NCP151

LDO Regulator, 300 mA / 300 mA, Dual, High PSRR

The NCP151 is a dual linear regulator capable of supplying 300 mA output current from 1.7 V input voltage. The device provides wide output voltage range from 0.8 V up to 3.6 V. In order to optimize performance for battery operated portable applications, the NCP151 employs the dynamic quiescent current adjustment for very low IQ consumption at no-load.

Features
• Operating Input Voltage Range 1.7 V to 5.5 V
• Available in Fixed Voltage Option: 0.8 V to 3.6 V
• ±2% Accuracy Over Load/Temperature
• Low Quiescent Current Typ. 100 μA
• Low Dropout: 210 mV for 300 mA @ 2.8 V
• Low Dropout: 370 mV for 300 mA @ 1.8 V
• High PSRR: Typ. 70 dB at 1 kHz @ OUT1, OUT2
• Stable with a 1 μF Small Case Size Ceramic Capacitors
• Available in XDFN4, 1 mm × 1 mm × 0.4 mm
• These Devices are Pb–Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications
• PDAs, Mobile Phones, GPS, Smartphones
• Wireless Handsets, Wireless LAN Devices, Bluetooth®, Zigbee®
• Bitcoin Miners
• Portable Medical Equipment
• Other Battery Powered Equipment

See detailed ordering and shipping information on page 2 of this data sheet.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

4. Performance guaranteed over the indicated operating temperature range by design and/or characterization. Production tested at $T_J = 25^\circ C$.

Low duty cycle pulse techniques are used during the testing to maintain the junction temperature as close to ambient as possible.

5. Dropout voltage is characterized when $V_{OUT}$ falls 100 mV below $V_{OUT}^{(NOM)}$.

APPLICATIONS INFORMATION

General
The NCP151 is a dual output 300 mA Low Dropout Linear Regulator. This device delivers high PSRR (70 dB at 1 kHz) and very good dynamic performance as load/line transients. In connection with low quiescent current this device is very suitable for various battery powered applications such as tablets, cellular phones, wireless and many others. Each output is fully protected in case of output overload, output short circuit condition and overheating, assuring a very robust design. The NCP151 device is housed in DFN−4 1 mm x 1 mm package which is useful for space constrains application.

Input Capacitor Selection (CIN)
Input capacitor connected as close as possible is necessary for ensure device stability. The X7R or X5R capacitor should be used for reliable performance over temperature range. The value of the input capacitor should be 1 μF or greater to ensure the best dynamic performance. This capacitor will provide a low impedance path for unwanted AC signals or noise modulated onto constant input voltage. There is no requirement for the ESR of the input capacitor but it is recommended to use ceramic capacitors for their low ESR and ESL. A good input capacitor will limit the influence of input trace inductance and source resistance during sudden load current changes.

Output Decoupling
The NCP151 requires an output capacitor connected as close as possible to the output pin of the regulator. The recommended capacitor value is 1 μF and X7R or X5R dielectric due to its low capacitance variations over the specified temperature range. The NCP151 is designed to remain stable with minimum effective capacitance of 0.68 μF to account for changes with temperature, DC bias and package size. Especially for small package size capacitors such as 0201 the effective capacitance drops rapidly with the applied DC bias. Please refer to Figure 24.

There is no requirement for the minimum value of Equivalent Series Resistance (ESR) for the COUT but the maximum value of ESR should be less than 1.7 Ω.

Larger output capacitors and lower ESR could improve the load transient response or high frequency PSRR. It is not recommended to use tantalum capacitors on the output due to their large ESR. The equivalent series resistance of tantalum capacitors is also strongly dependent on the temperature, increasing at low temperature.

Output Current Limit
Output Current is internally limited within the IC to a typical 600 mA. The NCP151 will source this amount of current measured with a voltage drops on the 90% of the nominal VOUT. If the Output Voltage is directly shorted to ground (VOUT = 0 V), the short circuit protection will limit the output current to 600 mA (typ). The current limit and short circuit protection will work properly over whole temperature range and also input voltage range. There is no limitation for the short circuit duration.

Thermal Shutdown
When the die temperature exceeds the Thermal Shutdown threshold (TSD = 160°C typical), Thermal Shutdown event is detected and the affected channel is turn−off. Second channel still working. The channel which is overheated will remain in this state until the die temperature decreases below the Thermal Shutdown Reset threshold (TSDU = 140°C typical).

The channel which is overheated will remain in this state until the die temperature decreases below the Thermal Shutdown Reset threshold (TSDU = 140°C typical). Once the device temperature falls below the 140°C the appropriate channel is enabled again. The thermal shutdown feature provides the protection from a catastrophic device failure due to accidental overheating. This protection is not intended to be used as a substitute for proper heat sinking. The long duration of the short circuit condition to some output channel could cause turn−off other output when heat sinking is not enough and temperature of the other output reach TSD temperature.

Power Dissipation
As power dissipated in the NCP151 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. The maximum power dissipation the NCP151 can handle is given by:

\[ P_{D(MAX)} = \frac{85°C - T_A}{\theta_{JA}} \]  

(eq. 1)

The power dissipated by the NCP151 for given application conditions can be calculated from the following equations:
\[ P_D = V_{IN} \times I_{GND} + I_{OUT1}(V_{IN} - V_{OUT1}) + I_{OUT2}(V_{IN} - V_{OUT2}) \] (eq. 2)

**Reverse Current**

The PMOS pass transistor has an inherent body diode which will be forward biased in the case that \( V_{OUT} > V_{IN} \). Due to this fact in cases, where the extended reverse current condition can be anticipated the device may require additional external protection.

**Power Supply Rejection Ratio**

The NCP151 features very good Power Supply Rejection ratio. If desired the PSRR at higher frequencies in the range 100 kHz – 10 MHz can be tuned by the selection of \( C_{OUT} \) capacitor and proper PCB layout.

**Turn–On Time**

The turn–on time is defined as the time period from \( EN \) assertion to the point in which \( V_{OUT} \) will reach 98% of its nominal value. This time is dependent on various application conditions such as \( V_{OUT(NOM)} \) \( C_{OUT} \) and \( T_A \). The NCP151 provides two options of \( V_{OUT} \) ramp–up time. The NCP151A have normal slew rate, typical 100 mV/\( \mu \)s and NCP151C and provide slower option with typical value 30 mV/\( \mu \)s which is suitable for camera sensor and other sensitive devices.

**PCB Layout Recommendations**

To obtain good transient performance and good regulation characteristics place \( C_{IN} \) and \( C_{OUT} \) capacitors close to the device pins and make the PCB traces wide. In order to minimize the solution size, use 0402 capacitors. Larger copper area connected to the pins will also improve the device thermal resistance. The actual power dissipation can be calculated from the equation above (Equation 2). Expose pad should be tied the shortest path to the GND pin.
