FDMF3033 –Smart Power Stage (SPS) Module

Features

- Supports PS4 Mode for IMVP-8
- Ultra-Compact 5 mm x 5 mm PQFN Copper-Clip Package with Flip Chip Low-Side MOSFET
- High Current Handling: 60 A
- 3-State 5 V PWM Input Gate Driver
- Low Shutdown Current: I_{VCC} < 6 µA
- Diode Emulation for Enhanced Light Load Efficiency
- Fairchild PowerTrench® MOSFETs for Clean Voltage Waveforms and Reduced Ringing
- Fairchild SyncFET™ Technology (Integrated Schottky Diode) in Low-Side MOSFET
- Integrated Bootstrap Schottky Diode
- Optimized / Extremely Short Dead-Times
- Under-Voltage Lockout (UVLO) on VCC
- Optimized for Switching Frequencies up to 1.5 MHz
- Operating Junction Temperature Range: -40°C to +125°C
- Fairchild Green Packaging and RoHS Compliance

Description

The SPS family is Fairchild's next-generation, fully optimized, ultra-compact, integrated MOSFET plus driver power stage solution for high-current, high-frequency, synchronous buck, DC-DC applications. The FDMF3033 integrates a driver IC with a bootstrap Schottky diode and two power MOSFETs into a thermally enhanced, ultra-compact 5 mm x 5 mm package.

With an integrated approach, the SPS switching power stage is optimized for driver and MOSFET dynamic performance, minimized system inductance, and power MOSFET $R_{DS(ON)}$. The SPS family uses Fairchild's high-performance PowerTrench® MOSFET technology, which reduces switch ringing, eliminating the need for a snubber circuit in most buck converter applications.

A driver IC with reduced dead times and propagation delays further enhances the performance. The FDMF3033 supports diode emulation (using FCCM pin) for improved light-load efficiency. The FDMF3033 also provides a 3-state 5 V PWM input for compatibility with a wide range of PWM controllers.

Applications

- Notebook, Tablet PC and Ultrabook
- Servers and Workstations, V-Core and Non-V-Core DC-DC Converters
- Desktop and All-in-One Computers, V-Core and Non-V-Core DC-DC Converters
- High-Current DC-DC Point-of-Load Converters
- Small Form-Factor Voltage Regulator Modules

Pin Configuration

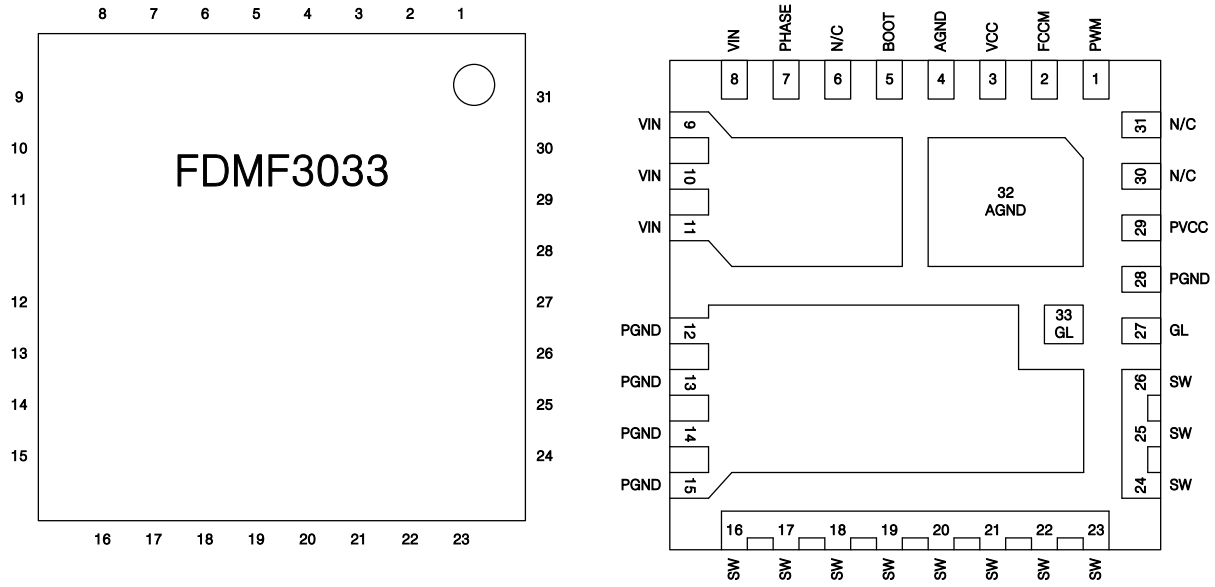

Figure 3. Pin Configuration - Top View and Transparent View

Pin Definitions

Pin #	Name	Description
1	PWM	PWM input to the gate driver IC
2	FCCM	The FCCM pin enables or disables Diode Emulation. When FCCM is LOW, diode emulation is allowed. When FCCM is HIGH, continuous conduction mode is forced. High impedance on the input of FCCM will shut down the driver IC (and module).
3	VCC	Power supply input for all analog control functions; this is the “quiet” V_{CC}
4, 32	AGND	Analog ground for analog portions of the IC and for substrate, pin 4 and pin 32 are internally fused (shorted)
5	BOOT	Supply for high-side MOSFET gate driver. A capacitor from BOOT to PHASE supplies the charge to turn on the N-channel high-side MOSFET. During the freewheeling interval (LS MOSFET on), the high side capacitor is recharged by an internal diode connected to PVCC.
6, 30, 31	N/C	No connect
7	PHASE	Return connection for the boot capacitor
8~11	VIN	Power input for the power stage
12~15, 28	PGND	Power return for the power stage
16~26	SW	Switching node junction between high and low side MOSFETs; also the input into both the gate driver SW node comparator and the ZCD comparator
27, 33	GL	Low-side MOSFET gate monitor
29	PVCC	Power supply input for LS(1) gate driver and boot diode

Note:
1. LS = Low Side.

Absolute Maximum Ratings

Stresses exceeding the Absolute Maximum Ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only. $T_A = T_J = 25°C$

Symbol	Parameter		Min.	Max.	Unit

$I_{O(AV)}$[2]	Output Current	f_{SW}=300 kHz, V_{IN}=12 V, V_{OUT}=1 V		60	A
		f_{SW}=1000 kHz, V_{IN}=12 V, V_{OUT}=1 V		55	
θ_{J-A}	Junction-to-Ambient Thermal Resistance			12.4	°C/W
θ_{J-PCB}	Junction-to-PCB Thermal Resistance (under Fairchild SPS Thermal Board)			1.8	°C/W
T_A	Ambient Temperature Range		-40	+125	°C
T_J	Maximum Junction Temperature			+150	°C
T_{STG}	Storage Temperature Range		-55	+150	°C
ESD	Electrostatic Discharge Protection	Human Body Model, JESD22-A114		1.5	kV
		Charged Device Model, JESD22-C101		2.5	

Note:

2. $I_{O(AV)}$ is rated with testing Fairchild's SPS evaluation board at $T_A = 25°C$ with natural convection cooling. This rating is limited by the peak SPS temperature, $T_J = 150°C$, and varies depending on operating conditions and PCB layout. This rating may be changed with different application settings.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended Operating Conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{CC}	Control Circuit Supply Voltage	4.5	5.0	5.5	V
PV_{CC}	Gate Drive Circuit Supply Voltage	4.5	5.0	5.5	V
V_{IN}	Output Stage Supply Voltage	4.5[3]	12.0	24.0[4]	V

Notes:

3. 3.0 V V_{IN} is possible according to the application condition.
4. Operating at high V_{IN} can create excessive AC voltage overshoots on the SW-to-GND and BOOT-to-GND nodes during MOSFET switching transient. For reliable SPS operation, SW to GND and BOOT to GND must remain at or below the Absolute Maximum Ratings in the table above.

Electrical Characteristics

Typical value is under V_{IN}=12 V, V_{CC}=PV_{CC}=5 V and T_A=T_J=+ 25°C unless otherwise noted. Minimum / Maximum values are under V_{IN}=12 V, V_{CC}=PV_{CC}=5 V ± 10% and T_J=T_A=-40 ~ 125°C unless otherwise noted.

Figure 25. PWM Timing Diagram

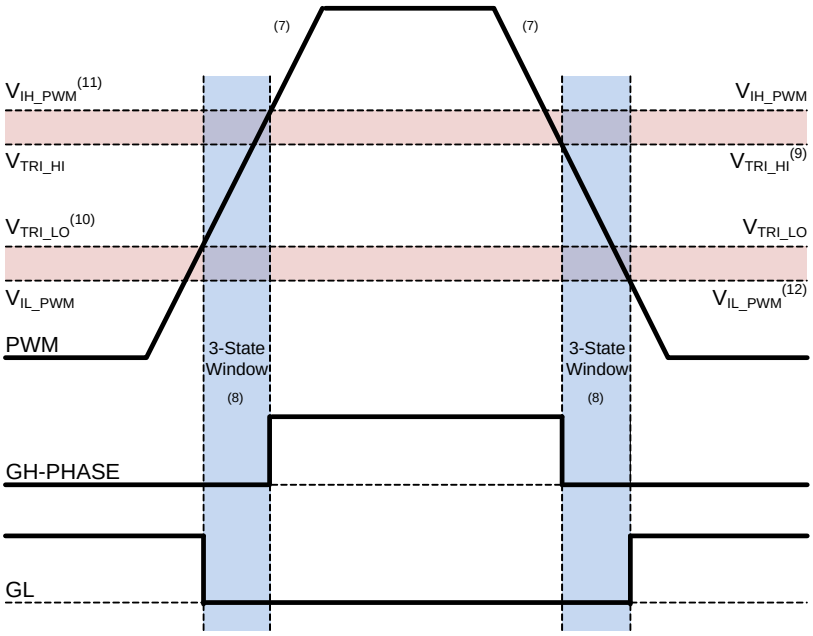

Figure 26. PWM Threshold Definition

Notes:

6. The timing diagram in Figure 26 assumes very slow ramp on PWM.
7. Slow ramp of PWM implies the PWM signal remains within the 3-state window for a time >>> $t_{D\_HOLD-OFF}$.
8. V_{TRI_HI} = PWM trip level to enter 3-state on PWM falling edge.
9. V_{TRI_LO} = PWM trip level to enter 3-state on PWM rising edge.
10. V_{IH_PWM} = PWM trip level to exit 3-state on PWM rising edge and enter the PWM HIGH logic state.
11. V_{IL_PWM} = PWM trip level to exit 3-state on PWM falling edge and enter the PWM LOW logic state.

Description

The SPS FDMF3033 is a driver-plus-MOSFET module optimized for the synchronous buck converter topology. A PWM input signal is required to properly drive the high-side and the low-side MOSFETs. The part is capable of driving speed up to 1.5 MHz.

Power-On Reset (POR & UVLO)

The FDMF3033 incorporates a POR feature that ensures both LDRV and HDRV are forced inactive (LDRV = HDRV = 0) until UVLO > 3.4 V (typical rising threshold). UVLO is performed on VCC (not on PVCC or VIN).

After all gate drive blocks are fully powered on and have finished the startup sequence, the internal driver IC EN_PWM signal is released HIGH, enabling the driver outputs. Once the driver POR has finished, the driver follows the state of the PWM signal (it is assumed that at startup the controller is either in a high-impedance state or forcing the PWM signal to be within the driver 3-state window).

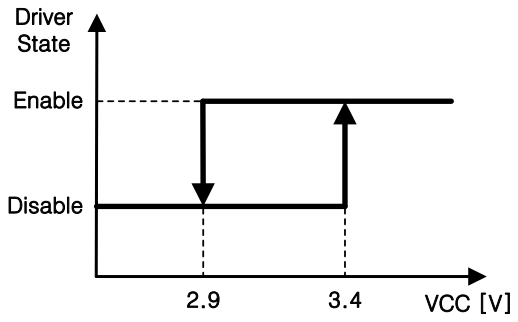

Figure 27. UVLO

3-State PWM Input

The FDMF3033 incorporates a 3-state 5 V PWM input gate drive design. The 3-state gate drive has both logic HIGH and LOW levels, along with a 3-state shutdown window. When the PWM input signal enters and remains within the 3-state window for a defined hold-off time ($t_{D\_HOLD-OFF}$), both GL and GH are pulled LOW. This feature enables the gate drive to shutdown both the high-side and the low-side MOSFETs to support features such as phase shedding, a common feature on multi-phase voltage regulators.

Table 1. PWM Logic Table

PWM	FCCM	GH	GL
3-state	1	0	0
0	1	0	1
1	1	1	0

FCCM

The FCCM pin can be used to control Diode Emulation or used to shut down the driver IC (with ICC < 6 µA, ICC = current consumed by VCC and PVCC). When FCCM is LOW, diode emulation is allowed. When FCCM is HIGH, continuous conduction mode is forced. High impedance on the input of FCCM shuts down the driver IC (and module).

Table 2. FCCM Logic Table

PWM	FCCM	GH	GL	Driver Enable State
x	3-state	0	0	0 (I_{CC} < 6 µA)
3-state	0	0	0	1
3-state	1	0	0	1
0	0	0	1 when IL > 0 0 when IL < 0	1
1	0	1	0	1
0	1	0	1	1
1	1	1	0	1

(FCCM = 1 → Forced CCM)
Setting the FCCM pin to a HIGH state will allow for forced CCM operation. During forced CCM, the FDMF3033 will always follow the PWM signal and allow for negative inductor current.

(FCCM = 0 → Diode Emulation / DCM)
Setting the FCCM pin to a LOW state will enable diode emulation. Diode emulation allows for higher converter efficiency under light load situations. With diode emulation is activated, the FDMF3033 will detect the zero current crossing of the output inductor (at light loads) and will turn off low side MOSFET gate GL to prevent negative inductor current from flowing. Diode emulation ensures Discontinuous Conduction Mode (DCM) operation. Diode emulation is asynchronous to the PWM signal. Therefore, the FDMF3033 will respond to the FCCM input immediately after it changes state.

(FCCM = HiZ → Shutdown)
Setting the FCCM pin to a HIGH impedance state (HiZ) will shutdown the driver IC with I_{CC}<6 µA. The FDMF3033 requires a startup latency time of (< 15 µsec) when exiting a HiZ FCCM state. Low I_{CC} driver shutdown is often needed to support power saving modes in multi-phase voltage regulator designs.

Power Sequence

The FDMF3033 requires four (4) input signals to perform normal switching operation: VIN, VCC / PVCC, PWM, and FCCM.

The VIN pins are tied to the system main DC power rail.

The PVCC and VCC pins are typically powered from the same 5 V source. These pins can be either tied directly together or tied together through an external RC filter. The filter resistor / capacitor is used to de-couple the switching noise from PVCC to VCC. Refer to Figure 1 for RC filter schematic.

The FCCM pin can be tied to the VCC rail with an external pull-up resistor and it will maintain HIGH once the VCC rail turns on. Or the FCCM pin can be directly tied to the PWM controller for other purposes.

Synchronous Buck Operating Modes

Continuous Current Mode with Positive Inductor Current (CCM1)

This condition is typical of a moderate-to-heavily loaded power stage. During this mode, the inductor current is always flowing towards the output capacitor. The high-side MOSFET is hard-switching during the turn-on and turn-off events. The low-side MOSFET acts a synchronous rectifier.

Continuous Current Mode with Negative Inductor Current (CCM2)

This operating mode can occur during two situations:

1.) A converter load transient may force the power stage to pull energy from the output capacitors and deliver the energy back to the input capacitors (Boost Mode). This situation is common in synchronous buck applications that require output voltage load-line positioning.

During this mode, the negative inductor current (current flowing into FDMF3033 SW node) may become large and persist for many cycles. This situation causes the low-side MOSFET to hard switch and the high-side MOSFET acts as a synchronous rectifier. It is highly recommended to check peak SW node voltage stress during any situation that can generate large negative inductor currents.

2.) A power stage that is operating in forced CCM mode with lighter converter loads. Here, the inductor peak-to-peak ripple current is greater than two times the load current and the inductor current is flowing both positive and negative in a switching cycle.

Discontinuous Current Mode (DCM)

This condition is typical of a lightly loaded power stage. During DCM, the high-side MOSFET turns on into an un-energized out filter inductor (i.e. zero inductor current). The inductor current ramps up during the high-side MOSFET on-time and is then allowed to ramp back down to aero amps during the low-side on-time (i.e. inductor current returns to zero every switching cycle).

High-Side Driver

The high-side driver (HDRV) is designed to drive a floating N-channel MOSFET (Q1). The bias voltage for the high-side driver is developed by a bootstrap supply circuit, consisting of the internal Schottky diode and external bootstrap capacitor (C_{BOOT}). During startup, the SW node should be held at PGND, allowing C_{BOOT} to charge to PVCC through the internal bootstrap diode. When the PWM input goes HIGH, HDRV begins to charge the gate of the high-side MOSFET (internal GH pin). During this transition, the charge is removed from the C_{BOOT} and delivered to the gate of Q1. As Q1 turns on, SW rises to V_{IN}, forcing the BOOT pin to V_{IN} + V_{BOOT}, which provides sufficient V_{GS} enhancement for Q1. To complete the switching cycle, Q1 is turned off by pulling HDRV to SW. C_{BOOT} is then recharged to PVCC when the SW falls to PGND. HDRV output is in phase with the PWM input. The high-side gate is held LOW when the driver is disabled or the PWM signal is held within the 3-state window for longer than the 3-state hold-off time, $t_{D\_HOLD-OFF}$.

Low-Side Driver

The low-side driver (LDRV) is designed to drive the gate-source of a ground-referenced, low-$R_{DS(ON)}$, N-channel MOSFET (Q2). The bias for LDRV is internally connected between the PVCC and AGND. When the driver is enabled, the driver output is 180° out of phase with the PWM input. When the driver is disabled (FCCM = 0 V), LDRV is held LOW.

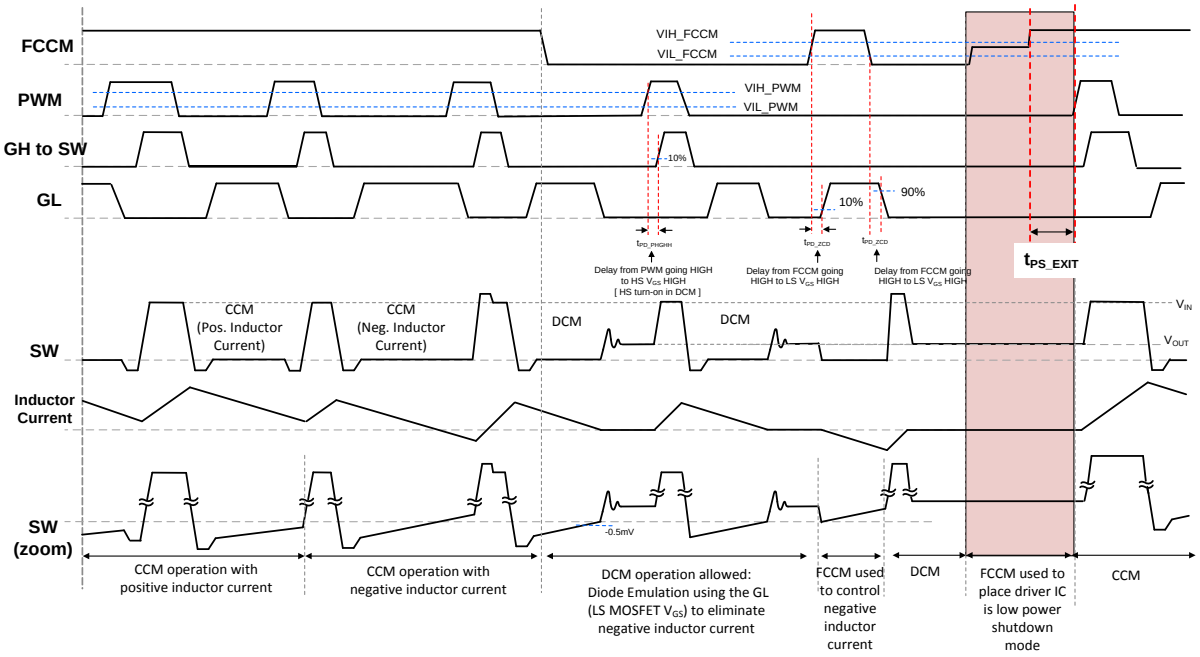

Figure 29. FCCM 3-State Timing Diagram

Application Information

Decoupling Capacitor for PVCC & VCC

For the supply inputs (PVCC and VCC pins), local decoupling capacitors are required to supply the peak driving current and to reduce noise during switching operation. Use at least 0.68 ~ 1 µF / 0402 ~ 0603 / X5R ~ X7R multi-layer ceramic capacitors for both power rails. Keep these capacitors close to the PVCC and VCC pins and PGND and AGND copper planes. If the de-coupling capacitors need to be located on the bottom side of board, place through-hole vias on each pad connecting top side and bottom side PVCC and VCC nodes with low impedance current paths, *see Figure 31 and Figure 32.*

The supply voltage range on PVCC and VCC is 4.5 V ~ 5.5 V, and typically 5 V for normal applications.

R-C Filter on VCC

The PVCC pin provides power to the gate drive of the high-side and low-side power MOSFETs. In most cases, PVCC can be connected directly to VCC, which is the pin that provides power to the analog and logic blocks of the driver. To avoid switching noise injection from PVCC into VCC, a filter resistor can be inserted between PVCC and VCC decoupling capacitors.

Recommended filter resistor value range is 0 ~ 4.7 Ω, typically 0 Ω for most applications.

Bootstrap Circuit

The bootstrap circuit uses a charge storage capacitor (C_{BOOT}). A bootstrap capacitor of 0.1 ~ 0.22 µF / 0402 ~ 0603 / X5R ~ X7R is usually appropriate for most switching applications. A series bootstrap resistor may be needed for specific applications to lower high-side MOSFET switching speed. The boot resistor is required when the SPS is switching above 15 V V_{IN}; when it is effective at controlling V_{SW} overshoot. R_{BOOT} value from zero to 4.7 Ω is typically recommended to reduce excessive voltage spike and ringing on the SW node. A higher R_{BOOT} value can cause lower efficiency due to high switching loss of high-side MOSFET.

Do not add a capacitor or resistor between the BOOT pin and GND.

PWM (Input)

The PWM pin recognizes three different logic levels from PWM controller: HIGH, LOW, and 3-state. When the PWM pin receives a HIGH command, the gate driver turns on the high-side MOSFET. When the PWM pin receives a LOW command, the gate driver turns on the low-side MOSFET. When the PWM pin receives a voltage signal inside of the 3-state window (V_{TRI_Window}) and exceeds the 3-state hold-off time, the gate driver turns off both high-side and low-side MOSFETs. To recognize the high-impedance 3-state signal from the controller, the PWM pin has an internal resistor divider from VCC to PWM to AGND. The resistor divider sets a voltage level on the PWM pin inside the 3-state window when the PWM signal from the controller is high-impedance.

FCCM (Input)

When the FCCM pin is set HIGH, the driver IC Zero Cross Detect (ZCD) comparator is disabled, and the high-side and low-side MOSFETs switch in FCCM (Forced CCM) and follow the PWM signal. When the FCCM pin is set LOW, the low-side MOSFET turns off when the SPS driver detects negative inductor current during the low-side MOSFET turn-on period. This operating mode is commonly referred to as diode emulation. The diode emulation feature allows for higher converter efficiency during light-load condition and PFM / DCM operation.

Applications that require diode emulation and/or low shutdown current should actively drive the FCCM pin from a PWM controller. Do not add any noise filter capacitor on the FCCM pin.

Power Loss and Efficiency

Figure 30 shows an example diagram for power loss and efficiency measurement.

Power loss calculation and equation examples:

$P_{IN} = (V_{IN} * I_{IN}) + (V_{CC} * I_{CC})$ [W]
$P_{SW} = V_{SW} * I_{OUT}$ [W]
$P_{OUT} = V_{OUT} * I_{OUT}$ [W]
$P_{LOSS\_MODULE} = P_{IN} – P_{SW}$ [W]
$P_{LOSS\_TOTAL} = P_{IN} – P_{OUT}$ [W]
$EFFI_{MODULE} = (P_{SW} / P_{IN}) * 100$ [%]
$EFFI_{TOTAL} = (P_{OUT} / P_{IN}) * 100$ [%]

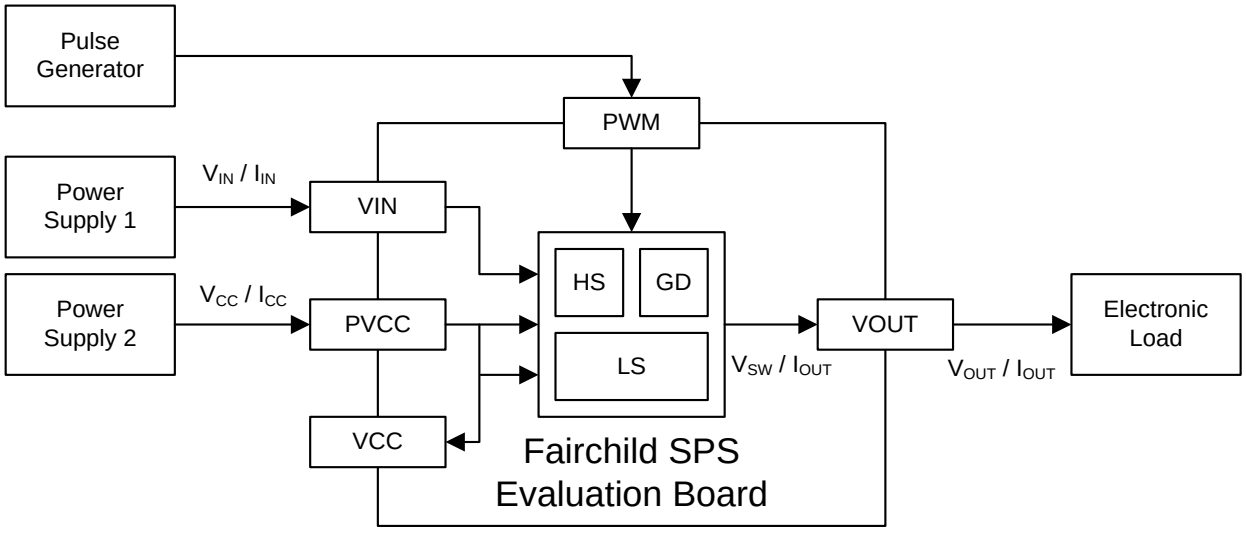

Figure 30. Power Loss and Efficiency Measurement Diagram

PCB Layout Guideline

Figure 31 and Figure 32 provide an example of single-phase layout for the FDMF3033 and critical components. All of the high-current paths; such as VIN, SW, VOUT, and GND coppers; should be short and wide for low parasitic inductance and resistance. This helps achieve a more stable and evenly distributed current flow, along with enhanced heat radiation and system performance.

Input ceramic bypass capacitors must be close to the VIN and PGND pins. This reduces the high-current power loop inductance and the input current ripple induced by the power MOSFET switching operation.

The SW copper trace serves two purposes. In addition to being the high-frequency current path from the SPS package to the output inductor, it serves as a heat sink for the low-side MOSFET. The trace should be short and wide enough to present a low-impedance path for the high-frequency, high-current flow between the SPS and the inductor. The short and wide trace minimizes electrical losses and SPS temperature rise. The SW node is a high-voltage and high-frequency switching node with high noise potential. Care should be taken to minimize coupling to adjacent traces. Since this copper trace acts as a heat sink for the low-side MOSFET, balance using the largest area possible to improve SPS cooling while maintaining acceptable noise emission.

An output inductor should be located close to the FDMF3033 to minimize the power loss due to the SW copper trace. Care should also be taken so the inductor dissipation does not heat the SPS.

PowerTrench® MOSFETs are used in the output stage and are effective at minimizing ringing due to fast switching. In most cases, no RC snubber on SW node is required. If a snubber is used, it should be placed close to the SW and PGND pins. The resistor and capacitor of the snubber must be sized properly to not generate excessive heating due to high power dissipation.

Decoupling capacitors on PVCC, VCC, and BOOT capacitors should be placed as close as possible to the PVCC ~ PGND, VCC ~ AGND, and BOOT ~ PHASE pin pairs to ensure clean and stable power supply. Their routing traces should be wide and short to minimize parasitic PCB resistance and inductance.

The board layout should include a placeholder for small-value series boot resistor on BOOT ~ PHASE. The boot-loop size, including series R_{BOOT} and C_{BOOT}, should be as small as possible.

A boot resistor may be required when the SPS is operating above 15 V V_{IN} and it is effective to control the high-side MOSFET turn-on slew rate and SW voltage overshoot. R_{BOOT} can improve noise operating margin in synchronous buck designs that may have noise issues due to ground bounce or high positive and negative V_{SW} ringing. Inserting a boot resistance lowers the SPS module efficiency. Efficiency versus switching noise must be considered. R_{BOOT} values from 0.5 Ω to 4.7 Ω are typically effective in reducing V_{SW} overshoot.

The VIN and PGND pins handle large current transients with frequency components greater than 100 MHz. If possible, these pins should be connected directly to the VIN and board GND planes. The use of thermal relief traces in series with these pins is not recommended since this adds extra parasitic inductance to the power path. This added inductance in series with either the VIN or PGND pin degrades system noise immunity by increasing positive and negative V_{SW} ringing.

PGND pad and pins should be connected to the GND copper plane with multiple vias for stable grounding. Poor grounding can create a noisy and transient offset voltage level between PGND and AGND. This could lead to faulty operation of gate driver and MOSFETs.

Ringing at the BOOT pin is most effectively controlled by close placement of the boot capacitor. Do not add any additional capacitors between BOOT to PGND. This may lead to excess current flow through the BOOT diode, causing high power dissipation.

The FCCM pin integrates weak internal pull-up and pull-down current sources. The current sources are used to help hold the FCCM in the 3-state window. This pin should not have any noise filter capacitors if actively driven by a PWM controller. Do not float this pin.

Multiple vias should be placed on the VIN and VOUT copper areas to interconnect nodes that are located on multiple layers (top, inner, and bottom layers). The vias will help to evenly distribute current flow and heat conduction.

Care should be taken when routing the copper pour area and via placement on the SW copper. A large SW node copper pour can result in excessive parasitic inductance and capacitance, which can increase switching noise. However, the copper pour area and via placement can affect the efficiency and thermal performance, where a large copper pour can help decrease thermal resistance and parasitic resistance. If possible, place the SW node copper on the top layer with no vias on the SW copper to minimize switch node parasitic noise. If multiple SW node layers are needed, vias should be relatively large and of reasonably low inductance.

Critical high-frequency components; such as R_{BOOT}, C_{BOOT}, RC snubber, and bypass capacitors; should be located as close to the respective SPS module pins as possible on the top layer of the PCB. If this is not feasible, they can be placed on the board bottom side and their pins connected from bottom to top through a network of low-inductance vias.

DETAIL 'A'

SCALE: 2:1

NOTES: UNLESS OTHERWISE SPECIFIED

A) DOES NOT FULLY CONFORM TO JEDEC REGISTRATION MO-220, DATED MAY/2005.
B) ALL DIMENSIONS ARE IN MILLIMETERS.
C) DIMENSIONS DO NOT INCLUDE BURRS OR MOLD FLASH. MOLD FLASH OR BURRS DOES NOT EXCEED 0.10MM.
D) DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
E) DRAWING FILE NAME: MKT-PQFN31BREV3

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. TO OBTAIN THE LATEST, MOST UP-TO-DATE DATASHEET AND PRODUCT INFORMATION, VISIT OUR WEBSITE AT HTTP://WWW.FAIRCHILDSEMI.COM. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

AUTHORIZED USE

Unless otherwise specified in this data sheet, this product is a standard commercial product and is not intended for use in applications that require extraordinary levels of quality and reliability. This product may not be used in the following applications, unless specifically approved in writing by a Fairchild officer: (1) automotive or other transportation, (2) military/aerospace, (3) any safety critical application – including life critical medical equipment – where the failure of the Fairchild product reasonably would be expected to result in personal injury, death or property damage. Customer's use of this product is subject to agreement of this Authorized Use policy. In the event of an unauthorized use of Fairchild's product, Fairchild accepts no liability in the event of product failure. In other respects, this product shall be subject to Fairchild's Worldwide Terms and Conditions of Sale, unless a separate agreement has been signed by both Parties.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Terms of Use

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

PRODUCT STATUS DEFINITIONS

Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative / In Design	Datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	Datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	Datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design.
Obsolete	Not In Production	Datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only.
