Overview

This Operating Manual covers information on safety and cautions. Please read the relevant information carefully and observe all the Warnings and Notes strictly.

⚠️ Warning
To avoid electric shock or personal injury, read the “Safety Information” and “Rules for Safe Operation” carefully before using the Meter.

Digital Multimeter Model 72-7740 and Model 72-7745 (hereafter referred to as “the Meter”) have autorange and manual range options with maximum reading 3999. The enclosure structure design adopted advanced “co-injection” technique in order to provide sufficient insulation.

In addition to the conventional measuring functions, there is a RS232C standard serial port equipped with Model 72-7745 for easy connection with computer to realize macro recording and monitoring and capture of transient dynamic data, displaying change of waveform during the measurement, providing data and evidence to engineering technicians for scientific research. This is also a highly applied digital multimeter of good performance with full overload protection and backlight function. Model 72-7745 also has true rms reading for AC voltage and AC current measurements.

Safety Information

This Meter complies with the standards IEC61010: in pollution degree 2, overvoltage category (CAT. III 1000V, CAT. IV 600V;) and double insulation.

CAT. III: Distribution level, fixed installation, with smaller transient overvoltages than CAT. IV

CAT IV: Primary supply level, overhead lines, cable systems etc.

Use the Meter only as specified in this operating manual, otherwise the protection provided by the Meter may be impaired.

In this manual, a **Warning** identifies conditions and actions that pose hazards to the user, or may damage the Meter or the equipment under test.

A **Note** identifies the information that user should pay attention to.

International electrical symbols used on the Meter and in this Operating Manual are explained on page 6.
Rules For Safe Operation

⚠️ Warning
To avoid possible electric shock or personal injury, and to avoid possible damage to the Meter or to the equipment under test, adhere to the following rules:

- Before using the Meter inspect the case. Do not use the Meter if it is damaged or the case (or part of the case) is removed. Look for cracks or missing plastic. Pay attention to the insulation around the connectors.
- Inspect the test leads for damaged insulation or exposed metal. Check the test leads for continuity. Replace damaged test leads with identical model number or electrical specifications before using the Meter.
- Do not apply more than the rated voltage, as marked on the Meter, between the terminals or between any terminal and ground.
- The rotary switch should be placed in the correct position and no change of range made during measurement, to prevent damage of the Meter.
- When working at an effective voltage over 60V DC or 30V rms AC, special care should be taken there is danger of electric shock.
- Use the proper terminals, function, and range for your measurements.
- Do not use or store the Meter in an environment of high temperature, humidity, explosive, flammable and strong magnetic field. The performance of the Meter may deteriorate after dampened.
- When using the test leads, keep your fingers behind the finger guards.
- Disconnect circuit power and discharge all high-voltage capacitors before testing resistance, continuity, diodes, current, or capacitance.
- Before measuring current, check the Meter’s fuses and turn off power to the circuit before connecting the Meter to the circuit.
- Replace the battery as soon as the battery indicator "\[ battery \]" appears. With a low battery, the Meter might produce false readings that can lead to electric shock and personal injury.
- Remove test lead, temperature probe, RS232C interface
cable and test clip from the Meter and turn the Meter power off before opening the case.
- When servicing the Meter, use only the same model number or identical electrical specifications replacement parts.
- The internal circuit of the Meter shall not be altered at will to avoid damage of the Meter and any accident.
- Soft cloth and mild detergent should be used to clean the surface of the Meter when servicing. No abrasive and solvent should be used to prevent the surface of the Meter from corrosion, damage and accident.
- The Meter is suitable for indoor use.
- Under the environment with high (+/-4kV) electrostatic discharge, the Meter may not be operated as normal condition. The user may require resetting the Meter.
- Remove the battery when not used for a prolonged period to avoid damage to the Meter.
- Please constantly check the battery as it may leak when it has been using for some time, replace the battery as soon as leaking appears. A leaking battery will damage the Meter.
- Periodically check the battery as it may leak after some time. If leakage is apparent, the battery should be immediately replaced to prevent damage.

Measurement Operation (4)

1. If Ω reading with shorted test leads is not ≤ 0.5Ω, check for loose test leads, incorrect function selection, or enabled Data Hold function.

2. For high-resistance measurement (>1MΩ), it is normal to take several seconds to obtain a stable reading.

3. The LCD displays OL indicating open-circuit for the tested resistor or the resistor value is higher than the maximum range of the Meter.

4. When resistance measurement has been completed, disconnect the connection between the test leads and the circuit under test, and remove the test leads from the input terminals of the Meter.

D. Testing for Continuity (see figure 6)

To avoid damage to the Meter or to the device under test, disconnect circuit power and discharge all the high-voltage capacitors before testing for continuity.

To test for continuity, connect the Meter as below:
1. Insert the red test lead into the HzVΩ terminal and the black test lead into the COM terminal.

2. Set the rotary switch to Ω and press BLUE button to select ¬Ω measurement mode.

3. The buzzer sounds if the resistance of a circuit under test is less than around 70 Ω

Note
1. The LCD displays OL indicating the circuit being tested is open.
Measurement Operation (5)

1. When continuity testing has been completed, disconnect the connection between the test leads and the circuit under test, and remove the test leads from the input terminals of the Meter.

E. Testing Diodes
(see figure 7)

⚠️ Warning
To avoid possible damage to the Meter and to the device under test, disconnect circuit power and discharge all high-voltage capacitors before testing diodes.

Use the diode test to check diodes, transistors, and other semiconductor devices. The diode test sends a current through the semiconductor junction, and then measures the voltage drop across the junction. A good silicon junction drops between 0.5V and 0.8V.

To test a diode out of a circuit, connect the Meter as follows:

1. Insert the red test lead into the HzVΩ terminal and the black test lead into the COM terminal.
2. Set the rotary switch to Ω and press BLUE button to select measurement mode.
3. For forward voltage drop readings on any semiconductor component, place the red test lead on the component’s anode and place the black test lead on the component’s cathode. The measured value shows on the display.

Note
1. In a circuit, a good diode should still produce a forward
Measurement Operation (6)

voltage drop reading of 0.5V to 0.8V; however, the reverse voltage drop reading can vary depending on the resistance of other pathways between the probe tips.

1. Connect the test leads to the proper terminals as said above to avoid error display. The LCD will display **OL** indicating diode being tested is open or polarity is reversed. The unit of diode is Volt (V), displaying the forward voltage drop readings.

1. When diode testing has been completed, disconnect the connection between the testing leads and the circuit under test, and remove the testing leads away from the input terminals of the Meter.

F. Capacitance Measurement (see figure 8)

![figure 8]

⚠️ Warning
To avoid damage to the Meter or to the equipment under test, disconnect circuit power and discharge all high-voltage capacitors before measuring capacitance. Use the DC Voltage function to confirm that the capacitor is discharged.

The Meter’s capacitance ranges are: 40.00nF, 400.0nF, 4.000μF, 40.00μF, and 100.0μF. To measure capacitance, connect the Meter as follows:

1. Insert the red test lead into the Hz V Ω terminal and the black test lead into the COM terminal.
2. Set the rotary switch to Ω and press BLUE button to select nF measurement mode.
3. Connect the test leads across with the object being measured. The measured value shows on the display.

Note
1. For testing polarized capacitors, connect the red clip to
Measurement Operation (7)

- anode & black clip to cathode instead of using test leads as mentioned above.
- To minimize the effect of capacitance stored in the test leads, the test lead should be as short as possible. To measure a small value of capacitance, use REL mode to remove the leads capacitance. Remaining voltage, insulated impedance, & dielectric absorption from the capacitor may cause slight measurement error.
- Higher value capacitors will require additional time for measurement. The 100μF range requires up to 15 seconds.
- The LCD displays **OL** indicating the tested capacitor is shorted or it exceeds the maximum range.
- When capacitance measurement has been completed, disconnect the connection between the test leads and the circuit under test and remove the test leads from the input terminals of the Meter.

G. Frequency Measurement
(see figure 9)

The measurement range is from 10Hz to 10MHz. To measure frequency, connect the Meter as follows:

1. Insert the red test lead into the HzV Ω terminal and the black test lead into the COM terminal.
2. Set the rotary switch to Hz; frequency measurement (Hz) is default or press Hz % to select Hz measurement mode.
3. Connect the test leads across with the object being measured. The measured value shows on the display.

Note
- When frequency measurement has been completed, disconnect the connection between the test leads and the circuit under test, and remove the test leads from the input terminals of the Meter.
Measurement Operation (8)

To obtain a stable reading when measuring input scope > 30V rms frequency signal:
Set the rotary switch to V = . Then press Hz% to select Hz measurement mode to obtain frequency value.
When input scope ≤ 30V rms, please follow the above step 2. carrying out the measurement.

When making frequency measurement at voltage or current range, please mind the following signal requirement table:

H. Measuring Duty Cycle (See figure 9)

The duty cycle measurement range is: 0.1%~99.9%. To measure duty cycle, do the following:
1. Set up the Meter to measure frequency.
2. To select duty cycle, press Hz % until the % symbol is shown on the display.
3. Connect the test leads across with the object being measured. The measured value shows on the display.

Note
- The LCD displays 000.0% indicating the input signal is high or low level.
- When duty cycle measurement has been completed, disconnect the connection between the test leads and the circuit under test, and remove the test leads from the input terminals of the Meter.
- To obtain a stable reading when measuring input scope > 30V rms frequency signal:
  Set the rotary switch to V = . Then press Hz% to select % measurement mode to obtain duty cycle value.
When input scope ≤ 30V rms, please follow the above step 2. carrying out the measurement.
Measurement Operation (9)

I. Temperature Measurement (see figure 10)

The temperature measurement range is -40°C~1000°C. To measure temperature, connect the Meter as follows:

1. Insert the red temperature probe into the **µAmA**C terminal and the black temperature probe into the COM terminal.
2. Set the rotary switch to °C.
3. Place the temperature probe to the object being measured. The measured value shows on the display.

Note

- The Meter automatically displays the temperature value inside the Meter when there is no temperature probe connection.
- The included point contact temperature probe can only be used up to 250°C. For any measurement higher than that, rod type temperature probe must be used.
- When temperature measurement has been completed, disconnect the connection between the test leads and the circuit under test, and remove the test leads from the input terminals of the Meter.

J. DC or AC Current Measurement (see figure 11)

⚠️ Warning
Never attempt an in-circuit current measurement where the open-circuit voltage between the circuit and ground is greater than 250V.
If the fuse burns out during measurement, the Meter may be damaged or the operator may be injured. Use proper terminals, function, and range for the measurement. When the test leads are connected to the current terminals, do not parallel them across any circuit.
Measurement Operation (10)
The current measurement has 3 measurement positions on the rotary switch: \(\mu A\)\(\approx\), mA\(\approx\) and A\(\approx\).

The \(\mu A\)\(\approx\) has a 400.0 \(\mu\)A and 4000 \(\mu\)A range, with auto ranging; the mA\(\approx\) has a 40.00mA and 400.0mA range, with auto ranging; A\(\approx\) position has a 4.000A and 10.00A range, with auto ranging.

To measure current, do the following:
1. Turn off power to the circuit. Discharge all high-voltage capacitors.
2. Insert the red test lead into the \(\mu A\)\(\approx\) or 10A terminal and the black test lead into the COM terminal. Use the 10A terminal and A\(\approx\) range if the current value to be tested is an unknown.
3. Set the rotary switch to \(\mu A\)\(\approx\), mA\(\approx\), or A\(\approx\).
4. The Meter defaults to DC current measurement mode. To toggle between DC and AC current measurement function, press BLUE button.
   - Model 72-7740: AC current is displayed as effective value of sine wave (mean value response).
   - Model 72-7745: AC current is displayed as true rms value.
5. Break the current path to be tested. Connect the red test lead to the more positive side of the break and the black test lead to the more negative side of the break.
6. Turn on power to the circuit.
   The measured value shows on the display.

Note
- (TRMS) stability period: (Model 72-7745)
   When the reading obtained is less than 100 digits, the true root mean square value converter needs a longer time to stabilize. When there is no input voltage, the maximum reading displayed is 10 digits.
- For safety sake, each measurement time for high current should be less than 10 seconds and the interval time between 2 measurements should be greater than 15 minutes.
- When current measurement has been completed, disconnect the connection between the test leads and the circuit under test, and remove the test leads from the input terminals of the Meter.
Operation of Hold Mode

⚠️ Warning
To avoid possibility of electric shock, do not use Hold mode to determine if circuits are without power. The Hold mode will not capture unstable or noisy readings.

The Hold mode is applicable to all measurement functions.
- Press `HOLD` to enter Hold mode; the Meter beeps.
- Press `HOLD` again or `RANGE` or `Hz %` or turn the rotary switch to exit Hold mode; the Meter beeps.
- In Hold mode, □ is displayed.

The Use of Relative Value Mode

The REL mode applies to all measurement functions except frequency/duty cycle measurement. It subtracts a stored value from the present measurement value and displays the result.

For instance, if the stored value is 20.0V and the present measurement value is 22.0V, the reading would be 2.0V. If a new measurement value is equal to the stored value then display 0.0V.

To enter or exit REL mode:
- Use rotary switch to select the measurement function before selecting REL. If measurement function changes manually after REL is selected, the Meter exits the REL mode.
- Press REL again to enter REL mode, auto ranging turns off except under capacitance testing mode, and the present measurement range is locked and display “0” as the stored value.
- Press REL again or turn the rotary switch to reset the stored value and exit REL mode.

Pressing HOLD □ in REL mode makes the Meter stop updating. Pressing HOLD □ again to resume updating.
The POWER button
This is a self-lock switch used to turn on or off the power of the Meter.

The BLUE button
It is used for selecting the required measurement function when more than one function exists at one position of the rotary switch.

Turning on the Display Backlight

⚠️ Warning
In order to avoid the hazard arising from mistaken readings in insufficient light or poor vision, please use Display Backlight function.

1. Press and hold HOLD for over 2 seconds to turn the Display Backlight on.
2. Press and hold HOLD again for over 2 seconds to turn the Display Backlight off, otherwise it will stay on continuously.

Sleep Mode (Model 72-7740)
To preserve battery life, the Meter automatically turns off after 30 minutes of inactivity.
To disable the Sleep Mode function, press BLUE button while turning on the Meter.

MAINTENANCE
This section provides basic maintenance information including battery and fuse replacement instruction.

⚠️ Warning
Do not attempt to repair or service your Meter unless you are qualified to do so and have the relevant calibration, performance test, and service information.

To avoid electrical shock or damage to the Meter, do not get water inside the case.

A. General Service
- Periodically wipe the case with a damp cloth and mild detergent. Do not use abrasives or solvents.
- To clean the terminals with a cotton bar with detergent, as dirt or moisture in the terminals can affect readings.
- Turn off the power of the Meter when it is not in use and take out the battery when not using for a long time.
- Take out the battery when it is using for a long time.
- Do not use or store the Meter in a place of humidity, high temperature, explosive, inflammable and strong magnetic field.

B. Testing the Fuses
⚠️ Warning
To avoid electrical shock or personal injury, remove the test leads and any input signals before replacing the battery or fuse.

To prevent damage or injury, install ONLY replacement fuses with identical amperage, voltage, and speed ratings.

To test the fuse:

1. Set the rotary switch to Ω•→•±• and press BLUE button to select•→
2. Plug a test lead into the terminal HzV Ω and touch the probe to the 10A terminal.
If the Meter does not work while the fuse is all right, send it to your dealer for repair.

C. Replacing the Battery (see figure 12)

![Image of battery replacement process]

**Warning**
To avoid false readings, which could lead to possible electric shock or personal injury, replace the battery as soon as the battery indicator “OL” appears.

Make sure the test leads are disconnected from the circuit being tested before opening the case bottom.

To replace the battery:

1. Press the POWER to turn the Meter off and remove all connections from the terminals.
2. Remove the screw from the battery compartment, and separate the battery compartment from the case bottom.
3. Remove the battery from the battery compartment.
4. Replace the battery with a new 9V battery (NEDA1604, 6F22 or 006P).
5. Rejoin the case bottom and battery compartment, and reinstall the screw.
D. Replacing the Fuses (see figure 13)

Warning
To avoid electrical shock, arc blast, personal injury or damage to the Meter, use specified fuses ONLY in accordance with the following procedure.

To replace the Meter’s fuse:

1. Press the POWER to turn the Meter off and remove all connections from the terminals.
2. Remove the screw from the battery compartment, and separate the battery compartment from the case bottom.
3. Remove the 2 rubber feet and 2 screws from the case bottom, and separate the case top from the case bottom.
4. Remove the fuse by gently prying one end loose, then take out the fuse from its bracket.
5. Install ONLY replacement fuses with the identical type and specification as follows and make sure the fuse is fixed firmly in the bracket.
   - Fuse 1: Glass fuse 0.5A, 250V, fast type, φ5x20mm.
   - Fuse 2: Glass fuse 10A, 250V, fast type, φ5x20mm.
6. Rejoin the battery compartment and the case top, and reinstall the screw.

7. Rejoin the case bottom and case top, and reinstall the 2 screws and 2 rubber feet.

Replacement of the fuses is seldom required. Burning of a fuse always results from improper operation.
