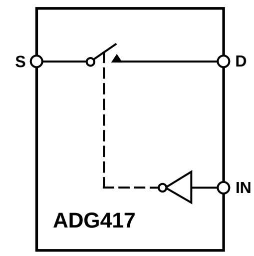
LC²MOS Precision Mini-DIP Analog Switch

ADG417

FEATURES
44 V Supply Maximum Ratings
V_{SS} to V_{DD} Analog Signal Range
Low On Resistance (<35 Ω)
Ultralow Power Dissipation (<35 μW)
Fast Switching Times
t_{ON} (160 ns max)
t_{OFF} (100 ns max)
Break-Before-Make Switching Action
Plug-In Replacement for DG417

APPLICATIONS
Precision Test Equipment
Precision Instrumentation
Battery Powered Systems
Sample Hold Systems

FUNCTIONAL BLOCK DIAGRAM



SWITCH SHOWN FOR A LOGIC "1" INPUT

GENERAL DESCRIPTION

The ADG417 is a monolithic CMOS SPST switch. This switch is designed on an enhanced LC²MOS process that provides low power dissipation yet gives high switching speed, low on resistance and low leakage currents.

The on resistance profile of the ADG417 is very flat over the full analog input range ensuring excellent linearity and low distortion. The part also exhibits high switching speed and high signal bandwidth. CMOS construction ensures ultralow power dissipation making the parts ideally suited for portable and battery powered instruments.

The ADG417 switch, which is turned ON with a logic low on the control input, conducts equally well in both directions when ON and has an input signal range that extends to the supplies. In the OFF condition, signal levels up to the supplies are blocked. The ADG417 exhibits break-before-make switching action for use in multiplexer applications. Inherent in the design is low charge injection for minimum transients when switching the digital input.

PRODUCT HIGHLIGHTS

1. Extended Signal Range
   The ADG417 is fabricated on an enhanced LC²MOS process, giving an increased signal range that extends to the supply rails.
2. Ultralow Power Dissipation
3. Low R_{ON}
4. Single Supply Operation
   For applications where the analog signal is unipolar, the ADG417 can be operated from a single rail power supply. The part is fully specified with a single +12 V power supply and will remain functional with single supplies as low as +5 V.

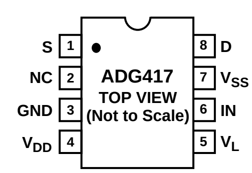
Table I. Truth Table

Logic	Switch Condition
0	ON
1	OFF

PIN CONFIGURATION DIP/SOIC



NC = NO CONNECT

ORDERING GUIDE

Model	Temperature Range	Package Options*
ADG417BN	–40°C to +85°C	N-8
ADG417BR	–40°C to +85°C	SO-8

*N = Plastic DIP, SO = 0.15" Small Outline IC (SOIC).

ABSOLUTE MAXIMUM RATINGS[1]

(T_A = +25°C unless otherwise noted)

V_{DD} to V_{SS}	+44 V
V_{DD} to GND	–0.3 V to +25 V
V_{SS} to GND	+0.3 V to –25 V
V_L to GND	–0.3 V to V_{DD} + 0.3 V
Analog, Digital Inputs[2]	V_{SS} – 2 V to V_{DD} +2 V or 30 mA, Whichever Occurs First
Continuous Current, S or D	30 mA
Peak Current, S or D (Pulsed at 1 ms, 10% Duty Cycle Max)	100 mA
Operating Temperature Range	
Industrial (B Version)	–40°C to +85°C
Extended (T Version)	–55°C to +125°C
Storage Temperature Range	–65°C to +150°C
Junction Temperature	150°C
Plastic Package, Power Dissipation	400 mW
θ_{JA}, Thermal Impedance	100°C/W
Lead Temperature, Soldering (10 sec)	+260°C
SOIC Package, Power Dissipation	400 mW
θ_{JA}, Thermal Impedance	155°C/W
Lead Temperature, Soldering	
Vapor Phase (60 sec)	+215°C
Infrared (15 sec)	+220°C

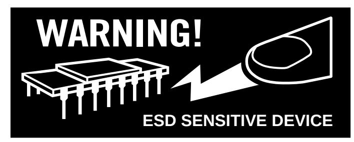
NOTES

[1]Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

[2]Overvoltages at IN, S or D will be clamped by internal diodes. Current should be limited to the maximum ratings given.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADG417 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.



TERMINOLOGY

V_{DD}	Most positive power supply potential.
V_{SS}	Most negative power supply potential in dual supplies. In single supply applications, it may be connected to GND.
V_L	Logic power supply (+5 V).
GND	Ground (0 V) reference.
S	Source terminal. May be an input or an output.
D	Drain terminal. May be an input or an output.
IN	Logic control input.
R_{ON}	Ohmic resistance between D and S.
I_S (OFF)	Source leakage current with the switch "OFF."
I_D (OFF)	Drain leakage current with the switch "OFF."
I_D, I_S (ON)	Channel leakage current with the switch "ON."
V_D (V_S)	Analog voltage on terminals D, S.
C_S (OFF)	"OFF" switch source capacitance.
C_D (OFF)	"OFF" switch drain capacitance.
C_D, C_S (ON)	"ON" switch capacitance.
t_{ON}	Delay between applying the digital control input and the output switching on.
t_{OFF}	Delay between applying the digital control input and the output switching off.
V_{INL}	Maximum input voltage for logic "0."
V_{INH}	Minimum input voltage for logic "1."
I_{INL} (I_{INH})	Input current of the digital input.
Charge Injection	A measure of the glitch impulse transferred from the digital input to the analog output during switching.
Off Isolation	A measure of unwanted signal coupling through an "OFF" channel.
I_{DD}	Positive supply current.
I_{SS}	Negative supply current.
I_L	Logic supply current.
