

## FEATURES

- 24 GHz to 24.25 GHz voltage controlled oscillator (VCO)
- 2-channel 24 GHz power amplifier (PA) with 8 dBm output
- Single-ended outputs
- 2-channel muxed outputs with mute function
- Programmable output power
- N divider output (frequency discriminator)
- 24 GHz local oscillator (LO) output buffer
- 250 MHz signal bandwidth
- Power control detector
- Auxiliary 8-bit ADC
- ±5°C temperature sensor
- 4-wire serial peripheral interface (SPI)
- Electrostatic discharge (ESD) performance
  - Human body model (HBM): 2000 V
  - Charged device model (CDM): 250 V
- Qualified for automotive applications

## APPLICATIONS

- Automotive radars
- Industrial radars
- Microwave radar sensors

## Industrial sensors

- Precision instrumentation
- Tank level sensors
- Smart sensors
  - Door opening
  - Energy saving

## Commercial sensors: object detection and tracking

- Cars, boats, aircraft, and UAVs (drones): collision avoidance
- Intelligent transportation systems: intelligent traffic monitoring and control
- Surveillance and security

## GENERAL DESCRIPTION

The **ADF5901** is a 24 GHz Tx monolithic microwave integrated circuit (MMIC) with an on-chip, 24 GHz VCO with PGA and dual Tx channels for radar systems. The on-chip, 24 GHz VCO generates the 24 GHz signal for the two Tx channels and the LO output. Each Tx channel contains a power control circuit. There is also an on-chip temperature sensor.

Control of all the on-chip registers is through a simple 4-wire interface.

The **ADF5901** comes in a compact 32-lead, 5 mm × 5 mm LFCSP package.

<sup>1</sup> Two signal planes (that is, on top and bottom surfaces of the board), two buried planes, and nine vias.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

- NOTES  
1. THE LFCSP HAS AN EXPOSED PAD THAT MUST BE CONNECTED TO GND.

Figure 4. Pin Configuration

Table 4. Pin Function Descriptions

| Pin No.                    | Mnemonic                | Description  |
|----------------------------|-------------------------|--|
| 1, 3, 6, 8, 10, 12, 13, 19 | GND                     | RF Ground. Tie all ground pins together.   |
| 2                          | TX <sub>OUT1</sub>      | 24 GHz Tx Output 1.  |
| 4, 5                       | TX_AHI                  | Voltage Supply for the Tx Section. Connect decoupling capacitors (0.1 μF, 1 nF, and 10 pF) to the ground plane as close as possible to this pin. TX_AHI must be the same value as AHI.   |
| 7                          | TX <sub>OUT2</sub>      | 24 GHz Tx Output 2.  |
| 9                          | ATEST                   | Analog Test Pin.   |
| 11                         | LO <sub>OUT</sub>       | LO Output.   |
| 14                         | RF_AHI                  | Voltage Supply for the RF Section. Connect decoupling capacitors (0.1 μF, 1 nF, and 10 pF) to the ground plane as close as possible to this pin. RF_AHI must be the same value as AHI.   |
| 15                         | REF <sub>IN</sub>       | Reference Input. This pin is a CMOS input with a nominal threshold of DVDD/2 and a dc equivalent input resistance of 100 kΩ. See Figure 14. This input can be driven from a TTL or CMOS crystal oscillator, or it can be ac-coupled. |
| 16                         | AHI                     | Voltage Supply for the Analog Section. Connect decoupling capacitors (0.1 μF, 1 nF, and 10 pF) to the ground plane as close as possible to this pin.   |
| 17                         | DVDD                    | Digital Power Supply. This supply may range from 3.135 V to 3.465 V. Place decoupling capacitors (0.1 μF, 1 nF, and 10 pF) to the ground plane as close as possible to this pin. DVDD must be the same value as AHI.                 |
| 18                         | VREG                    | Internal 1.8 V Regulator Output. Connect a 220 nF capacitor to ground as close as possible to this pin.  |
| 20                         | CE                      | Chip Enable. A logic low on this pin powers down the device. Taking the pin high powers up the device, depending on the status of the power-down bit, PD1.   |
| 21                         | CLK                     | Serial Clock Input. This serial clock input clocks in the serial data to the registers. The data is latched into the 32-bit shift register on the CLK rising edge. This input is a high impedance CMOS input.                        |
| 22                         | DATA                    | Serial Data Input. The serial data is loaded MSB first with the four LSBs as the control bits. This input is a high impedance CMOS input.  |
| 23                         | LE                      | Load Enable, CMOS Input. When LE goes high, the data stored in the shift registers is loaded into one of the 16 latches with the latch selected via the control bits.  |
| 24                         | DOUT                    | Serial Data Output.  |
| 25                         | MUXOUT                  | Multiplexer Output. This multiplexer output allows either the scaled RF or the scaled reference frequency to be accessed externally.   |
| 26                         | R <sub>SET</sub>        | Resistor Setting Pin. Connecting a 5.1 kΩ resistor between this pin and GND sets an internal current. The nominal voltage potential at the R <sub>SET</sub> pin is 0.62 V.   |
| 27                         | AUX                     | Auxiliary Output. The VCO/2 output or VCO/4 is available.  |
| 28                         | $\overline{\text{AUX}}$ | Complementary Auxiliary Output. The VCO/2 output or VCO/4 is available.  |
| 29                         | V <sub>TUNE</sub>       | Control Input to the VCO. This voltage determines the output.  |
| 30                         | VCO_AHI                 | Voltage Supply for the VCO Section. Connect decoupling capacitors (0.1 μF, 1 nF, and 10 pF) to the ground plane as close as possible to this pin. VCO_AHI must be the same value as AHI.   |

| Pin No. | Mnemonic | Description  |
|---------|----------|--|
| 31      | C1       | Decoupling Capacitor 1. Place a 47 nF capacitor to ground as close as possible to this pin.  |
| 32      | C2       | Decoupling Capacitor 2. Place a 220 nF capacitor to ground as close as possible to this pin. |
|         | EP       | Exposed Pad. The LFCSP has an exposed pad that must be connected to GND.                     |

# THEORY OF OPERATION

## REFERENCE INPUT SECTION

The reference input stage is shown in Figure 14. SW1 and SW2 are normally closed switches. SW3 is normally open. When power-down is initiated, SW3 is closed and SW1 and SW2 are opened. This configuration ensures that there is no loading of the REF<sub>IN</sub> pin on power-down.

Figure 14. Reference Input Stage

## RF INT DIVIDER

The RF INT counter allows a division ratio in the RF feedback counter. Division ratios from 75 to 4095 are allowed.

## INT, FRAC, AND R RELATIONSHIP

Generate the RF VCO frequency (RF<sub>OUT</sub>) using the INT and FRAC values in conjunction with the R counter, as follows:

$$RF_{OUT} = f_{REF} \times (INT + (FRAC/2^{25})) \times 2 \tag{1}$$

where:

RF<sub>OUT</sub> is the output frequency of internal VCO.

f<sub>REF</sub> is the internal reference frequency.

INT is the preset divide ratio of the binary 12-bit counter (75 to 4095).

FRAC is the numerator of the fractional division (0 to 2<sup>25</sup> - 1).

$$f_{REF} = REF_{IN} \times ((1 + D)/(R \times (1 + T))) \tag{2}$$

where:

REF<sub>IN</sub> is the reference input frequency.

D is the REF<sub>IN</sub> doubler bit (0 or 1).

R is the preset divide ratio of the binary, 5-bit, programmable reference counter (1 to 32).

T is the REF<sub>IN</sub> divide by 2 bit (0 or 1).

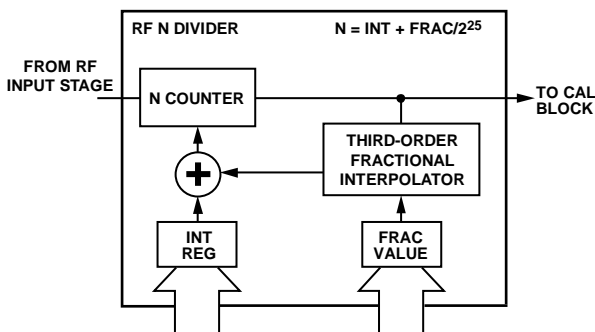

Figure 15. RF N Divider

Figure 16. Reference Divider

## R COUNTER

The 5-bit R counter allows the input reference frequency (REF<sub>IN</sub>) to be divided down to supply the reference clock to the VCO calibration block. Division ratios from 1 to 32 are allowed.

## INPUT SHIFT REGISTER

The ADF5901 digital section includes a 5-bit RF R counter, a 12-bit RF N counter, and a 25-bit FRAC counter. Data is clocked into the 32-bit input shift register on each rising edge of CLK. The data is clocked in MSB first. Data is transferred from the input shift register to one of 12 latches on the rising edge of LE. The destination latch is determined by the state of the five control bits (C5, C4, C3, C2, and C1) in the input shift register. These are the five LSBs (DB4, DB3, DB2, DB1, and DB0, respectively), as shown in Figure 2. Table 5 shows the truth table for these bits. Figure 17 and Figure 18 show a summary of how the latches are programmed.

## PROGRAM MODES

Table 5 and Figure 19 through Figure 30 show how to set up the program modes in the ADF5901.

Several settings in the ADF5901 are double buffered. These include the LSB fractional value, R counter value (R divider), reference doubler, clock divider, RDIV2, and MUXOUT. This means that two events must occur before the device uses a new value for any of the double-buffered settings. First, the new value is latched into the device by writing to the appropriate register. Second, a new write must be performed on Register R5.

For example, updating the fractional value can involve a write to the 13 LSB bits in Register R6 and the 12 MSB bits in Register R5. Write to Register R6 first, followed by the write to Register R5. The frequency change begins after the write to Register R0. Double buffering ensures that the bits written to in Register R6 do not take effect until after the write to Register R5.

**Table 5. C5, C4, C3, C2, and C1 Truth Table**

| Control Bits |          |          |          |          | Register |
|--------------|----------|----------|----------|----------|----------|

Figure 18. Register Summary (Register 7 to Register 11)

13336-018

Figure 19. Register 0 (R0)

13336-019

## REGISTER 0

### Control Bits

With Bits[C5:C1] set to 00000, Register R0 is programmed. Figure 19 shows the input data format for programming this register.

### Auxiliary Buffer Gain

Bits[DB23:DB21] set the auxiliary output buffer gain (see Figure 19).

### Auxiliary Divide by 2

Bit DB20 selects the auxiliary output divider. Setting this bit to 0 selects divide by 2 (6 GHz output). Setting the bit to 1 selects divide by 1 (12 GHz output).

### Power-Up R Counter

Bit DB15 provides the power-up bit for the R counter block. Setting this bit to 0 performs a power-down of the counter block. Setting this bit to 1 returns the counter block to normal operation.

### Power-Up N Counter

Bit DB14 provides the power-up bit for the N counter block. Setting this bit to 0 performs a power-down of the counter

block. Setting this bit to 1 returns the counter block to normal operation.

### Tx2 Amplitude Calibration

Bit DB12 provides the control bit for amplitude calibration of the Transmitter 2 (Tx2) output. Set this bit to 0 for normal operation. Setting this bit to 1 performs an amplitude calibration of the Tx2 output.

### Tx1 Amplitude Calibration

Bit DB11 provides the control bit for amplitude calibration of the Tx1 output. Set this bit to 0 for normal operation. Setting this bit to 1 performs an amplitude calibration of the Tx1 output.

### Power-Up VCO

Bit DB10 provides the power-up bit for the VCO. Setting this bit to 0 performs a power-down of the VCO. Setting this bit to 1 performs a power-up of the VCO.

### VCO Calibration

Bit DB9 provides the control bit for frequency calibration of the VCO. Set this bit to 0 for normal operation. Setting this bit to 1 performs a VCO frequency and amplitude calibration.

**Power-Up ADC**

Bit DB8 provides the power-up bit for the ADC. Setting this bit to 0 performs a power-down of the ADC. Setting this bit to 1 performs a power-up of the ADC.

**Power-Up Tx2 Output**

Bit DB7 provides the power-up bit for the Tx2 output. Setting this bit to 0 performs a power-down of the Tx2 output. Setting this bit to 1 performs a power-up of the Tx2 output. Only one Tx output can be powered up at any time, either Tx1 (DB6) or Tx2 (DB7).

**Power-Up Tx1 Output**

Bit DB6 provides the power-up bit for the Tx1 output. Setting this bit to 0 performs a power-down of the Tx1 output. Setting this bit to 1 performs a power-up of the Tx1 output. Only one Tx output can be powered up at any time, either Tx1 (DB6) or Tx2 (DB7).

**Power-Up LO Output**

Bit DB5 provides the power-up bit for the LO output. Setting this bit to 0 performs a power-down of the LO output. Setting this bit to 1 performs a power-up of the LO output.

**REGISTER 1**

**Control Bits**

With Bits[C5:C1] set to 00001, Register R1 is programmed. Figure 20 shows the input data format for programming this register.

**Tx Amplitude Calibration Reference Code**

Bits[DB12:DB5] set the Tx amplitude calibration reference code (see Figure 20) for the two Tx outputs during calibration. Calibrate the output power on the Tx outputs from -20 dBm to 8 dBm by setting the Tx amplitude calibration reference code (see Figure 7).

Figure 20. Register 1 (R1)

13336-020

Figure 21. Register 2 (R2)

**REGISTER 2**

**Control Bits**

With Bits[C5:C1] set to 00010, Register R2 is programmed. Figure 21 shows the input data format for programming this register.

**ADC Start**

Bit DB15 starts the ADC conversion. Setting this bit to 1 starts an ADC conversion.

**ADC Average**

Bits[DB14:DB13] program the ADC average, which is the number of averages of the ADC output (see Figure 21).

**ADC Clock Divider**

Bits[DB12:DB5] program the clock divider, which is used as the sampling clock for the ADC (see Figure 21). The output of the R divider block clocks the ADC clock divider. Program a divider value to ensure the ADC sampling clock is 1 MHz.

Figure 22. Register 3 (R3)

**REGISTER 3**

**Control Bits**

With Bits[C5:C1] set to 00011, Register R3 is programmed. Figure 22 shows the input data format for programming this register.

**MUXOUT Control**

Bits[DB15:DB12] control the on-chip multiplexer of the ADF5901. See Figure 22 for the truth table.

**Input/Output (IO) Level**

Bit DB11 controls the DOUT logic levels. Setting this bit to 0 sets the DOUT logic level to 1.8 V. Setting this bit to 1 sets the DOUT logic level to 3.3 V.

**Readback Control**

Bits[DB10:DB5] control the readback data to DOUT on the ADF5901. See Figure 22 for the truth table.

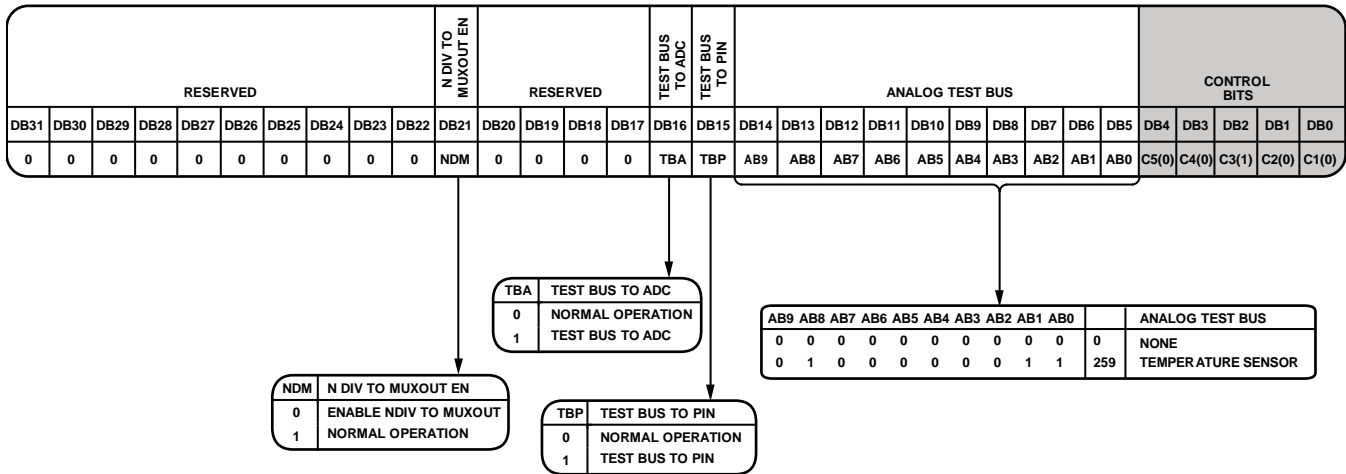

Figure 23. Register 4 (R4)

13336-023

\*THE FRAC VALUE IS MADE UP OF THE 12-BIT MSB STORED IN REGISTER R5, AND THE 13-BIT LSB REGISTER STORED IN REGISTER R6. FRAC VALUE = 13-BIT LSB + 12-BIT MSB x 2<sup>13</sup>.

Figure 24. Register 5 (R5)

13336-024

## REGISTER 4

### Control Bits

With Bits[C5:C1] set to 00100, Register R4 is programmed. Figure 23 shows the input data format for programming this register.

### N Divider to MUXOUT Enable

Bit DB21 controls the internal N divider signal for MUXOUT. Setting this bit to 0 enables the internal N divider signal to MUXOUT. Setting this bit to 1 returns the device to normal operation.

### Test Bus to ADC

Bit DB16 controls the ATEST pin. Set this bit to 0 for normal operation. Setting this bit to 1 connects the analog test bus to the ADC input.

### Test Bus to Pin

Bit DB15 controls the ATEST pin. Setting this bit to 0 sets the ATEST pin to high impedance. Setting this bit to 1 connects the analog test bus to the ATEST pin.

### Analog Test Bus

Bits[DB14:DB5] control the analog test bus. This analog test bus allows access to internal test signals for the temperature sensor. See Figure 23 for the truth table.

## REGISTER 5

### Control Bits

With Bits[C5:C1] set to 00101, Register R5 is programmed. Figure 24 shows the input data format for programming this register.

**12-Bit Integer Value (INT)**

These 12 bits (Bits[DB28:DB17]) set the INT value, which determines the integer part of the RF division factor. This INT value is used in Equation 5. See the RF Synthesis: a Worked Example section for more information. All integer values from 75 to 4095 are allowed.

**12-Bit MSB Fractional Value (FRAC)**

These 12 bits (Bits[DB16:DB5]), together with Bits[DB17:DB5] (FRAC LSB word) in Register R6, control what is loaded as the FRAC value into the fractional interpolator. This FRAC value partially determines the overall RF division factor. It is also used in Equation 1. These 12 bits are the most significant bits (MSB) of the 25-bit FRAC value, and Bits[DB17:DB5] (FRAC LSB word) in Register R6 are the least significant bits (LSB). See the RF Synthesis: a Worked Example section for more information.

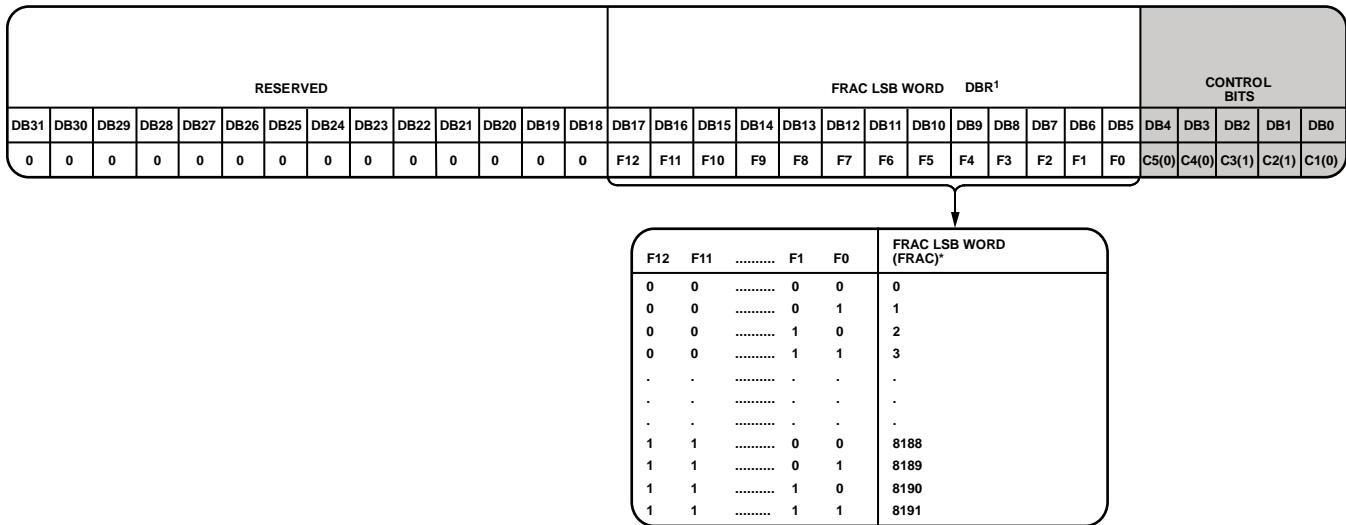

**REGISTER 6**

**Control Bits**

With Bits[C5:C1] set to 00110, Register R6 is programmed. Figure 25 shows the input data format for programming this register.

**13-Bit LSB FRAC Value**

These 13 bits (Bits[DB17:DB5]), together with Bits[DB16:DB5] (FRAC MSB word) in Register R5, control what is loaded as the FRAC value into the fractional interpolator. This FRAC value partially determines the overall RF division factor. It is also used in Equation 1. These 13 bits are the least significant bits (LSB) of the 25-bit FRAC value, and Bits[DB14:DB3] (FRAC MSB word) in Register R5 are the most significant bits (MSB). See the RF Synthesis: a Worked Example section for more information.

<sup>1</sup>DBR = DOUBLE-BUFFERED REGISTER.

\*THE FRAC VALUE IS MADE UP OF THE 12-BIT MSB STORED IN REGISTER R5, AND THE 13-BIT LSB REGISTER STORED IN REGISTER R6. FRAC VALUE = 13-BIT LSB + 12-BIT MSB × 2<sup>13</sup>.

Figure 25. Register 6 (R6)

13336-025

Figure 26. Register 7 (R7)

**REGISTER 7**

**Control Bits**

With Bits[C5:C1] set to 00111, Register R7 is programmed. Figure 26 shows the input data format for programming this register.

**Master Reset**

Bit DB25 provides a master reset bit for the device. Setting this bit to 1 performs a reset of the device and all register maps. Setting this bit to 0 returns the device to normal operation.

**Clock Divider**

Bits[DB23:DB12] set a divider for the VCO frequency calibration. Load the divider such that the time base is 10 μs (see Figure 26).

**Divide by 2 (RDIV2)**

Setting the DB11 bit to 1 inserts a divide by 2 toggle flip flop between the R counter and VCO calibration block.

**Reference Doubler**

Setting DB10 to 0 feeds the REF<sub>IN</sub> signal directly to the 5-bit R counter, disabling the doubler. Setting this bit to 1 multiplies the REF<sub>IN</sub> frequency by a factor of 2 before the REF<sub>IN</sub> signal is fed into the 5-bit R counter.

The maximum allowable REF<sub>IN</sub> frequency when the doubler is enabled is 50 MHz.

**5-Bit R Divider**

The 5-bit R counter allows the input reference frequency (REF<sub>IN</sub>) to be divided down to produce the reference clock to the VCO calibration block. Division ratios from 1 to 31 are allowed.

Figure 30. Register 11 (R11)

**REGISTER 10**

**Control Bits**

With Bits[C5:C1] set to 01010, Register R10 is programmed. Figure 29 shows the input data format for programming this register.

**REGISTER 11**

**Control Bits**

With Bits[C5:C1] set to 01011, Register R11 is programmed. Figure 30 shows the input data format for programming this register.

**Counter Reset**

Bit DB5 provides a counter reset bit for the counters. Setting this bit to 1 performs a counter reset of the device counters. Setting this bit to 0 returns the device to normal operation.

**INITIALIZATION SEQUENCE**

After powering up the device, administer the following programming sequence. The following sequence locks the VCO to 24.125 GHz with a 100 MHz reference and a 50 MHz reference divider frequency:

1. Write 0x02000007 to Register R7 to perform a master reset.
2. Write 0x0000002B to Register R11 to reset the counters.
3. Write 0x0000000B to Register R11 to enable the counters.
4. Write 0x1D32A64A to Register R10.
5. Write 0x2A20B929 to Register R9.
6. Write 0x40003E88 to Register R8 to set the frequency calibration divider clock to 100 kHz.
7. Write 0x809FE520 to Register R0 to power up the device and LO (10 μs).
8. Write 0x011F4827 to Register R7 to set the R counter clock to 50 MHz and the calibration clock to 100 kHz.
9. Write 0x00000006 to Register R6 to set the LSB FRAC = 0.
10. Write 0x01E28005 to Register R5 to set INT = 241 and MSB FRAC = 1024. Therefore, N = 240.25.

11. Write 0x00200004 to Register R4 to set the ATEST pin to high impedance.
12. Write 0x01890803 to Register R3 to set the IO level to V<sub>DD</sub> = 3.3 V.
13. Write 0x00020642 to Register R2 to set the ADC clock to 1 MHz.
14. Write 0xFFFF7FFE1 to Register R1 to set the Tx amplitude level.
15. Write 0x809FE720 to Register R0 to set the VCO frequency calibration (800 μs).
16. Write 0x809FE560 to Register R0 to power Tx1 on, Tx2 off, and LO on.
17. Write 0x809FED60 to Register R0 to set the Tx1 amplitude calibration (400 μs).
18. Write 0x809FE5A0 to Register R0 to turn Tx1 off, Tx2 on, and LO on.
19. Write 0x809FF5A0 to Register R0 to set the Tx2 amplitude calibration (400 μs).
20. Write 0x2800B929 to Register R9.
21. Write 0x809F25A0 to Register R0 to disable the R and N counters.

**RECALIBRATION SEQUENCE**

The ADF5901 can be recalibrated after the initialization sequence is complete and the device is powered up. The recalibration sequence must be run for every 10°C temperature change; the temperature can be monitored using the temperature sensor (see the Temperature Sensor section).

1. Write 0x809FE520 to Register R0 to enable the counters. Tx1 and Tx2 are off, and LO is on.
2. Write 0x2A20B929 to Register R9.
3. Write 0xFFFF7FFE1 to Register R1 to set the Tx amplitude level.
4. Write 0x809FE720 to Register R0 to set the VCO frequency calibration (800 μs).

5. Write 0x809FE560 to Register R0 to power Tx1 on, Tx2 off, and LO on.
6. Write 0x809FED60 to Register R0 to set the Tx1 amplitude calibration (400 μs).
7. Write 0x89FE5A0 to Register R0 to power Tx1 off, Tx2 on, and LO on.
8. Write 0x809FF5A0 to Register R0 to set the Tx2 amplitude calibration (400 μs).
9. Write 0x2800B929 to Register R9.
10. Write 0x809F25A0 to Register R0 to disable the R and N counters.

**TEMPERATURE SENSOR**

The ADF5901 has an on-chip temperature sensor that can be accessed on the ATEST pin or as a digital word on DOUT following an ADC conversion. The temperature sensor operates over the full operating temperature range of -40°C to +105°C. The accuracy can be improved by performing a one-point calibration at room temperature and storing the result in memory.

With the temperature sensor on the analog test bus and test bus connected to the ATEST pin (Register 4 set to 0x0000A064) the ATEST voltage can be converted to temperature with the following equation:

$$Temperature (^{\circ}C) = \frac{(V_{ATEST} - V_{OFF})}{V_{GAIN}} \tag{3}$$

where:

- $V_{ATEST}$  is the voltage on the ATEST pin.
- $V_{OFF} = 0.699$  V, the offset voltage.
- $V_{GAIN} = 6.4 \times 10^{-3}$ , the voltage gain.

The temperature sensor result can be converted to a digital word with the ADC and readback on DOUT with the following sequence:

1. Write 0x809FA5A0 to Register R0 to enable the counters.
2. Write 0x00012064 to Register R4 to connect the analog test bus to the ADC and  $V_{TEMP}$  to the analog test bus.
3. Write 0x00028C82 to Register R2 to start the ADC conversion.
4. Write 0x018902C3 to Register R3 to set the output ADC data to DOUT.
5. Read back DOUT.
6. Write 0x809F25A0 to Register R0 to disable R and N counters.

Convert the DOUT word to temperature with the following equation:

$$Temperature (^{\circ}C) = \frac{((ADC \times V_{LSB}) - V_{OFF})}{V_{GAIN}} \tag{4}$$

where:

- ADC is the ADC code read back on DOUT.
- $V_{LSB} = 7.33$  mV, the ADC LSB voltage.
- $V_{OFF} = 0.699$  V, the offset voltage.
- $V_{GAIN} = 6.4 \times 10^{-3}$ , the voltage gain.

**RF SYNTHESIS: A WORKED EXAMPLE**

The following equation governs how to program the ADF5901:

$$RF_{OUT} = (INT + (FRAC/2^{25})) \times (f_{REF}) \times 2 \tag{5}$$

where:

- $RF_{OUT}$  is the RF frequency output.
- INT is the integer division factor.
- FRAC is the fractionality.

$$f_{REF} = REF_{IN} \times ((1 + D)/(R \times (1 + T))) \tag{6}$$

where:

- $REF_{IN}$  is the reference frequency input.
- D is the reference doubler bit, DB10 in Register R7 (0 or 1).
- R is the reference division factor.
- T is the reference divide by 2 bit, DB11 in Register R7 (0 or 1).

For example, in a system where a 24.125 GHz RF frequency output ( $RF_{OUT}$ ) is required and a 100 MHz reference frequency input ( $REF_{IN}$ ) is available,  $f_{REF}$  is set to 50 MHz.

From Equation 6,

$$f_{REF} = (100 \text{ MHz} \times (1 + 0)/(1 \times (1 + 1))) = 50 \text{ MHz}$$

From Equation 5,

$$24.125 \text{ GHz} = 50 \text{ MHz} \times (N + FRAC/2^{25}) \times 2$$

Calculating the N and FRAC values,

$$N = \text{int}(RF_{OUT}/(f_{REF} \times 2)) = 241$$

$$FRAC = F_{MSB} \times 2^{13} + F_{LSB}$$

$$F_{MSB} = \text{int}(((RF_{OUT}/(f_{REF} \times 2)) - N) \times 2^{12}) = 1024$$

$$F_{LSB} = \text{int}((((RF_{OUT}/(f_{REF} \times 2)) - N) \times 2^{12}) - F_{MSB}) \times 2^{13} = 0$$

where:

- $F_{MSB}$  is the 12-bit MSB FRAC value in Register R5.
- $F_{LSB}$  is the 13-bit LSB FRAC value in Register R6.
- int() makes an integer of the argument in parentheses.

## APPLICATIONS INFORMATION

### APPLICATION OF THE ADF5901 IN FMCW RADAR

Figure 31 shows the application of the ADF5901 in a frequency modulated continuous wave (FMCW) radar system.

In the FMCW radar system, the ADF4159 generates the sawtooth or triangle ramps necessary for this type of radar to operate.

The ADF4159 controls the  $V_{TUNE}$  pin on the ADF5901 (Tx) MMIC and thus the frequency of the VCO and the Tx output signal on TX<sub>OUT1</sub> or TX<sub>OUT2</sub>. The LO signal from the ADF5901 is fed to the LO input on the ADF5904.

The ADF5904 downconverts the signal from the four receiver antennas to baseband with the LO signal from the Tx MMIC.

The downconverted baseband signals from the four receiver channels on the ADF5904 are fed to the ADAR7251 4-channel, continuous time,  $\Sigma$ - $\Delta$  analog-to-digital converter (ADC).

A digital signal processor (DSP) follows the ADC to handle the target information processing.

ORDERING GUIDE

| Model <sup>1</sup> | Temperature Range | Package Description                              | Package Option |
|--------------------|-------------------|--|----------------|
| ADF5901WCCPZ       | -40°C to +105°C   | 32-Lead Lead Frame Chip Scale Package [LFCSP_WQ] | CP-32-12       |
| ADF5901WCCPZ-RL7   | -40°C to +105°C   | 32-Lead Lead Frame Chip Scale Package [LFCSP_WQ] | CP-32-12       |
| EV-ADF5901SD2Z     |                   | Evaluation Board                                 |                |

<sup>1</sup> Z = RoHS Compliant Part.

AUTOMOTIVE PRODUCTS

The [ADF5901W](#) models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
