragraph in Description .....	<b>1</b>
• Added Junction temperature to Absolute Maximum Ratings .....	<b>4</b>
• Deleted last two sentences and figure from Serial Communication section .....	<b>9</b>
• Deleted second sentence from READ ROM Command section .....	<b>9</b>
• Deleted MATCH ROM and SEARCH ROM sections .....	<b>9</b>
• Deleted text from first sentence and deleted third sentence from SKIP ROM Command section.....	<b>9</b>
• Changed from: a part is selected by a ROM command to: a part is issued a SKIP ROM command in the last sentence of the Memory/Status Function Commands section.....	<b>9</b>
• Changed from: the ROM command is followed to: the SKIP ROM command is followed in the first sentence of the READ MEMORY/Page CRC section.....	<b>10</b>
• Changed from: Initialization and ROM Command Sequence to: Initialization and SKIP ROM Command Sequence in <a href="#">Figure 7</a> .....	<b>10</b>
• Changed from: the ROM command is followed to: the SKIP ROM command is followed in the first sentence of the READ MEMORY/Field CRC section .....	<b>10</b>
• Changed from: Initialization and ROM Command Sequence to: Initialization and SKIP ROM Command Sequence in <a href="#">Figure 8</a> .....	<b>11</b>
• Changed from: After issuing a ROM command to: After issuing a SKIP ROM command in the second sentence of the second paragraph of the WRITE MEMORY Command section .....	<b>11</b>
• Changed from: After issuing a ROM command to: After issuing a SKIP ROM command in the first sentence of the

## 5 Pin Configuration and Functions

**LP Package  
3-Pin TO-92  
(Bottom View)**

### Pin Functions

PIN			I/O	DESCRIPTION
NAME	SOT-23	TO-92		
SDQ	1	1	I	Data
VSS	2, 3	2	—	Ground. Both pins should be connected to system ground.
NC	—	3	—	No connection. This pin should be connected to system ground or left floating.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

	MIN	MAX	UNIT
DC voltage applied to data, $V_{PU}$	-0.3	7	V
Low-level output current, $I_{OL}$		40	mA
ESD IEC 61000-4-2 Air discharge, Data to $V_{SS}$ , $V_{SS}$ to data		15	kV
Operating free-air temperature, $T_A$	-20	70	°C
Communication free-air temperature, $T_{A(Comm)}$ <sup>(2)</sup>	-40	85	°C
Junction temperature, $T_J$		125	°C
Storage temperature, $T_{stg}$	-55	125	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Communication is specified by design

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{PU}$	Operational pull-up voltage	2.65		5.5	V
$R_{PU}$	Serial communication interface pull-up resistance		5		kΩ

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		bq2022A		UNIT
		DBZ (3 PINS)	LP (3 PINS)	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	244.3	158.5	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	104.9	55.6	
R <sub>θJB</sub>	Junction-to-board thermal resistance	93.1	n/a	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	4.8	26.8	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	66.4	137.8	
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	n/a	n/a	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics: DC

T<sub>A</sub> = -20°C to 70°C; V<sub>PU(min)</sub> = 2.65 V<sub>DC</sub> to 5.5 V<sub>DC</sub>, all voltages relative to VSS

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>DATA</sub>	Supply current	V <sub>PU</sub> = 5.5 V			20	μA
V <sub>OL</sub>	Low-level output voltage	Logic 0, V <sub>PU</sub> = 5.5 V, I <sub>OL</sub> = 4 mA, SDQ pin			0.4	V
		Logic 0, V <sub>PU</sub> = 2.65 V, I <sub>OL</sub> = 2 mA			0.4	
V <sub>OH</sub>	High-level output voltage	Logic 1		V <sub>PU</sub>	5.5	
I <sub>OL</sub>	Low-level output current (sink)	V <sub>OL</sub> = 0.4 V, SDQ pin			4	mA
V <sub>IL</sub>	Low-level input voltage	Logic 0			0.8	V
V <sub>IH</sub>	High-level input voltage	Logic 1	2.2			V
V <sub>PP</sub>	Programming voltage		11.5		12	V

## 6.6 Switching Characteristics: AC

T<sub>A</sub> = -20°C to 70°C; V<sub>PU(min)</sub> = 2.65 V<sub>DC</sub> to 5.5 V<sub>DC</sub>, all voltages relative to VSS

PARAMETER		TEST CONDITIONS	MIN	MAX	UNIT
t <sub>c</sub>	Bit cycle time <sup>(1)</sup>		60	120	μs
t <sub>WSTRB</sub>	Write start cycle <sup>(1)</sup>		1	15	μs
t <sub>WDSU</sub>	Write data setup <sup>(1)</sup>		t <sub>WSTRB</sub>	15	μs
t <sub>WDH</sub>	Write data hold <sup>(1) (2)</sup>		60	t <sub>c</sub>	μs
t <sub>rec</sub>	Recovery time <sup>(1)</sup>		1		μs
		For memory command only	5		
t <sub>RSTRB</sub>	Read start cycle <sup>(1)</sup>		1	13	μs
t <sub>ODD</sub>	Output data delay <sup>(1)</sup>		t <sub>RSTRB</sub>	13	μs
t <sub>ODHO</sub>	Output data hold <sup>(1)</sup>		17	60	μs
t <sub>RST</sub>	Reset time <sup>(1)</sup>		480		μs
t <sub>PPD</sub>	Presence pulse delay <sup>(1)</sup>		15	60	μs
t <sub>PP</sub>	Presence pulse <sup>(1)</sup>		60	240	μs
t <sub>EPROG</sub>	EPROM programming time		2500		μs
t <sub>PSU</sub>	Program setup time		5		μs
t <sub>PREC</sub>	Program recovery time		5		μs
t <sub>PRE</sub>	Program rising-edge time			5	μs
t <sub>PFE</sub>	Program falling-edge time			5	μs
t <sub>RSTREC</sub>			480		μs

(1) 5-kΩ series resistor between SDQ pin and V<sub>PU</sub>. (See [Figure 18](#).)

(2) t<sub>WDH</sub> must be less than t<sub>c</sub> to account for recovery.

## 6.7 Typical Characteristics

## 7 Detailed Description

### 7.1 Overview

The *Functional Block Diagram* shows the relationships among the major control and memory sections of the bq2022A. The bq2022A has three main data components: a 64-bit factory-programmed ROM, including 8-bit family code, 48-bit identification number and 8-bit CRC value, 1024-bit EPROM, and EPROM STATUS bytes. Power for read and write operations is derived from the DATA pin. An internal capacitor stores energy while the signal line is high and releases energy during the low times of the DATA pin, until the pin returns high to replenish the charge on the capacitor. A special manufacturer's PROGRAM PROFILE BYTE can be read to determine the programming profile required to program the part.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 1024-Bit EPROM

Table 1 is a memory map of the 1024-bit EPROM section of the bq2022A, configured as four pages of 32 bytes each. The 8-byte RAM buffers are additional registers used when programming the memory. Data are first written to the RAM buffer and then verified by reading an 8-bit CRC from the bq2022A that confirms proper receipt of the data. If the buffer contents are correct, a programming command is issued and an 8-byte segment of data is written into the selected address in memory. This process ensures data integrity when programming the memory. The details for reading and programming the 1024-bit EPROM portion of the bq2022A are in the *Memory/Status Function Commands* section of this data sheet.

**Table 1. 1024-Bit EPROM Data Memory Map**

ADDRESS(HEX)	PAGE
0060-007F	Page 3
0040-005F	Page 2
0020-003F	Page 1
0000-001F	Page 0

### 7.3.2 EPROM Status Memory

In addition to the programmable 1024-bits of memory are 64 bits of status information contained in the EPROM STATUS memory. The STATUS memory is accessible with separate commands. The STATUS bits are EPROM and are read or programmed to indicate various conditions to the software interrogating the bq2022A. The first byte of the STATUS memory contains the write protect page bits, that inhibit programming of the corresponding page in the 1024-bit main memory area if the appropriate write-protection bit is programmed. Once a bit has been programmed in the write protect page byte, the entire 32-byte page that corresponds to that bit can no longer be altered but may still be read. The write protect bits may be cleared by using the WRITE STATUS command.

The next four bytes of the EPROM STATUS memory contain the page address redirection bytes. Bits in the EPROM status bytes can indicate to the host what page is substituted for the page by the appropriate redirection byte. The hardware of the bq2022A makes no decisions based on the contents of the page address redirection bytes. This feature allows the user's software to make a data patch to the EPROM by indicating that a particular page or pages should be replaced with those indicated in the page address redirection bytes. The ones complement of the new page address is written into the page address redirection byte that corresponds to the original (replaced) page. If a page address redirection byte has an FFh value, the data in the main memory that corresponds to that page are valid. If a page address redirection byte has some other hex value, the data in the page corresponding to that redirection byte are invalid, and the valid data can now be found at the ones complement of the page address indicated by the hexadecimal value stored in the associated page address redirection byte. A value of FDh in the redirection byte for page 1, for example, indicates that the updated data are now in page 2. The details for reading and programming the EPROM status memory portion of the bq2022A are given in the [Memory/Status Function Commands](#) section.

**Table 2. EPROM Status Bytes**

ADDRESS (HEX)	PAGE
00h	Write protection bits BIT0—write protect page 0 BIT1—write protect page 1 BIT2—write protect page 2 BIT3—write protect page 3 BIT4 to 7—bitmap of used pages
01h	Redirection byte for page 0
02h	Redirection byte for page 1
03h	Redirection byte for page 2
04h	Redirection byte for page 3
05h	Reserved
06h	Reserved
07h	Factory programmed 00h

### 7.3.3 Error Checking

To validate the data transmitted from the bq2022A, the host generates a CRC value from the data as they are received. This generated value is compared to the CRC value transmitted by the bq2022A. If the two CRC values match, the transmission is error-free. The equivalent polynomial function of this CRC is  $X^8 + X^5 + X^4 + 1$ . Details are found in the [CRC Generation](#) section of this data sheet.

### 7.3.4 Customizing the bq2022A

The 64-bit ID identifies each bq2022A. The 48-bit serial number is unique and programmed by Texas Instruments. The default 8-bit family code is 09h; however, a different value can be reserved on an individual customer basis. Contact your Texas Instruments sales representative for more information.

### 7.3.5 Bus Termination

Because the drive output of the bq2022A is an open-drain, N-channel MOSFET, the host must provide a source current or a 5-k $\Omega$  external pullup, as shown in the typical application circuit in [Figure 18](#).

## 7.4 Device Functional Modes

The device is in active mode during SDQ communication or while the SDQ is kept at valid  $V_{PU}$  voltages.

## 7.5 Programming

### 7.5.1 Serial Communication

A host reads, programs, or checks the status of the bq2022A through the command structure of the SDQ interface.

### 7.5.2 Initialization

Initialization consists of two pulses, the RESET and the PRESENCE pulses. The host generates the RESET pulse, while the bq2022A responds with the PRESENCE pulse. The host resets the bq2022A by driving the DATA bus low for at least 480  $\mu$ s. For more details, see the [RESET and PRESENCE PULSE](#) section.

### 7.5.3 ROM Commands

#### 7.5.3.1 READ ROM Command

The READ ROM command sequence is the fastest sequence that allows the host to read the 8-bit family code and 48-bit identification number. The READ ROM sequence starts with the host generating the RESET pulse of at least 480  $\mu$ s. The bq2022A responds with a PRESENCE pulse. Next, the host continues by issuing the READ ROM command, 33h, and then reads the ROM and CRC byte using the READ signaling (see the READ and WRITE signals section) during the data frame.

Figure 5. READ ROM Sequence

#### 7.5.3.2 SKIP ROM Command

This SKIP ROM command, CCh, allows the host to access the memory/status functions. The SKIP ROM command is directly followed by a memory/status functions command.

Figure 6. SKIP ROM Sequence

### 7.5.4 Memory/Status Function Commands

Six memory/status function commands allow read and modification of the 1024-bit EPROM data memory or the 64-bit EPROM status memory. There are two types of READ MEMORY command, plus the WRITE MEMORY, READ STATUS, and WRITE STATUS commands. Additionally, the part responds to a PROGRAM PROFILE byte command. The bq2022A responds to memory/status function commands only after a part is issued a SKIP ROM command.

## Programming (continued)

### 7.5.5 READ MEMORY Commands

Two READ MEMORY commands are available on the bq2022A. Both commands are used to read data from the 1024-bit EPROM data field. They are the READ MEMORY/Page CRC and the READ MEMORY/Field CRC commands. The READ MEMORY/Page CRC generates CRC at the end any 32-byte page boundary whereas the READ MEMORY/Field CRC generates CRC when the end of the 1024-bit data memory is reached.

#### 7.5.5.1 READ MEMORY/Page CRC

To read memory and generate the CRC at the 32-byte page boundaries of the bq2022A, the SKIP ROM command is followed by the READ MEMORY/Generate CRC command, C3h, followed by the address low byte and then the address high byte.

An 8-bit CRC of the command byte and address bytes is computed by the bq2022A and read back by the host to confirm that the correct command word and starting address were received. If the CRC read by the host is incorrect, a reset pulse must be issued and the entire sequence must be repeated. If the CRC received by the host is correct, the host issues read time slots and receives data from the bq2022A starting at the initial address and continuing until the end of a 32-byte page is reached. At that point, the host sends eight additional read time slots and receive an 8-bit CRC that is the result of shifting into the CRC generator all of the data bytes from the initial starting byte to the last byte of the current page. Once the 8-bit CRC has been received, data is again read from the 1024-bit EPROM data field starting at the next page. This sequence continues until the final page and its accompanying CRC are read by the host. Thus each page of data can be considered to be 33 bytes long, the 32 bytes of user-programmed EPROM data and an 8-bit CRC that gets generated automatically at the end of each page.

Initialization and SKIP ROM Command Sequence	READ MEMORY/Generate CRC Command C3h	Address Low Byte A0                      A7	Address High Byte A8                      A15	Read and Verify CRC	EPROM Memory and CRC Byte Generated at 32-Byte Page Boundaries
--	---	--	--	---------------------	--

NOTE: Individual bytes of address and data are transmitted LSB first.

**Figure 7. READ MEMORY/Page CRC**

#### 7.5.5.2 READ MEMORY/Field CRC

To read memory without CRC generation on 32-byte page boundaries, the SKIP ROM command is followed by the READ MEMORY command, F0h, followed by the address low byte and then the address high byte.

#### NOTE

As shown in [Figure 8](#), individual bytes of address and data are transmitted LSB first.

An 8-bit CRC of the command byte and address bytes is computed by the bq2022A and read back by the host to confirm that the correct command word and starting address were received. If the CRC read by the host is incorrect, a reset pulse must be issued and the entire sequence must be repeated. If the CRC received by the host is correct, the host issues read time slots and receives data from the bq2022A starting at the initial address and continuing until the end of the 1024-bit data field is reached or until a reset pulse is issued. If reading occurs through the end of memory space, the host may issue eight additional read time slots and the bq2022A responds with an 8-bit CRC of all data bytes read from the initial starting byte through the last byte of memory. After the CRC is received by the host, any subsequent read time slots appear as logical 1s until a reset pulse is issued. Any reads ended by a reset pulse prior to reaching the end of memory does not have the 8-bit CRC available.

Initialization and SKIP ROM Command Sequence	READ MEMORY Command F0h	Address Low Byte A0            A7	Address High Byte A8            A15	Read and Verify CRC	Read EPROM Memory Until End of EPROM Memory	Read and Verify CRC
--	-------------------------	--------------------------------------	--	---------------------	---	---------------------

**Figure 8. READ MEMORY/Field CRC**

### 7.5.6 WRITE MEMORY Command

The WRITE MEMORY command is used to program the 1024-bit EPROM memory field. The 1024-bit memory field is programmed in 8-byte segments. Data is first written into an 8-byte RAM buffer one byte at a time. The contents of the RAM buffer is then ANDed with the contents of the EPROM memory field when the programming command is issued.

Figure 9 illustrates the sequence of events for programming the EPROM memory field. After issuing a SKIP ROM command, the host issues the WRITE MEMORY command, 0Fh, followed by the low byte and then the high byte of the starting address. The bq2022A calculates and transmits an 8-bit CRC based on the WRITE command and address.

If at any time during the WRITE MEMORY process, the CRC read by the host is incorrect, a reset pulse must be issued, and the entire sequence must be repeated.

After the bq2022A transmits the CRC, the host then transmits 8 bytes of data to the bq2022A. Another 8-bit CRC is calculated and transmitted based on the 8 bytes of data. If this CRC agrees with the CRC calculated by the host, the host transmits the program command 5Ah and then applies the programming voltage for at least 2500  $\mu$ s or  $t_{\text{EPROG}}$ . The contents of the RAM buffer is then logically ANDed with the contents of the 8-byte EPROM offset by the starting address.

The starting address can be any integer multiple of eight between 0000 and 007F (hex) such as 0000, 0008, and 0010 (hex).

The WRITE DATA MEMORY command sequence can be terminated at any point by issuing a reset pulse except during the program pulse period  $t_{\text{PROG}}$ .

---

#### NOTE

The bq2022A responds with the data from the selected EPROM address sent least significant-bit first. This response should be checked to verify the programmed byte. If the programmed byte is incorrect, then the host must reset the part and begin the write sequence again.

---

For both of these cases, the decision to continue programming is made entirely by the host, because the bq2022A is not able to determine if the 8-bit CRC calculated by the host agrees with the 8-bit CRC calculated by the bq2022A.

Prior to programming, bits in the 1024-bit EPROM data field appear as logical 1s.

NOTE: Individual bytes of address and data are transmitted LSB first

**Figure 9. WRITE MEMORY Command Flow**

**7.5.7 READ STATUS Command**

The READ STATUS command is used to read data from the EPROM status data field. After issuing a SKIP ROM command, the host issues the READ STATUS command, AAh, followed by the address low byte and then the address high byte.

**NOTE**

An 8-bit CRC of the command byte and address bytes is computed by the bq2022A and read back by the host to confirm that the correct command word and starting address were received.

If the CRC read by the host is incorrect, a reset pulse must be issued and the entire sequence must be repeated. If the CRC received by the host is correct, the host issues read time slots and receives data from the bq2022A starting at the supplied address and continuing until the end of the EPROM Status data field is reached. At that point, the host receives an 8-bit CRC that is the result of shifting into the CRC generator all of the data bytes from the initial starting byte through the final factory-programmed byte that contains the 00h value.

This feature is provided because the EPROM status information may change over time making it impossible to program the data once and include an accompanying CRC that is always valid. Therefore, the READ status command supplies an 8-bit CRC that is based on (and always is consistent with) the current data stored in the EPROM status data field.

After the 8-bit CRC is read, the host receives logical 1s from the bq2022A until a reset pulse is issued. The READ STATUS command sequence can be ended at any point by issuing a reset pulse.

Initialization and SKIP ROM Command Sequence	READ MEMORY Command AAh	Address Low Byte A0 A7	Address High Byte A8 A15	Read and Verify CRC	Read STATUS Memory Until End of STATUS Memory	Read and Verify CRC
--	-------------------------	---------------------------	-----------------------------	---------------------	---	---------------------

**Figure 10. READ STATUS Command**

**7.5.8 WRITE STATUS Command**

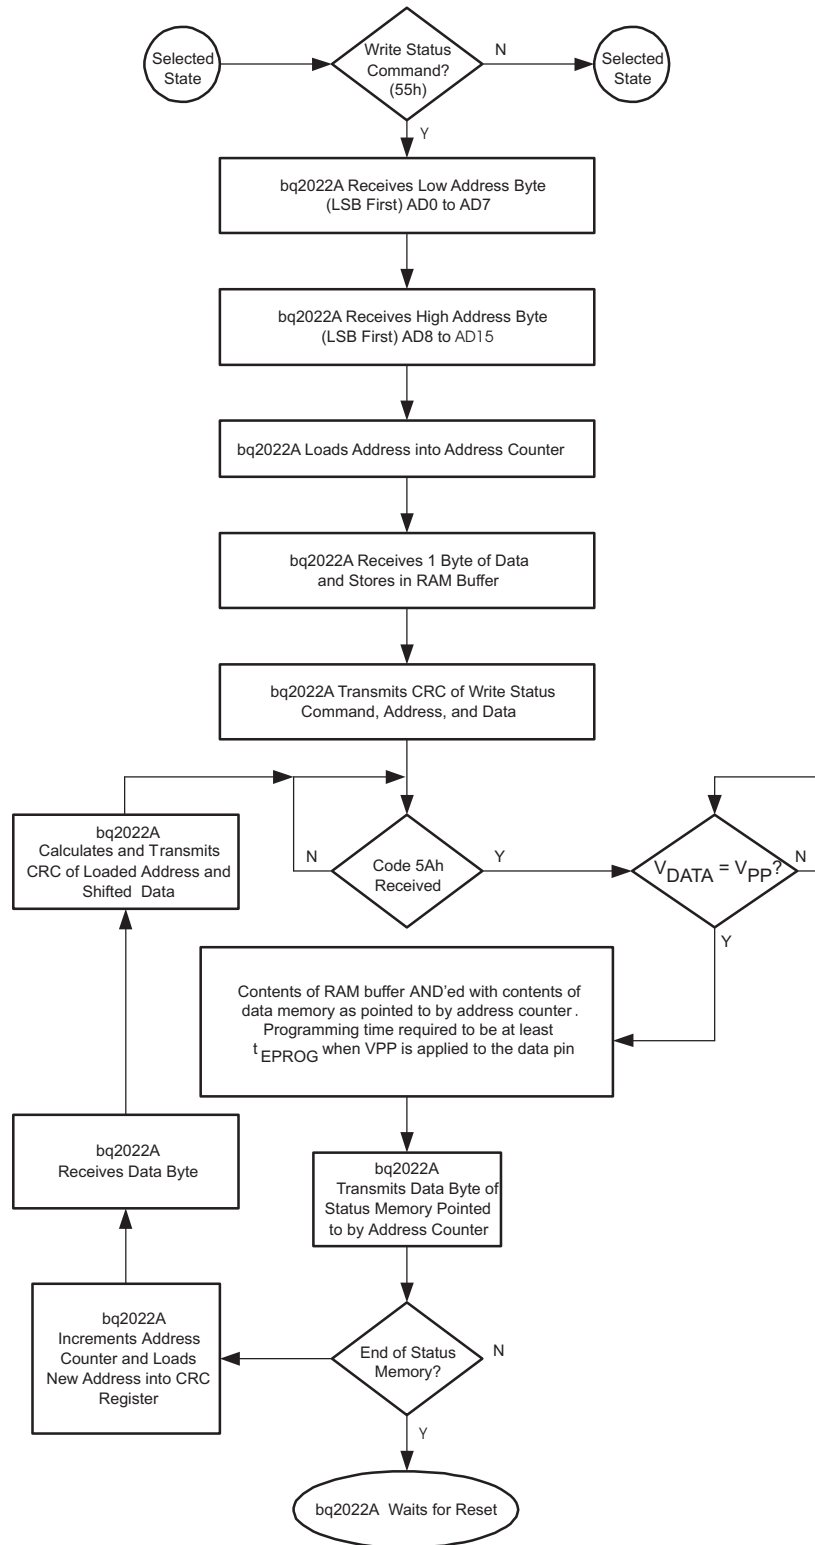

The WRITE STATUS command is used to program the EPROM Status data field after the bq2022A has been issued SKIP ROM command.

The flow chart in [Figure 11](#) illustrates that the host issues the WRITE STATUS command, 55h, followed by the address low byte and then the address high byte the followed by the byte of data to be programmed.

**NOTE**

Individual bytes of address and data are transmitted LSB first. An 8-bit CRC of the command byte, address bytes, and data byte is computed by the bq2022A and read back by the host to confirm that the correct command word, starting address, and data byte were received.

If the CRC read by the host is incorrect, a reset pulse must be issued and the entire sequence must be repeated. If the CRC received by the host is correct, the program command (5Ah) is issued. After the program command is issued, then the programming voltage,  $V_{PP}$  is applied to the DATA pin for period  $t_{PROG}$ . Prior to programming, the first seven bytes of the EPROM STATUS data field appear as logical 1s. For each bit in the data byte provided by the host that is set to a logical 0, the corresponding bit in the selected byte of the EPROM STATUS data field is programmed to a logical 0 after the programming pulse has been applied at the byte location. The eighth byte of the EPROM STATUS byte data field is factory-programmed to contain 00h.

**Figure 11. WRITE STATUS Command Flow**

After the programming pulse is applied and the data line returns to  $V_{PU}$ , the host issues eight read time slots to verify that the appropriate bits have been programmed. The bq2022A responds with the data from the selected EPROM STATUS address sent least significant bit first. This response should be checked to verify the programmed byte. If the programmed byte is incorrect, then the host must reset the device and begin the write sequence again. If the bq2022A EPROM data byte programming was successful, the bq2022A automatically increments its address counter to select the next byte in the STATUS MEMORY data field. The least significant byte of the new two-byte address is also loaded into the 8-bit CRC generator as a starting value. The host issues the next byte of data using eight write time slots.

As the bq2022A receives this byte of data into the RAM buffer, it also shifts the data into the CRC generator that has been preloaded with the LSB of the current address and the result is an 8-bit CRC of the new data byte and the LSB of the new address. After supplying the data byte, the host reads this 8-bit CRC from the bq2022A with eight read time slots to confirm that the address incremented properly and the data byte was received correctly. If the CRC is incorrect, a Reset Pulse must be issued and the Write Status command sequence must be restarted. If the CRC is correct, the host issues a programming pulse and the selected byte in memory is programmed.

#### NOTE

The initial write of the WRITE STATUS command, generates an 8-bit CRC value that is the result of shifting the command byte into the CRC generator, followed by the two-address bytes, and finally the data byte. Subsequent writes within this WRITE STATUS command due to the bq2022A automatically incrementing its address counter generates an 8-bit CRC that is the result of loading (not shifting) the LSB of the new (incremented) address into the CRC generator and then shifting in the new data byte.

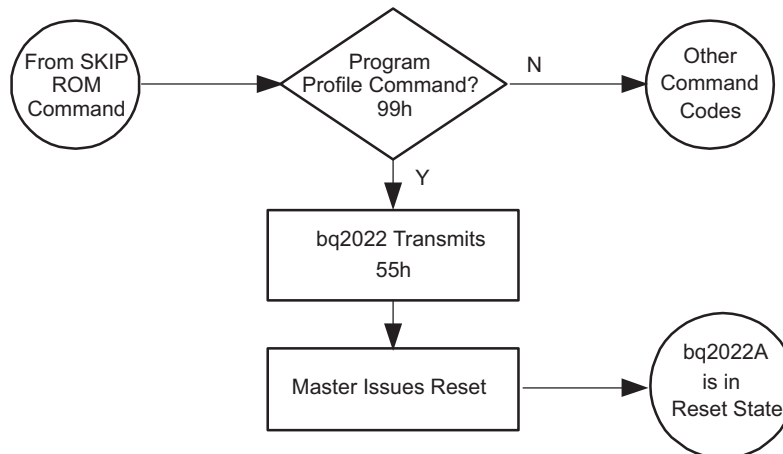

For both of these cases, the decision to continue programming the EPROM Status registers is made entirely by the host, because the bq2022A is not able to determine if the 8-bit CRC calculated by the host agrees with the 8-bit CRC calculated by the bq2022A. If an incorrect CRC is ignored and a program pulse is applied by the host, incorrect programming could occur within the bq2022A. Also note that the bq2022A always increments its internal address counter after the receipt of the eight read time slots used to confirm the programming of the selected EPROM byte. The decision to continue is again made entirely by the host, therefore if the EPROM data byte does not match the supplied data byte but the master continues with the WRITE STATUS command, incorrect programming could occur within the bq2022A. The WRITE STATUS command sequence can be ended at any point by issuing a reset pulse.

**Table 3. Command Code Summary**

COMMAND (HEX)	DESCRIPTION	CATEGORY
33h	Read Serialization ROM and CRC	ROM Commands Available in Command Level I
CCh	Skip Serialization ROM	
F0h	Read Memory/Field CRC	Memory Function Commands Available in Command Level II
AAh	Read EPROM Status	
C3h	Read Memory/Page CRC	
0Fh	Write Memory	
99h	Programming Profile	
55h	Write EPROM Status	Program Command Available Only in WRITE MEMORY and WRITE STATUS Modes
5Ah	Program Control	

### 7.5.9 PROGRAM PROFILE Byte

The PROGRAM PROFILE byte is read to determine the WRITE MEMORY programming sequence required by a specific manufacturer. After issuing a ROM command, the host issues the PROGRAM PROFILE BYTE command, 99h. [Figure 12](#) shows the bq2022A responds with 55h. This informs the host that the WRITE MEMORY programming sequence is the one described in the [WRITE MEMORY Command](#) section of this data sheet.

**Figure 12. PROGRAM PROFILE Command Flow**

### 7.5.10 SDQ Signaling

All SDQ signaling begins with initializing the device, followed by the host driving the bus low to write a 1 or 0, or to begin the start frame for a bit read. [Figure 13](#) shows the initialization timing, whereas [Figure 14](#) and [Figure 15](#) show that the host initiates each bit by driving the DATA bus low for the start period,  $t_{WSTRB}$  /  $t_{RSTRB}$ . After the bit is initiated, either the host continues controlling the bus during a WRITE, or the bq2022A responds during a READ.

### 7.5.11 RESET and PRESENCE PULSE

If the DATA bus is driven low for more than 120  $\mu$ s, the bq2022A may be reset. [Figure 13](#) shows that if the DATA bus is driven low for more than 480  $\mu$ s, the bq2022A resets and indicates that it is ready by responding with a PRESENCE PULSE.

**Figure 13. Reset Timing Diagram**

### 7.5.12 WRITE Bit

The WRITE bit timing diagram in [Figure 14](#) shows that the host initiates the transmission by issuing the  $t_{WSTRB}$  portion of the bit and then either driving the DATA bus low for a WRITE 0, or releasing the DATA bus for a WRITE 1.

**Figure 14. WRITE Bit Timing Diagram**

### 7.5.13 READ Bit

The READ bit timing diagram in Figure 15 shows that the host initiates the transmission of the bit by issuing the  $t_{RSTRB}$  portion of the bit. The bq2022A then responds by either driving the DATA bus low to transmit a READ 0 or releasing the DATA bus to transmit a READ 1.

Figure 15. READ Bit Timing Diagram

### 7.5.14 PROGRAM PULSE

Figure 16. PROGRAM PULSE Timing Diagram

### 7.5.15 IDLE

If the bus is high, the bus is in the IDLE state. Bus transactions can be suspended by leaving the DATA bus in IDLE. Bus transactions can resume at any time from the IDLE state.

### 7.5.16 CRC Generation

The bq2022A has an 8-bit CRC stored in the most significant byte of the 64-bit ROM. The bus master can compute a CRC value from the first 56 bits of the 64-bit ROM and compare it to the value stored within the bq2022A to determine if the ROM data has been received error-free by the bus master. The equivalent polynomial function of this CRC is:  $X^8 + X^5 + X^4 + 1$ .

Under certain conditions, the bq2022A also generates an 8-bit CRC value using the same polynomial function just shown and provides this value to the bus master to validate the transfer of command, address, and data bytes from the bus master to the bq2022A. The bq2022A computes an 8-bit CRC for the command, address, and data bytes received for the WRITE MEMORY and the WRITE STATUS commands and then outputs this value to the bus master to confirm proper transfer. Similarly, the bq2022A computes an 8-bit CRC for the command and address bytes received from the bus master for the READ MEMORY, READ STATUS, and READ DATA/GENERATE 8-BIT CRC commands to confirm that these bytes have been received correctly. The CRC generator on the bq2022A is also used to provide verification of error-free data transfer as each page of data from the 1024-bit EPROM is sent to the bus master during a READ DATA/GENERATE 8-BIT CRC command, and for the eight bytes of information in the status memory field.

In each case where a CRC is used for data transfer validation, the bus master must calculate a CRC value using the polynomial function previously given and compare the calculated value to either the 8-bit CRC value stored in the 64-bit ROM portion of the bq2022A (for ROM reads) or the 8-bit CRC value computed within the bq2022A. The comparison of CRC values and decision to continue with an operation are determined entirely by the bus master. No circuitry on the bq2022A prevents a command sequence from proceeding if the CRC stored in or calculated by the bq2022A does not match the value generated by the bus master. Proper use of the CRC can result in a communication channel with a high level of integrity.

Figure 17. 8-Bit CRC Generator Circuit ( $X^8 + X^5 + X^4 + 1$ )

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

A typical application consists of a microcontroller that is configured to be a SDQ communication host device and the bq2022A being the SDQ slave device. The host and slave have open drain functionality for which a pull-up resistor (typically 10 kΩ) is required connected to a pull-up voltage in the range of 2.65 V to 5.5 V.

### 8.2 Typical Application

No additional capacitance is needed on the SDQ line and may result in a communication failure.

Figure 18. Typical Application Circuit

#### 8.2.1 Design Requirements

Table 4. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Pull-up voltage	2.65 V to 5.5 V
Operating free-air temperature	-20°C to 70°C
Pull-up resistor	10 kΩ typ

## 8.2.2 Detailed Design Procedure

### 8.2.2.1 Programming Circuit Example

The bq2022A requires a 12-V maximum pulse signal to program the OTP memory. It is necessary to have a programming test setup for production. Figure 19 shows an example of what the circuit could be for such setup. The Programming Module contains the microcontroller that acts as SDQ master and also controls the time of the programming pulse and its width. The 12-V supply is the source for the programming pulse. Only SDQ and VSS signals need to exit the test setup as the Application Circuit containing the bq2022A under test is connected only for programming and verifying data.

The Programming Module typically will connect to a PC using interface such as USB. The diagram in Figure 19 does not include the interface to a PC which can vary depending on the system designer's choice.

**Figure 19. bq2022A Programming Circuit Example**

### 8.2.2.2 SDQ Master Best Practices

It may be necessary to “bit-bang” a GPIO on the host system to act as the SDQ master. In this case, some additional error checking should be built into the code used to reset the bq2022A to ensure that the slave is operating as expected on the bus.

Whenever the host sends a reset, the bq2022A responds with a presence pulse. The host should confirm, before the presence pulse, that the bus has been released and returned to a high level, indicating that nothing is holding the bus unexpectedly low. As the minimum  $t_{ppd}$  is 15  $\mu$ s, having the host look for a logic high on the bus 10  $\mu$ s after releasing the bus at the end of the reset is sufficient to confirm the bus is released for the bq2022A to respond.

### 8.2.3 Application Curve

Figure 20. Supply Current vs. Temperature

## 9 Power Supply Recommendations

The bq2022A is a low-power device that only needs to be turned on when communicating. The device power comes from the voltage supply that is used for digital I/O in the system. A dedicated VCC pin does not exist in the device for which there is not a requirement of a supply input bypass capacitor. The device obtains its power from the SDQ communication input which can be sustained during normal communication activity.

The ramp time of the SDQ voltage when power is initially applied may be slow due to current limiting from the source. Ramp times greater than 200  $\mu$ s might cause undesired bouncing of the POR circuit and result in the device not generating a presence pulse. To account for this undesired effect on the device a best practice for the communication master would be to issue a “hard” reset to the device by pulling down the SDQ line for >5 ms and then releasing the SDQ bus before issuing the reset pulse that is approximately 480  $\mu$ s long.

Figure 21. Power Up Best Practice

Figure 21 illustrates the best practice for dealing with initial power on ramps, shown as (1) in the figure, that may be long in duration. The host should issue a “hard” reset, (2), of > 5 ms, which resets the device and generate a presence delay and presence pulse, (3). After that, a “soft” reset of approximately 480  $\mu$ s can be applied, (4), which also generates a high presence delay and low presence pulse, (5).

## 10 Layout

### 10.1 Layout Guidelines

The bq2022A only has one signal (SDQ). Best practice is to route the signal trace directly from the SDQ pin of bq2022A to the external connector of the application system or to host SDQ master device. Signal trace should be shielded properly with a parallel ground plane. If possible use two vias per VSS pin to reach the ground plane [Figure 22](#). If a full ground plane is not available to the bq2022A, then try to connect both VSS pins with a large trace surrounding most of the device and have a trace leaving the VSS pin that is adjacent to SDQ pin so that it follows the SDQ trace back to the SDQ master interface pins [Figure 23](#).

### 10.2 Layout Example

**Figure 22. Board Layout Example with Ground Plane**

**Figure 23. Board Layout Example without Ground Plane**

## 11 Device and Documentation Support

### 11.1 Documentation Support

#### 11.1.1 Related Documentation

*bq2022A Evaluation Software User's Guide* ([SLUU258](#))

### 11.2 Trademarks

SDQ is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ2022ADBZR	ACTIVE	SOT-23	DBZ	3	3000	Green (RoHS & no Sb/Br)	CU NIPDAU   Call TI	Level-1-260C-UNLIM	-20 to 70	BYCI	<a href="#">Samples</a>
BQ2022ADBZRG4	ACTIVE	SOT-23	DBZ	3	3000	Green (RoHS & no Sb/Br)	Call TI	Level-1-260C-UNLIM	-20 to 70	BYCI	<a href="#">Samples</a>
BQ2022ALPR	ACTIVE	TO-92	LP	3	2000	Green (RoHS & no Sb/Br)	CU SN	N / A for Pkg Type	0 to 70	BYE	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
