### Functional Diagram

### General Description

The HMC5445LS6 is a three-stage GaAs pHEMT MMIC 1 Watt Power Amplifier which operates between 24 and 27 GHz. The HMC5445LS6 provides 26 dB of gain, and +31 dBm of saturated output power and 18% PAE from a +6V supply. The RF I/Os are DC blocked and matched to 50 Ohms for ease of integration into Multi-Function-Modules (MFMs). The HMC5445LS6 eliminates the need for wire bonding and allows the use of surface mount manufacturing techniques.

[2] Circuit Board Material: Rogers 4350

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation board should be mounted to an appropriate heat sink. The evaluation circuit board shown is available from Hittite upon request.
