## Technical Reference

### Capacitive Proximity Sensors

4

**Capacitive proximity sensors are designed to detect both metallic and nonmetallic targets.** They are ideally suited for liquid level control and for sensing powdered or granulated material.

#### Strengths and Weaknesses

Consider these strengths and weaknesses of the capacitive proximity sensor:

#### Capacitive Proximity Sensor Attributes

##### Attributes

##### Strengths

Can detect both metallic and nonmetallic objects at greater ranges than inductive sensors

High switching rate for rapid response applications (counting)

Can detect liquid targets through non-metallic barriers (glass, plastic)

Long operation life, solid-state output for "bounce free" signals

##### Weaknesses

Affected by varying temperature, humidity and moisture conditions

Not as accurate as inductive proximity sensors

#### Applications

Here are some examples showing how the detection power of capacitive proximity sensors is used:

- **Liquid level detection applications**, such as preventing overfilling or underfilling, are common in the packaging industry
- **Material level control applications**, such as assuring that a sleeve of labels on a labeling line is not empty
- **Counting applications**, such as tracking units passing a point on a conveyor
- **Induction molding process**, detection of level of plastic pellets in feed hopper

### Operation of the Capacitive Proximity Sensor

A capacitor consists of two metal plates separated by an insulator (called a **dielectric**). **The operation of this type of sensor is based on dielectric capacitance**, which is the ability of a dielectric to store an electrical charge.

The distance between the plates determines the ability of the capacitor to store a charge.

**Measuring the change in capacitance as an object enters the electrical field can be used as an ON/OFF switching function.**

### Capacitor Operation

When this principle is applied to the capacitive proximity sensor, **one capacitive plate is part of the switch, the enclosure (the sensor face) is the insulator. The target is the other "plate."** Ground is the common path.

Capacitive proximity sensors can detect any target that has a dielectric constant greater than air. Liquids have high dielectric constants. Metal also makes a good target.

### Capacitive Proximity Sensor Operation

The capacitive proximity sensor has four basic elements: a sensor (which is a dielectric), an oscillator circuit, a detector circuit and an output circuit.

As an object approaches the sensor, the **dielectric constant of the capacitor changes**. The oscillator circuit's **oscillation begins when feedback capacitance is detected**. This is just the opposite in the inductive proximity sensor, where the oscillation is damped when the target is present.

### Oscillator Damping

The **detector circuit** monitors the oscillator's output. When it detects sufficient change in the field, it switches on the output circuit.

The **output circuit** remains active until the target leaves the sensing field. The oscillator responds with a decrease in amplitude, and when it is no longer receiving sufficient capacitance feedback, the detector circuit switches OFF.

There is a built-in **difference between the operate and release amplitudes to provide hysteresis**.

### Capacitive Proximity Sensor Influences

Many of the same factors that influence the sensing range of inductive proximity sensors, also influence the sensing range of capacitive proximity sensors.

Typically, capacitive sensors have a greater sensing range than inductive sensors.

**Sensing distance for capacitive proximity sensors is dependent on plate diameter.** With inductive proximity sensors, the size of the coil is the determining factor.

### Typical Proximity Sensing Ranges

Sensor with a Tubular Diameter of:	Inductive Unshielded Sensor	Capacitive Unshielded Sensor
18 mm	8 mm	15 mm
30 mm	15 mm	25 mm
34 mm	—	35 mm

### Sensitivity Adjustment

Most capacitive proximity sensors are equipped with sensitivity adjustment potentiometers. Because the sensor measures a dielectric gap, it is important to be able to compensate for target and application conditions and adjust the sensing range.

### Target Material and Size

A capacitive sensor should not be hand-held during set up. Because your hand has a dielectric constant greater than air, the sensor may detect your hand rather than the intended target.

Capacitive sensors can detect both ferrous and non-ferrous materials equally well. **There is no derating factor to be applied when sensing metal targets.** But, other materials do affect the sensing range.

Because they can be used to detect liquid through a nonmetallic material such as glass or plastic, you need to ensure that the sensor detects just the liquid, not the container. **The transparency of the container has no effect on the sensing.**

### Environment

Many of the same factors that affect inductive proximity sensors, also affect capacitive sensors, only more so.

- Embeddable mounting—capacitive sensors are generally treated as **non-shielded devices**, and therefore, **are not embeddable**
- Flying chips—they are **more sensitive to both metallic and nonmetallic chips** and residue
- Adjacent sensors—**more space between devices is required** due to the greater, non-shielded sensing range
- Target background—because of both the greater sensing range, and its ability to sense metallic and nonmetallic materials, **greater care in applying these sensors is needed when background conditions are present**
- Ambient atmosphere—the **amount of humidity in the air may cause a capacitive sensor to operate** even when no target is present
- Welding magnetic fields—capacitive sensors **are generally not applied in a welding environment**
- Radio Frequency Interference (RFI)—in the same way that inductive proximity sensors are affected, **RFI interferes with capacitive sensor circuitry**
- Showering arc (EFT)—**induced electrical noise affects these sensors** in the same way it does for an inductive sensor

**Product Selection Guide**

**Threaded Body Capacitive Proximity Sensors**

**Page V8-T4-6**

**Overview**

These self-contained devices will detect both metallic and nonmetallic targets. A full threaded housing provides ease of mounting.

**Applications**

Liquid level control  
Nonmetallic targets

**Product Features**

18 and 30 mm diameters with threaded housing  
Shielded and unshielded sensing  
Two-wire AC—20 to 250V  
Three-wire DC—10 to 30V, NPN and PNP  
2-meter PVC cable or 4-pin micro-connector  
Short circuit and reverse polarity protected (DC models)  
LED indicator  
Sensitivity adjustment

**Technical Data and Specifications**

Contact ratings—  
AC: 300 mA  
DC: 300 mA  
Enclosure ratings—  
NEMA® 1, 2, 3, 3S, 4, 12, 13  
IP65  
Construction—  
POM  
Nuts, nylon 66

**Approvals**

CE

**Smooth Body Capacitive Proximity Sensors**

**Page V8-T4-10**

**Overview**

Smooth body capacitive models feature longer ranges than our threaded body models and include a convenient mounting bracket.

**Applications**

Liquid level control  
Nonmetallic targets

**Product Features**

34 mm diameter  
Shielded and unshielded sensing  
Two-wire AC—20 to 250V  
Three-wire DC—10 to 30V, NPN and PNP  
2-meter PVC cable or 4-pin micro-connector  
Short circuit and reverse polarity protected (DC models)  
LED indicator  
Sensitivity adjustment  
Includes mounting bracket

**Technical Data and Specifications**

Contact ratings—  
AC: 300 mA  
DC: 300 mA  
Enclosure ratings—  
NEMA 1, 2, 3, 3S, 4, 12, 13  
IP65  
Construction—  
POM  
Nuts, nylon 66

### Threaded Body Sensors

#### Product Description

Type E53 Capacitive Proximity Sensors from Eaton’s electrical sector are self-contained devices designed to detect both metallic and nonmetallic targets. They are ideally suited for liquid level control and for sensing powdered or granulated material. For best operation, they should be used in an environment having relatively constant temperature and humidity.

#### Features

- Detect liquids, powders and other materials that are difficult or impossible to detect with other sensor types
- Plastic body is corrosion resistant
- Sensitivity adjustment
- Output indicator LED

#### DANGER

**THIS SENSOR IS NOT A SAFETY DEVICE AND IS NOT INTENDED TO BE USED AS A SAFETY DEVICE. This sensor is designed only to detect and read certain data in an electronic manner and perform no use apart from that, specifically no safety-related use. This sensor product does not include self-checking redundant circuitry, and the failure of this sensor product could cause either an energized or de-energized output condition, which could result in death, serious bodily injury, or property damage.**
