

LNB supply and control IC with step-up and I²C interface

Datasheet - production data

- LPM function (low power mode) to reduce dissipation
- Overload and overtemperature internal protections with I²C diagnostic bits
- LNB short-circuit dynamic protection
- +/- 4 kV ESD tolerant on output power pins

Applications

- STB satellite receivers
- TV satellite receivers
- PC card satellite receivers

Features

- Complete interface between LNB and I²C bus
- Built-in DC-DC converter for single 12 V supply operation and high efficiency (typ. 93% @ 0.5 A)
- Selectable output current limit by external resistor
- Compliant with main satellite receiver output voltage specifications (15 programmable levels)
- Accurate built-in 22 kHz tone generator suits widely accepted standards
- 22 kHz tone waveform integrity guaranteed at no-load condition
- Low drop post regulator and high efficiency step-up PWM with integrated power NMOS allowing low power losses

Description

Intended for analog and digital satellite receivers/Sat-TV and Sat-PC cards, the LNBH25S is a monolithic voltage regulator and interface IC, assembled in QFN24L (4x4 mm) specifically designed to provide 13/18 V power supply and 22 kHz tone signaling to the LNB down-converter in the antenna dish or to the multi-switch box. In this application field, it offers a complete solution with extremely low component count and low power dissipation together with a simple design and I²C standard interface.

2 Application information

This IC has a built-in DC-DC step-up converter that, from a single source (8 V to 16 V), generates voltages (V_{UP}) which let the integrated LDO post-regulator (generating 13 V/18 V LNB output voltages plus 22 kHz DiSEqC™ tone) work with a minimum dissipated power of 0.5 W typ. @ 500 mA load (the LDO drop voltage is internally kept at $V_{UP}-V_{OUT} = 1$ V typ.). The LDO power dissipation can be reduced when 22 kHz tone output is disabled by setting the LPM bit to “1” see [Section 2.4: "LPM \(low power mode\)"](#). The IC is also provided with an undervoltage lockout circuit that disables the whole circuit when the supplied V_{CC} drops below a fixed threshold (4.7 V typ.). The step-up converter soft-start function reduces the inrush current during startup. SS time is internally fixed at 4 ms typ. to switch from 0 to 13 V and 6 ms typ. switch from 0 to 18 V.

2.1 DiSEqC data encoding (DSQIN pin)

The internal 22 kHz tone generator is factory trimmed in accordance with DiSEqC standards, and can be active in 3 different ways:

1. By an external 22 kHz source DiSEqC data connected to the DSQIN logic pin (TTL compatible). In this case I²C tone control bits have to be set: EXT_M = TEN = 1.
2. By an external DiSEqC data envelope source connected to the DSQIN logic pin. In this case I²C tone control bits must be set: EXT_M = 0 and TEN = 1.
3. Through TEN I²C bit if the 22 kHz presence is requested in continuous mode. In this case the DSQIN TTL pin must be pulled high and EXT_M bit is set to “0”.

Each of the above solutions requires that during the 22 kHz tone activation and/or DiSEqC data transmission, the LPM bit has to be set to “0” see [Section 2.4: "LPM \(low power mode\)"](#).

2.2 Data encoding by external 22 kHz tone TTL signal

In order to improve design flexibility, an external tone signal can be input on the DSQIN pin by setting the EXT_M bit to “1”.

The DSQIN is a logic input pin, which activates the 22 kHz tone on V_{OUT} pin, by using the LNBH25S integrated tone generator.

The output tone waveforms are internally controlled by the LNBH25S tone generator in terms of rise/fall time and tone amplitude, while, the external 22 kHz signal on the DSQIN pin is used to define the frequency and the duty cycle of the output tone. A TTL compatible 22 kHz signal is required for the proper control of the DSQIN pin function. Before sending the TTL signal to the DSQIN pin, the EXT_M and TEN bits have to be previously set to “1”. As soon as the DSQIN internal circuit detects the 22 kHz TTL external signal code, the LNBH25S activates the 22 kHz tone on the V_{OUT} output with about 1 μs delay from TTL signal activation, and it stops with about 60 μs delay after the 22 kHz TTL signal on DSQIN has expired, refer to [Figure 2: "Tone enable and disable timing \(using external waveform\)"](#).

Figure 2: Tone enable and disable timing (using external waveform)

2.3 Data encoding by external DiSEqC envelope control through the DSQIN pin

If an external DiSEqC envelope source is available, the internal 22 kHz generator can be active during the tone transmission by connecting the DiSEqC envelope source to the DSQIN pin. In this case the I²C tone control bits must be set: EXT_M = 0 and TEN = 1. In this manner, the internal 22 kHz signal is superimposed to the V_{OUT} DC voltage to generate the LNB output 22 kHz tone. During the period in which the DSQIN is kept high, the internal control circuit activates the 22 kHz tone output.

The 22 kHz tone on the VOUT pin is active with about 6 μs delay from the DSQIN TTL signal rising edge, and it stops with a delay time in the range from 15 μs to 60 μs after the 22 kHz TTL signal on DSQIN has expired, refer to [Figure 3: "Tone enable and disable timing \(using envelope signal\)"](#).

Figure 3: Tone enable and disable timing (using envelope signal)

2.4 LPM (low power mode)

In order to reduce the total power loss, the LNBH25S is provided with the LPM I²C bit that can be active (LPM=1) in applications where the 22 kHz tone can be disabled for long periods. The LPM bit can be set to "1" when the DiSEqC data transmission is not requested (no 22 kHz tone output is present); the drop voltage across the integrated LDO regulator (V_{UP}-V_{OUT}) is reduced to 0.6 V typ. and, consequently, the power loss inside the LNBH25S linear regulator is reduced as well. For example: at 500 mA load, LPM=1 allowing a minimum LDO dissipated power of 0.3 W typ. It is recommended to set the LPM bit to "0" before starting the 22 kHz DiSEqC data transmission; at this condition the drop voltage across the LDO is kept to 1 V typ. LPM=0 if the LPM function is not used.

2.5 DiSEqC 2.0 implementation

The built-in 22 kHz tone detector completes the fully bi-directional DiSEqC 2.0 interfacing. The input pin (DETIN) has to be AC coupled to the DiSEqC bus, and extracted PWK data is available on the DSQOUT pin. To comply with the bi-directional DiSEqC 2.0 bus hardware requirements, an output RL filter is needed. In order to avoid 22 kHz waveform

distortion during tone transmission, the LNBH25S is provided with the BPSW pin to be connected to an external transistor, which allows the output RL filter to be bypassed in DiSEqC 2.x applications while in transmission mode. Before starting tone transmission, TEN bit has to be set to "1" and after ending tone transmission, TEN bit has to be set to "0".

2.6 Output current limit selection

The linear regulator current limit threshold can be set by an external resistor connected to the ISEL pin. The resistor value defines the output current limit by the equation:

$$I_{LIM} \text{ (typ.)} = \frac{13915}{RSEL}^{1.111}$$

with ISET=0

$$I_{LIM} \text{ (typ.)} = \frac{6808}{RSEL}^{1.068}$$

with ISET=1

see ISET bit description in [Table 9: "Data 3 \(read/write register. Register address = 0X4\)"](#), where RSEL is the resistor connected between ISEL and GND expressed in kΩ and $I_{LIM}(\text{typ.})$ is the typical current limit threshold expressed in mA. I_{LIM} can be set up to 1 A.

2.7 Output voltage selection

The linear regulator output voltage level can be easily programmed in order to accomplish application specific requirements, using 4 bits of an internal data 1 register, see [Section 7.3: "Data registers"](#) and [Table 14: "Output voltage selection table \(data1 register, write mode\)"](#) for exact programmable values. Register writing is accessible via I²C bus.

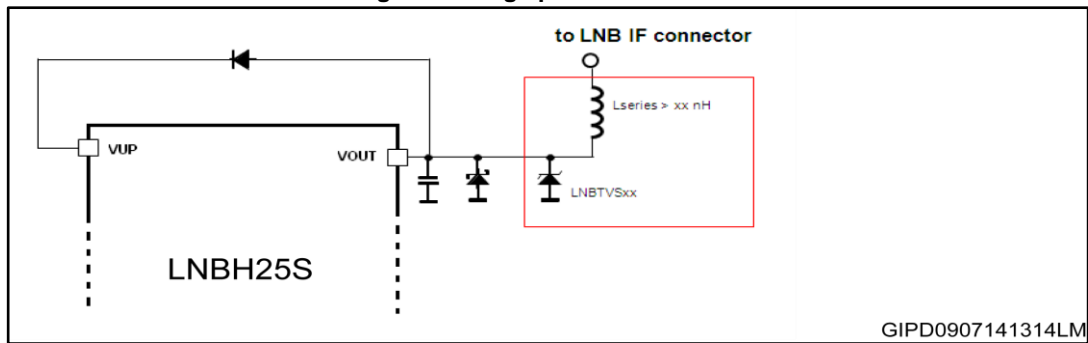

2.8 Diagnostic and protection functions

The LNBH25S has 8 diagnostic internal functions provided by I²C bus, by reading 8 bits on two status registers (in read mode). All the diagnostic bits are, in normal operation (that is no failure detected), set to low. Two diagnostic bits are dedicated to the overtemperature and overload protection status (OTF and OLF) while the remaining 6 bits are dedicated to the output voltage level (VMON), to 22 kHz tone characteristics (TMON), to the minimum load current (IMON), to external voltage source presence on the VOUT pin (PDO), to the input voltage power not good function (PNG) and to the 22 kHz tone presence on the DETIN pin (TDET). Once the OLF (or OTF or PNG) bit is active (set to "1"), it is latched to "1" until relevant cause is removed and a new register reading operation is performed.

2.9 Surge protections and TVS diodes

The LNBH25S device is directly connected to the antenna cable in a set-top box. Atmospheric phenomenon can cause high voltage discharges on the antenna cable causing damage to the attached devices. Surge pulses occur due to direct or indirect lightning strikes to an external (outdoor) circuit. This leads to currents or electromagnetic fields causing high voltage or current transients. Transient voltage suppressor (TVS) devices are usually placed, as shown in the following schematic, to protect the STB output circuits where the LNBH25S and other devices are electrically connected to the antenna cable.

Figure 4: Surge protection circuit

For this purpose, the use of the LNBTVSxx surge protection diodes specifically designed by ST is recommended. The selection of the LNBTVSxx diodes should be based on the maximum peak power dissipation supported by the diode (see the LNBTVS datasheet for further details).

2.10 FLT (fault flag)

In order to get an immediate feedback on diagnostic status, the LNBH25S is equipped with a dedicated fault flag pin (FLT). In case of overload (OLF bit=1) or overheating (OTF bit=1) or if “power no good” (PNG bit=1) condition is detected, the FLT pin (open drain output) is set to low and is kept low until the relevant activating diagnostic bit is cleared. Diagnostic bits: OLF, OTF and PNG, once activated, are kept latched to “1” until the root cause is removed and a new register reading operation is performed by the microprocessor. The FLT pin has to be connected to a positive voltage (5 V max.) by a pull-up resistor.

2.11 VMON (output voltage diagnostic)

When the device output voltage is active (VOUT pin), its value is internally monitored and, as long as the output voltage level is below the guaranteed limits, VMON I²C bit is set to “1”. See [Table 17: "Output voltage diagnostic \(VMON bit, status 1 register\) characteristics"](#) for more details.

2.12 TMON (22 kHz tone diagnostic)

The 22 kHz tone can be internally detected and monitored if DETIN pin is connected to the LNB output bus, see typical application circuit in [Figure 7: "DiSEqC 2.x application circuit"](#), through a decoupling capacitor. The tone diagnostic function is provided with TMON I²C bit. If the 22 kHz tone amplitude and/or the tone frequency is out of the guaranteed limits, see [Table 19: "22 kHz tone diagnostic \(TMON bit, status 2 register\) characteristics"](#), TMON I²C bit is set to “1”.

2.13 TDET (22 kHz tone detection)

When a 22 kHz tone presence is detected on DETIN pin, TDET I²C bit is set to “1”.

2.14 IMON (minimum output current diagnostic)

In order to detect the output load absence (no LNB connected on the bus or cable not connected to the IRD) the LNBH25S is provided with a minimum output current flag by the IMON I²C bit, accessible in read mode, which is set to "1" if the output current is lower than 12 mA (typ.). IMON function should be used with the 22 kHz tone transmission deactivated, otherwise the IMON bit could be set to "0" even if the output current is below the minimum current threshold. To activate IMON diagnostic function, the EN_IMON I²C bit has to be set to "1" in the data 4 register. As soon as the IMON function is active by EN_IMON=1, V_{OUT} rises 21 V (typ.) on the VSEL bit setting. This operation is applied to be sure that the LNBH25S output has the higher voltage in the LNB bus. Do not use this function in an application environment where 21 V voltage level is not supported by other peripherals connected to the LNB bus.

2.15 PDO (overcurrent detection on output pull-down stage)

When an overcurrent occurs on the pull-down output stage due to an external voltage source greater than the LNBH25S nominal V_{OUT} and for a time longer than I_{SINK_TIME-OUT} (10 ms typ.), PDO I²C bit is set to "1". This may happen due to an external voltage source on the LNB output (VOUT pin).

For current threshold and deglitch time details, see [Table 13: "Electrical characteristics"](#).

2.16 Power-on I²C interface reset and undervoltage lockout

The I²C interface, built into the LNBH25S, is automatically reset at power-on. As long as the V_{CC} is below the undervoltage lockout (UVLO) threshold (4.7 V typ.), the interface does not respond to any I²C command and all data register bits are initialized to zero, therefore the power blocks are disabled. Once V_{CC} rises above 4.8 V typ. the I²C interface becomes operative and data registers can be configured by the main microprocessor.

2.17 PNG (input voltage minimum detection)

When input voltage (VCC pin) is lower than LPD (low power diagnostic) minimum thresholds, the PNG I²C bit is set to "1" and the FLT pin is set low. See [Table 13: "Electrical characteristics"](#) for threshold details.

2.18 ISW (inductor switching current limit)

In order to allow low saturation current inductors to be used, the maximum DC-DC inductor switching current limit threshold can be set by one I²C bit (ISW). Two values are available: 2.5 A typ. (with ISW = 1) and 4 A typ. (with ISW = 0).

2.19 COMP (boost capacitors and inductor)

The DC-DC converter compensation loop can be optimized to properly work with both ceramic and electrolytic capacitors (VUP pin). For this purpose, one I²C bit in the data 4 register, see COMP [Table 10: "Data 4 \(read/write register. Register address = 0X5\)"](#) can be set to "1" or "0" as follows:

- COMP = 0 for electrolytic capacitors
- COMP = 1 for ceramic capacitors

For recommended DC-DC capacitor and inductor values see [Section 5: "Typical application circuits"](#) and the BOM in [Table 6: "DiSEqC 2.x bill of material"](#).

2.20 OLF (overcurrent and short-circuit protection and diagnostic)

To reduce the total power dissipation during an overload or a short-circuit condition, the device is provided with a dynamic short-circuit protection. It is possible to set the short-circuit current protection either statically (simple current clamp) or dynamically by the PCL bit of I²C data 3 register. When the PCL (pulsed current limiting) bit is set low, the overcurrent protection circuit works dynamically: as soon as an overload is detected, the output current is provided for T_{ON} time (90 ms or 180 ms typ., according to the TIMER bit programmed in the data 3 register) and after that, the output is set in shutdown for T_{OFF} time of typically 900 ms. Simultaneously, the diagnostic OLF I²C bit of the system register is set to "1" and the FLT pin is set to low level. After this time has elapsed, the output is resumed for a time T_{ON}. At the end of T_{ON}, if the overload is still detected, the protection circuit cycles again through T_{OFF} and T_{ON}. At the end of a full T_{ON} in which no overload is detected, normal operation is resumed and the OLF diagnostic bit is reset to low after a register reading. Typical T_{ON} + T_{OFF} time is 990 ms (if TIMER=0) or 1080 ms (if TIMER=1) and it is determined by an internal timer. This dynamic operation can reduce the power dissipation in short-circuit condition, assuring excellent power-on startup in most conditions. However, there may be some cases in which a highly capacitive load on the output may cause a difficult startup when the dynamic protection is chosen. This can be solved by initiating any power startup in static mode (PCL=1) and, then, switching to the dynamic mode (PCL=0) after a specified period of time depending on the output capacitance. Also, in static mode, the diagnostic OLF bit goes to "1" (and the FLT pin is set to low) when the current clamp limit is reached and returns low when the overload condition is cleared and register reading is performed.

After the overload condition is removed, normal operation can be resumed in two ways, according to the OLR I²C bit on the data 4 register.

If OLR=1, all VSEL 1..4 bits are reset to "0" and LNB output (VOUT pin) is disabled. To re-enable the output stage, VSEL bits have to be set again by the microprocessor, and the OLF bit is reset to "0" after a register reading operation.

If OLR=0, output is automatically re-enabled as soon as the overload condition is removed, and the OLF bit is reset to "0" after a register reading operation.

2.21 OTF (thermal protection and diagnostic)

The LNBH25S is also protected against overheating: when the junction temperature exceeds 150 °C (typ.), the step-up converter and the linear regulator shut off, the diagnostic OTF bit in the status 1 register is set to "1" and the FLT pin is set to low level. After the overtemperature condition is removed, normal operation can be resumed in two ways, according to the THERM I²C bit on the data 4 register.

If THERM=1, all VSEL 1..4 bits are reset to "0" and LNB output (VOUT pin) is disabled. To re-enable the output stage, VSEL bits must be set again by the microprocessor, while the OTF bit is reset to "0" after a register reading operation.

If THERM=0, output is automatically re-enabled as soon as the overtemperature condition is removed, while the OTF bit is reset to "0" after a register reading operation.

3 Pin configuration

Figure 5: Pin connection (top view)

Table 2: Pin description

| Pin | Symbol | Name | Pin function |
|-----|--------|-------------------|---|
| 2 | FLT | FLT | Open drain output for IC fault conditions. It is set low in case of overload (OLF bit) or overheating status (OTF bit) or power not good (PNG) is detected. To be connected to pull-up resistor (5 V max.) |
| 3 | LX | NMOS drain | Integrated N-channel power MOSFET drain |
| 4 | PGND | Power ground | DC-DC converter power ground. To be connected directly to exposed pad |
| 6 | ADDR | Address setting | Two I ² C bus addresses available by setting the address pin level voltage. See Table 16: "Address pin characteristics" |
| 7 | SCL | Serial clock | Clock from I ² C bus |
| 8 | SDA | Serial data | Bi-directional data from/to I ² C bus |
| 9 | ISEL | Current selection | The resistor "RSEL" connected between ISEL and GND defines the linear regulator current limit threshold. Refer to Section 2.6: "Output current limit selection" and ISET bit description in Table 9: "Data 3 (read/write register. Register address = 0X4)" |
| 15 | GND | Analog ground | Analog circuit ground. To be connected directly to the exposed pad |
| 16 | VBYP | Bypass capacitor | Needed for internal pre-regulator filtering. The VBYP pin connects an external ceramic capacitor. Any connection of this pin to external current or voltage sources may cause permanent damage to the device |

| Pin | Symbol | Name | Pin function |
|------------------------------|--------|--|---|
| 17 | VCC | Supply input | 8 to 16 V IC DC-DC power supply |
| 18 | BPSW | Switch control | To be connected to an external transistor to be used to bypass the output RL filter needed in DiSEqC 2.x applications during DiSEqC transmitting mode, see Section 5: "Typical application circuits" . Set to ground if it is not used. Open drain pin |
| 19 | DETIN | Tone detector input | 22 kHz tone decoder input open drain pin has to be AC coupled to the DiSEqC 2.0 bus. Set to ground if it is not used |
| 20 | VOUT | LNB output port | Output of the integrated very low drop linear regulator. See Table 14: "Output voltage selection table (data 1 register, write mode)" for voltage selections and description |
| 21 | VUP | Step-up voltage | Input of the linear post-regulator. The voltage on this pin is monitored by the internal step-up controller to keep a minimum dropout across the linear pass transistor |
| 22 | DSQIN | DSQIN for DiSEqC envelope input or external 22 kHz TTL input | It can be used as DiSEqC envelope input or external 22 kHz TTL input depending on EXTM I ² C bit setting as follows: EXTM=0, TEN=1. It accepts the DiSEqC envelope code from the main microcontroller. The LNBH25S uses this code to modulate the internally generated 22 kHz carrier. If EXTM=TEN=1. It accepts external 22 kHz logic signals which activate the 22 kHz tone output, refer to Section 2.3: "Data encoding by external DiSEqC envelope control through the DSQIN pin" . Pull-up high if the tone output is activated by the TEN I ² C bit only |
| 23 | DSQOUT | DiSEqC output | Open drain output of the tone detector to the main microcontroller for DiSEqC 2.0 data decoding. It is low when tone is detected to the DETIN input pin. Set to ground if it is not used |
| Epad | Epad | Exposed pad | To be connected with power ground and to the ground layer through vias to dissipate heat |
| 1, 5, 10, 11, 12, 13, 14, 24 | NC | Not internally connected | Not internally connected. These pins can be connected to GND to improve thermal performance |

4 Maximum ratings

Table 3: Absolute maximum ratings

| Symbol | Parameter | Value | Unit |
|-------------|---|--------------------|------|
| V_{CC} | DC power supply input voltage pins | -0.3 to 20 | V |
| V_{UP} | DC input voltage | -0.3 to 40 | V |
| I_{OUT} | Output current | Internally limited | mA |
| V_{OUT} | DC output pin voltage | -0.3 to 40 | V |
| V_I | Logic input pin voltage (SDA, SCL, DSQIN, ADDR pins) | -0.3 to 7 | V |
| V_O | Logic output pin voltage (FLT, DSQOUT) | -0.3 to 7 | V |
| V_{BPSW} | BPSW pin voltage | -0.3 to 40 | V |
| V_{DETIN} | Detector input signal amplitude | -0.6 to 2 | V |
| I_O | Logic output pin current (FLT, DSQOUT, BPSW) | 10 | mA |
| LX | LX input voltage | -0.3 to 30 | V |
| V_{BYP} | Internal reference pin voltage | -0.3 to 4.6 | V |
| ISEL | Current selection pin voltage | -0.3 to 3.5 | V |
| T_{STG} | Storage temperature range | -50 to 150 | °C |
| T_J | Operating junction temperature range | -25 to 125 | °C |
| ESD | ESD rating with human body model (HBM) all pins, unless power output pins | 2 | kV |
| | ESD rating with human body model (HBM) for power output pins | 4 | |

Table 4: Thermal data

| Symbol | Parameter | Value | Unit |
|------------|---|-------|------|
| R_{thJC} | Thermal resistance junction-case | 2 | °C/W |
| R_{thJA} | Thermal resistance junction-ambient with the device soldered on 2s2p 4-layer PCB provided with thermal vias below exposed pad | 40 | °C/W |

Absolute maximum ratings are those values beyond which damage to the device may occur. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to absolute maximum-rated conditions for extended periods may affect the device reliability. All voltage values are referred to network ground terminal.

5 Typical application circuits

Figure 6: DiSEqC 1.x application circuit

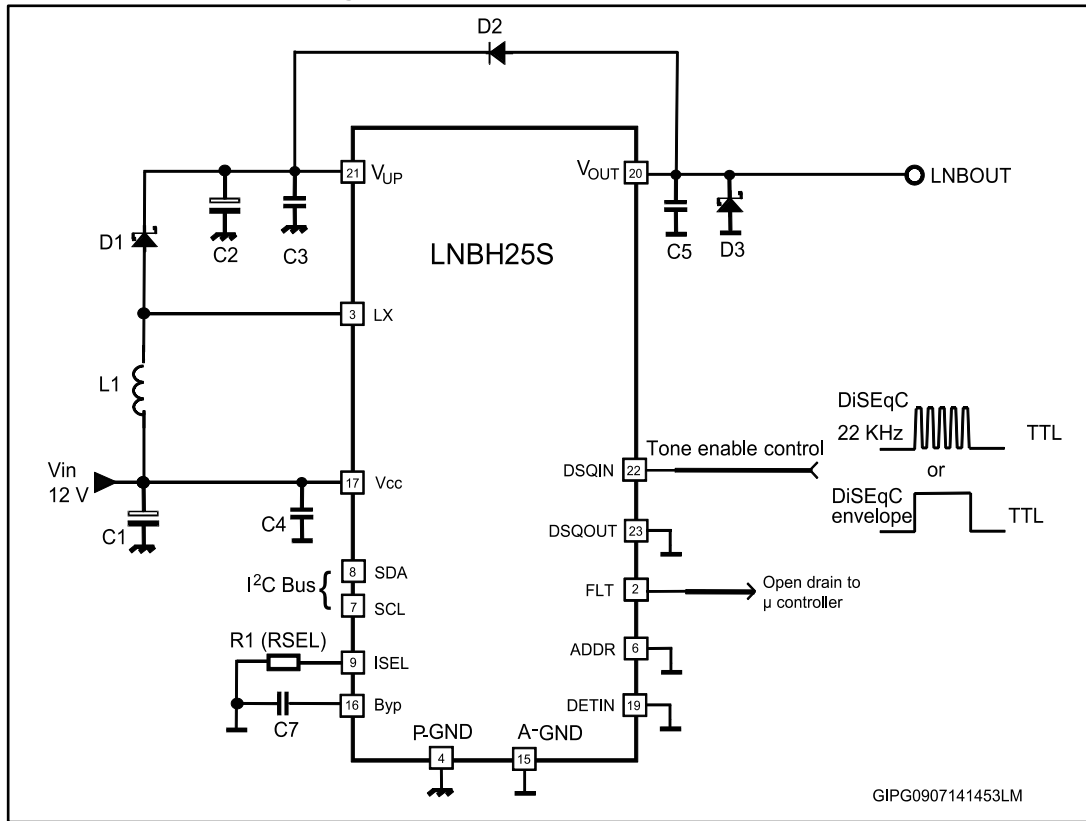

Table 5: DiSEqC 1.x bill of material

| Component | Notes |
|-----------|--|
| R1 (RSEL) | SMD resistor. Refer to Table 13: "Electrical characteristics" and ISEL pin description in Table 2: "Pin description" |
| C1 | > 25 V electrolytic capacitor, 100 μ F or higher is suitable or > 25 V ceramic capacitor, 10 μ F or higher is suitable |
| C2 | With COMP = 0, > 25 V electrolytic capacitor, 100 μ F or higher is suitable or with COMP = 1, > 35 V ceramic capacitor, 22 μ F (or 2 x 10 μ F) or higher is suitable |
| C3 | From 470 nF to 2.2 μ F ceramic capacitor placed as closer as possible to VUP pins. Higher values allow lower DC-DC noise |
| C5 | From 100 nF to 220 nF ceramic capacitor placed as close as possible to VOUT pins. Higher values allow lower DC-DC noise |
| C4, C7 | 220 nF ceramic capacitors. To be placed as close as possible to VOUT pin |
| D1 | STPS130A or similar Schottky diode |
| D2 | 1N4001-07, S1A-S1M, or any similar general purpose rectifier |
| D3 | BAT54, BAT43, 1N5818, or any low power Schottky diode with $I_F(AV) > 0.2$ A, $V_{RRM} > 25$ V, $V_F < 0.5$ V. To be placed as close as possible to VOUT pin |

| Component | Notes |
|-----------|---|
| D2 | 1N4001-07, S1A-S1M, or any similar general purpose rectifier |
| D3 | BAT54, BAT43, 1N5818, or any low power Schottky diode with $I_F(AV) > 0.2$ A, $V_{RRM} > 25$ V, $V_F < 0.5$ V. To be placed as closer as possible to VOUT pin |
| L1 | With COMP = 0, use 10 μ H inductor with $I_{SAT} > I_{PEAK}$ where I_{PEAK} is the boost converter peak current or with COMP=1 and C2 = 22 μ F, use 6.8 μ H inductor with $I_{SAT} > I_{PEAK}$ where I_{PEAK} is the boost converter peak current |
| L2 | 220 μ H - 270 μ H inductor as per DiSEqC 2.x specification |
| TR1 | MMBTA92, 2STR2160 or any low power PNP with $I_C > 250$ mA, $V_{CE} > 30$ V, can be used Also any small power PMOS with $I_D > 250$ mA, $R_{DS(on)} < 0.5$ W, $V_{DS} > 20$ V, can be used |

6 I²C bus interface

Data transmission from the main microprocessor to the LNBH25S and vice versa takes place through the 2-wire I²C bus interface, consisting of the 2-line SDA and SCL (pull-up resistors to positive supply voltage must be externally connected).

6.1 Data validity

As shown in [Figure 8: "Data validity on the I²C bus"](#), the data on the SDA line must be stable during the high semi-period of the clock. The high and low state of the data line can only change when the clock signal on the SCL line is low.

6.2 Start and stop condition

As shown in [Figure 9: "Timing diagram of I²C bus"](#), a start condition is a transition from high to low of the SDA line while SCL is high. The stop condition is a transition from low to high of the SDA line while SCL is high. A stop condition must be sent before each start condition.

6.3 Byte format

Every byte transferred to the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is the first to be transferred.

6.4 Acknowledge

The master (microprocessor) puts a resistive high level on the SDA line during the acknowledge clock pulse, see [Figure 10: "Acknowledge on the I²C bus"](#). The peripheral (LNBH25S), which acknowledges, must pull down (low) the SDA line during the acknowledge clock pulse, so that the SDA line is stable low during this clock pulse. The peripheral, which has been addressed, has to generate acknowledge after the reception of each byte, otherwise the SDA line remains at high level during the ninth clock pulse time. In this case, the master transmitter can generate the stop information in order to abort the transfer. The LNBH25S doesn't generate acknowledge if the V_{CC} supply is below the undervoltage lockout threshold (4.7 V typ.).

6.5 Transmission without acknowledge

If the detection of the LNBH25S acknowledges is not necessary, the microprocessor can use a simpler transmission: it simply waits for one clock without checking the slave acknowledging, and sends the new data. This approach is less protected from misworking and decreases noise immunity.

Figure 8: Data validity on the I²C bus

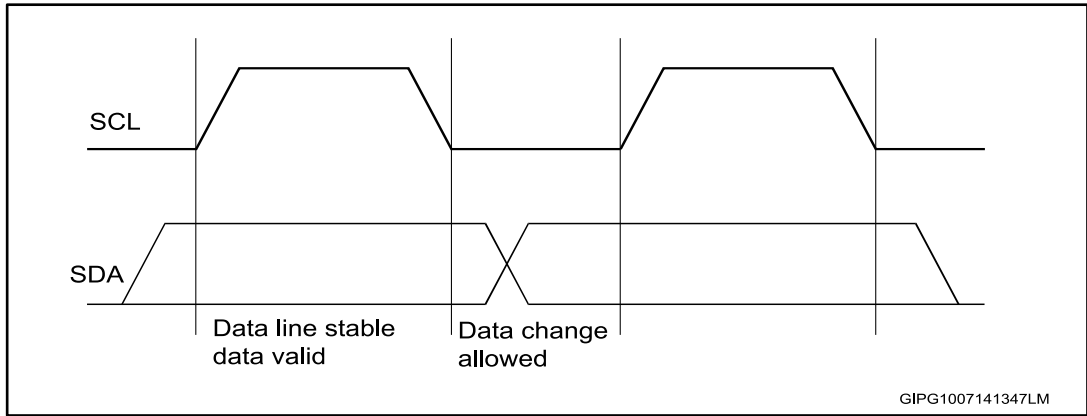

Figure 9: Timing diagram of I²C bus

Figure 10: Acknowledge on the I²C bus

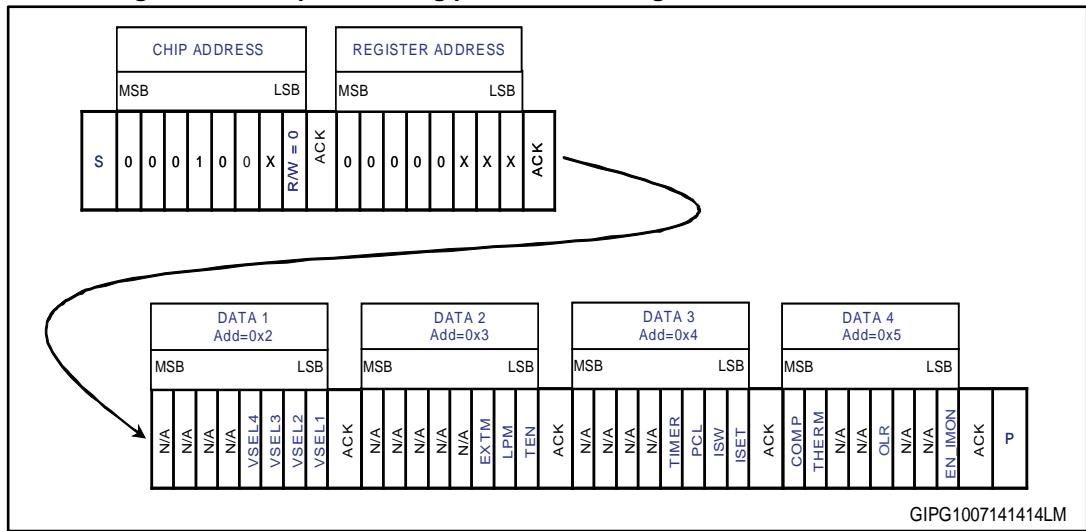

7 I²C interface protocol

7.1 Write mode transmission

The LNBH25S interface protocol is made up of:

- A start condition (S)
- A chip address byte with the LSB bit R/W = 0
- A register address (internal address of the first register to be accessed)
- A sequence of data (byte to write to the addressed internal register + acknowledge)
- The following bytes, if any, to be written to successive internal registers
- A stop condition (P). The transfer lasts until a stop bit is encountered
- The LNBH25S, as slave, acknowledges every byte transfer

Figure 11: Example of writing procedure starting with first data address 0X2

ACK = acknowledge

S = start

P = stop

R/W = 1/0, read/write bit

X = 0/1, set the values to select the chip address, see [Table 16: "Address pin characteristics"](#) for pin selection and to select the register address, see [Table 7: "Data 1 \(read/write register. Register address = 0X2\)"](#).

The writing procedure can start from any register address by simply setting X values in the register address byte (after the chip address). It can be also stopped by the master by sending a stop condition after any acknowledge bit.

7.2 Read mode transmission

In read mode the byte sequence as follows:

- A start condition (S)
- A chip address byte with the LSB bit R/W=0
- The register address byte of the internal first register to be accessed
- A stop condition (P)
- A new master transmission with the chip address byte and the LSB bit R/W=1
- After the acknowledge, the LNBH25S starts to send the addressed register content. As long as the master keeps the acknowledge low, the LNBH25S transmits the next address register byte content
- The transmission is terminated when the master sets the acknowledge high with the following stop bit

Figure 12: Example of reading procedure starting with first status address 0X0

ACK = acknowledge

S = start

P = stop

R/W = 1/0, read/write bit

X = 0/1, set the values to select the chip address, see [Table 16: "Address pin characteristics"](#) for pin selection and to select the register address see [Table 7: "Data 1 \(read/write register. Register address = 0X2\)"](#).

The writing procedure can start from any register address (status 1,2 or data 1..4) by simply setting X values in the register address byte (after the chip address). It can be also stopped by the master by sending a stop condition after any acknowledge bit.

7.3 Data registers

The data 1..4 registers can be addressed both to write and read mode. In read mode they return the last writing byte status received in the previous write transmission.

The following tables provide the register address values of data 1..4 and a function description of each bit.

Table 7: Data 1 (read/write register. Register address = 0X2)

| Bit | Name | Value | Description |
|-------------|-------|-------|---|
| Bit 0 (LSB) | VSEL1 | 0/1 | Output voltage selection bits. Refer to Table 14: "Output voltage selection table (data1 register, write mode)" |
| Bit 1 | VSEL2 | 0/1 | |
| Bit 2 | VSEL3 | 0/1 | |
| Bit 3 | VSEL4 | 0/1 | |
| Bit 4 | N/A | 0 | Reserved. Keep to "0" |
| Bit 5 | N/A | 0 | Reserved. Keep to "0" |
| Bit 6 | N/A | 0 | Reserved. Keep to "0" |
| Bit 7 (MSB) | N/A | 0 | Reserved. Keep to "0" |

N/A = reserved bit

All bits reset to "0" at power-on

Table 8: Data 2 (read/write register. Register address = 0X3)

| Bit | Name | Value | Description |
|-------------|------|-------|--|
| Bit 0 (LSB) | TEN | 1 | 22 kHz tone enabled. Tone output controlled by DSQIN pin |
| | | 0 | 22 kHz tone output disabled |
| Bit 1 | LPM | 1 | Low power mode active (used with 22 kHz tone output disabled only) |
| | | 0 | Low power mode deactivated (keep always LPM = 0 during 22 kHz tone transmission) |
| Bit 2 | EXTM | 1 | DSQIN input pin is set to receive external 22 kHz TTL signal source |
| | | 0 | DSQIN input pin is set to receive external DiSEqC envelope TTL signal |
| Bit 3 | N/A | 0 | Reserved. Keep to "0" |
| Bit 4 | N/A | 0 | Reserved. Keep to "0" |
| Bit 5 | N/A | 0 | Reserved. Keep to "0" |
| Bit 6 | N/A | 0 | Reserved. Keep to "0" |
| Bit 7 (MSB) | N/A | 0 | Reserved. Keep to "0" |

N/A = reserved bit

All bits reset to 0 at power-on

Table 9: Data 3 (read/write register. Register address = 0X4)

| Bit | Name | Value | Description |
|-------------|-------|-------|---|
| Bit 0 (LSB) | ISET | 1 | Current limit of LNB output (VOUT pin) set to lower current range (see Section 2.6: "Output current limit selection") |
| | | 0 | Current limit of LNB output (VOUT pin) set to default range (see Section 2.6: "Output current limit selection") |
| Bit 1 | ISW | 1 | DC-DC, inductor switching current limit set to 2.5 A typ. |
| | | 0 | DC-DC, inductor switching current limit set to 4 A typ. |
| Bit 2 | PCL | 1 | Pulsed (dynamic) LNB output current limiting is deactivated |
| | | 0 | Pulsed (dynamic) LNB output current limiting is active |
| Bit 3 | TIMER | 1 | Pulsed (dynamic) LNB output current T _{ON} time set to 180 ms typ. |
| | | 0 | Pulsed (dynamic) LNB output current T _{ON} time set to 90 ms typ. |
| Bit 4 | N/A | 0 | Reserved. Keep to "0" |
| Bit 5 | N/A | 0 | Reserved. Keep to "0" |
| Bit 6 | N/A | 0 | Reserved. Keep to "0" |
| Bit 7(MSB) | N/A | 0 | Reserved. Keep to "0" |

N/A = reserved bit

All bits reset to 0 at power-on

Table 10: Data 4 (read/write register. Register address = 0X5)

| Bit | Name | Value | Description |
|-------------|---------|-------|---|
| Bit 0 (LSB) | EN_IMON | 1 | IMON diagnostic function is enabled. (V _{OUT} is set to 21 V typ.) |
| | | 0 | IMON diagnostic function is disabled, keep always at "0" if IMON is not used |
| Bit 1 | N/A | - | Reserved |
| Bit 2 | N/A | - | Reserved |
| Bit 3 | OLR | 1 | In case of overload protection activation (OLF=1), all VSEL 1..4 bits are reset to "0" and LNB output (VOUT pin) is disabled. VSEL bits have to be set again by the master after the overcurrent condition is removed (OLF=0) |
| | | 0 | In case of overload protection activation (OLF=1) the LNB output (VOUT pin) is automatically enabled as soon as the overload condition is removed (OLF=0) with the previous VSEL bits setting |
| Bit 4 | N/A | - | Reserved |
| Bit 5 | N/A | - | Reserved |

| Bit | Name | Value | Description |
|------------|-------|-------|---|
| Bit 6 | THERM | 1 | If thermal protection is active (OTF=1), all VSEL 1..4 bits are reset to "0" and LNB output (VOUT pin) is disabled. VSEL bits have to be set again by the master after the overtemperature condition is removed (OTF=0) |
| | | 0 | If thermal protection is active (OTF=1) the LNB output (VOUT pin) is automatically enabled as soon as the overtemperature condition is removed (OTF=0) with the previous VSEL bits setting |
| Bit 7(MSB) | COMP | 1 | DC-DC converter compensation: set to use very low ESR capacitors or ceramic caps on VUP pin |
| | | 0 | DC-DC converter compensation: set to use standard electrolytic capacitors on VUP pin |

N/A = reserved bit

All bits reset to 0 at power-on

7.4 Status registers

Status 1, 2 registers can be only addressed to read mode and provide the diagnostic functions described in the following tables.

Table 11: Status 1 (read register. Register address = 0X0)

| Bit | Name | Value | Description |
|-------------|------|-------|---|
| Bit 0 (LSB) | OLF | 1 | VOUT pin overload protection has been triggered ($I_{OUT} > I_{LIM}$). Refer to Table 9: "Data 3 (read/write register. Register address = 0X4)" for the overload operation settings (ISET, PCL, TIMER bits) |
| | | 0 | No overload protection has been triggered to the VOUT pin ($I_{OUT} < I_{LIM}$) |
| Bit 1 | N/A | - | Reserved |
| Bit 2 | VMON | 1 | Output voltage (VOUT pin) lower than VMON specification thresholds. Refer to Table 17: "Output voltage diagnostic (VMON bit, status 1 register) characteristics" |
| | | 0 | Output voltage (VOUT pin) is within the VMON specifications |
| Bit 3 | N/A | - | Reserved |
| Bit 4 | PDO | 1 | Overcurrent detected on output pull-down stage for a time longer than the deglitch period. This may happen due to an external voltage source present on the LNB output (VOUT pin) |
| | | 0 | No overcurrent detected on output pull-down stage |
| Bit 5 | N/A | - | Reserved |
| Bit 6 | OTF | 1 | Junction overtemperature is detected, $T_J > 150\text{ °C}$. See also THERM bit setting in Table 10: "Data 4 (read/write register. Register address = 0X5)" |
| | | 0 | Junction overtemperature is not detected, $T_J < 135\text{ °C}$. T_J is below thermal protection threshold |
| Bit 7 (MSB) | PNG | 1 | Input voltage (VCC pin) lower than LPD minimum thresholds. Refer to Table 13: "Electrical characteristics" |
| | | 0 | Input voltage (VCC pin) higher than LPD thresholds. Refer to Table 13: "Electrical characteristics" |

N/A = reserved bit

All bits reset to 0 at power-on

Table 12: Status 2 (read register. Register address = 0X1)

| Bit | Name | Value | Description |
|-------------|------|-------|--|
| Bit 0 (LSB) | TDET | 1 | 22 kHz tone presence is detected on the DETIN pin |
| | | 0 | No 22 kHz tone is detected on the DETIN pin |
| Bit 1 | N/A | - | Reserved |
| Bit 2 | TMON | 1 | 22 kHz tone present on the DETIN pin is out of TMON specification threshold: the tone frequency or the A _{TONE} (tone amplitude) is out of the thresholds guaranteed in the TMON electrical characteristics |
| | | 0 | 22 kHz tone present on the DETIN pin is within TMON specification thresholds. Refer to Table 19: "22 kHz tone diagnostic (TMON bit, status 2 register) characteristics" |
| Bit 3 | N/A | - | Reserved |
| Bit 4 | IMON | 1 | Output current (from VOUT pin) is lower than IMON specification thresholds |
| | | 0 | Output current (from VOUT pin) is higher than IMON specifications |
| Bit 5 | N/A | - | Reserved |
| Bit 6 | N/A | - | Reserved |
| Bit 7(MSB) | N/A | - | Reserved |

N/A = reserved bit

All bits reset to 0 at power-on

8 Electrical characteristics

See [Section 5: "Typical application circuits"](#), T_J from 0 to 85 °C, all data 1..4 register bits set to 0 unless $VSEL1 = 1$, $RSEL = 11.5 \text{ k}\Omega$, $DSQIN = \text{low}$, $V_{IN} = 12 \text{ V}$, $I_{OUT} = 50 \text{ mA}$, unless otherwise stated. Typical values are referred to $T_J = 25 \text{ }^\circ\text{C}$. $V_{OUT} = V_{OUT}$ pin voltage. See [Section 6: "I²C bus interface"](#) and [Section 7: "I²C interface protocol"](#).

Table 13: Electrical characteristics

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|------------|---------------------------------------|---|------|--------------|------|---------------|
| V_{IN} | Supply voltage ⁽¹⁾ | | 8 | 12 | 16 | V |
| I_{IN} | Supply current | $I_{OUT} = 0 \text{ mA}$ | | 6 | | mA |
| | | 22 kHz tone enabled (TEN=1), $DSQIN = \text{high}$, $I_{OUT} = 0 \text{ mA}$ | | 10 | | mA |
| | | $VSEL1=VSEL2=VSEL3=VSEL4=0$ | | 1 | | mA |
| V_{OUT} | Output voltage total accuracy | Valid at any V_{OUT} selected level | -3.5 | | +3.5 | % |
| V_{OUT} | Line regulation | $V_{IN} = 8 \text{ to } 16 \text{ V}$ | | | 40 | mV |
| V_{OUT} | Load regulation | I_{OUT} from 50 to 750 mA | | 100 | | |
| I_{LIM} | Output current limiting thresholds | $RSEL = 11.5 \text{ k}\Omega$, $ISET = 0$ | 750 | | 1100 | mA |
| | | $RSEL = 16.2 \text{ k}\Omega$, $ISET = 0$ | 500 | | 750 | |
| | | $RSEL = 22 \text{ k}\Omega$, $ISET = 0$ | 350 | | 550 | |
| I_{LIM} | Output current limiting thresholds | $RSEL = 11.5 \text{ k}\Omega$, $ISET = 1$ | | 500 | | mA |
| | | $RSEL = 16.2 \text{ k}\Omega$, $ISET = 1$ | | 350 | | |
| | | $RSEL = 22 \text{ k}\Omega$, $ISET = 1$ | | 250 | | |
| I_{SC} | Output short-circuit current | $RSEL = 11.5 \text{ k}\Omega$, $ISET = 0$ | | 500 | | mA |
| SS | Soft-start time | V_{OUT} from 0 to 13 V | | 4 | | ms |
| SS | Soft-start time | V_{OUT} from 0 to 18 V | | 6 | | ms |
| T13-18 | Soft transition rise time | V_{OUT} from 13 to 18 V | | 1.5 | | ms |
| T18-13 | Soft transition fall time | V_{OUT} from 18 to 13 V | | 1.5 | | ms |
| T_{OFF} | Dynamic overload protection off-time | PCL = 0, output shorted | | 900 | | ms |
| T_{ON} | Dynamic overload protection on-time | PCL = TIMER = 0, output shorted | | $T_{OFF}/10$ | | |
| | | PCL = 0, TIMER = 1, output shorted | | $T_{OFF}/5$ | | |
| A_{TONE} | Tone amplitude | $DSQIN = \text{high}$, $EXTM=0$, $TEN=1$ I_{OUT} from 0 to 750 mA C_{BUS} from 0 to 750 nF | 0.55 | 0.675 | 0.8 | V_{PP} |
| F_{TONE} | Tone frequency | $DSQIN = \text{high}$, $EXTM=0$, $TEN=1$ | 20 | 22 | 24 | kHz |
| D_{TONE} | Tone duty cycle | | 43 | 50 | 57 | % |
| t_r, t_f | Tone rise or fall time ⁽²⁾ | | 5 | 8 | 15 | μs |

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|----------------------------|--|--|------|------|------|-----------------|
| Eff _{DC/DC} | DC-DC converter efficiency | I _{OUT} = 500 mA | | 93 | | % |
| F _{SW} | DC-DC converter switching frequency | | | 440 | | kHz |
| UVLO | Undervoltage lockout thresholds | UVLO threshold rising | | 4.8 | | V |
| | | UVLO threshold falling | | 4.7 | | |
| V _{LP} | Low power diagnostic (LPD) thresholds | V _{LP} threshold rising | | 7.2 | | V |
| | | V _{LP} threshold falling | | 6.7 | | |
| V _{IL} | DSQIN, pin logic low | | | | 0.8 | V |
| V _{IH} | DSQIN, pin logic high | | 2 | | | V |
| I _{IH} | DSQIN, pin input current | V _{IH} = 5 V | | 15 | | μA |
| F _{DETIN} | Tone detector frequency capture range ⁽³⁾ | 0.4 V _{PP} sine wave | 19 | 22 | 25 | kHz |
| V _{DETIN} | Tone detector input amplitude ⁽³⁾ | Sine wave signal, 22 kHz | 0.3 | | 1.5 | V _{PP} |
| Z _{DETIN} | Tone detector input impedance | | | 150 | | kΩ |
| V _{OL_BPSW} | BPSW pin low voltage | I _{OL_BPSW} = 5 mA, DSQIN = high, EXTM=0, TEN=1 | | 0.7 | | V |
| V _{OL} | DSQOUT, FLT pins logic LOW | DETIN tone present, I _{OL} = 2 mA | | 0.3 | 0.5 | V |
| I _{OZ} | DSQOUT, FLT pins leakage current | DETIN tone absent, V _{OH} = 6 V | | | 10 | μA |
| I _{OBK} | Output backward current | All VSELx=0, V _{OBK} = 30 V | | -3 | -6 | mA |
| I _{SINK} | Output low-side sink current | V _{OUT} forced at V _{OUT_NOM} + 0.1 V | | 70 | | mA |
| I _{SINK_TIME-OUT} | Low-side sink current time-out | V _{OUT} forced at V _{OUT_NOM} + 0.1 V PDO I ² C bit is set to 1 after this time is elapsed | | 10 | | ms |
| I _{REV} | Max. reverse current | V _{OUT} forced at V _{OUT_NOM} + 0.1 V after PDO bit is set to 1 (I _{SINK_TIME-OUT} elapsed) | | 2 | | mA |
| T _{SHDN} | Thermal shutdown threshold | | | 150 | | °C |
| DT _{SHDN} | Thermal shutdown hysteresis | | | 15 | | °C |

Notes:

⁽¹⁾In applications where (V_{CC} - V_{OUT}) > 1.3 V the increased power dissipation inside the integrated LDO must be taken into account in the application thermal management design.

⁽²⁾Guaranteed by design.

⁽³⁾Frequency range in which the DETIN function is guaranteed. The V_{PP} level is intended on the LNB bus (before the C6 capacitor. See typical application circuit for DiSEqC 2.x). I_{OUT} from 0 to 750 mA, C_{BUS} from 0 to 750 nF.

Table 14: Output voltage selection table (data1 register, write mode)

| VSEL4 | VSEL3 | VSEL2 | VSEL1 | V _{OUT} min. | V _{OUT} voltage | V _{OUT} max. | Function |
|-------|-------|-------|-------|-----------------------|--------------------------|-----------------------|---|
| 0 | 0 | 0 | 0 | | 0.000 | | V _{OUT} disabled. The LNBH25S is set in standby mode |
| 0 | 0 | 0 | 1 | 12.545 | 13.000 | 13.455 | |
| 0 | 0 | 1 | 0 | 12.867 | 13.333 | 13.800 | |

| 1 | 0 | 0 | 1 | 17.836 | 18.483 | 19.130 | |
| 1 | 0 | 1 | 0 | 18.158 | 18.817 | 19.475 | |
| 1 | 0 | 1 | 1 | 18.48 | 19.150 | 19.820 | |
| 1 | 1 | 0 | 0 | 18.801 | 19.483 | 20.165 | |
| 1 | 1 | 0 | 1 | 19.123 | 19.817 | 20.510 | |
| 1 | 1 | 1 | 0 | 19.445 | 20.150 | 20.855 | |
| 1 | 1 | 1 | 1 | 19.766 | 20.483 | 21.200 | |

T_J from 0 to 85 °C, V_I = 12 V

Table 15: I²C electrical characteristics

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|------------------|---------------------------------------|--|------|------|------|------|
| V _{IL} | Low level input voltage | SDA, SCL | | | 0.8 | V |
| V _{IH} | High level input voltage | SDA, SCL | 2 | | | V |
| I _{IN} | Input current | SDA, SCL, V _{IN} = 0.4 to 4.5 V | -10 | | 10 | μA |
| V _{OL} | Low level output voltage ^a | SDA (open drain), I _{OL} = 6 mA | | | 0.6 | V |
| F _{MAX} | Maximum clock frequency | SCL | | | 400 | kHz |

T_J from 0 to 85 °C, V_I = 12 V

Table 16: Address pin characteristics

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|---------------------|--|--|------|------|------|------|
| V _{ADDR-1} | "0001000(R/W)" address pin voltage range | R/W bit determines the transmission mode: read (R/W=1) write (R/W=0) | 0 | | 0.8 | V |
| V _{ADDR-2} | "0001001(R/W)" address pin voltage range | R/W bit determines the transmission mode: read (R/W=1) write (R/W=0) | 2 | | 5 | V |

^a Guaranteed by design.

Refer to [Section 5: "Typical application circuits"](#), T_J from 0 to 85 °C, all dat 1..4 register bits set to "0", RSEL = 11.5 k Ω , DSQIN = low, V_{IN} = 12 V, I_{OUT} = 50 mA, unless otherwise stated. Typical values are referred to T_J = 25 °C. V_{OUT} = VOUT pin voltage. See [Section 6: "I²C bus interface"](#) and [Section 7: "I²C interface protocol"](#).

Table 17: Output voltage diagnostic (VMON bit, status 1 register) characteristics

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|------------|---|--------------------------------------|------|------|------|------|
| V_{TH-L} | Diagnostic low threshold at V_{OUT} = 13.0 V | VSEL1 = 1, VSEL2 = VSEL3 = VSEL4 = 0 | 80 | 90 | 95 | % |
| V_{TH-L} | Diagnostic low threshold at V_{OUT} = 18.15 V | VSEL4 = 1, VSEL1 = VSEL2 = VSEL3 = 0 | 80 | 90 | 95 | % |

If the output voltage is lower than the min. value, the VMON I²C bit is set to 1.

If VMON=0 then $V_{OUT} > 80\%$ of V_{OUT} typical

If VMON=1 then $V_{OUT} < 95\%$ of V_{OUT} typical

Refer to [Section 5: "Typical application circuits"](#), T_J from 0 to 85 °C, RSEL = 11.5 k Ω , DSQIN = low, V_{IN} = 12 V, unless otherwise stated. Typical values are referred to T_J = 25 °C. V_{OUT} = VOUT pin voltage. See [Section 6: "I²C bus interface"](#) and [Section 7: "I²C interface protocol"](#).

Table 18: Output current diagnostic (IMON bit, status 2 register) characteristics

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|----------|--------------------------------------|--|------|------|------|------|
| I_{TH} | Minimum current diagnostic threshold | EN_IMON = 1 (V_{OUT} is set to 21 V typ.) | 5 | 12 | 20 | mA |

If the output current is lower than the min. threshold limit, the IMON I²C bit is set to 1. If the output current is higher than the max. threshold limit, the IMON I²C bit is set to 0.

Refer to [Section 5: "Typical application circuits"](#), T_J from 0 to 85 °C, all data 1..4 register bits set to "0" unless $VSEL1 = 1$, $TEN = 1$, $RSEL = 11.5 \text{ k}\Omega$, $DSQIN = \text{high}$, $V_{IN} = 12 \text{ V}$, $I_{OUT} = 50 \text{ mA}$, unless otherwise stated. Typical values are referred to $T_J = 25 \text{ }^\circ\text{C}$. $V_{OUT} =$ VOUT pin voltage. See [Section 6: "I²C bus interface"](#) and [Section 7: "I²C interface protocol"](#).

Table 19: 22 kHz tone diagnostic (TMON bit, status 2 register) characteristics

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
|------------|--------------------------------------|----------------------|------|------|------|------|
| A_{TH-L} | Amplitude diagnostic low threshold | DETIN pin AC coupled | 200 | 300 | 400 | mV |
| A_{TH-H} | Amplitude diagnostic high threshold | DETIN pin AC coupled | 900 | 1100 | 1200 | mV |
| F_{TH-L} | Frequency diagnostic low thresholds | DETIN pin AC coupled | 13 | 16.5 | 20 | kHz |
| F_{TH-H} | Frequency diagnostic high thresholds | DETIN pin AC coupled | 24 | 29.5 | 38 | kHz |

If the 22 kHz tone parameters are lower or higher than the above limits, the TMON I²C bit is set to "1".

9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

Table 20: QFN24L (4x4 mm) mechanical data

| Dim. | mm | | |
|------|------|------|------|
| | Min. | Typ. | Max. |
| A | 0.80 | 0.90 | 1.00 |
| A1 | 0.00 | 0.02 | 0.05 |
| b | 0.18 | 0.25 | 0.30 |
| D | 3.90 | 4.00 | 4.10 |
| D2 | 2.55 | 2.70 | 2.80 |
| E | 3.90 | 4.00 | 4.10 |
| E2 | 2.55 | 2.70 | 2.80 |
| e | 0.45 | 0.50 | 0.55 |
| L | 0.25 | 0.35 | 0.40 |

10 Revision history

Table 21: Document revision history

| Date | Revision | Changes |
|-------------|----------|---|
| 23-Jul-2014 | 1 | Initial release. |
| 24-Mar-2015 | 2 | Updated section 2.6, figure 5 and table 13. |

IMPORTANT NOTICE – PLEASE READ CAREFULLY

STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST's terms and conditions of sale in place at the time of order acknowledgement.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of Purchasers' products.
