

FEATURES

- Triaxial, digital gyroscope with digital range scaling
 - $\pm 75^\circ/\text{sec}$, $\pm 150^\circ/\text{sec}$, $\pm 300^\circ/\text{sec}$ settings
 - Tight orthogonal alignment, 0.05°
- Triaxial, digital accelerometer, $\pm 18 g$
- Triaxial, digital magnetometer, ± 2.5 gauss
- Autonomous operation and data collection
 - No external configuration commands required
 - 220 ms start-up time
 - 4 ms sleep mode recovery time
- Factory calibrated sensitivity, bias, and axial alignment
 - Calibration temperature range: -40°C to $+85^\circ\text{C}$
- SPI-compatible serial interface
- Embedded temperature sensor
- Programmable operation and control
 - Automatic and manual bias correction controls
 - Bartlett window FIR length, number of taps
 - Digital I/O: data ready, alarm indicator, general-purpose
 - Alarms for condition monitoring
 - Sleep mode for power management
 - DAC output voltage
 - Enable external sample clock input up to 1.2 kHz
 - Single-command self test
- Single-supply operation: 4.75 V to 5.25 V
- 2000 g shock survivability
- Operating temperature range: -40°C to $+105^\circ\text{C}$

APPLICATIONS

- Unmanned aerial vehicles
- Platform control
- Digital compassing
- Navigation

FUNCTIONAL BLOCK DIAGRAM

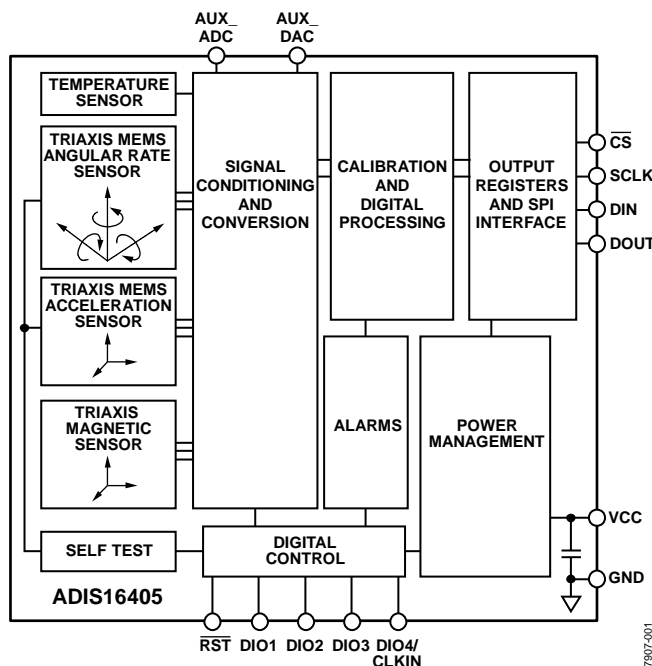

Figure 1.

GENERAL DESCRIPTION

The ADIS16405 iSensor[®] product is a complete inertial system that includes a triaxial gyroscope, a triaxial accelerometer, and a triaxial magnetometer. The ADIS16405 combines the Analog Devices, Inc., proprietary iMEMS[®] technology with signal conditioning that optimizes dynamic performance. The factory calibration characterizes each sensor for sensitivity, bias, alignment, and linear acceleration (gyroscope bias). As a result, each sensor has its own dynamic compensation for correction formulas that provide accurate sensor measurements over a temperature range of -40°C to $+85^\circ\text{C}$. The magnetometers employ a self correction function to provide accurate bias performance over temperature as well.

The ADIS16405 provides a simple, cost effective method for integrating accurate, multiple axis inertial sensing into industrial

systems, especially when compared with the complexity and investment associated with discrete designs.

All necessary motion testing and calibration are part of the production process at the factory, greatly reducing system integration time. Tight orthogonal alignment simplifies inertial frame alignment in navigation systems. An improved serial peripheral interface (SPI) and register structure provide faster data collection and configuration control. By using a compatible pinout and the same package as the ADIS16362/ADIS16364/ADIS16365/ ADIS16367 family, upgrading to the ADIS16405 requires only firmware changes to accommodate additional sensors and register map updates.

This compact module is approximately 23 mm \times 23 mm \times 23 mm and provides a flexible connector interface that enables multiple mounting orientation options.

| POWER SUPPLY | | | | | |
| Operating Voltage Range, VCC | | 4.75 | 5.0 | 5.25 | V |
| Power Supply Current | Low power mode at $T_A = 25^\circ\text{C}$ | | 45 | | mA |
| | Normal mode at $T_A = 25^\circ\text{C}$ | | 70 | | mA |
| | Sleep mode at $T_A = 25^\circ\text{C}$ | | 600 | | μA |

¹ The digital I/O signals are driven by an internal 3.3 V supply, and the inputs are 5 V tolerant.

² Endurance is qualified as per JEDEC Standard 22, Method A117, and measured at -40°C , $+25^\circ\text{C}$, $+85^\circ\text{C}$, and $+125^\circ\text{C}$.

³ The data retention lifetime equivalent is at a junction temperature (T_J) of 85°C as per JEDEC Standard 22, Method A117. Data retention lifetime decreases with junction temperature.

⁴ These times do not include thermal settling and internal filter response times (330 Hz bandwidth), which can affect overall accuracy.

TIMING SPECIFICATIONS

T_A = 25°C, V_{CC} = 5 V, unless otherwise noted.

Figure 4. Input Clock Timing Diagram

ABSOLUTE MAXIMUM RATINGS

Table 3.

| Parameter | Rating |
|-------------------------------|--------------------------------|
| Acceleration | |
| Any Axis, Unpowered | 2000 <i>g</i> |
| Any Axis, Powered | 2000 <i>g</i> |
| VCC to GND | −0.3 V to +6.0 V |
| Digital Input Voltage to GND | −0.3 V to +5.3 V |
| Digital Output Voltage to GND | −0.3 V to VCC + 0.3 V |
| Analog Input to GND | −0.3 V to +3.6 V |
| Operating Temperature Range | −40°C to +105°C |
| Storage Temperature Range | −65°C to +125°C ^{1,2} |

¹ Extended exposure to temperatures outside the specified temperature range of −40°C to +105°C can adversely affect the accuracy of the factory calibration. For best accuracy, store the devices within the specified operating range of −40°C to +105°C.

² Although the device is capable of withstanding short term exposure to 125°C and above, long-term exposure threatens internal mechanical integrity.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Table 4. Package Characteristics

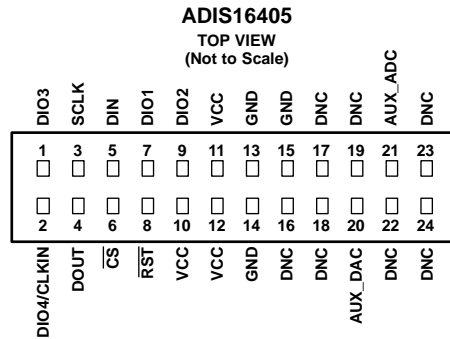

| Package Type | θ_{JA} | θ_{JC} | Device Weight |
|----------------|---------------|---------------|---------------|
| 24-Lead Module | 39.8°C/W | 14.2°C/W | 16 g |

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TYPICAL PERFORMANCE CHARACTERISTICS

Figure 7. Gyroscope Root Allan Variance

Figure 8. Accelerometer Root Allan Variance

THEORY OF OPERATION

BASIC OPERATION

The ADIS16405 is an autonomous system that requires no user initialization. When it has a valid power supply, it initializes itself and starts sampling, processing, and loading sensor data into the output registers at a sample rate of 819.2 SPS. DIO1 pulses high after each sample cycle concludes. The SPI interface enables simple integration with many embedded processor platforms, as shown in Figure 9 and Table 6.

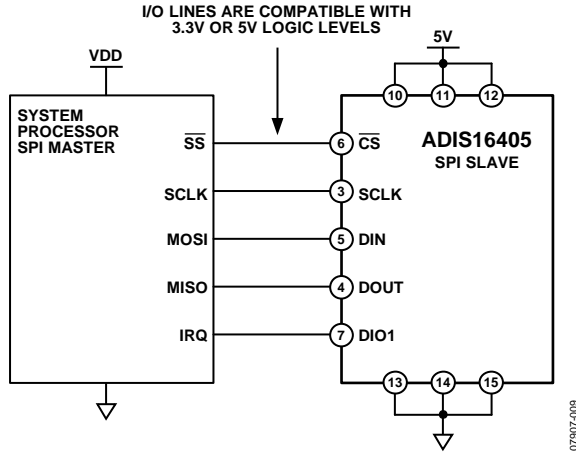

Figure 9. Electrical Connection Diagram

Table 6. Generic Master Processor Pin Names and Functions

| Pin Name | Function |
|----------|----------------------------|
| SS | Slave select |
| SCLK | Serial clock |
| MOSI | Master output, slave input |
| MISO | Master input, slave output |
| IRQ | Interrupt request |

The ADIS16405 SPI interface supports full duplex serial communication (simultaneous transmit and receive) and uses the bit sequence shown in Figure 10. Table 7 provides a list of the most common settings that require attention to initialize the serial port of a processor for the ADIS16405 SPI interface.

Table 7. Generic Master Processor SPI Settings

| Processor Setting | Description |
|-------------------------------------|---|
| Master | The ADIS16405 operates as a slave. |
| SCLK Rate \leq 2 MHz ¹ | Normal mode, SMPL_PRD[7:0] \leq 0x08. |
| CPOL = 1 | Clock polarity. |
| CPHA = 1 | Clock phase. |
| MSB First | Bit sequence. |
| 16-Bit | Shift register/data length. |

¹ For burst mode, SCLK rate \leq 1 MHz. For low power mode, SCLK rate \leq 300 kHz.

READING SENSOR DATA

Although the ADIS16405 produces data independently, it operates as a SPI slave device that communicates with system (master) processors using the 16-bit segments displayed in Figure 10. Individual register reads require two such 16-bit sequences. The first 16-bit sequence provides the read command bit (R/W = 0) and the target register address (A6 to A0). The second sequence transmits the register contents (D15 to D0) on the DOUT line. For example, if DIN = 0x0A00, the content of XACCL_OUT shifts out on the DOUT line during the next 16-bit sequence.

The SPI operates in full duplex mode, which means that the master processor can read the output data from DOUT while using the same SCLK pulses to transmit the next target address on DIN.

DEVICE CONFIGURATION

The user register memory map (see Table 8) identifies configuration registers with either a W (write only) or R/W (read/write). Configuration commands also use the bit sequence displayed in Figure 10. If the MSB is equal to 1, the last eight bits (DC7 to DC0) in the DIN sequence load into the memory address associated with the address bits (A6 to A0). For example, if DIN = 0xA11F, then 0x1F loads into Address Location 0x21 (XACCL_OFF, upper byte) at the conclusion of the data frame.

Most of the registers have a backup location in nonvolatile flash memory. The master processor must manage the backup function. Set GLOB_CMD[3] = 1 (DIN = 0xBE04) to execute a manual flash update (backup) operation, which copies the user registers into their respective flash memory locations. This operation takes 50 ms and requires the power supply voltage to be within the specified limit to complete properly. The FLASH_CNT register provides a running count of these events for managing the long-term reliability of the flash memory.

BURST MODE DATA COLLECTION

Burst mode data collection offers a more efficient method for collecting data from the ADIS16405. In sequential data cycles (each separated by one SCLK period), all output registers clock out on DOUT. This sequence starts when the DIN sequence is 0011 1110 0000 0000 (0x3E00). Next, the contents of each output register are output from DOUT, starting with SUPPLY_OUT and ending with AUX_ADC (see Figure 11). The addressing sequence shown in Table 8 determines the order of the outputs in burst mode.

MEMORY MAP

Table 8. User Register Memory Map¹

| Name | R/W | Flash Backup | Address ² | Default | Function | Bit Assignments |
|------------|-----|--------------|----------------------|---------|--|-----------------|
| FLASH_CNT | R | Yes | 0x00 | N/A | Flash memory write count | N/A |
| SUPPLY_OUT | R | No | 0x02 | N/A | Power supply measurement | See Table 9 |

¹ N/A means not applicable.

² Each register contains two bytes. The address of the lower byte is displayed. The address of the upper byte is equal to the address of the lower byte plus 1.

NOTES

1. DOUT BITS ARE BASED ON THE PREVIOUS 16-BIT SEQUENCE ($\bar{R} = 0$).

Figure 10. SPI Communication Bit Assignments

Figure 11. Burst Mode Read Sequence

OUTPUT DATA REGISTERS

Figure 6 provides the positive measurement direction for each gyroscope, accelerometer, and magnetometer. Table 9 provides the configuration and scale factor for each output data register in the ADIS16405. All inertial sensor outputs are in 14-bit, twos complement format, which means that 0x0000 is equal to 0 LSB, 0x0001 is equal to +1 LSB, and 0x3FFF is equal to -1 LSB. The following is an example of how to calculate the sensor measurement from the XGYRO_OUT:

$$XGYRO_OUT = 0x3B4A$$

$$0x000 - 0x3B4A = -0x04B6 = (4 \times 256 + 11 \times 16 + 6) - 0x04B6 = -1206 \text{ LSB}$$

$$Rate = 0.05^\circ/sec \times (-1206) = -60.3^\circ/sec$$

Therefore, an ZGYRO_OUT output of 0x3B4A corresponds to a clockwise rotation around the z-axis (see Figure 6) of 60.3°/sec when looking at the top of the package.

Table 9. Output Data Register Formats

| Register | Bits | Format | Scale |
|------------------------|------|----------------------|------------|
| SUPPLY_OUT | 14 | Binary, 5 V = 0x0814 | 2.418 mV |
| XGYRO_OUT ¹ | 14 | Twos complement | 0.05°/sec |
| YGYRO_OUT ¹ | 14 | Twos complement | 0.05°/sec |
| ZGYRO_OUT ¹ | 14 | Twos complement | 0.05°/sec |
| XACCL_OUT | 14 | Twos complement | 3.33 mg |
| YACCL_OUT | 14 | Twos complement | 3.33 mg |
| ZACCL_OUT | 14 | Twos complement | 3.33 mg |
| XMAGN_OUT | 14 | Twos complement | 0.5 mgauss |
| YMAGN_OUT | 14 | Twos complement | 0.5 mgauss |
| ZMAGN_OUT | 14 | Twos complement | 0.5 mgauss |
| TEMP_OUT ² | 12 | Twos complement | 0.14°C |
| AUX_ADC | 12 | Binary, 1 V = 0x04D9 | 806 μV |

¹ Assumes that the scaling is set to ±300°/sec. This factor scales with the range.

² The typical output for this register at 25°C is 0x0000.

Each output data register uses the bit assignments shown in Figure 12. The ND flag indicates that unread data resides in the output data registers. This flag clears and returns to 0 during an output register read sequence. It returns to 1 after the next internal sample updates the registers with new data. The EA flag indicates that one of the error flags in the DIAG_STAT register (see Table 23) is active (true). The remaining 14 bits are for data.

Figure 12. Output Register Bit Assignments

Auxiliary ADC

The AUX_ADC register provides access to the auxiliary ADC input channel. The ADC is a 12-bit successive approximation converter that has an equivalent input circuit to the one shown in Figure 13. The maximum input is 3.3 V. The ESD protection diodes can handle 10 mA without causing irreversible damage. The on resistance (R1) of the switch has a typical value of 100 Ω. The sampling capacitor, C2, has a typical value of 16 pF.

Figure 13. Equivalent Analog Input Circuit (Conversion Phase: Switch Open, Track Phase: Switch Closed)

CALIBRATION

Manual Bias Calibration

The bias offset registers in Table 10, Table 11, and Table 12 (hard iron correction for magnetometer) provide a manual adjustment function for the output of each sensor. For example, if XGYRO_OFF equals 0x1FF6, the XGYRO_OUT offset shifts by -10 LSB, or -0.125°/sec. The DIN command for the upper byte is DIN = 0x9B1F; for the lower byte, DIN = 0x9AF6.

Table 10. XGYRO_OFF, YGYRO_OFF, ZGYRO_OFF

| Bits | Description (Default = 0x0000) |
|---------|---|
| [15:13] | Not used. |
| [12:0] | Data bits. Twos complement, 0.0125°/sec per LSB. Typical adjustment range = ±50°/sec. |

Table 11. XACCL_OFF, YACCL_OFF, ZACCL_OFF

| Bits | Description (Default = 0x0000) |
|---------|--|
| [15:12] | Not used. |
| [11:0] | Data bits. Twos complement, 3.33 mg/LSB. Typical adjustment range = ±6.75 g. |

Table 12. XMAGN_HIF, YMAGN_HIF, ZMAGN_HIF

| Bits | Description (Default = 0x0000) |
|---------|--|
| [15:14] | Not used. |
| [13:0] | Data bits. Twos complement, 0.5 mgauss/LSB. Typical adjustment range = ±4 gauss. |

Magnetometer Soft Iron Correction (Scale Factor)

The soft iron correction factor for the magnetometer provides the opportunity to change the scale factor for each individual axis.

Table 13. XMAGN_SIF, YMAGN_SIF, ZMAGN_SIF

| Bits | Description (Default = 0x0800) |
|---------|--|
| [15:12] | Not used. |
| [11:0] | Data bits. Binary, linear scale adjustment factor between 0x0000 (0x) and 0x3FFF (2x). |

Gyroscope Automatic Bias Null Calibration

Set GLOB_CMD[0] = 1 (DIN = 0xBE01) to execute this function, which measures the gyroscope outputs and then loads the gyroscope offset registers with the opposite values to provide a quick bias calibration. Then, all sensor data resets to 0, and the flash memory updates automatically within 50 ms (see Table 14).

Gyroscope Precision Automatic Bias Null Calibration

Set GLOB_CMD[4] = 1 (DIN = 0xBE10) to execute this function, which takes the sensor offline for 30 sec while it collects a set of gyroscope data and calculates a more accurate bias correction factor for each gyroscope. When calculated, the correction factor loads into the three gyroscope offset registers, all sensor data resets to 0, and the flash memory updates automatically within 50 ms (see Table 14).

Restoring Factory Calibration

Set GLOB_CMD[1] = 1 (DIN = 0xBE02) to execute this function, which resets each user calibration register (see Table 10, Table 11, and Figure 11) to 0x0000, resets all sensor data to 0, and automatically updates the flash memory within 50 ms (see Table 14).

Linear Acceleration Bias Compensation (Gyroscope)

Set MSC_CTRL[7] = 1 (DIN = 0xB486) to enable correction for low frequency acceleration influences on gyroscope bias. Note that the DIN sequence also preserves the factory default condition for the data ready function (see Table 19).

OPERATIONAL CONTROL

Global Commands

The GLOB_CMD register provides trigger bits for several useful functions. Setting the assigned bit to 1 starts each operation, which returns the bit to 0 after completion. For example, set GLOB_CMD[7] = 1 (DIN = 0xBE80) to execute a software reset, which stops the sensor operation and runs the device through its start-up sequence. This includes loading the control registers with their respective flash memory locations prior to producing new data. Reading the GLOB_CMD registers (DIN = 0x3E00) starts the burst mode read sequence.

Table 14. GLOB_CMD

| Bits | Description |
|--------|-------------------------------------|
| [15:8] | Not used |
| 7 | Software reset command |
| [6:5] | Not used |
| 4 | Precision autonull command |
| 3 | Flash update command |
| 2 | Auxiliary DAC data latch |
| 1 | Factory calibration restore command |
| 0 | Autonull command |

Internal Sample Rate

The SMPL_PRD register provides discrete sample rate settings, using the bit assignments in Table 15 and the following equation:

$$t_s = t_B \times (N_S + 1)$$

where:

t_s is the sample rate. When SMPL_PRD[7:0] = 0x0A, the sample rate is 149 SPS.

t_B is the time base.

N_S is the increment setting.

Table 15. SMPL_PRD

| Bits | Description (Default = 0x0001) |
|--------|--|
| [15:8] | Not used |
| 7 | Time base (t_B) 0 = 0.61035 ms, 1 = 18.921 ms |
| [6:0] | Increment setting (N_S) Internal sample period = $t_s = t_B \times (N_S + 1)$ |

The default sample rate setting of 819.2 SPS preserves the sensor bandwidth and provides optimal performance. For systems that value slower sample rates, simply read the device at a slower rate and keep the internal sample rate at 819.2 SPS. Use the programmable filter (SENS_AVG) to reduce the bandwidth along with the reduced read rates. The data-ready function (MSC_CTRL) can drive an interrupt routine that uses a counter to help ensure data coherence at the reduced update rates.

Power Management

Setting SMPL_PRD \geq 0x0A also sets the sensor in low power mode. For systems that require the lower power dissipation, in-system characterization helps users to quantify the associated performance trade-offs. In addition to sensor performance, this mode affects SPI data rates (see Table 2). Set SLP_CNT[8] = 1 (DIN = 0xBB01) to start the indefinite sleep mode, which requires a \overline{CS} assertion (high to low), reset, or power cycle to wake up. Use SLP_CNT[7:0] to put the device in sleep mode for a given period of time. For example, SLP_CNT[7:0] = 0x64 (DIN = 0xBA64) puts the device to sleep for 50 seconds.

Table 16. SLP_CNT

| Bits | Description |
|--------|---|
| [15:9] | Not used |
| 8 | Indefinite sleep mode, set to 1 |
| [7:0] | Programmable sleep time bits, 0.5 sec/LSB |

Digital Filtering

A programmable low-pass filter provides additional opportunity for noise reduction on the inertial sensor outputs. This filter contains two cascaded averaging filters that provide a Bartlett window FIR filter response (see Figure 14). For example, SENS_AVG[2:0] = 100 (DIN = B804) sets each stage tap to 16. When used with the default sample rate of 819.2 SPS, this filter setting reduces the sensor bandwidth to approximately 16 Hz.

Figure 14. Bartlett Window FIR Frequency Response
(Taps = 2N + 1, Phase = N Samples)

Dynamic Range

There are three dynamic range settings for the gyroscope. The lower dynamic range settings ($\pm 75^\circ/\text{sec}$ and $\pm 150^\circ/\text{sec}$) limit the minimum filter tap sizes to maintain resolution. For example, set SENS_AVG[10:8] = 010 (DIN = 0xB902) for a measurement range of $\pm 150^\circ/\text{sec}$. Because this setting can influence the filter settings, program SENS_AVG[10:8], then SENS_AVG[2:0] if more filtering is required.

Table 17. SENS_AVG

| Bits | Description (Default = 0x0402) |
|---------|---|
| [15:11] | Not used |
| [10:8] | Measurement range (sensitivity) selection 100 = $\pm 300^\circ/\text{sec}$ (default condition) 010 = $\pm 150^\circ/\text{sec}$, filter taps ≥ 4 (Bits[2:0] $\geq 0x02$) 001 = $\pm 75^\circ/\text{sec}$, filter taps ≥ 16 (Bits[2:0] $\geq 0x04$) |
| [7:3] | Not used |
| [2:0] | Number of taps in each stage $N = 2^M$ |

INPUT/OUTPUT FUNCTIONS

General-Purpose I/O

DIO1, DIO2, DIO3, and DIO4 are configurable, general-purpose I/O lines that serve multiple purposes according to the following control register priority: MSC_CTRL, ALM_CTRL, and GPIO_CTRL. For example, set GPIO_CTRL = 0x080C (DIN = 0xB308, and then 0xB20C) to set DIO1 and DIO2 as inputs and DIO3 and DIO4 as outputs, with DIO3 set low and DIO4 set high.

Table 18. GPIO_CTRL

| Bits | Description (Default = 0x0000) |
|---------|---|
| [15:12] | Not used |
| 11 | General-Purpose I/O Line 4 (DIO4) data level |
| 10 | General-Purpose I/O Line 3 (DIO3) data level |
| 9 | General-Purpose I/O Line 2 (DIO2) data level |
| 8 | General-Purpose I/O Line 1 (DIO1) data level |
| [7:4] | Not used |
| 3 | General-Purpose I/O Line 4 (DIO4), direction control 1 = output, 0 = input |
| 2 | General-Purpose I/O Line 3 (DIO3), direction control 1 = output, 0 = input |
| 1 | General-Purpose I/O Line 2 (DIO2), direction control 1 = output, 0 = input |
| 0 | General-Purpose I/O Line 1 (DIO1), direction control 1 = output, 0 = input |

Input Clock Configuration

The input clock allows external control over sampling in the ADIS16405. Set GPIO_CTRL[3] = 0 (DIN = 0x0B200) and SMPL_PRD[7:0] = 0x00 (DIN = 0xB600) to enable this function. See Table 2 and Figure 4 for timing information.

Data Ready I/O Indicator

The factory default sets DIO1 as a positive data ready indicator signal. The MSC_CTRL[2:0] register provides configuration options for changing this. For example, set MSC_CTRL[2:0] = 100 (DIN = 0xB404) to change the polarity of the data ready signal for interrupt inputs that require negative logic inputs for activation. The resulting pulse width is between 100 μs and 200 μs over all conditions.

Table 19. MSC_CTRL

| Bits | Description (Default = 0x0006) |
|---------|---|
| [15:12] | Not used |
| 11 | Memory test (clears on completion) 1 = enabled, 0 = disabled |
| 10 | Internal self test enable (clears on completion) 1 = enabled, 0 = disabled |
| 9 | Manual self test, negative stimulus 1 = enabled, 0 = disabled |
| 8 | Manual self test, positive stimulus 1 = enabled, 0 = disabled |
| 7 | Linear acceleration bias compensation for gyroscopes 1 = enabled, 0 = disabled |
| 6 | Linear accelerometer origin alignment 1 = enabled, 0 = disabled |
| [5:3] | Not used |
| 2 | Data ready enable 1 = enabled, 0 = disabled |
| 1 | Data ready polarity 1 = active high, 0 = active low |
| 0 | Data ready line select 1 = DIO2, 0 = DIO1 |

Auxiliary DAC

The 12-bit AUX_DAC line can drive its output to within 5 mV of the ground reference when it is not sinking current. As the output approaches 0 V, the linearity begins to degrade (~100 LSB beginning point). As the sink current increases, the nonlinear range increases. The DAC latch command moves the values of the AUX_DAC register into the DAC input register, enabling both bytes to take effect at the same time.

Table 20. AUX_DAC

| Bits | Description (Default = 0x0000) |
|---------|--|
| [15:12] | Not used. |
| [11:0] | Data bits. Scale factor = 0.8059 mV/code, offset binary format, 0 V = 0 codes. |

Table 21. Setting AUX_DAC = 1 V

| DIN | Description |
|--------|--|
| 0xB0D9 | AUX_DAC[7:0] = 0xD9 (217 LSB). |
| 0xB104 | AUX_DAC[15:8] = 0x04 (1024 LSB). |
| 0xBE04 | GLOB_CMD[2] = 1. Move values into the DAC input register, resulting in a 1 V output level. |

DIAGNOSTICS

Self Test

The self test function offers the opportunity to verify the mechanical integrity of each MEMS sensor. It applies an electrostatic force to each sensor element, which results in mechanical displacement that simulates a response to actual motion. Table 1 lists the expected response for each sensor, which provides pass/fail criteria.

Set MSC_CTRL[10] = 1 (DIN = 0xB504) to run the internal self test routine, which exercises all inertial sensors, measures each response, makes pass/fail decisions, and reports them to error flags in the DIAG_STAT register. MSC_CTRL[10] resets itself to 0 after completing the routine. MSC_CTRL[9:8] (DIN = 0xB502 or 0xB501) provide manual control over the self test function. Table 22 shows an example test flow for using this option to check the x-axis gyroscope. Zero motion provides results that are more reliable. The settings in Table 22 are flexible and provide opportunity for optimization around speed and noise influence. For example, using fewer filtering taps decreases delay times but increases the opportunity for noise influence.

Memory Test

Setting MSC_CTRL[11] = 1 (DIN = 0xB508) performs a checksum verification of the flash memory locations. The pass/fail result loads into DIAG_STAT[6].

Status

The error flags provide indicator functions for common system level issues. All of the flags clear (set to 0) after each DIAG_STAT register read cycle. If an error condition remains, the error flag returns to 1 during the next sample cycle. DIAG_STAT[1:0] does not require a read of this register to return to 0.

Table 22. Manual Self Test Example Sequence

| DIN | Description |
|--------|---|
| 0xB601 | SMPL_PRD[7:0] = 0x01, sample rate = 819.2 SPS. |
| 0xB904 | SENS_AVG[15:8] = 0x04, gyroscope range = $\pm 300^\circ/\text{sec}$. |
| 0xB802 | SENS_AVG[7:0] = 0x02, four-tap averaging filter. Delay = 50 ms. |
| 0x0400 | Read XGYRO_OUT. |
| 0xB502 | MSC_CTRL[9] = 1, gyroscope negative self test. Delay = 50 ms. |
| 0x0400 | Read XGYRO_OUT. Calculate the positive change from the first reading to the second reading of XGYRO_OUT, and check to make sure the change is within the positive self test response range specified in Table 1. |
| 0xB501 | MSC_CTRL[9:8] = 01, gyroscope/accelerometer positive self test. Delay = 50 ms. |
| 0x0400 | Read XGYRO_OUT. Calculate the negative change from the first reading to the third reading of XGYRO_OUT, and check to make sure the change is within the positive self test response range specified in Table 1. |
| 0xB500 | MSC_CTRL[15:8] = 0x00. |

Table 23. DIAG_STAT Bit Descriptions

| Bit | Description |
|-----|---|
| 15 | Z-axis accelerometer self test failure 1 = fail, 0 = pass |
| 14 | Y-axis accelerometer self test failure 1 = fail, 0 = pass |
| 13 | X-axis accelerometer self test failure 1 = fail, 0 = pass |

| 5 | Self test diagnostic error flag 1 = fail, 0 = pass |
| 4 | Sensor overrange 1 = fail, 0 = pass |
| 3 | SPI communication failure 1 = fail, 0 = pass |
| 2 | Flash update failure 1 = fail, 0 = pass |
| 1 | Power supply above 5.25 V 1 = power supply ≥ 5.25 V, 0 = power supply ≤ 5.25 V |
| 0 | Power supply below 4.75 V 1 = power supply ≤ 4.75 V, 0 = power supply ≥ 4.75 V |

Alarm Registers

The alarm function provides monitoring for two independent conditions. The ALM_CTRL register provides control inputs for data source, data filtering (prior to comparison), static comparison, dynamic rate of change (ROC) comparison, and output indicator configurations. The ALM_MAGx registers establish the trigger threshold and polarity configurations.

Table 27 gives an example of how to configure a static alarm. The ALM_SMPLx registers provide the number of samples to use in the dynamic ROC configuration. The period equals the number in the ALM_SMPLx register multiplied by the sample period time, which is established by the SMPL_PRD register. See Table 28 for an example of how to configure the sensor for this type of function.

Table 24. ALM_CTRL Bit Designations

| Bits | Description (Default = 0x0000) |
|---------|--|
| [15:12] | Alarm 2 source selection 0000 = disable 0001 = power supply output 0010 = x-axis gyroscope output 0011 = y-axis gyroscope output 0100 = z-axis gyroscope output 0101 = x-axis accelerometer output 0110 = y-axis accelerometer output 0111 = z-axis accelerometer output 1000 = x-axis magnetometer output 1001 = y-axis magnetometer output 1010 = z-axis magnetometer output 1011 = gyroscope temperature output 1100 = auxiliary ADC input |

| DIN | Description |
|-------------------|---|
| 0xAF55, 0xAE17 | ALM_CTRL = 0x5517. Alarm 1 input = XACCL_OUT. Alarm 2 input = XACCL_OUT. Static level comparison, filtered data. DIO2 output indicator, positive polarity. |
| 0xA783, 0xA641 | ALM_MAG1 = 0x8341. Alarm 1 is true if XACCL_OUT > +0.5 g. |
| 0xA93C, 0xA8BF | ALM_MAG2 = 0x3CBF. Alarm 2 is true if XACCL_OUT < -0.5 g. |

Table 28. Alarm Configuration Example 2

| DIN | Description |
|-------------------|--|
| 0xAF76, 0xAE87 | ALM_CTRL = 0x7687. Alarm 1 input = ZACCL_OUT. Alarm 2 input = YACCL_OUT. Rate of change comparison, unfiltered data. DIO2 output indicator, positive polarity. |
| 0xB601 | SMPL_PRD = 0x0001. Sample rate = 819.2 SPS. |
| 0xAB08 | ALM_SMPL1 = 0x0008. Alarm 1 rate of change period = 9.77 ms. |
| 0xAC50 | ALM_SMPL2 = 0x0050. Alarm 2 rate of change period = 97.7 ms. |
| 0xA783, 0xA641 | ALM_MAG1 = 0x8341. Alarm 1 is true if XACCL_OUT > +0.5 g. |
| 0xA93C, 0xA8BE | ALM_MAG2 = 0x3CBE. Alarm 2 is true if XACCL_OUT < -0.5 g. |
