

## Description

The F2913 is a high isolation, low insertion loss, 50Ω SP2T absorptive RF switch designed for a multitude of wireless and RF applications. This device covers a broad frequency range of 50MHz to 6000MHz. In addition to providing low insertion loss, the F2913 also delivers high linearity and high isolation performance while providing a 50Ω termination at all RF ports.

The F2913 uses a single positive supply voltage of +2.7V to +5.5V and supports three states using either +1.8V or +3.3V control logic.

## Competitive Advantage

- Low insertion loss
- High isolation
- Excellent linearity
- Fast switching time
- High termination power handling
- Extended temperature range

## Typical Applications

- Base Station 2G, 3G, 4G, 5G
- Portable Wireless
- Repeaters and E911 Systems
- Digital Pre-Distortion
- Point-to-Point Infrastructure
- Public Safety Infrastructure
- WIMAX Receivers and Transmitters
- Military Systems, JTRS Radios
- RFID Handheld and Portable Readers
- Test / ATE Equipment

## Features

- Low insertion loss: 0.79dB at 2GHz
- High isolation:
  - 71dB at 1GHz
  - 65dB at 2GHz
  - 58dB at 4GHz
- High IIP3: +65dBm at 2.6GHz
- Supply voltage: +2.7V to +5.5V
- 1.8V and 3.3V compatible control logic
- Operating temperature: -40°C to +110°C
- 4 × 4 mm 20-VFQFPN package

## Pin Descriptions

Table 1. Pin Descriptions

Pin	Name	Function
1, 15, 18	GND	This pin is internally connected to the exposed paddle. Connect this pin to ground as close as possible to the pin.
2, 4, 5, 6, 7, 9, 10, 11, 12, 14, 19	GND	Connect this pin directly to ground as close as possible to the pin with thru vias.
3	RF1	RF1 Port. If this pin is not 0V DC, then an external coupling capacitor must be used.
8	RFC	RF Common Port. If this pin is not 0V DC, then an external coupling capacitor must be used.
13	RF2	RF2 Port. If this pin is not 0V DC, then an external coupling capacitor must be used.
16	C2	Logic control pin. See Table 7 for proper logic setting.
17	C1	Logic control pin. See Table 7 for proper logic setting.
20	V <sub>DD</sub>	Power supply. Bypass to GND with capacitors shown in the Figure 30 as close as possible to the pin.
	EP	Exposed Pad. This is internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

## Absolute Maximum Ratings

Stresses beyond those listed below may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Typical Operating Conditions (TOCs)

Unless otherwise noted:

- $V_{DD} = +3.3V$
- $T_{EP} = 25^{\circ}C$ . All temperatures are referenced to the exposed paddle.
- $Z_S = Z_L = 50\Omega$
- $f_{RF} = 1GHz$
- Small signal tests done at 0dBm input power.
- +13dBm per tone for IIP3 measurements.
- RF1 or RF2 are the driven ports.
- Evaluation Kit traces and connector losses are de-embedded for the insertion loss and isolation plots. All other plots include the loss and effects of the PCB.

## Application Information

### Default Start-up

The C1 and C2 control pins include no internal pull-down resistors to logic LOW or pull-up resistors to logic HIGH.

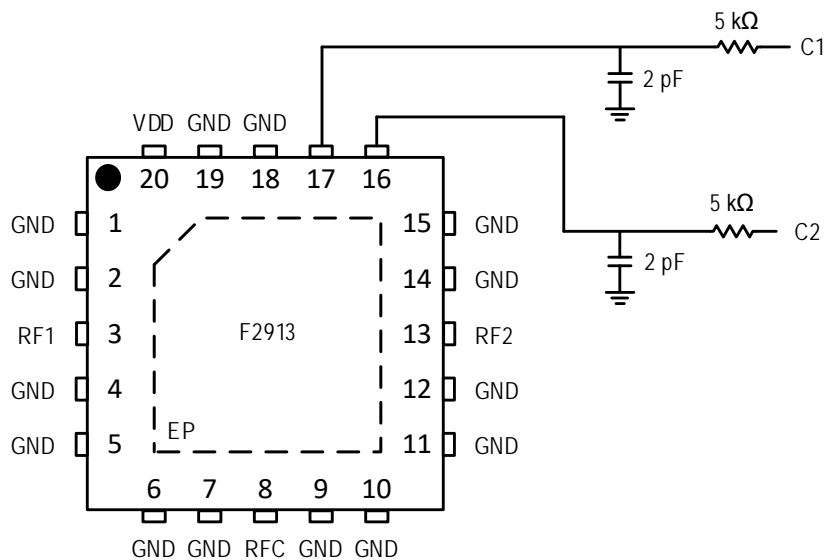

### Power Supplies

A common  $V_{DD}$  power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade the noise figure, and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate slower than  $1V / 20\mu s$ . In addition, all control pins should remain at 0V ( $\pm 0.3V$ ) while the supply voltage ramps up or while it returns to zero.

### Control Pin Interface

If a clean control signal for pins 16 and 17 cannot be guaranteed due to overshoot, undershoot, or ringing, etc., the following circuit at the input of the control pins is recommended.

## Evaluation Kit (EVKit) Operation

### External Supply Setup

1. Set up a  $V_{DD}$  power supply in the range of +2.7V to +5.5V with the power supply output disabled.
2. Connect the disabled  $V_{DD}$  supply connection to J6 pins 1, 3, 13, or 15 and GND to J6 pins 2, 4, 6, 8, 10, 12, 14, or 16.

### Logic Control Setup

1. With the logic control lines disabled, set the HIGH and LOW logic levels to satisfy the levels stated in the electrical specifications table.
2. Connect the disabled logic control to J6 VCTRL1 (pins 5 or 7) and VCTRL2 (pins 9 or 11).
3. See Table 7 for the logic truth table. Note that C1 in the table corresponds to VCTRL1 on the EVKIT and C2 corresponds to VCTRL2.

### Turn On Procedure

1. Set up the supplies and EVKIT as noted in the External Supply Setup and Logic Control Setup sections above.
2. Enable the  $V_{DD}$  supply.
3. Enable the logic control signals.
4. Set the logic settings to achieve the desired Table 7 configuration. Note that external control logic should not be applied without  $V_{DD}$  being present.

### Turn Off Procedure

1. Set the logic control pins to 0V.
2. Disable the  $V_{DD}$  supply.
