The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC flag (successful frame/wake-up transmission flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

25.3.1.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 13_H (n = 0)

Initial value: 00H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 25.22 RLN3nLEST register contents

Bit Position	Bit Name	Function
b7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
b6	Reserved	When read, an initial value is returned. When written, write an initial value.
b5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: checksum error has been detected.
b4	Reserved	When read, an initial value is returned. When written, write an initial value.
b3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
b2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
b1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
b0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication.

In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register.

RPER flag (response preparation error flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode.

CSER flag (checksum error flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode.

FER flag (framing error flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode.

FTER flag (timeout error flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTER flag is set to 1 upon frame timeout error or response timeout error detection. To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode.

PBER flag (physical bus error flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The PBER flag is set to 1 upon physical bus error detection. To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode or LIN wake-up mode.

BER flag (bit error flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The BER flag is set to 1 upon bit error detection. To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode or LIN wake-up mode.

25.3.1.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3_Base> + 14_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.23 RLN3nLDFC register contents

Bit Position	Bit Name	Function
b7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
b6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.
b5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
b4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
b3 to b0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS bit (transmission/reception continuation select bit)

The LSS bit sets the data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

FSM bit (frame separate mode select bit)

The FSM bit sets the response communication mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 0), response is transmitted/received without the RTS bit in the RLN3nLTRC register being set.

With 1 set, frame separate mode is selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 0), response is transmitted when the following conditions are satisfied.

- Header transmission is successfully completed (the HTRC bit in the RLN3nLST register is 1).
- Response transmission is requested (the RTS bit in the RLN3nLTRC register is 1).

For response reception (the RFT bit is 0), set the FSM bit to 0.

When causing a transition to LIN self-test mode, set this bit to 0 before transition.

For details of frame separate mode, refer to **Section 25.7.4.1, (1) Frame Separate Mode**.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM bit (checksum select bit)

The CSM bit sets the checksum mode.

With 0 set, classic checksum mode is selected.

With 1 set, enhanced checksum mode is selected.

When the timeout error is used (the TER bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details of the bit error, refer to **Section 25.7.7, Error Status**.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.

During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT bit (response field communication direction select bit)

The RFT bits set the direction of the response field communication.

With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).

With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] bits (response field length select bits)

The RFDL bits set the length of the response field data.

The data length can be 0 to 8 bytes excluding the checksum size.

To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the FTS bit in the RLN3nLTRC register is 0).

To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).

During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

25.3.1.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 15_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP[1:0]		ID[5:0]					
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.24 RLN3nLIDB register contents

Bit Position	Bit Name	Function
b7	IDP1	Parity Setting (P1) Sets the parity bit (P1) to be transmitted in the ID field.
b6	IDP0	Parity Setting (P0) Sets the parity bit (P0) to be transmitted in the ID field.
b5 to b0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN self-test mode, this register operates as follows:

- When RFT bit is 1 (transmission):
The reversed value of the value transmitted can be read from the register. The value to be transmitted can be written to the register before communication.
- When RFT bit is 0 (reception):
The reversed value of the value received can be read from the register. The value to be received can be written to the register before communication.

IDP[1:0] bits (parity setting bits)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame (IDP0 for P0 and IDP1 for P1). Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] bits (ID setting bits)

The ID bit sets the 6-bit ID value to be transmitted in the ID field of the LIN frame.

25.3.1.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 16_H (n = 0)

Initial value: 00_H

Table 25.25 RLN3nLCBR register contents

Bit Position	Bit Name	Function
b7 to b0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
The value transmitted can be read from the register. Read the value after transmission is completed.
Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
The value received can be read from the register. Read the value after transmission is completed.
Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
The reversed value of the value transmitted can be read from the register. Read the value after transmission is completed.
Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
The reversed value of the value received can be read from the register. Read the value after transmission is completed.
The value to be received can be written to the register before communication.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

25.3.1.19 RLN3nLDBRm — LIN Data Buffer m Register (m = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3_Base> + 18_H (n = 0)
 RLN3nLDBR2: <RLIN3_Base> + 19_H (n = 0)
 RLN3nLDBR3: <RLIN3_Base> + 1A_H (n = 0)
 RLN3nLDBR4: <RLIN3_Base> + 1B_H (n = 0)
 RLN3nLDBR5: <RLIN3_Base> + 1C_H (n = 0)
 RLN3nLDBR6: <RLIN3_Base> + 1D_H (n = 0)
 RLN3nLDBR7: <RLIN3_Base> + 1E_H (n = 0)
 RLN3nLDBR8: <RLIN3_Base> + 1F_H (n = 0)

Initial value: 00_H

Table 25.26 RLN3nLDBRm (m = 1 to 8) register contents

Bit Position	Bit Name	Function
b7 to b0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting Range: 00 _H to FF _H

For response transmission:

The LDBR_n registers set the data to be transmitted in the response field.

Use these registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 0 (not frame separate mode)
- FTS bit in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)

or

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)

For response reception:

The LDBR_n registers hold the data received in the response field.

The received data is overwritten. If an error is detected, the data prior to reception interruption is stored in the register.

Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)

For transmission of response data of 9 bytes or more:

Use the LDBRn registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)

For reception of response data of 9 bytes or more:

Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
The reversed value of the value transmitted can be read from the registers. The value to be transmitted can be written to the registers before communication.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
The reversed value of the value received can be read from the register. The value to be received can be written to the registers before communication.

25.3.2 LIN Slave Related Registers

25.3.2.1 RLN3nLWBR — LIN Wake-up Baud Rate Select Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 01_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 25.27 RLN3nLWBR register contents

Bit Position	Bit Name	Function
b7 to b4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 0 1 1 1: 8 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
b3 to b1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
b0	Reserved	When read, an initial value is returned. When written, write an initial value.

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

NSPB[3:0] bits (bit sampling count select bits)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the bit rate).

When the frame communication is performed in LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10B), set these bits to “0111_B” (8 sampling).

LPRS[2:0] bits (prescaler clock select bits)

The LPRS bits select the frequency division ratio for the prescaler. In LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10B), the prescaler clock must be set to 8 MHz to 12 MHz.

25.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 02_H (n = 0)

Initial value: 00_H

Table 25.28 RLN3nLBRP0 register contents

Bit Position	Bit Name	Function
b7 to b0	BRP[7:0]	Lower 8 bits of the 16-bit counter in the baud rate prescaler Note: The BRP bits can be set to 00H only when LWBR.LPRS = 000 (1/1).

Set the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

Assuming that the value set in the RLN3nLBRP0 and RLN3nLBRP1 registers is low-level, baud rate prescaler divides the frequency of the clock that is divided by the LPRS bits (prescaler clock select) by $L + 1$.

The RLN3nLBRP0 and RLN3nLBRP1 registers can be accessed in 16-bit units.

25.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 03_H (n = 0)

Initial value: 00_H

Table 25.29 RLN3nLBRP1 register contents

Bit Position	Bit Name	Function
b7 to b0	BRP[15:8]	Upper 8 bits of the 16-bit counter in the baud rate prescaler Note: The BRP bits can be set to 00H only when LWBR.LPRS = 000 (1/1).

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

Assuming that the value set in the RLN3nLBRP0 and RLN3nLBRP1 registers is low-level, baud rate prescaler divides the frequency of the clock that is divided by the LPRS bits (prescaler clock select) by $L + 1$.

The RLN3nLBRP0 and RLN3nLBRP1 registers can be accessed in 16-bit units.

25.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 04_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.30 RLN3nLSTC register contents

Bit Position	Bit Name	Function
b7 to b1	Reserved	When read, an initial value is returned. When written, write an initial value.
b0	LSTM	LIN self test mode bit 0: LIN self test mode is not set. 1: LIN self test mode is set.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

Writing A7_H, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed thus placing LIN self-test mode to be entered, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, refer to **Section 25.8, LIN Self-Test Mode**.

LSTM bit (LIN self test mode bit)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For leaving LIN self-test mode, refer to **Section 25.8, LIN Self-Test Mode**.

Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of A7_H, 58_H, and 01_H.

25.3.2.5 RLN3nLMD — LIN Mode Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 08_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	—	—	LMD[1:0]	
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 25.31 RLN3nLMD register contents

Bit Position	Bit Name	Function
b7, b6	Reserved	When read, an initial value is returned. When written, write an initial value.
b5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
b4	LIOS	LIN Interrupt Output Select 0: LIN interrupt is used. 1: Transmission interrupt, successful reception interrupt, and reception status error interrupt are used.
b3, b2	Reserved	When read, an initial value is returned. When written, write an initial value.
b1, b0	LMD[1:0]	LIN Mode Select b1 b0 1 0: LIN Slave mode with Auto Baud rate detection

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

LRDNFS bit (LIN reception data noise filtering disable bit)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

LIOS bit (LIN interrupt output select bit)

The LIOS bit selects the number of interrupt outputs from the LIN Interface.

With 0 set, the LIN interrupt is generated from the LIN Interface.

With 1 set, the transmission interrupt, successful reception interrupt, and reception status error interrupt are generated from the LIN Interface.

For each interrupt source, refer to **Section 25.4, Interrupt Sources**.

LMD[1:0] bits (LIN mode select bits)

The LMD bits select the LIN Interface mode.

To use this module as an LIN slave, set these bits to “10_B” (auto baud rate detection).

25.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 09_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LBLT
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.32 RLN3nLBFC register contents

Bit Position	Bit Name	Function
b7 to b1	Reserved	When read, an initial value is returned. When written, write an initial value.
b0	LBLT	Reception Break (Low-Level) Detection Width Setting 0: A break (low-level) is detected in 10 Tbits 1: A break (low-level) is detected in 11 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

LBLT bit (Reception Break (Low-Level) Detection Width Setting bit)

- When RLN3nLMD.LMD is “10_B” (in LIN slave mode (auto baud rate))
 - 0: Low-level width of 10 Tbits or longer is detected.
 - 1: Low-level width of 11 Tbits or longer is detected.

25.3.2.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 0A_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 25.33 RLN3nLSC register contents

Bit Position	Bit Name	Function
b7, b6	Reserved	When read, an initial value is returned. When written, write an initial value.
b5, b4	IBS[1:0]	Inter-byte space setting bits b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 1: 2 Tbits 1 1: 3 Tbits
b3	Reserved	When read, an initial value is returned. When written, write an initial value.
b2 to b0	IBHS[2:0]	Inter-byte space (header)/response space select bits b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

This register is enabled only during response transmission, and disabled during response reception.

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] bits (inter-byte space select bits)

These bits set the width of the inter-byte space of the response transmission.

0 Tbit to 3 Tbits can be set.

IBHS[2:0] bits (response space select bits)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.

0 Tbit to 7 Tbits can be set.

25.3.2.8 RLN3nLWUP — LIN Wake-up Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 0B_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 25.34 RLN3nLWUP register contents

Bit Position	Bit Name	Function
b7 to b4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
b3 to b0	Reserved	When read, an initial value is returned. When written, write an initial value.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

WUTL[3:0] bits (wake-up transmission low level width select bits)

These bits set the low-level width of the wake-up frame transmission.

1 Tbit to 16 Tbits can be set.

25.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 0C_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.35 RLN3nLIE register contents

Bit Position	Bit Name	Function
b7 to b4	Reserved	When read, an initial value is returned. When written, write an initial value.
b3	SHIE	Successful Header Transmission Interrupt Enable 0: Disables successful header transmission interrupt. 1: Enables successful header transmission interrupt.
b2	ERRIE	Error Detection Interrupt Enable 0: Disables error detection interrupt. 1: Enables error detection interrupt.
b1	FRCIE	Successful Response/Wake-up Reception Interrupt Enable 0: Disables successful Response/wake-up reception interrupt. 1: Enables successful Response/wake-up reception interrupt.
b0	FTCIE	Successful Response/Wake-up Transmission Interrupt Enable 0: Disables successful Response/wake-up transmission interrupt. 1: Enables successful Response/wake-up transmission interrupt.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

SHIE bit (Successful Header Reception Interrupt Enable)

The SHIE bit enables or disables interrupt generation upon successful reception of a header.

With 0 set, the interrupt is not generated when the HTRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE bit (error detection interrupt enable bit)

The ERRIE bit enables or disables interrupt generation upon detection of an error.

With 0 set, the interrupt is not generated when the ERR flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt is generated when the ERR flag in the RLN3nLST register is set to 1.

Interrupt sources can be the bit error, frame/response timeout error, framing error, sync filed error, ID parity error, checksum error, and response preparation error.

Detection of the bit error, frame/response timeout error, sync filed error, ID parity error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE bit (successful frame/wake-up reception interrupt enable bit)

The FRCIE bit enables or disables interrupt generation upon successful reception of a response or a wake-up signal (counting of low level width of the input signal).

With 0 set, the interrupt is not generated when the FRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE bit (successful frame/wake-up transmission interrupt enable bit)

The FTCIE bit enables or disables interrupt generation upon successful transmission of a response or a wake-up signal.

With 0 set, the interrupt is not generated when the FTC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt is generated when the FTC flag in the RLN3nLST register is set to 1.

25.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 0D_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	IPERE	—	SFERE	FERE	—	—	BERE
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R	R	R/W

Table 25.36 RLN3nLEDE register contents

Bit Position	Bit Name	Function
b7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
b6	IPERE	ID Parity Error Detection Enable 0: Disables ID Parity error detection. 1: Enables ID Parity error detection.
b5	Reserved	When read, an initial value is returned. When written, write an initial value.
b4	SFERE	Sync Field Error Detection Enable 0: Disables Sync Field error detection. 1: Enables Sync Field error detection.
b3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
b2, b1	Reserved	When read, an initial value is returned. When written, write an initial value.
b0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).

LTES bit (timeout error select bit)

The LTES bit selects the specific timeout function to be used.

With 0 set, the timeout function applies to frame timeout.

With 1 set, the timeout function applies to response timeout.

For details of the timeout error, refer to **Section 25.7.7, Error Status**.

IPERE bit (ID Parity error Detection Enable bit)

This bit enables or disables detection of the ID parity error.

With 0 set, the ID parity error is not detected.

With 1 set, the ID parity error is detected.

When this bit is set to 1, the detection result is reflected in the IPER flag in the RLN3nLEST register.

For details of the ID parity error, refer to **Section 25.7.7, Error Status**.

SFERE bit (sync field Error Detection Enable bit)

This bit enables or disables detection of the sync field error.

With 0 set, the sync field error is not detected.

With 1 set, the sync field error is detected.

Regardless of the setting of this bit, when a sync field error is detected, this module waits for the next header.

When this bit is set to 1, the detection result is reflected in the SFER flag in the RL3nLEST register.

For details of the sync field error, refer to **Section 25.7.7, Error Status**.

FERE bit (framing error detection enable bit)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is indicated in the FER flag in the RL3nLEST register.

For details of the framing error, refer to **Section 25.7.7, Error Status**.

BERE bit (bit error detection enable bit)

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is indicated in the BER flag in the RL3nLEST register.

For details of the bit error, refer to **Section 25.7.7, Error Status**.

25.3.2.11 RLN3nLCUC — LIN Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 0E_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.37 RLN3nLCUC register contents

Bit Position	Bit Name	Function
b7 to b2	Reserved	When read, an initial value is returned. When written, write an initial value.
b1	OM1	LIN Mode Select 0: LIN wake-up mode is caused. 1: LIN operation mode is caused.
b0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 bit (LIN mode select bit)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.

With 0 set, LIN wake-up mode is caused.

With 1 set, LIN operation mode is caused.

This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 bit (LIN reset bit)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.

With 0 set, LIN reset mode is caused.

With 1 set, LIN reset mode is canceled.

25.3.2.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 10_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	LNRR	RTS	FTS
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 25.38 RLN3nLTRC register contents

Bit Position	Bit Name	Function
b7 to b3	Reserved	When read, an initial value is returned. When written, write an initial value.
b2	LNRR	No LIN response request bit 0: Response for the reception ID 1: No response for the reception ID
b1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped. 1: Response transmission/reception is started.
b0	FTS	LIN Transmission/wake-up Transmission /Reception Start 0: Header reception/wake-up transmission /reception is stopped. 1: Header reception /wake-up transmission reception is started.

LNRR bit (LIN response no request bit)

After receiving the header and checking the received ID, set this bit to 1 if no response is transmitted/received.

Once set, this bit is automatically cleared to 0 upon detection of new sync field or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

Do not set this bit and the RTS bit to 1 simultaneously.

Writing a value to this bit is disabled in LIN reset mode (when the OMM0 bit is 0) or when the FTS bit is 0 (header reception or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, use this bit only for the completion of the header. (Do not use this bit for the second or latter data group.)

RTS bit (response transmission/reception start bit)

After receiving the header and checking the received ID, set this bit to 1 at the response reception or at the start of response reception.

After receiving the header and checking the received ID, set this bit to 1 at the start of response transmission/reception.

Once set, this bit is automatically cleared to 0 upon completion of response or transition to LIN reset mode.

Only 1 can be written to this bit; 0 cannot be written.

Do not set this bit and the LRNN bit to 1 simultaneously

Writing a value to this bit is disabled in LIN reset mode (when the OMM0 bit is 0).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group transmission/reception or transition to LIN reset mode.

FTS bit (frame transmission/Wake-up transmission/reception start bit)

Set this bit to 1 to start header reception or wake-up transmission/reception.

Also set this bit to 1 to allow wake-up reception (counting of the low level width of the input signal).

Only 1 can be written to this bit; 0 cannot be written.

Writing a value to this bit is disabled in LIN reset mode (when the OMM0 bit is 0). This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

25.3.2.13 RLN3nLMST — LIN Mode Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 11_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.39 RLN3nLMST register contents

Bit Position	Bit Name	Function
b7 to b2	Reserved	When read, an initial value is returned. When written, write an initial value.
b1	OMM1	LIN Mode Status Monitor 0: The module is in LIN wake-up mode. 1: The module is in LIN operation mode.
b0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM1 bit (LIN mode status monitor)

The OMM1 bit indicate the current operating mode.

OMM0 bit (LIN reset status monitor)

The OMM0 bit indicates the current operating mode.

25.3.2.14 RLN3nLST — LIN Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 12_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 25.40 RLN3nLST register contents

Bit Position	Bit Name	Function
b7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
b6	D1RC	Successful Data 1 Reception Flag These bits are always read as 0. The write value should always be 0.
b5, b4	Reserved	When read, an initial value is returned. When written, write an initial value.
b3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
b2	Reserved	When read, an initial value is returned. When written, write an initial value.
b1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
b0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, the register retains 00_H.

HTRC flag (successful header transmission flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value before 1 is written. The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear this bit to 0, write 0 to the bit.

To detect a new header in the response field upon completion of header reception, clear this bit after it is set to 1.

D1RC flag (successful data 1 reception flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt is not generated. Write 0 to clear this bit.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR flag (error detection flag)

The ERR flag is set to 1 upon detection of an error. Here, an interrupt is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication, write 0 to the RPER, IPER, CSER, SFER, FER, TER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode.

FRC flag (successful frame/wake-up reception flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). Write 0 to clear this bit.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC flag (successful frame/wake-up transmission flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). Write 0 to clear this bit.

When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

25.3.2.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 13_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	IPER	CSER	SFER	FER	TER	—	BER
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 25.41 RLN3nLEST register contents

Bit Position	Bit Name	Function
b7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
b6	IPER	ID Parith Error Flag 0: ID parity error has not been detected. 1: ID parity error has been detected.
b5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: checksum error has been detected.
b4	SFER	Sync field Error Flag 0: Sync field error has not been detected. 1: Sync field error has been detected.
b3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
b2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
b1	Reserved	When read, an initial value is returned. When written, write an initial value.
b0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode. In LIN reset mode, the register retains 00_H.

RPER flag (response preparation error flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. Write 0 to clear this bit.

IPER flag (ID Parity error flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

This bit is set to 1 upon ID parity error detection. Write 0 to clear this bit.

CSER flag (checksum error flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The CSER flag is set to 1 upon checksum error detection. Write 0 to clear this bit.

SFER flag (Sync field error flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

This bit is set to 1 upon sync field error detection. Write 0 to clear this bit.

FER flag (framing error flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication, write 0 to the bit in LIN operation mode.

TER flag (Time out error flag)

Only 0 can be written to the TER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

This flag is set to 1 upon frame timeout error or response timeout error detection. Write 0 to clear this bit.

BER flag (bit error flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The BER flag is set to 1 upon bit error detection. Write 0 to clear this bit.

25.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3_Base> + 14_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	—	LCS	RCDS	RFDL[3:0]			
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.42 RLN3nLDFC register contents

Bit Position	Bit Name	Function
b7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
b6	Reserved	When read, an initial value is returned. When written, write an initial value.
b5	LCS	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
b4	RCDS	Response Field Communication Direction Select 0: Reception 1: Transmission
b3 to b0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS bit (transmission/reception continuation select bit)

The LSS bit sets the data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

In LIN communication, Do not set “1” to this bit.

This should be set when the RTS bit is 0 (response transmission/reception stopped).

LCS bit (checksum select bit)

The CSM bit sets the checksum mode.

With 0 set, classic checksum mode is selected.

With 1 set, enhanced checksum mode is selected.

When the timeout error is used (the TER bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details of the bit error, refer to **Section 25.7.7, Error Status**.

When the length of the response field data is 0 byte (the RFDL bit is 0), do not set this bit to “1” (enhanced).

When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.

During transmission of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

This should be set when the RTS bit is 0 (response transmission/reception stopped).

RCDS bit (response field communication direction select bit)

This bit selects the direction of the response field communication.

With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low-level width of the input signal is counted).

With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.

This bit should be set when the RTS bit in the RLN3nLTRC register is 0 in LIN operation mode (response transmission/reception stopped) or when the FTS bit is 0 in LIN wake-up mode (header reception or wake-up transmission/reception stopped).

When response data of 9 bytes or more is to be transmitted or received, do not change this bit setting after the first data group through the last data group.

RFDL[3:0] bits (response field length select bits)

The RFDL bits set the length of the response field data.

The data length can be 0 to 8 bytes excluding the checksum size.

These bits should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped).

When response data of 9 bytes or more is to be transmitted, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit in the RLN3nLDFC register is 1) include the checksum.

25.3.2.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 15_H (n = 0)

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.43 RLN3nLIDB register contents

Bit Position	Bit Name	Function
b7, b6	IDP[1:0]	Parity Setting Stores the parity bits (P) to be received in the ID field.
b5 to b0	ID[5:0]	ID Setting Stores the 6-bit ID value to be received in the ID field.

The value in the RLN3nLIDB register is enabled after the completion of header reception. In LIN mode (LIN operation mode, LIN wake-up mode), writing to this register is disabled.

In LIN self-test mode, the reversed value of the value received can be read. The value to be received can be written to this register before communication.

IDP[1:0] bits (parity setting bits)

The IDP bits store the parity bits (P0 and P1) to be received in the ID field of the LIN frame. When the IPERE bit in the RLN3nLEDE register is 1 (ID parity detection enable), the received value and the value calculated internally are checked. If they do not match, IPER (ID parity error flag) is set.

ID[5:0] bits (ID setting bits)

The ID bit stores the 6-bit ID value to be transmitted received in the ID field of the LIN frame.

25.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3_Base> + 16_H (n = 0)

Initial value: 00_H

Table 25.44 RLN3nLCBR register contents

Bit Position	Bit Name	Function
b7 to b0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
The value transmitted can be read from the register. Read the value after transmission is completed.
Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
The value received can be read from the register. Read the value after reception is completed.
Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
The reversed value of the value transmitted can be read from the register. Read the value after transmission is completed.
Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
The reversed value of the value received can be read from the register. Read the value after reception is completed.
The value to be received can be written to the register before communication.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

25.3.2.19 RLN3nLDBRm — LIN Data Buffer m Register (m = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3_Base> + 18_H (n = 0)
 RLN3nLDBR2: <RLIN3_Base> + 19_H (n = 0)
 RLN3nLDBR3: <RLIN3_Base> + 1A_H (n = 0)
 RLN3nLDBR4: <RLIN3_Base> + 1B_H (n = 0)
 RLN3nLDBR5: <RLIN3_Base> + 1C_H (n = 0)
 RLN3nLDBR6: <RLIN3_Base> + 1D_H (n = 0)
 RLN3nLDBR7: <RLIN3_Base> + 1E_H (n = 0)
 RLN3nLDBR8: <RLIN3_Base> + 1F_H (n = 0)

Initial value: 00_H

Table 25.45 RLN3nLDBRm (m = 1 to 8) register contents

Bit Position	Bit Name	Function
b7 to b0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting Range: 00 _H to FF _H

For response transmission:

The LDBR_n registers set the data to be transmitted in the response field.

These registers should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception is halted).

For response reception:

The RLN3nLDBR_n registers hold the data received in the response field.

The received data is overwritten. If an error is detected, the data prior to reception interruption is stored in the register.

Do not read these registers when the RTS bit is 1 (response transmission/reception is started)

In LIN self-test mode, these registers operate as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
The reversed value of the value transmitted can be read from the registers. The value to be transmitted can be written to the registers before communication.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
The reversed value of the value received can be read from the register. The value to be received can be written to the registers before communication.

25.4 Interrupt Sources

The LIN Interface generates four types of interrupt requests.

- LINn successful transmission interrupt
- LINn successful reception interrupt
- LINn reception status error interrupt
- LINn interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the LINn interrupt.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the LINn successful transmission interrupt, LINn successful reception interrupt, or LINn reception status error interrupt depending on the interrupt request.

Table 25.46 lists the sources for each interrupt.

Table 25.46 Interrupt Sources

		LIOS bit in RLN3nLMD register is 0		LIOS bit in RLN3nLMD register is 1	
		LINn Interrupt	LINn Successful Transmission Interrupt	LINn Interrupt	LINn Successful Transmission Interrupt
LIN mode	LIN master mode	<ul style="list-style-type: none"> • Successful frame transmission • Successful frame reception • Successful wake-up transmission • Successful wake-up reception • Successful header transmission • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error 	<ul style="list-style-type: none"> • Successful frame transmission • Successful wake-up transmission • Successful header transmission 	<ul style="list-style-type: none"> • Successful wake-up reception • Successful wake-up reception 	<ul style="list-style-type: none"> • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error
	LIN slave mode	<ul style="list-style-type: none"> • Successful response transmission • Successful response reception • Successful wake-up transmission • Successful wake-up reception • Successful header reception • Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error 	<ul style="list-style-type: none"> • Successful response transmission • Successful wake-up transmission 	<ul style="list-style-type: none"> • Successful response reception • Successful wake-up reception • Successful header reception 	<ul style="list-style-type: none"> • Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error

Each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1.

25.5 Modes

The LIN Interface provides the following three modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode
(LIN master mode/LIN slave mode [auto baud rate])
- LIN self-test mode

The supply of clocks to the LIN Interface is stopped in LIN reset mode, which reduces power consumption.

Figure 25.2 shows mode transitions. **Table 25.47** describes mode transition conditions. **Table 25.48** lists operations available in each mode.

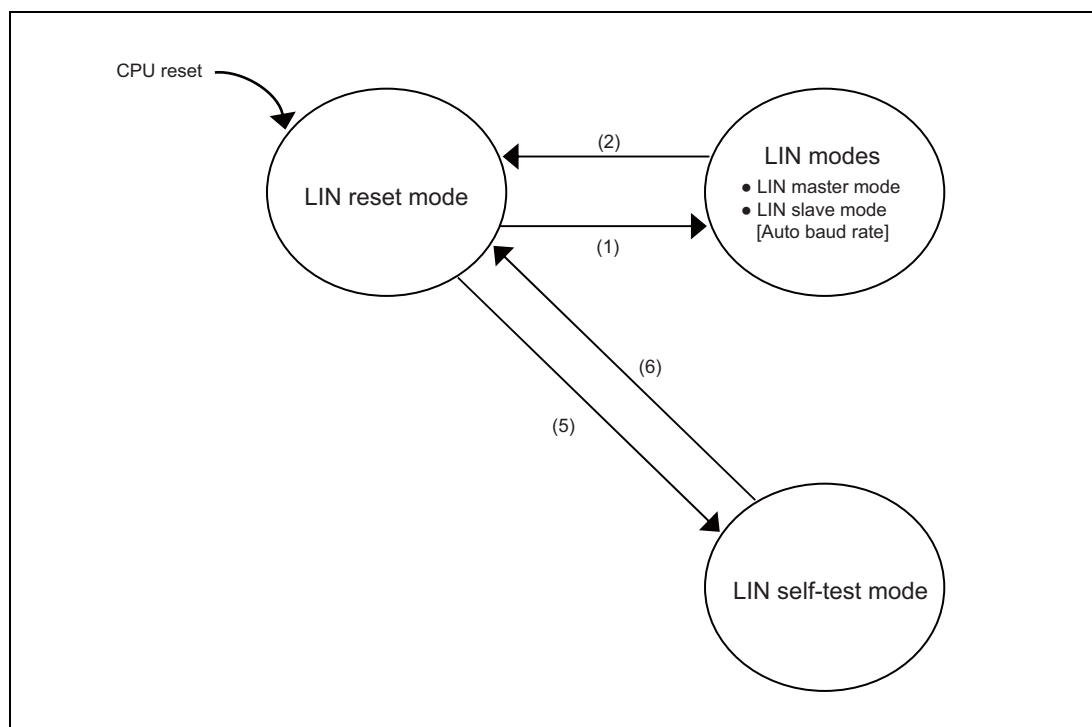

Figure 25.2 Mode Transitions

Table 25.47 Transition Condition of Each Mode

Mode transition	Transition condition
1 LIN reset mode → LIN mode (LIN master mode)	LMD bit in RLN3nLMD register = 00 _B and OM1 and OM0 bits in RLN3nLCUC register = 01 _B or 11 _B
LIN reset mode → LIN mode (LIN slave mode [auto baud rate])	LMD bit in RLN3nLMD register = 10 _B and OM1 and OM0 bits in RLN3nLCUC register = 01 _B or 11 _B
2 LIN mode → LIN reset mode	OM0 bit in RLN3nLCUC register = 0 _B
5 LIN reset mode → LIN self-test mode	See Section 25.8, LIN Self-Test Mode.
6 LIN self-test mode → LIN reset mode	See Section 25.8, LIN Self-Test Mode.

Table 25.48 Operations Available in Each Mode

LIN mode		
LIN master mode	LIN slave mode [auto baud rate]	LIN self-test mode
Header transmission	Header reception	Self test
Response transmission	Response transmission	
Response reception	Response reception	
Wake-up transmission	Wake-up transmission	
Wake-up reception	Wake-up reception	
Error detection	Error detection	

Whether a transition has been caused to LIN reset mode or LIN mode can be verified by reading the LMD bits in the RLN3nLMD register or the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 25.8, LIN Self-Test Mode**.

25.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0b (LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0_B (LIN reset mode). In this mode, the LIN communication function is halted.

From LIN reset mode, transitions to LIN mode and LIN self-test mode can be made.

When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRm register (m = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

25.7 LIN Mode

LIN mode can operate in the following submodes: LIN master mode and LIN slave mode [auto baud rate].

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

In LIN slave mode [auto baud rate], header reception, response transmission, response reception, wake-up transmission, wake-up reception, and error detection can be performed.

The LIN slave mode [auto baud rate] allows automatic detection of the break field and the sync field, and sets a baud rate based on the results of measurement of a sync field. The baud rate can be set to the range from 1kbps to 20kbps. Clocks that are divided by a prescaler should be set to 8 to 12 MHz. In such a case, settings for the LPRS[2:0] bits should be determined from the frequency of the LIN communication clock source and initially be set.

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 10_B (LIN slave mode [auto baud rate]) and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B or 11_B set LIN slave mode [auto baud rate], turning the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B or 11_B.

When changing a submode to another submode within LIN mode, a transition to LIN reset mode should first be made and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 25.3 shows the transition of operation modes. **Table 25.49** describes the transition conditions of operation modes.

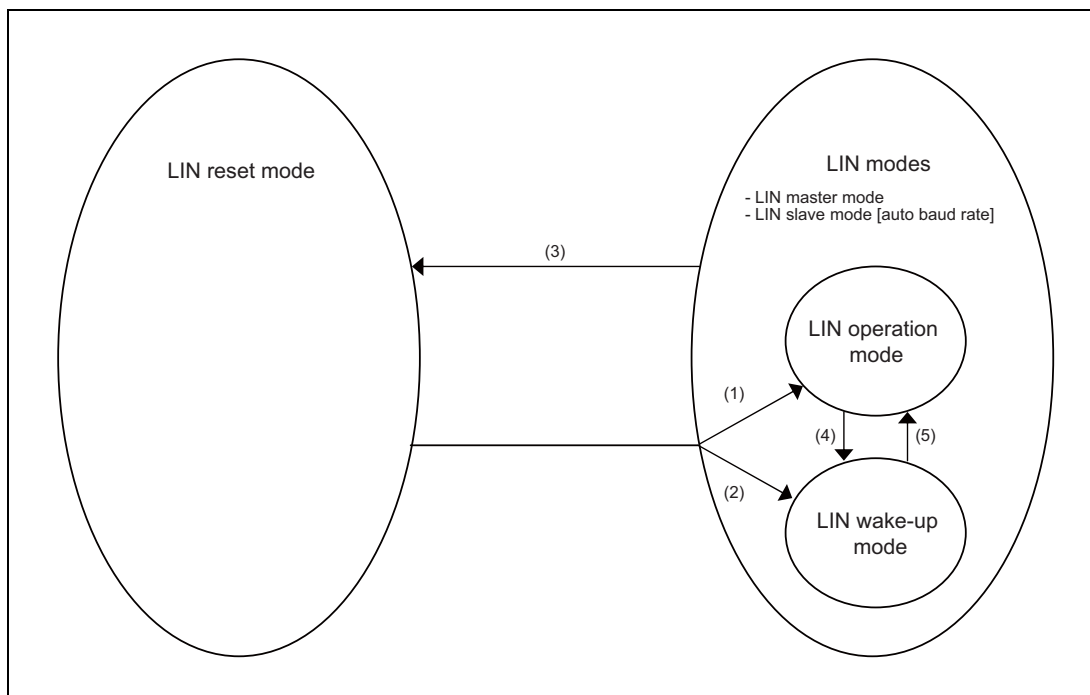

Figure 25.3 Transition of Operation Modes

Table 25.49 Transition Conditions of Operation Modes

Operation mode transition	Transition condition
(1) LIN reset mode → LIN mode - LIN operation mode	LMD bit in RLN3nLMD register = 00 _B or 10 _B and OM1 and OM0 bits in RLN3nLCUC register = 11 _B
(2) LIN reset mode → LIN mode - LIN wake-up mode	LMD bit in RLN3nLMD register = 00 _B or 10 _B and OM1 and OM0 bits in RLN3nLCUC register = 01 _B
(3) LIN mode -LIN operation mode -LIN wake-up mode → LIN reset mode	OM0 bit in LCUC register = 0 _B
(4) LIN mode *1 -LIN operation mode → LIN mode - LIN wake-up mode	OM1 and OM0 bits in RLN3nLCUC register = 01 _B
(5) LIN mode *1 -LIN wake-up mode → LIN mode - LIN operation mode	OM1 and OM0 bits in RLN3nLCUC register = 11 _B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is going on (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_b. Communication settings should be performed after the RLN3nLMST register has become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be performed after the RLN3nLMST register has become 01_B.

25.7.1 LIN Master Mode

25.7.1.1 Header Transmission

Figure 25.4 shows the operation of the LIN Interface (LIN master mode) in header transmission. **Table 25.50** provides processing in header transmission.

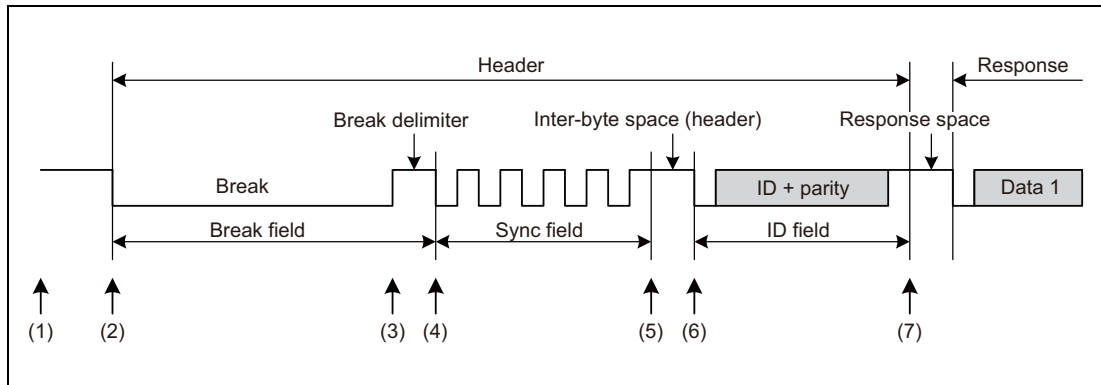

Figure 25.4 Operation in Header Transmission

Table 25.50 Processing in Header Transmission

Software processing	LIN Interface processing
(1) <ul style="list-style-type: none"> • Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN Interface to the LIN master mode: LIN operation mode • Sets information on the frame to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data) 	Waits for the setting of the FTS bit in the RLN3nLTRC register by software (idle)
(2) Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3) Waits for an interrupt request	Transmits a break delimiter.

(6)	Sets a header reception complete flag.
(7) <ul style="list-style-type: none"> • Checks the RLIN3nLST register, and clears flags. • Checks the RLIN3nLIDB register, and prepares a response. 	<ul style="list-style-type: none"> • Completes a header reception process. • Waits for a response request.

Note: For information about error detection, refer to **Section 25.7.7, Error Status**.

(1) Auto Baud Rate Correction Function

In LIN slave mode [auto baud rate], the system always measures the low-level widths that are received. If the first “Low level” width is 10 times (if the BLT bit of the RLN3nLBFC register is “0”) or 11 times (if the BLT bit of the RLN3nLBFC register is “1”) or greater calculated from the average of the starting 2 bits (the period of the consecutive fall edges from the beginning of the sync field) of the sync field, the system concludes that the detection of break field was successful, and temporarily halts the receive processing, and verifies that the data in the sync field is 55_H. When confirming that the data is 55_H and the reception of the sync field is successful, the system automatically sets the baud rate correction results in the RLN3nLBRP1 and RLN3nLBRP0 registers.

If data is received up to the ID field without error, a successful header reception interrupt is generated at the stop bit position.

If the sync field data is not 55_H, the system concludes that the detection of a sync field failed. If an error is produced, an error flag is set, and an error interrupt is generated.

In such a case, the LIN Interface waits for the detection of another break field (“Low”).

Baud rates are not corrected when the send/receive processing remains stopped.

Auto baud rate correction is not performed when the transmit/receive processing remains stopped.

When the operation reaches the stop bit position for receive processing while the transmit/receive processing is enabled, framing error or bit error is detected and an interrupt of the reception status may be generated. This includes the reception of break field under communication.

25.7.3 Data Transmission/Reception

25.7.3.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data is compared bit by bit, and the results are stored in the BER flag in the RLIN3nLEST register (see **Section 25.7.7, Error Status**).

In LIN slave mode [auto baud rate], if 1 Tbit is generated to be $4f_{LIN}$, the sampling point for received data is at the third clock cycle (75% position). If 1 Tbit is generated to be $8f_{LIN}$, the sampling point for received data is at the 7th clock cycle (87.5% position).

Figure 25.13 shows an example of data transmission timing.

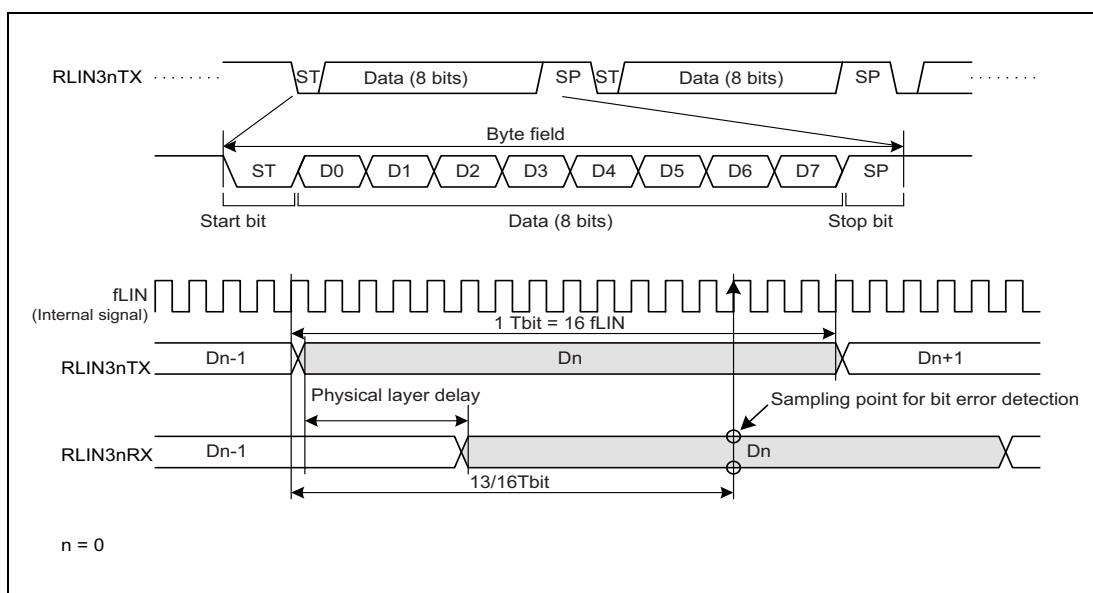

Figure 25.13 Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode)

25.7.3.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again $(0.5 \times Z-1)/Z$ Tbit ($Z =$ number of samples (4, 6, 8, 16)) later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the clearing of the resetting is low-level-fixed or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN Interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN Interface uses a noise filter, and for a sampling value the value determined by a 3-sampling majority rule on prescaler clocks is used. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN Interface does not use a noise filter, and for a sampling value the value of the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 25.14 shows an example of data reception timing.

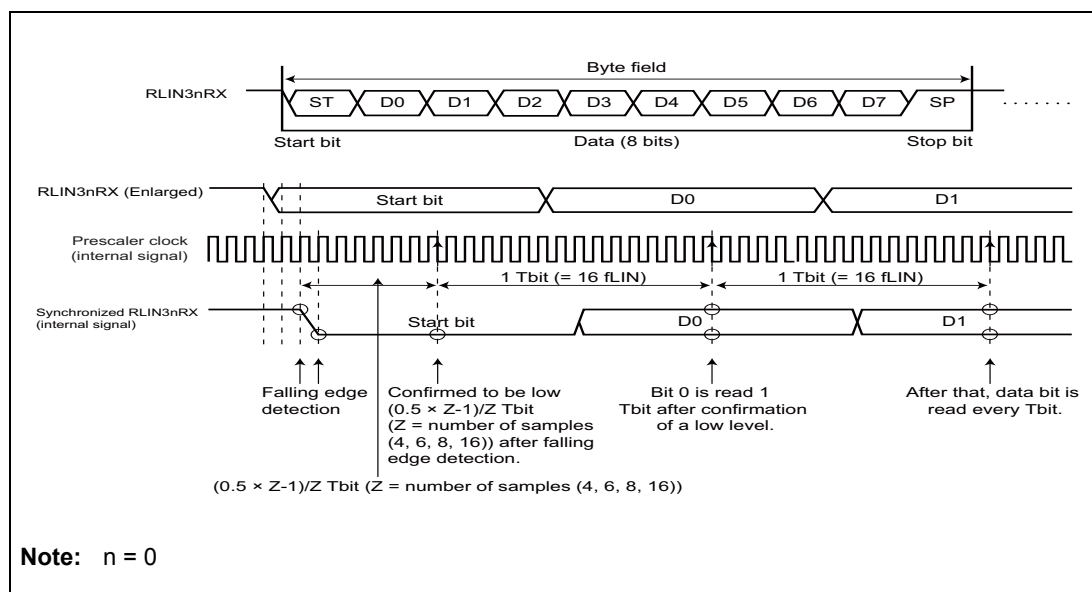

Figure 25.14 Example of Data Reception Timing

25.7.4 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN Interface sends or receives data continuously.

25.7.4.1 Transmission of LIN frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register. (n = 0)

Figure 25.15 depicts the LIN transmission processing and the required buffer.

Figure 25.15 LIN Transmission Processing and Required Buffer

(1) Frame Separate Mode

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN3nLST register turns 1 (successful header transmission).

Use frame separate mode when sending or receiving response data of 9 bytes or greater in LIN master mode.

25.7.4.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame is stored in registers RLN3nRLN3nLDBR1 to RLN3nLDBR8, respectively, upon receipt of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; however, no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.n = 0 to5

Figure 25.16 depicts the LIN reception processing and the required buffer.

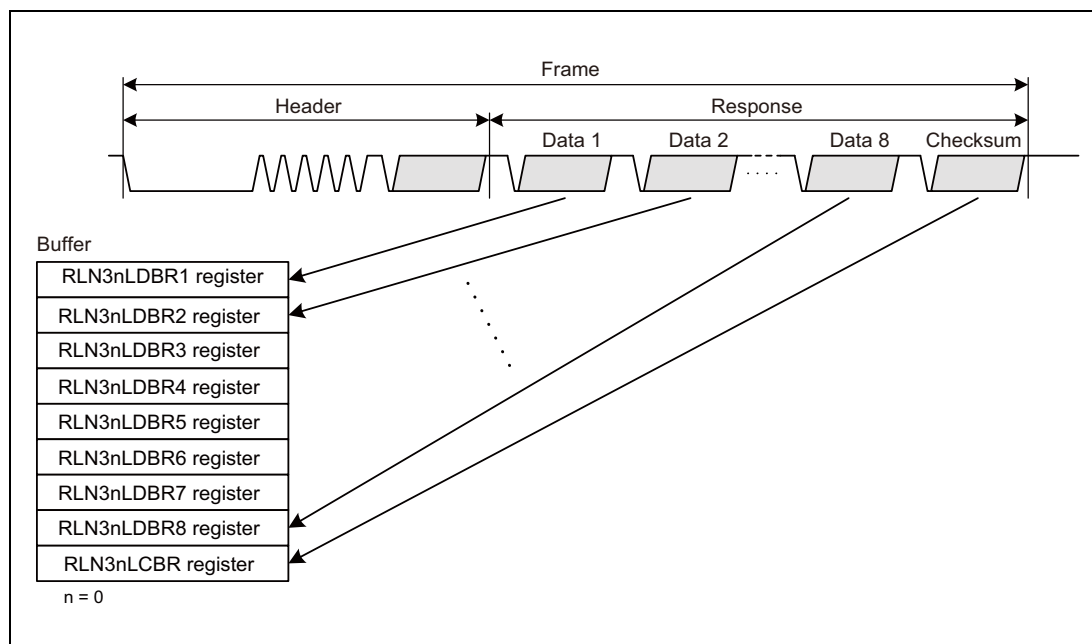

Figure 25.16 LIN Reception Processing and Required Buffer

(1) Reception of Data 1

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register turns 1 (successful data 1 reception).

25.7.4.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less (including a checksum field); however, responses in 10 bytes or greater can also be sent and received.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be sent or received is not the final data group) in the first data group (variable in 0 to 8 bytes) before sending or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit should be set to 0 (indicating that the next data group to be sent or received is the final data group, and a checksum should be appended to the final data group).

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register in the RLN3nLDFC register to 1 (frame separate mode).

NOTE

In LIN slave mode, the LIN Interface can detect a new break field during the transmission or reception of a response.

25.7.5 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

25.7.5.1 Wake-up Transmission

In LIN wake-up mode, setting the RCDS bit in the RLN3nLDFC register to 1 (transmission) and the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register.

If a wake-up low is output without any bit error, the FTC flag in the RLN3nLST register turns 1 (successful response or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful response/wakeup transmission interrupt enabled), an interrupt request is generated.

If a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

Figure 25.17 shows the wake-up transmission timing.

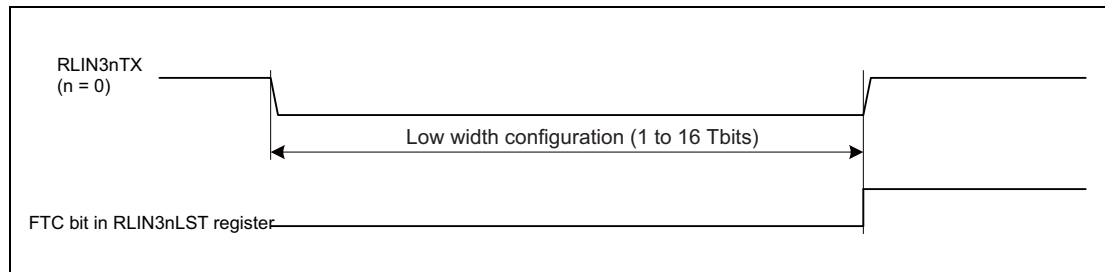

Figure 25.17 Wake-up Transmission Timing

25.7.5.2 Wake-up Reception

The detection of a wake-up involves the use of an input signal low level width count function.

The input signal low level width count function measures the low width of the input signal to the RLIN3nTX pin, using the same sampling point as data reception. The function can measure the input signal low level width of 2.5 Tbits or greater.

When using this function, in LIN wake-up mode set the RCDS bit in the RLN3nLDFC register to 0 (reception), and the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception a started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register turns 1 (successful response/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful response or wake-up reception interrupt enabled), an interrupt request is generated.

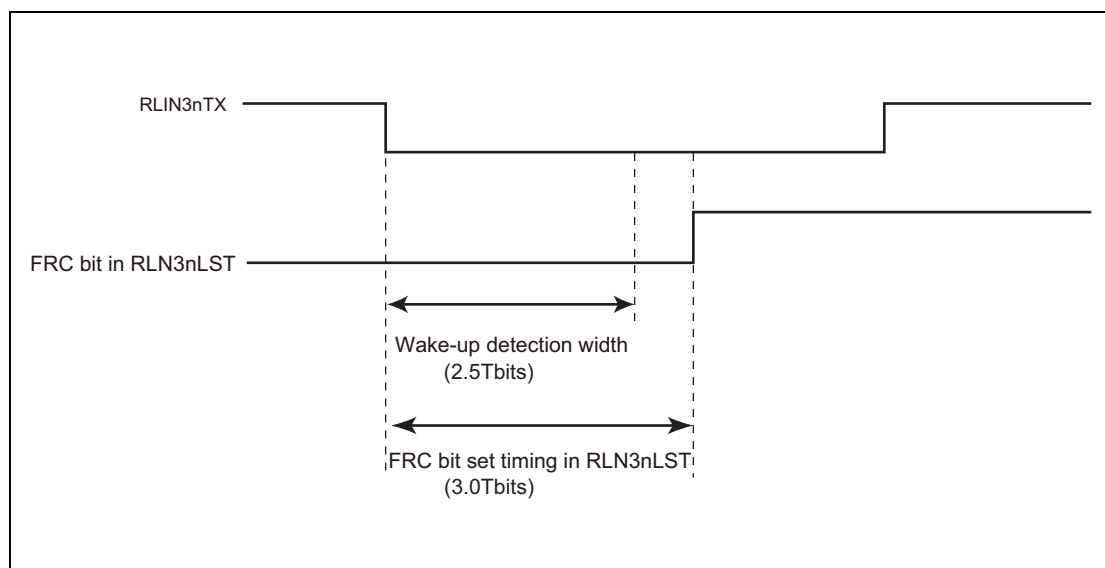

Figure 25.18 Input Signal Low level Count Function

25.7.6 Status

During LIN mode operation, the LIN Interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/header reception, can generate interrupt requests.

Table 25.57 shows the types of statuses available in LIN master mode. **Table 25.58** lists the types of statuses available in LIN slave mode [auto baud rate].

Table 25.57 Types of Statuses in LIN Master Mode

Status	Status set condition	Status clear condition	Operation mode capable of status detection	Corresponding bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN–reset mode, if actually the LIN Interface is cleared from LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN Interface enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN Interface enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN Interface enters LIN wake-up mode.	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	OMM1 bit in RLN3nLMST register	—
Frame/wake-up transmission end	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	<ul style="list-style-type: none"> When another communication is started When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	<ul style="list-style-type: none"> When another communication is started When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	FRC flag in RLN3nLST register	√
Error detection	If any of the PRER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	<ul style="list-style-type: none"> When another communication is started When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	ERR flag in RLN3nLST register	√
Data 1 reception end	The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field is received.*2	<ul style="list-style-type: none"> When another communication is started When cleared by software After transition to LIN reset mode 	LIN operation mode	D1RC flag in RLN3nLST register	—
Header transmission end	When a header field is transmitted successfully.	<ul style="list-style-type: none"> When another communication is started When cleared by software After transition to LIN reset mode 	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the PRER flag, CSER flag, FER flag, FTER flag, PBER flag or BER flags in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

Table 25.58 Types of Statuses in LIN Slave Mode

Status	Status set condition	Status clear condition	Operation mode capable of detecting a status	Corresponding bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if actually the LIN Interface is cleared from LIN reset mode.	After the OM0 bit of the RLN3nLCUC register is set to LIN reset mode, if actually the LIN Interface enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMS T register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN Interface enters LIN operation mode.	<ul style="list-style-type: none"> After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN Interface enters LIN wake-up mode. 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	OMM1 bit in RLN3nLMS T register	—
Frame/wake-up transmission end	When a response field, a wake-up signal, or a data group is transmitted successfully.	<ul style="list-style-type: none"> When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a response field, a wake-up signal, or a data group is received successfully.	<ul style="list-style-type: none"> When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	FRC flag in RLN3nLST register	√
Error detection	If any of the PRER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	<ul style="list-style-type: none"> When cleared by software After transition to LIN reset mode 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	ERR flag in RLN3nLST register	√
Data 1 reception end	The RCDS bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field is received.*2	<ul style="list-style-type: none"> When cleared by software After transition to LIN reset mode 	LIN operation mode	D1RC flag in RLN3nLST register	—
Header reception end	When a header field is received successfully.	<ul style="list-style-type: none"> When cleared by software After transition to LIN reset mode 	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the PRER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag or BER flags in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

25.7.7 Error Status

25.7.7.1 LIN Master Mode

(1) Types of Error Statuses

The LIN Interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

Table 25.59 shows the types of error statuses.

Table 25.59 Types of Error Statuses in LIN Master Mode

Status	Error detection condition	Operation mode capable of error detection	Communication	Enable/disable detection	Corresponding bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	Cancel	√	BER flag in RLN3nLEST register
Physical bus error	<ul style="list-style-type: none"> LIN bus is detected to be high level when sending a break LIN bus is detected to be low level when sending a break delimiter LIN bus is detected to be high level when sending a wake-up 	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	Cancel	√	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*2	LIN operation mode	Cancel	√	FTER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	√	FER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	—	×	CSER flag in RLN3nLEST register
Response preparation error	<p>One of the following conditions occurs in frame separate mode during a multi-byte response reception:</p> <ul style="list-style-type: none"> The first reception data byte is received after completion of header transmission but before a response transmission/reception request is set The first reception data byte is received after the completion of previous data group reception before a transmission/reception request for another data group is set 	LIN operation mode	Cancel	×	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and this can be calculated according to the following formula:

[Frame timeout]

On classic selection (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

On enhanced selection (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package

Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.0 or 2.1 on enhanced selection.

[Response timeout]

$$\text{Timeout time} = (\text{number of data bytes} + 1) \times 14 \text{ [Tbit]}$$

The error status is cleared when the next communication is started, by software, or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 25.19 shows the time domain in which the LIN Interface in master mode performs monitoring for error detection.

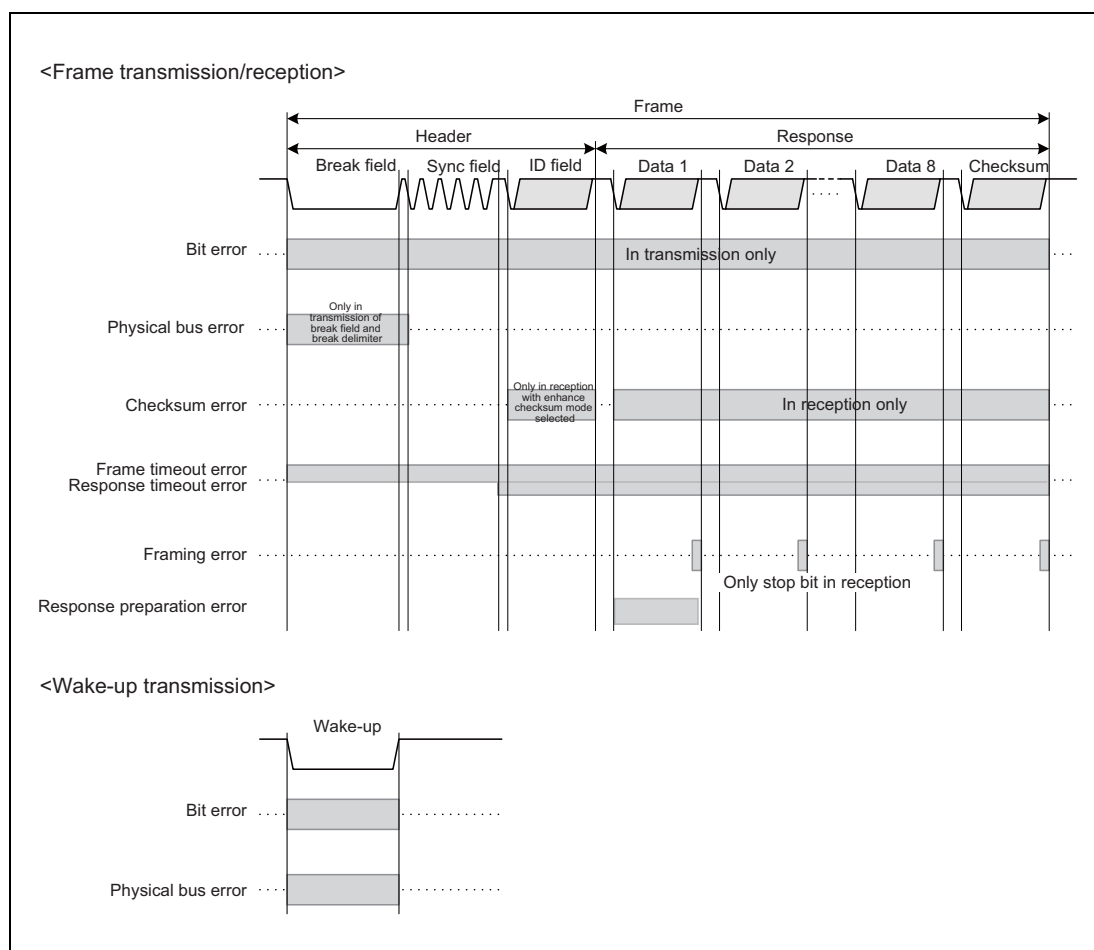

Figure 25.19 Target Time Area for LIN Error Detection (LIN Master Mode)

25.7.7.2 LIN Slave Mode

(1) Types of Error Statuses

The LIN Interface can detect seven types of error statuses in LIN slave mode [auto baud rate]. These error statuses can be verified by checking the corresponding bits in the RLN3nLEST register.

Table 25.60 shows the types of error statuses.

Table 25.60 Types of Error Statuses in LIN Slave Mode

Status	Error detection condition	Operation mode capable of error detection	Communication	Enable/disable detection	Corresponding bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match*1	<ul style="list-style-type: none"> LIN operation mode LIN wake-up mode 	Cancel	√	BER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Cancel	√	TER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	√	FER flag in RLN3nLEST register
Sync field error	If the width of the break low level is greater than the width set by the LBLT bit in the RLN3nLBFC register and the sync field is not 55 _H	LIN operation mode	Cancel*4	√*5	SFER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	—*6	×	CSEF flag in RLN3nLEST register
ID parity error	If the received ID parity bit does not match the value that is automatically calculated by the LIN Interface	LIN operation mode	Cancel	√	√
Response preparation error	<ul style="list-style-type: none"> After the reception of a header, before the first reception data byte is received, response preparation is not made in time. Before the completion of receiving the first reception data byte for the next data group in a multi-byte response reception, response preparation for the next group is not made in time 	LIN operation mode	Cancel	×	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit error can be detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and this can be calculated according to the following formula:

[Frame timeout]

On classic selection (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

On enhanced selection (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.0 or 2.1 on enhanced selection.

[Response timeout]

Timeout time = (number of data bytes + 1) × 14 [Tbit]

The timeout time is 8 data bytes until the RTS or LNRR bit in the RLN3nLTRC register is set.

Note 4. Communication is canceled, and waits for the detection of another break low.

Note 5. Only flag setting can be enabled or disabled; detection cannot be enabled or disabled.

Note 6. Before the set timing, the frame is complete.

The error status is cleared by software or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 25.20 shows the time domain in which the LIN Interface in slave mode performs monitoring for error detection.

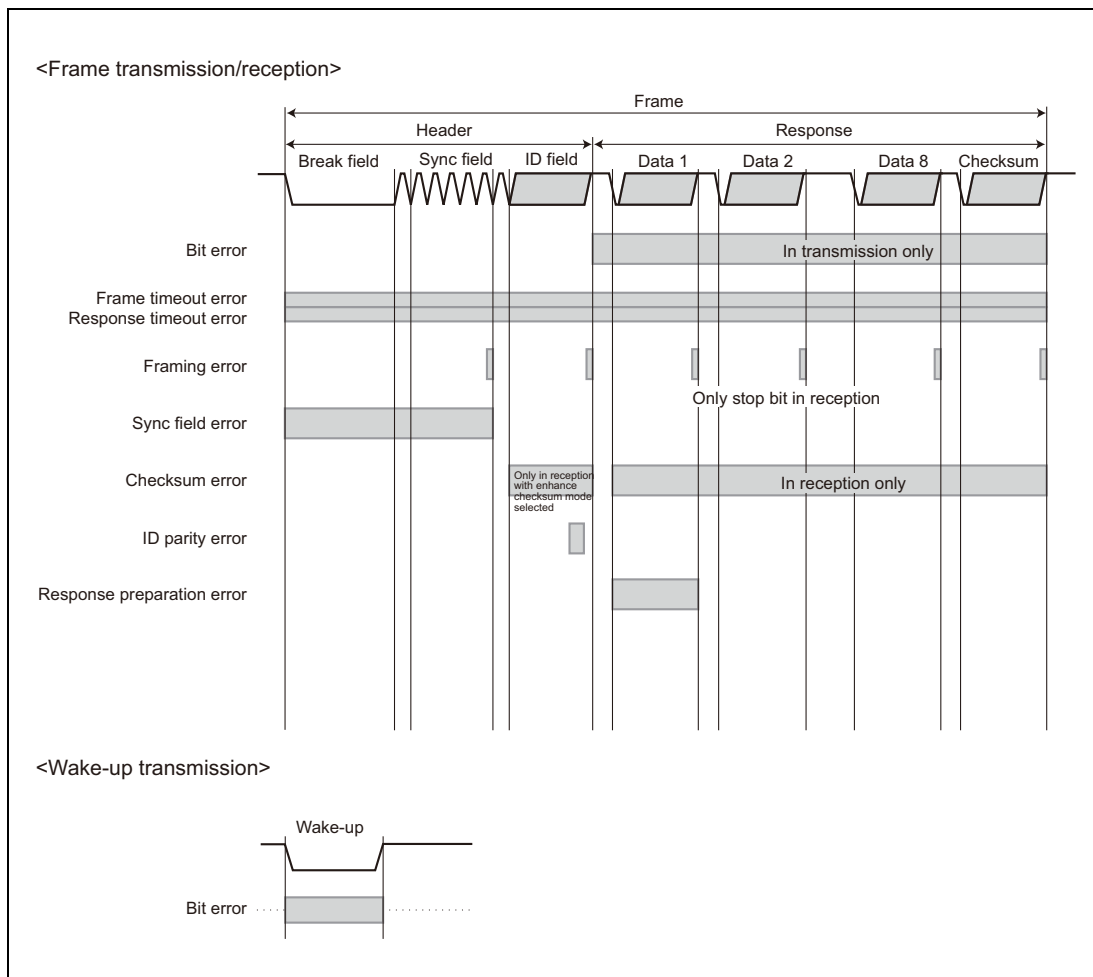

Figure 25.20 Target Time Area for LIN Error Detection (LIN Slave Mode)

25.8 LIN Self-Test Mode

When the LIN interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected in the LIN interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX.

The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following two types.

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception

In LIN self-test mode, the operate is at the fastest baud rate, regardless of the setting of the baud rate generator,

Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps]. (The NSPB bits in the RLIN3nLWBR register should be set to 0000_B or 1111_B.)

In addition, in LIN self-mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- Frame/response timeout error

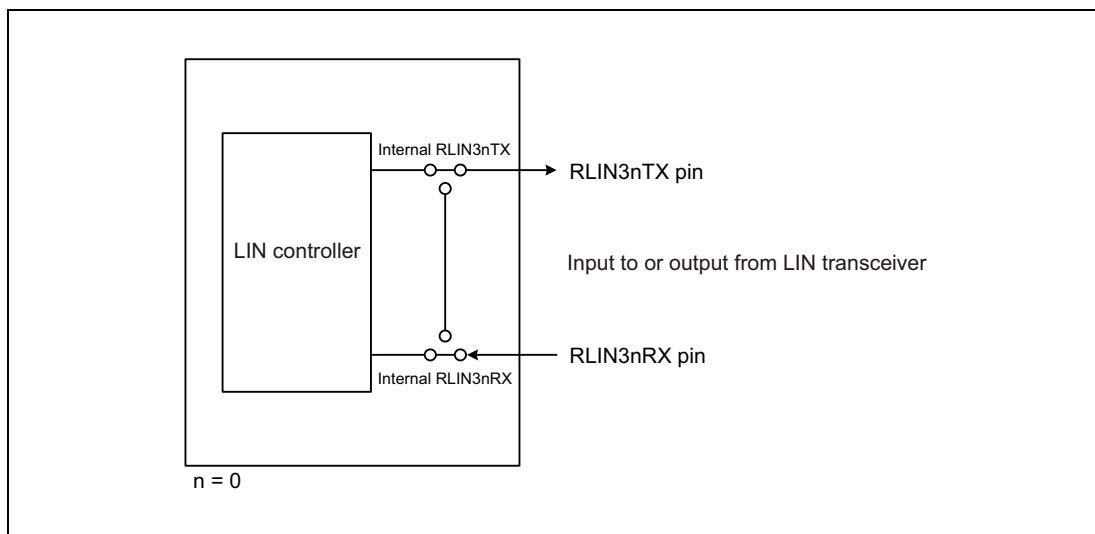

Figure 25.21 Connection in LIN Reset Mode and LIN Mode

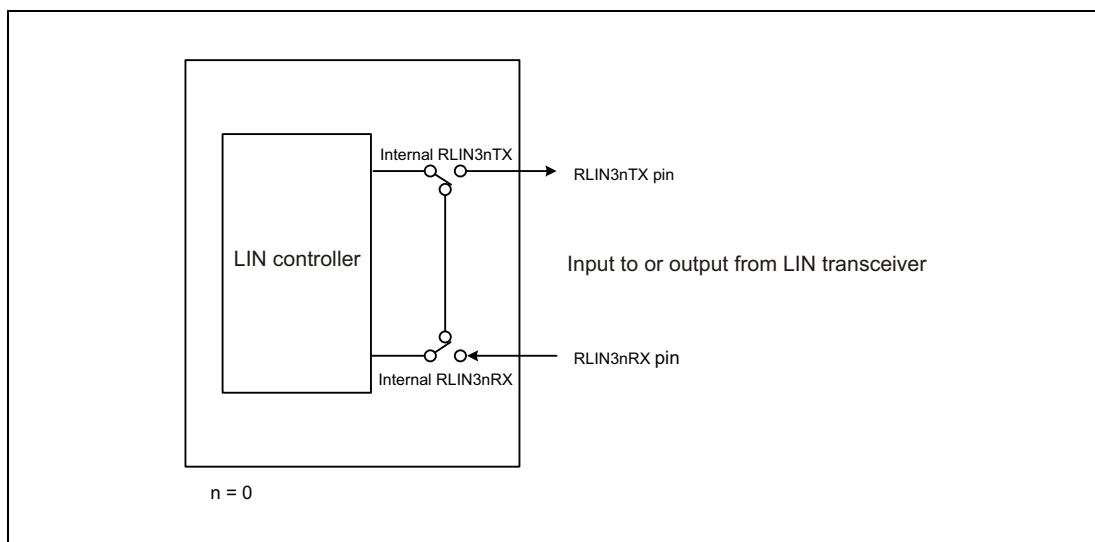

Figure 25.22 Connection in LIN Self-Test Mode

25.8.1 Change to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.

When the LSTM bit in the RLN3nLSTC register is set to 1, the shift to the LIN self-test mode is checked.

When changing to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Change to LIN reset mode
Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
LMD bits in RLN3nLMD = 00_B (LIN master mode)
- 1st write: RLN3nLSTC register = 1010 0111 (A7_H)
- 2nd write: RLN3nLSTC register = 0101 1000 (58_H)
- 3rd write: RLN3nLSTC register = 0000 0001 (01_H)
- Verify the transition to LIN self-test mode
Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write (A7_H) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

25.8.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
 RLN3nLWBR register = 0000xxxxB*¹
 RLN3nLBRP0 register = xxxxxxxxB*¹
 RLN3nLBRP1 register = xxxxxxxxB*¹
 RLN3nLMD register = 00xxxx00B*¹
- Set the interrupt enable and error enable related registers.
 RLN3nLIE register = 0000xxxxB
 RLN3nLEDE register = x000x0xxB
- Set the break field and space related registers.
 RLN3nLBFC register = 00xxxxxB
 RLN3nLSC register = 00xx0xxxB
- Cancel the LIN reset mode.
 Write 11B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11B.
- Set the transmit frame related registers.
 RLN3nLDFC register = 00x1xxxxB
 RLN3nLIDB register = xxxxxxxxB
 RLN3nLDRB1 to RLN3nLDRB8 registers = xxxxxxxxB
- Header transmission → response transmission started
 Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).
 The LIN master self mode (transmission) is executed. In this mode, interrupt are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN interface.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRm (m = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not necessary.

Note 2. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled). The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) [\text{Tbit}]$$

$$1 \text{ Tbit} = \text{LIN communication clock source} \times 16$$

25.8.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
 RLN3nLWBR register = 0000xxxxB*¹
 RLN3nLBRP0 register = xxxxxxxxB*¹
 RLN3nLBRP1 register = xxxxxxxxB*¹
 RLN3nLMD register = 00xxxx00B*¹
- Set the interrupt enable and error enable related registers.
 RLN3nLIE register = 0000xxxxB
 RLN3nLEDE register = x000x0xxB
- Set the break field and space related registers.
 RLN3nLBFC register = 00xxxxxB
 RLN3nLSC register = 00xx0xxxB*¹
- Cancel the LIN reset mode.
 Write 11B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11B.
- Set the reception frame related registers.
 RLN3nLDFC register = 00x0xxxxB
 RLN3nLIDB register = xxxxxxxxB
 RLN3nLDRB1 to RLN3nLDRB8 registers = xxxxxxxxB
 RLN3nLCBR register = xxxxxxxxB
 Since the checksum is not automatically calculated, set the calculation value. If an incorrect checksum is set at this time, the checksum error can be tested.
- Header transmission → response reception started
 Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).
 The LIN master self mode (reception) is executed. In this mode, interrupt are generated, and status and error status are also updated.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRm (m = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the

successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).

The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

$$10 \times (\text{number of data bytes} + 1) [\text{Tbit}]$$
$$1 \text{ Tbit} = \text{LIN communication clock source} \times 16$$

25.8.4 Terminating LIN Self-Test Mode

To terminate LIN self-test mode, perform the procedure below:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register have turned 11_B, change to LIN reset mode.
- Verify the cancelation of LIN self-test mode.
Read the LSTM bit in the RLN3nLSTC register; confirm that it is not 0 (not in LIN self-test)
- Verify the transition to LIN reset mode.
Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

25.9 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (f_{LIN}) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (f_{LIN}) by the number of samples is the bit rate. The reciprocal of this bit rate is called the bit time (T_{bit}).

The LIN Interface has two kinds of baud rate generators. The baud rate generators switch over according to the mode used.

25.9.1 LIN Master Mode (x.7.1)

Figure 25.23 shows a block diagram of baud rate generation in LIN master mode.

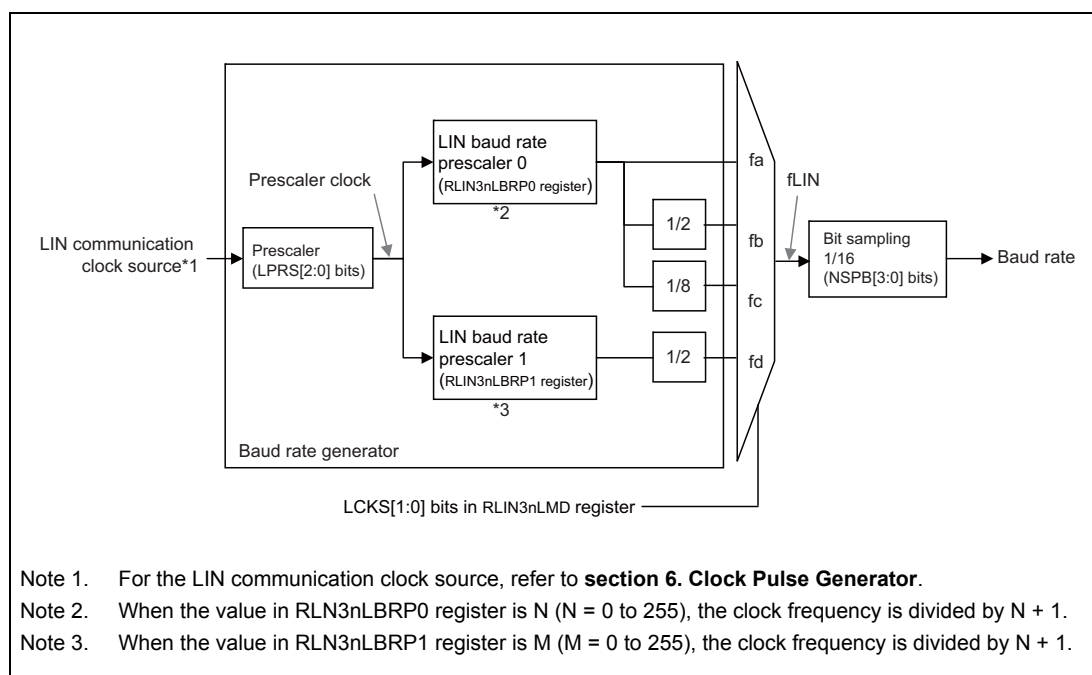

Figure 25.23 Block Diagram of Baud Rate Generation in LIN Master Mode

Set the LIN communication clock source to the range from 25 MHz to 33.33 MHz. By setting the RLN3nLBRP0 register so that f_a is 307200 Hz ($= 19200 \times 16$), the resulting bit rates are $f_a = 19200 \times 16$, $f_b = 9600 \times 16$ and $f_c = 2400 \times 16$. These bit rates are frequency-divided by 16 in the bit timing generator, enabling bit rates of 19200 bps, 9600 bps and 2400 bps to be generated. Also, by setting the RLN3nLBRP1 register so that f_d is 166672 Hz ($= 10417 \times 16$), the resulting bit rate is $f_d = 10417 \times 16$. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

Table 25.61 shows examples of baud rate (19200, 10417, 9600, and 2400 bps) generation for each LIN communication clock source frequency, and also the corresponding errors.

Table 25.61 Examples of Baud Rate (19200, 10417, 9600, and 2400 bps) Generation in LIN Master Mode

LIN communication clock source [MHz]	Target baud rate [kbps]	Baud rate [kbps]	Error [%]
33	2.400	2.4038	0.16
	9.600	9.6154	0.16
	10.417	10.4167	0.00
	19.200	19.2308	0.16
25	2.400	2.4038	0.16
	9.600	9.6154	0.16
	10.417	10.4167	0.00
	19.200	19.2308	0.16

25.9.2 LIN Slave Mode

Figure 25.24 shows a block diagram of baud rate generation in LIN slave mode.

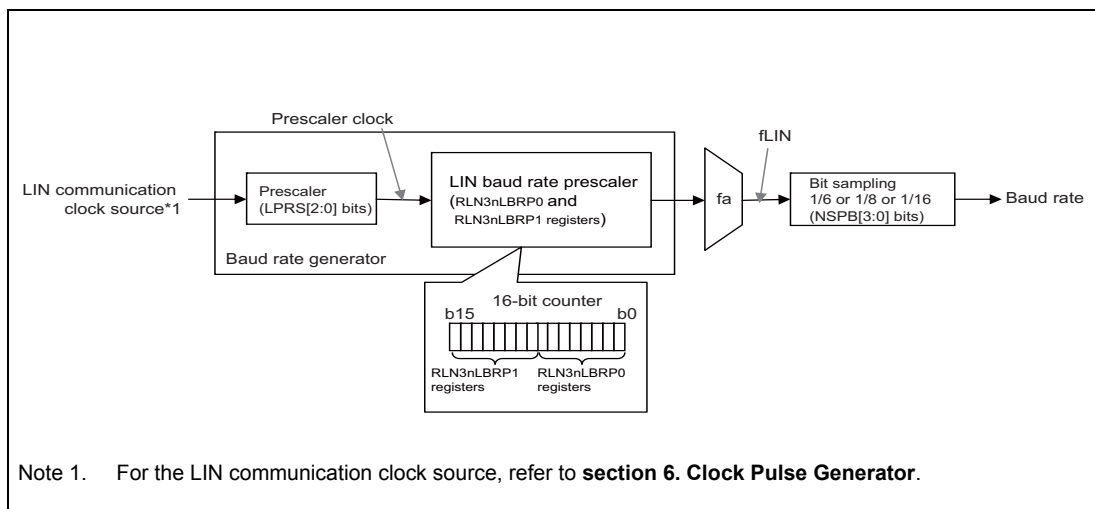

Figure 25.24 Block Diagram of Baud Rate Generation in LIN Slave Mode

In LIN slave mode [auto baud rate], the baud rate can be set to the range from 1 kbps to 20 kbps. Set the clock that was frequency-divided by the prescaler to between 8 and 12 MHz.

25.10 Noise Filter

The LIN Interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLIN3nLMD register to 0 (to use the noise filter), the noise filter is activated. The synchronized RLIN3nRX is sampled by the prescaler clock. The sampled synchronous RLIN3nRX determines the value of each bit of the received data.

Figure 25.25 shows the configuration of the noise filter, **Figure 25.26** an example of a noise filter circuit, and **Figure 25.27** the determination of the received data when the noise filter is used.

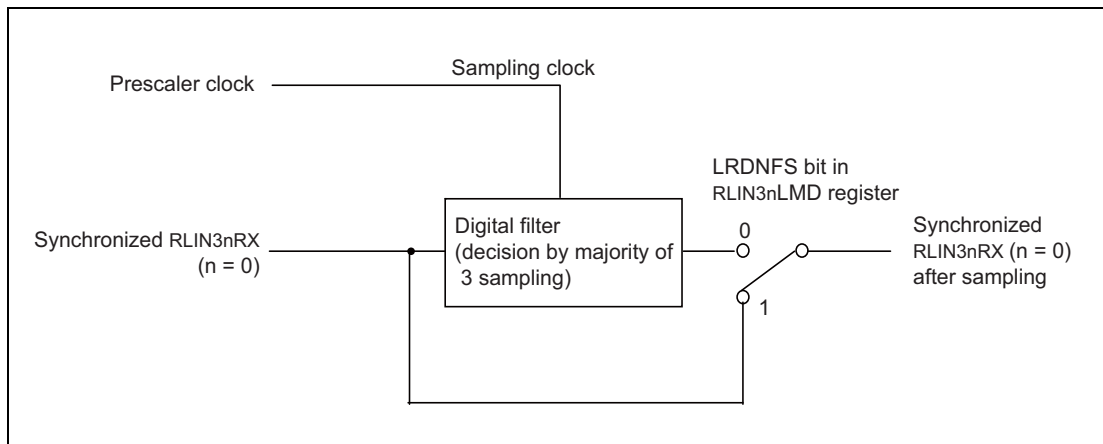

Figure 25.25 Configuration of Noise Filter

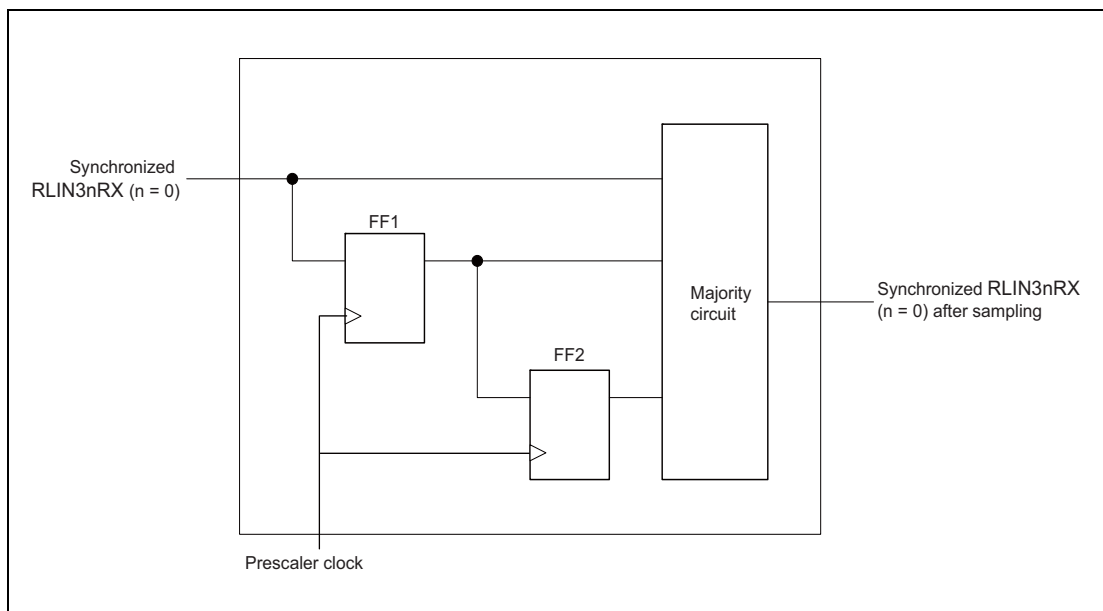

Figure 25.26 Example of Noise Filter Circuit

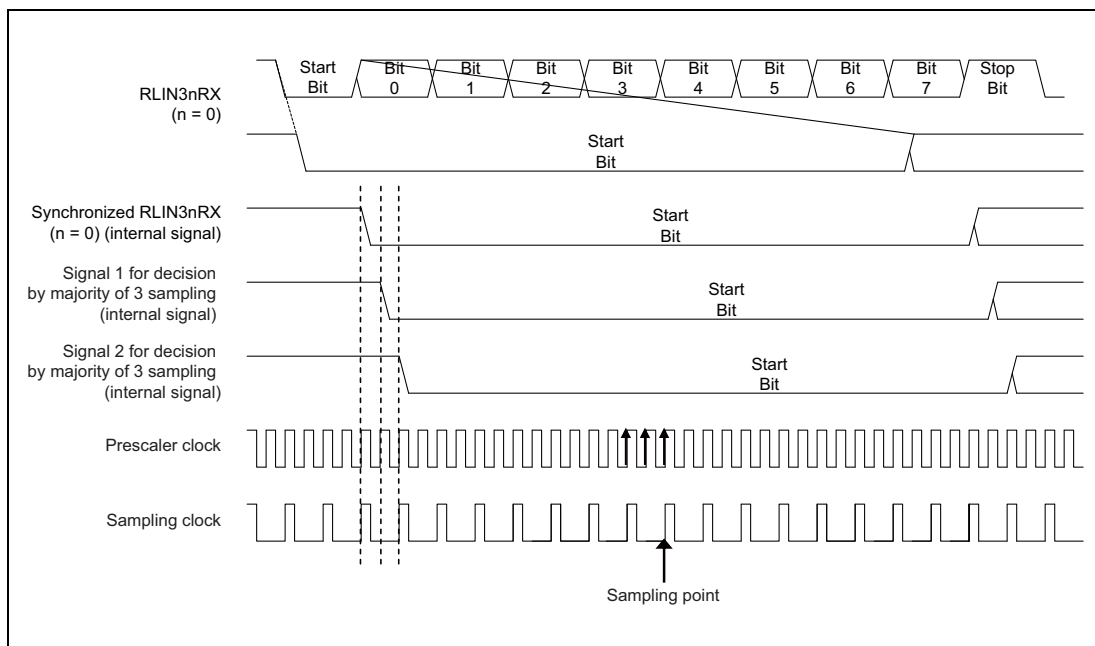

Figure 25.27 Determination of Received Data when Noise Filter is Used

26. Ethernet Controller

This LSI has an on-chip Ethernet controller (ETHER) conforming to the Ethernet or the IEEE802.3 MAC (Media Access Control) layer standard. Connecting a physical-layer LSI (PHY-LSI) complying with this standard enables the ETHER to perform transmission and reception of Ethernet/IEEE802.3 frames. The Ethernet controller in this LSI has one MAC layer interface port, which can be made to perform transmission and reception independently.

The ETHER can transfer the transmitted or received Ethernet frame data to and from the transmit/receive buffer in the memory at high speed using a dedicated direct memory access controller (E-DMAC).

26.1 Features

- MAC (Media Access Control) function
 - Constructs/deconstructs data frames (frame format conforming to IEEE802.3, 2000 Edition)
 - Supports transfer at 10 and 100 Mbps
 - Supports full-duplex mode
 - One channel (ETHER0)
 - Flow control conforming to IEEE802.3x
 - Supports one PHY interface conforming to IEEE802.3
 - MII (Media Independent Interface)
 - Upward protocol support (checksum) function
- E-DMAC (Direct Memory Access Controller for Ethernet controller) function
 - Data transfer between ETHER and external/internal memory
 - One channel
 - 32-byte burst transfer
 - Supports single-frame/single-descriptor operation and single-frame/multi-descriptor (multi-buffer) operation
 - Transfer data width: 32 bits
 - Transmit/receive FIFO (for transmission: 2 Kbytes, for reception: 4 Kbytes)
 - Function for calculating the intelligent checksum value

Figure 26.1 shows the configuration of the ETHER.

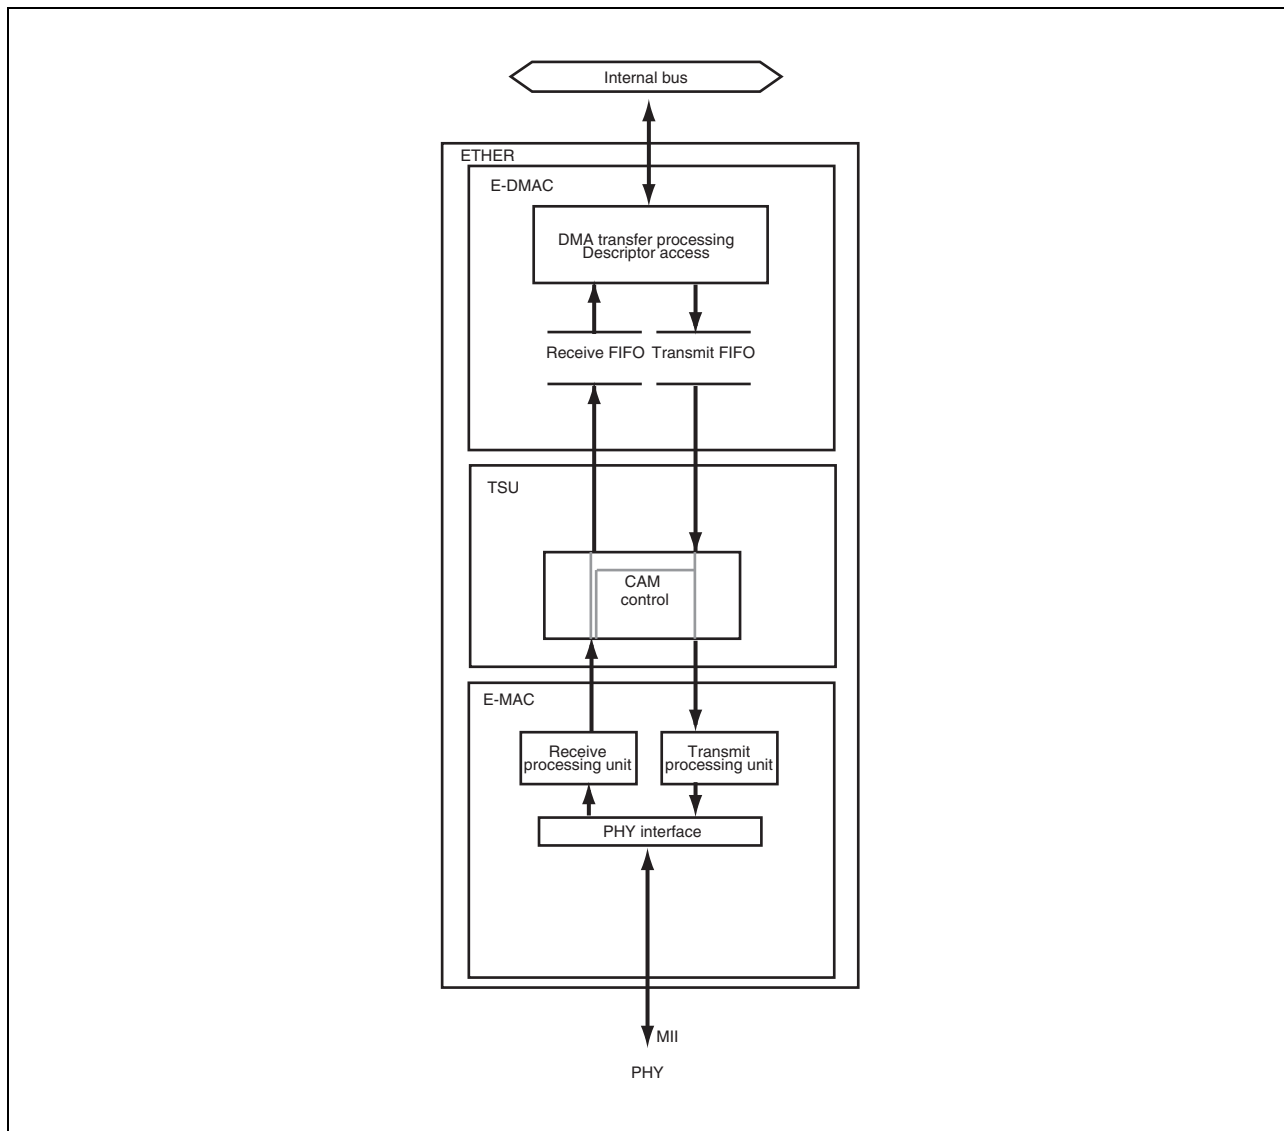

Figure 26.1 Configuration of ETHER

26.2 Input/Output Pins

Table 26.1 lists the pin configuration of the ETHER.

Table 26.1 Pin Configuration

Name	Abbreviation	I/O	Function
Transmit clock	ET_TXCLK*1	Input	ET_TXEN, ET_TXD[3:0] timing reference signal
Transmit enable	ET_TXEN*1	Output	Indicates that transmit data is ready on ET_TXD[3:0]
MII transmit data	ET_TXD[3:0]*1	Output	MII transmit data
Collision detection	ET_COL*1	Input	Collision detection signal
Transmit error	ET_TXER*1	Output	Not asserted in the ETHER
Receive clock	ET_RXCLK*1	Input	ET_RXDV, ET_RXD[3:0], ET_RXER timing reference signal
Receive data valid	ET_RXDV*1	Input	Indicates that valid receive data is on ET_RXD[3:0]
MII receive data	ET_RXD[3:0]*1	Input	MII receive data
Receive error	ET_RXER*1	Input	Identifies error state occurred during data reception
Carrier detection	ET_CRD*1	Input	Carrier detection signal
Management data clock	ET_MDC*1	Output	Reference clock signal for information transfer via ET_MDIO
Management data I/O	ET_MDIO*1	I/O	Bidirectional signal for exchange of management information between STA and PHY

Note 1. MII signal conforming to IEEE802.3u

26.3 Register Descriptions

Table 26.2 shows the configuration of registers of the ETHER.

Table 26.2 Register Configuration

Name	Abbreviation	R/W	Address	Access Size
Software reset register	ARSTR	R/W	H'E820 4800	32
E-MAC mode register	ECMR0	R/W	H'E820 3500	32

26.3.1 Software Reset Register (ARSTR)

ARSTR resets all blocks (E-MAC, TSU, and E-DMAC) in the ETHER. By writing 1 to the ARST bit in this register, a software reset is issued to all blocks of the ETHER (for 256 cycles of internal bus clock B ϕ). The ARST bit is always read as 0. While a software reset is issued, register access to all blocks of the ETHER is prohibited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ARST	0	R/W	Software Reset When 1 is written to this bit, a software reset is issued to all blocks of the ETHER (for 256 cycles of internal bus clock B ϕ). Writing 0 does not affect this bit. This bit is always read as 0. While a software reset is issued, register access to all blocks of the ETHER is prohibited. The following registers are not initialized by a software reset. TSU_ADRH0 to TSU_ADRH31, TSU_ADRL0 to TSU_ADRL31, TXNLCR0, TXALCR0, RXNLCR0, RXALCR0

26.3.2 E-MAC Mode Register (ECMR)

ECMR is a 32-bit readable/writable register that specifies the operating mode of the ETHER. The settings in this register are normally made in the initialization process following a reset.

The operating mode setting must not be changed while the transmitting and receiving functions are enabled. To switch the operating mode, return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCCM	—	—	RCSC	—	DPAD	RZPF	ZPF	PFR	RXF	TXF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	MCT	—	—	—	—	—	—	RE	TE	—	—	—	DM	PRM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	TRCCM	0	R/W	Counter Clear Mode Sets the method for clearing the counter register. Refer to the description of each register. 0: Cleared to 0 when the relevant register is written 1: Cleared to 0 when the relevant register is read
25, 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	RCSC	0	R/W	Checksum Calculation Specifies whether to perform automatic calculation (hardware calculation) of the checksum of the receive frame data unit. 0: Checksum is not automatically calculated 1: Checksum is automatically calculated Note that the checksum calculation of a frame with a VLAN tag is not supported. For details, see section 26.6.1, Checksum Calculation of Ethernet Frames.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
21	DPAD	0	R/W	Data Padding 0: Padding is inserted to data less than 60 bytes so it is transmitted as 60-byte data 1: Padding is not inserted to data less than 60 bytes and it is transmitted without changes
20	RZPF	0	R/W	PAUSE Frame Reception with TIME = 0 0: Reception of a PAUSE frame whose TIME parameter value is 0 is disabled 1: Reception of a PAUSE frame whose TIME parameter value is 0 is enabled
19	ZPF	0	R/W	PAUSE Frame Usage with TIME = 0 Enable 0: Control of a PAUSE frame whose TIME parameter value is 0 is disabled. The next frame is not transmitted until the time specified by the Timer value has elapsed. If a PAUSE frame whose time specified by the Timer value is 0 is received, that PAUSE frame is discarded. 1: Control of a PAUSE frame whose TIME parameter value is 0 is enabled. When the data size in the receive FIFO becomes smaller than the FCFTTR setting before the time specified by the Timer value elapses, an automatic PAUSE frame with a Timer value of 0 is transmitted. On receiving a PAUSE frame with a Timer value of 0, the transmission wait state is canceled.

Bit	Bit Name	Initial Value	R/W	Description
18	PFR	0	R/W	PAUSE Frame Receive Mode 0: PAUSE frame is not transferred to E-DMAC 1: PAUSE frame is transferred to E-DMAC
17	RXF	0	R/W	Operating Mode for Receiving Port Flow Control 0: PAUSE frame detection is disabled 1: Flow control for the receiving port is enabled
16	TXF	0	R/W	Operating Mode for Transmitting Port Flow Control 0: Flow control for the transmitting port is disabled (Automatic PAUSE frame is not transmitted) 1: Flow control for the transmitting port is enabled (Automatic PAUSE frame is transmitted as required)
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	MCT	0	R/W	Multicast Address Frame Receive Mode 0: Frames other than the multicast address set by the CAM entry table 0 to 31 (H/L) registers are received. However, if the on-chip CAM entry table reference is disabled, all multicast address frames are received. 1: Only the multicast address set by the CAM entry table 0 to 31 (H/L) registers is received.
12 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	RE	0	R/W	Reception Enable If a switch is made from receiving function enabled (RE = 1) to disabled (RE = 0) while a frame is being received, the receiving function will be enabled until reception of the corresponding frame is completed. 0: Receiving function is disabled 1: Receiving function is enabled
5	TE	0	R/W	Transmission Enable If a switch is made from transmitting function enabled (TE = 1) to disabled (TE = 0) while a frame is being transmitted, the transmitting function will be enabled until transmission of the corresponding frame is completed. 0: Transmitting function is disabled 1: Transmitting function is enabled
4 to 2	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DM	0	R/W	Full-duplex Transfer Enable 0: Full-duplex transfer function is disabled. 1: Full-duplex transfer function is enabled.
0	PRM	0	R/W	Promiscuous Mode Setting this bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.). 0: ETHER performs normal operation 1: ETHER performs promiscuous mode operation

Note: • All bits, except for TE and RE, should be changed while the transmitting function is disabled (TE = 0) and the receiving function is disabled (RE = 0).

26.3.3 E-MAC Status Register (ECSR)

ECSR is a 32-bit readable/writable register that indicates the status in the E-MAC. This status can be notified to the CPU by interrupts. When 1 is written to the PFR0I and ICD bits, the corresponding flags can be cleared. Writing 0 does not affect the flag. For bits that generate interrupts, the interrupt can be enabled or disabled by the corresponding bit in ECSIPR.

The interrupts generated due to this status register are indicated in the ECI bit in EESR of the E-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PFR0I	—	—	—	ICD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PFR0I	0	R/W	PAUSE Frame Retransmit Retry Over Indicates whether the retransmit count for retransmitting a PAUSE frame when flow control is enabled has exceeded the retransmit upper-limit set in the automatic PAUSE frame retransmit count register (TPAUSER). 0: PAUSE frame retransmit count has not exceeded the upper limit 1: PAUSE frame retransmit count has exceeded the upper limit
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ICD	0	R/W	Illegal Carrier Detection Indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used. 0: PHY-LSI has not detected an illegal carrier on the line 1: PHY-LSI has detected an illegal carrier on the line

26.3.4 E-MAC Interrupt Permission Register (ECSIPR)

ECSIPR is a 32-bit readable/writable register that enables or disables the interrupt sources indicated by ECSR. Each bit can disable or enable interrupts corresponding to the bits in ECSR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PFR IP	PHY IP	LCHN GIP	MPDIP	ICDIP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PFR IP	0	R/W	PAUSE Frame Retransmit Interrupt Enable 0: Interrupt notification by the PFR IP bit is disabled 1: Interrupt notification by the PFR IP bit is enabled
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ICDIP	0	R/W	Illegal Carrier Detect Interrupt Enable 0: Interrupt notification by the ICD bit is disabled 1: Interrupt notification by the ICD bit is enabled

26.3.5 PHY Interface Register (PIR)

PIR is a 32-bit readable/writable register that provides a means of accessing the PHY-LSI internal registers via the MII.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	MDI	Undefined	R	MII Management Data-In Indicates the level of the ET_MDIO pin.
2	MDO	0	R/W	MII Management Data-Out Outputs the value set in this bit from the ET_MDIO pin when the MMD bit is 1.
1	MMD	0	R/W	MII Management Mode Specifies the data read/write direction with respect to the MII. 0: Read direction is specified 1: Write direction is specified
0	MDC	0	R/W	MII Management Data Clock Outputs the value set in this bit from the MDC pin and supplies the MII with the management data clock. For the method of accessing the MII registers, see section 26.5.2, Accessing MII Registers.

26.3.6 MAC Address High Register (MAHR)

MAHR is a 32-bit readable/writable register that specifies the upper 32 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MA[47:32]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MA[47:16]	All 0	R/W	MAC Address Bits 47 to 16 These bits are used to set the upper 32 bits of the MAC address. If the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'01234567 in this register.

26.3.7 MAC Address Low Register (MALR)

MALR is a 32-bit readable/writable register that specifies the lower 16 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MA[15:0]	All 0	R/W	MAC Address Bits 15 to 0 These bits are used to set the lower 16 bits of the MAC address. If the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'000089AB in this register.

26.3.8 Receive Frame Length Register (RFLR)

RFLR is a 32-bit readable/writable register that specifies the maximum frame length (in bytes) that can be received by this LSI. The settings in this register must not be changed while the receiving function is enabled.

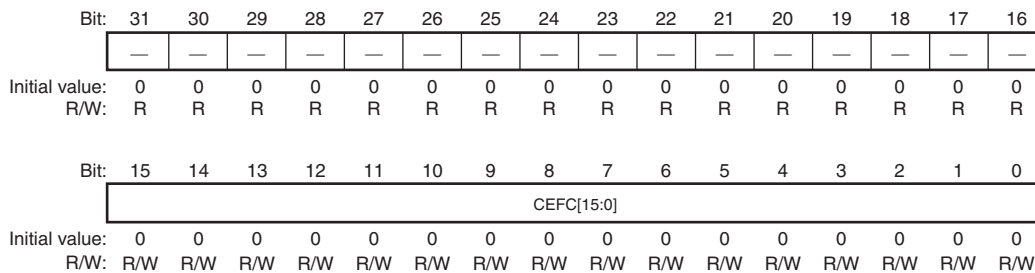

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFL[17:16]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17 to 0	RFL[17:0]	All 0	R/W	Receive Frame Length The frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data is not included in the transfer. When data that exceeds the specified value is received, the part of data that exceeds the specified value is discarded. H'00000 to H'005EE: 1,518 bytes H'005EF: 1,519 bytes H'005F0: 1,520 bytes : : H'007FF: 2,047 bytes H'00800: 2,048 bytes : : H'01000: 4,096 bytes : : H'10000: 65,536 bytes : : H'20000 to H'3FFFF: 131,072 bytes

26.3.9 CRC Error Frame Receive Counter Register (CEFCR)

CEFCR is a 16-bit counter that indicates the number of times a frame with a CRC error was received. When the value in this register reaches H'0000FFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	CEFEC[15:0]	All 0	R/W	CRC Error Frame Count These bits indicate the number of CRC error frames received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.10 Frame Receive Error Counter Register (FRECR)

FRECR is a 16-bit counter that indicates the number of frames for which a receive error was generated by the RXER pin input from the PHY-LSI. FRECR is incremented each time the RXER pin becomes active. When the value in this register reaches H'0000FFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	FRECR[15:0]	All 0	R/W	Frame Receive Error Count These bits indicate the number of errors during frame reception.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.11 Too-Short Frame Receive Counter Register (TSFRCR)

TSFRCR is a 16-bit counter that indicates the number of frames received with a length fewer than 64 bytes. When the value in this register reaches H'0000FFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECCR set to 1. When the TRCCM bit in ECCR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSFC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	TSFC[15:0]	All 0	R/W	Too-Short Frame Receive Count These bits indicate the number of frames received with a length of less than 64 bytes.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.12 Too-Long Frame Receive Counter Register (TLFRCR)

TLFRCR is a 16-bit counter that indicates the number of frames received with a length exceeding the value specified by the receive frame length register (RFLR). When the value in this register reaches H'0000FFFF, count-up is halted. This register is not incremented when a frame containing residual bits is received. In this case, the reception of the frame is indicated in the residual-bit frame receive counter register (RFRCR). This register is cleared to 0 when it is read with the TRCCM bit in ECCR set to 1. When the TRCCM bit in ECCR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TLFC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	TLFC[15:0]	All 0	R/W	Too-Long Frame Receive Count These bits indicate the number of frames received with a length exceeding the value in RFLR.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.13 Residual-Bit Frame Receive Counter Register (RFCR)

RFCR is a 16-bit counter that indicates the number of frames received containing residual bits (less than an 8-bit unit). When the value in this register reaches H'0000FFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	RFC[15:0]	All 0	R/W	Residual-Bit Frame Receive Count These bits indicate the number of frames received containing residual bits.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.14 Multicast Address Frame Receive Counter Register (MAFCR)

MAFCR is a 16-bit counter that indicates the number of frames received with a specified multicast address. When the value in this register reaches H'0000FFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MAFC[15:0]	All 0	R/W	Multicast Address Frame Count These bits indicate the number of multicast frames received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.15 Automatic PAUSE Frame Register (APR)

APR is used to set the TIME parameter value of an automatic PAUSE frame. When an automatic PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AP[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	AP[15:0]	All 0	R/W	Automatic PAUSE These bits set the TIME parameter value of an automatic PAUSE frame. One bit is equivalent to 512 bit-time. When flow control is enabled in transmission (PAUSE frame transmission) (TXF bit in ECMR = 1), set a value other than H'0000 in these bits. H'0000: — H'0001: 512 × 1 bit-time H'0002: 512 × 2 bit-time : : H'FFFF: 512 × 65,535 bit-time Note: The bit-time becomes as follows according to the transfer speed. 100 Mbps: 1 bit-time = 10 ns 10 Mbps: 1 bit-time = 100 ns

26.3.16 Manual PAUSE Frame Register (MPR)

MPR is used to set the TIME parameter value of a manual PAUSE frame. When a manual PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MP[15:0]	All 0	R/W	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame. One bit is equivalent to 512 bit-time. H'0000: — H'0001: 512 × 1 bit-time H'0002: 512 × 2 bit-time : : H'FFFF: 512 × 65,535 bit-time Note: The bit-time becomes as follows according to the transfer speed. 100 Mbps: 1 bit-time = 10 ns 10 Mbps: 1 bit-time = 100 ns

26.3.17 Automatic PAUSE Frame Retransmit Count Register (TPAUSER)

TPAUSER is used to set the upper limit for the number of times to retransmit an automatic PAUSE frame. The settings in this register must not be changed while the transmitting function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PFTXC[15:0]	All 0	R	PAUSE Frame Transmit Count These bits indicate the total number of automatic PAUSE frames and manual PAUSE frames transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.19 PAUSE Frame Receive Counter Register (PFRCR)

PFRCR is a 16-bit counter that indicates the number of times a PAUSE frame is received. This register is cleared to 0 when it is read.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFRXC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PFRXC[15:0]	All 0	R	PAUSE Frame Receive Count These bits indicate the number of PAUSE frames received when flow control is enabled in reception (RXF bit in ECMR = 1).

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.20 TSU Counter Reset Register (TSU_CTRST)

TSU_CTRST clears the transmit, receive, and relay frame counters to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CTRST	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CTRST	0	R/W	TSU Counter Reset When 1 is written to this bit, the values of registers TXNLCR0, TXALCR0, RXNLCR0, and RXALCR0 are cleared to 0. Writing 0 does not affect this bit. This bit is always read as 0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.21 VLANtag Set Register (TSU_VTAG0)

TSU_VTAG0 enables or disables the frame receive/discard evaluation function based on the VLAN number, and also sets the VLAN number.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VTAG0	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VID0[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	VTAG0	0	R/W	Port 0 VLANtag Evaluation Function 0: Disables receive/discard evaluation for frames based on the VLAN number 1: Enables receive/discard evaluation for frames based on the VLAN number
30 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	VID0[11:0]	All 0	R/W	V-LAN ID Setting (VID) These bits set the VLAN number received by receive frames.

26.3.22 CAM Entry Table Busy Register (TSU_ADSBSY)

When CAM entry table registers (TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31) are set by register writing, the ADSBSY bit in this register is set to 1 (when the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, the ADSBSY bit is automatically restored to 0).

Access to TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 is prohibited, while the ADSBSY bit in this register is set to 1. This register is a read-only status register, which must not be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADSBSY	0	R	CAM Entry Table Setting Busy When TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 are set by register writing, this bit is set to 1. When the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, this bit is automatically restored to 0. Access to TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 is prohibited, while this bit is set to 1. Writing to this register is also prohibited.

26.3.23 CAM Entry Table Enable Register (TSU_TEN)

TSU_TEN enables or disables the settings of TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26.3.24 CAM Entry Table 0H to 31H Registers (TSU_ADRH0 to TSU_ADRH31)

TSU_ADRH0 to TSU_ADRH31 are entry tables referred to by the CAM in reception and relay. Each of these registers sets the upper 32 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered.

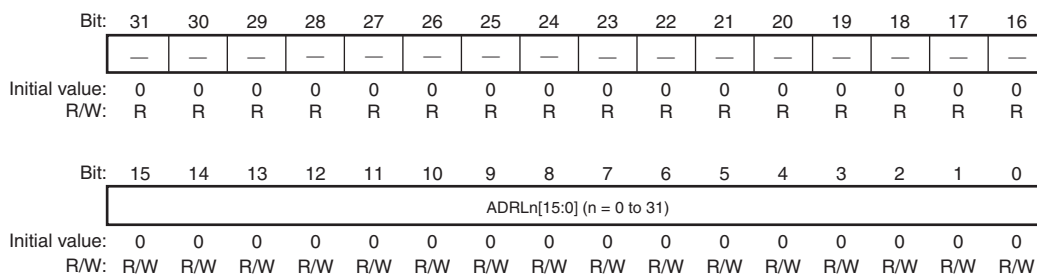

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADRHn[31:0] (n: 0 to 31)	All 0	R/W	MAC Address Bits These bits set the upper 32 bits of the MAC address. When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set H'01234567 in this register.

Note: • Set the CAM entry tables following the procedure below.

1. Check that the ADSBSY bit in TSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by TSU_ADRH0 to TSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by TSU_ADRL0 to TSU_ADRL31.

26.3.25 CAM Entry Table 0L to 31L Registers (TSU_ADRL0 to TSU_ADRL31)

TSU_ADRL0 to TSU_ADRL31 are entry tables referred to by the CAM in reception and relay. Each of these registers sets the lower 16 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	ADRLn[15:0] (n: 0 to 31)	All 0	R/W	MAC Address Bits These bits set the lower 16 bits of the MAC address. When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set H'000089AB in this register.

Note: • Set the CAM entry tables following the procedure below.

1. Check that the ADSBSY bit in TSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by TSU_ADRH0 to TSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by TSU_ADRL0 to TSU_ADRL31.

26.3.26 Transmit Frame Counter Register (Normal Transmission Only) (TXNLCR0)

TXNLCR0 is a 32-bit counter indicating the number of frames successfully transmitted in the E-MAC. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NTC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NTC0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NTC0[31:0]	All 0	R	Transmit Frame Counter Bits These bits indicate the number of frames successfully transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.27 Transmit Frame Counter Register (Normal and Erroneous Transmission) (TXALCR0)

TXALCR0 is a 32-bit counter indicating the number of frames transmitted in the E-MAC, including the number of frames erroneously transmitted. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TC0[31:0]	All 0	R	Transmit Frame Counter Bits These bits indicate the number of frames successfully transmitted and erroneously transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.28 Receive Frame Counter Register (Normal Reception Only) (RXNLCR0)

RXNLCR0 is a 32-bit counter indicating the number of frames successfully received in the E-MAC. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NRC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NRC0[31:0]	All 0	R	Receive Frame Counter Bits These bits indicate the number of frames successfully received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.29 Receive Frame Counter Register (Normal and Erroneous Reception) (RXALCR0)

RXALCR0 is a 32-bit counter indicating the number of frames received in the E-MAC, including the number of frames erroneously received. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RC0[31:16]

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RC0[31:0]	All 0	R	Receive Frame Counter Bits These bits indicate the number of frames successfully received and erroneously received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.30 E-DMAC Start Register (EDSR)

EDSR specifies activation of the transmitting unit and receiving unit of the E-DMAC. This register can only be written to, and the read values are invalid.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ENT	0	W	E-DMAC Transmitting Unit Start 0: Stops the E-DMAC transmitting unit 1: Starts the E-DMAC transmitting unit
0	ENR	0	W	E-DMAC Receiving Unit Start 0: Stops the E-DMAC receiving unit 1: Starts the E-DMAC receiving unit

26.3.31 E-DMAC Mode Register (EDMR)

EDMR is a 32-bit readable/writable register that specifies E-DMAC resetting and the transmit/receive descriptor length. This register is to be set before the transmitting or receiving function is enabled (before the TR bit in EDTRR or the RR bit in EDRRR is set to 1). However, the SWRR and SWRT bits can be written to even after the transmitting or receiving function is enabled. If a software reset is executed with this register during data transmission, abnormal data may be transmitted on the line. Execute a software reset with this register before specifying the transmit/receive descriptor length or modifying the settings of TDLAR, RDLAR, and so forth, the setting of ECMR (E-MAC mode register), and the settings of registers related to the E-DMAC and E-MAC operation.

To execute a software reset with this register, 1 must be written to both the SWRT and SWRR bits simultaneously. Writing 1 to the SWRT and SWRR bits initializes the E-MAC registers and E-DMAC registers, except for TDLAR, RDLAR, and RMFCR of the E-DMAC. The TSU registers (registers whose names are prefixed with TSU_) are not initialized. The SWRT and SWRR bits in EDMR0 initializes the registers related to the E-DMAC and E-MAC. Note that during the period a software reset is issued (for 64 cycles of the internal bus clock Bck), accesses to all Ethernet-related registers are prohibited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	DE	0	R/W	Transmit/Receive Frame Endian Sets the endian mode for DMA transfer of frame data between the transmit/receive FIFO and transmit/receive buffer. 0: Big endian (longword access) 1: Little endian (longword access)
5, 4	DL[1:0]	00	R/W	Transmit/Receive Descriptor Length These bits specify the descriptor length. (See section 26.4.1, Descriptors and Descriptor List.) 00: 16 bytes 01: 32 bytes 10: 64 bytes 11: Setting prohibited
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SWRT	0	R/W	Software Reset of Transmit FIFO Controller [Writing] 0: Disabled 1: Software reset started [Reading] 0: Software reset not executed (or completed) 1: Software reset being executed
0	SWRR	0	R/W	Software Reset of Receive FIFO Controller [Writing] 0: Disabled 1: Software reset started [Reading] 0: Software reset not executed (or completed) 1: Software reset being executed

26.3.32 E-DMAC Transmit Request Register (EDTRR)

EDTRR is a 32-bit readable/writable register that issues transmit directives to the E-DMAC. After writing 11 to bits TR[1:0] in this register, the E-DMAC reads the transmit descriptor at the address specified by TDLAR. If the TACT bit of this transmit descriptor is set to 1 (valid), transmit DMA transfer by the E-DMAC starts. When DMA transfer based on the first transmit descriptor is completed, the E-DMAC reads the next transmit descriptor. If the TACT bit of that transmit descriptor is set to 1 (valid), the E-DMAC continues transmit DMA operation. If the TACT bit of a transmit descriptor is cleared to 0 (invalid), the E-DMAC clears bits TR[1:0] and stops transmit DMA operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TR[1:0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	TR[1:0]	00	R/W	Transmit Request 00, 01, 10: Transmission-halted state If 00, 01, or 10 is written to these bits, the E-DMAC stops DMA transfer of the currently processed transmit descriptor, reads the next transmit descriptor, and then clears these bits. (Write-back is completed for the valid transmit descriptors that have been detected up till then.) The E-DMAC clears these bits when transmit descriptor empty occurs, or transmission of a transmit descriptor has completed. (Write-back is completed for the valid transmit descriptors that have been detected up till then.) 11: Transmit DMA operation by E-DMAC After writing 11 to these bits, the E-DMAC starts reading a transmit descriptor.

26.3.33 E-DMAC Receive Request Register (EDRRR)

EDRRR is a 32-bit readable/writable register that issues receive directives to the E-DMAC. After writing 1 to the RR bit in this register, the E-DMAC reads the receive descriptor at the address specified by RDLAR. If the RACT bit of this receive descriptor is set to 1 (valid), and the receive FIFO holds a receive frame, the E-DMAC starts receive DMA transfer. When DMA transfer based on the first receive descriptor is completed, the E-DMAC reads the next receive descriptor. If the RACT bit of that receive descriptor is set to 1 (valid), the E-DMAC continues receive DMA operation. However, if the receive FIFO holds no receive data, the E-DMAC places receive DMA operation in the standby state. If the RACT bit of the receive descriptor is cleared to 0 (invalid), the E-DMAC clears the RR bit and stops receive DMAC operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RR	0	R/W	Receive Request 0: Receiving function is disabled*1 If 0 is written to this bit, the E-DMAC stops receive operation after DMA transfer of one frame has completed and then clears this bit. The E-DMAC clears this bit when receive descriptor empty occurs. 1: Receive descriptor is read, and the E-DMAC is ready to receive.

Note 1. If the receiving function is disabled during frame reception, write-back is not performed successfully to the receive descriptor. Following pointers to read a receive descriptor become abnormal and the E-DMAC cannot operate successfully. In this case, to make E-DMAC reception enabled again, execute a software reset by the SWRT and SWRR bits in EDMR0. To disable the E-DMAC receiving function without executing a software reset, specify the RE bit in ECMR0. Next, after the E-DMAC has completed the reception and write-back to the receive descriptor has been confirmed, disable the receiving function using this register.

26.3.34 Transmit Descriptor List Start Address Register (TDLAR)

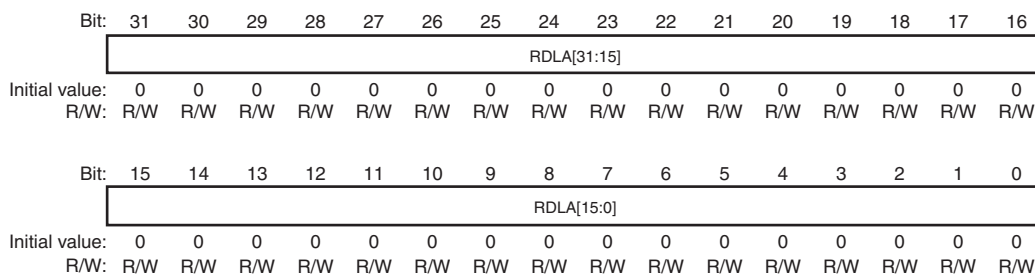

TDLAR is a 32-bit readable/writable register that specifies the start address of the transmit descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DL bits in EDMR. This register must not be modified during transmission. Modifications to this register should only be made in the transmission-halted state specified by bits TR[1:0] (= 00) in the E-DMAC transmit request register (EDTRR).

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDLA[31:0]	All 0	R/W	Transmit Descriptor Start Address The lower bits are set according to the specified descriptor length. 16-byte boundary: TDLA[3:0] = 0000 32-byte boundary: TDLA[4:0] = 00000 64-byte boundary: TDLA[5:0] = 000000

26.3.35 Receive Descriptor List Start Address Register (RDLAR)

RDLAR is a 32-bit readable/writable register that specifies the start address of the receive descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DL bits in EDMR. This register must not be modified during reception. Modifications to this register should only be made while reception is disabled by the RR bit (= 0) in the E-DMAC receive request register (EDRRR).

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDLA[31:0]	All 0	R/W	Receive Descriptor Start Address The lower bits are set according to the specified descriptor length. 16-byte boundary: RDLA[3:0] = 0000 32-byte boundary: RDLA[4:0] = 00000 64-byte boundary: RDLA[5:0] = 000000

26.3.36 E-MAC/E-DMAC Status Register (EESR)

EESR is a 32-bit readable/writable register that shows communications status information on the E-DMAC in combination with the E-MAC. The information in this register is reported in the form of interrupt sources. Individual bits are cleared by writing 1 (however, bit 22 (ECI) is a read-only bit that is not cleared by writing 1) and are not affected by writing 0. Each interrupt source can also be masked by means of the corresponding bit in the E-MAC/E-DMAC status interrupt permission register (EESIPR).

The interrupt generated by this status register is ETHERI. For interrupt priorities, see section 7.4, Interrupt Sources.

26	TABT	0	R/W	<p>Transmit Abort Detect</p> <p>Indicates that the E-MAC aborts transmitting a frame because of failures during frame transmission.</p> <p>0: Frame transmission has not been aborted or no transmission directive 1: Frame transmission has been aborted</p>
25	RABT	0	R/W	<p>Receive Abort Detect</p> <p>Indicates that the E-MAC aborts receiving a frame because of failures during frame reception.</p> <p>0: Frame reception has not been aborted or no reception directive 1: Frame reception has been aborted</p>

Bit	Bit Name	Initial Value	R/W	Description
24	RFCOF	0	R/W	Receive Frame Counter Overflow Indicates that the frame counter in the receive FIFO has overflowed. 0: Receive frame counter has not overflowed 1: Receive frame counter has overflowed
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	ECI	0	R	E-MAC Status Register Source This bit is a read-only bit. When the source of an ECSR interrupt is cleared, this bit is also cleared. 0: E-MAC status interrupt source has not been detected 1: E-MAC status interrupt source has been detected
21	TC[0]	0	R/W	Frame Transmission Complete Indicates, in combination with the TC[1] bit, that all the data specified by the transmit descriptor has been transmitted from the E-MAC. For details, see the description of the TC[1] bit.
20	TDE	0	R/W	Transmit Descriptor Empty Indicates that the transmit descriptor valid bit (TACT) of a transmit descriptor read by the E-DMAC is not set if the previous descriptor does not represent the end of a frame in multi-buffer frame processing based on single-frame/multi-descriptor operation. As a result, an incomplete frame may be sent. 0: Transmit descriptor active bit TACT = 1 detected 1: Transmit descriptor active bit TACT = 0 detected When transmit descriptor empty (TDE = 1) occurs, execute a software reset and initiate transmission. In this case, transmission starts from the address that is stored in the transmit descriptor list start address register (TDLAR).
19	TFUF	0	R/W	Transmit FIFO Underflow Indicates that an underflow has occurred in the transmit FIFO during frame transmission. Incomplete data is sent onto the line. 0: Underflow has not occurred 1: Underflow has occurred
18	FR	0	R/W	Frame Reception Indicates that a frame has been received and the receive descriptor has been updated. This bit is set to 1 each time a frame is received. 0: Frame has not been received 1: Frame has been received
17	RDE	0	R/W	Receive Descriptor Empty Indicates that the RACT bit of a receive descriptor read by the E-DMAC for receive DMA operation is cleared to 0 (invalid). When receive descriptor empty (RDE = 1) occurs, reception can be resumed by setting the RACT bit (cleared to 0) of the receive descriptor to 1 and then writing 1 to the RR bit in EDRRR. 0: Receive descriptor active bit RACT = 1 detected 1: Receive descriptor active bit RACT = 0 detected
16	RFOF	0	R/W	Receive FIFO Overflow Indicates that the receive FIFO has overflowed during frame reception. 0: Overflow has not occurred 1: Overflow has occurred
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10, 9	—	Undefined	R	Reserved The write value should always be 0.
8	—	0	R	Reserved The write value should always be 0.
7	RMAF	0	R/W	Receive Multicast Address Frame 0: Multicast address frame has not been received 1: Multicast address frame has been received
6, 5	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	RRF	0	R/W	Receive Residual-Bit Frame 0: Residual-bit frame has not been received 1: Residual-bit frame has been received
3	RTLFL	0	R/W	Receive Too-Long Frame Indicates that a frame whose byte size exceeds the upper limit for the receive frame length set by RFLR has been received. 0: Too-long frame has not been received 1: Too-long frame has been received
2	RTSFL	0	R/W	Receive Too-Short Frame Indicates that a frame of fewer than 64 bytes has been received. 0: Too-short frame has not been received 1: Too-short frame has been received
1	PRE	0	R/W	PHY-LSI Receive Error 0: PHY-LSI receive error has not been detected 1: PHY-LSI receive error has been detected
0	CERF	0	R/W	CRC Error on Received Frame 0: CRC error has not been detected 1: CRC error has been detected

26.3.37 E-MAC/E-DMAC Status Interrupt Permission Register (EESIPR)

EESIPR is a 32-bit readable/writable register that enables interrupts corresponding to individual bits in the E-MAC/E-DMAC status register (EESR). An interrupt is enabled by writing 1 to the corresponding bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	CERFIP	0	R/W	CRC Error on Received Frame Interrupt Enable 0: CRC error interrupt is disabled 1: CRC error interrupt is enabled

26.3.38 Transmit/Receive Status Copy Enable Register (TRSCER)

TRSCER specifies whether the information for the transmit and receive state reported by bits 26, 25, and 10 to 0 in the E-MAC/E-DMAC status register (EESR) is to be reflected in the TFE or RFE bit of the corresponding descriptor. The bits in this register correspond to bits 26, 25, and 10 to 0 in EESR. When a bit is cleared to 0, the transmit status (bits 26 and 10 to 8 in EESR) is reflected in the TFE bit of the transmit descriptor, and the receive status (bits 25 and 7 to 0 in EESR) is reflected in the RFE bit of the receive descriptor. In this case, the state of a status bit set to 1 is reflected as the TFE or RFE bit set to 1. When a bit is set to 1, the occurrence of the corresponding source is not reflected in the descriptor. After this LSI is reset, all bits are cleared to 0.

0	CERFCE	0	R/W	CERF Bit Copy Directive 0: Reflects the CERF bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor

26.3.39 Receive Missed-Frame Counter Register (RMFCR)

RMFCR is a 16-bit counter that indicates the number of frames that could not be saved in the receive buffer and so were discarded during reception. When the receive FIFO overflows, the receive frames in the FIFO are discarded. The number of frames discarded at this time is counted. When the value in this register reaches H'0000FFFF, count-up is halted. Clear the counter by writing H'00000000 in this register. Note that a value other than H'00000000 must not be written to this register.

15 to 0	MFC[15:0]	All 0	R/W	Missed-Frame Counter These bits indicate the number of frames that are discarded and not transferred to the receive buffer during reception.

26.3.40 Transmit FIFO Threshold Register (TFTR)

TFTR is a 32-bit readable/writable register that specifies the transmit FIFO threshold at which the first transmission is started. The actual threshold is 4 times the set value. The E-MAC starts transmission when the amount of data in the transmit FIFO exceeds the number of bytes specified by this register, when the transmit FIFO is full, or when one frame of data write is performed. This register must not be written to during transmission (bits TR[1:0] in EDTRR = 11).

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TFT[10:0]	All 0	R/W	Transmit FIFO Threshold A value in 32-byte units and smaller than the FIFO size specified by FDR must be set as the transmit FIFO threshold. H'000: Store and forward modes H'008: 32 bytes H'010: 64 bytes H'018: 128 bytes : : H'07F: 508 bytes H'080: 512 bytes : : H'0FF: 1,020 bytes H'100: 1,024 bytes : : H'1FF: 2,044 bytes H'200: 2,048 bytes

Note: • When starting transmission before one frame of data write has completed, take care no underflow occurs.

26.3.41 FIFO Depth Register (FDR)

FDR is a 32-bit readable/writable register that specifies the sizes of the transmit and receive FIFOs.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	TFD[2:0]	All 1	R/W	Transmit FIFO Size Specifies 256 bytes to 2 Kbytes in 256-byte units as the size of the transmit FIFO whose maximum size is 2 Kbytes. The setting must not be changed after transmission/reception has started. H'00: 256 bytes H'01: 512 bytes : : H'07: 2048 bytes
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	RFD[4:0]	All 1	R/W	Receive FIFO Size Specifies 256 bytes to 4 Kbytes in 256-byte units as the size of the receive FIFO whose maximum size is 4 Kbytes. The setting must not be changed after transmission/reception has started. H'00: 256 bytes H'01: 512 bytes : : H'0F: 4096 bytes

26.3.42 Receiving Method Control Register (RMCR)

RMCR is a 32-bit readable/writable register that specifies the control method for the RE bit in ECMR while a frame is received. This register must be set during the receiving-halted state.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RNC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RNC	0	R/W	Receive Enable Control Sets whether to continue frame reception. 0: Upon completion of reception of one frame, the E-DMAC writes the receive status to the descriptor and clears the RR bit in EDRRR to 0. 1: Upon completion of reception of one frame, the E-DMAC writes (writes back) the receive status to the descriptor. In addition, the E-DMAC reads the next descriptor and prepares for reception of the next frame.

26.3.43 Receive Descriptor Fetch Address Register (RDFAR)

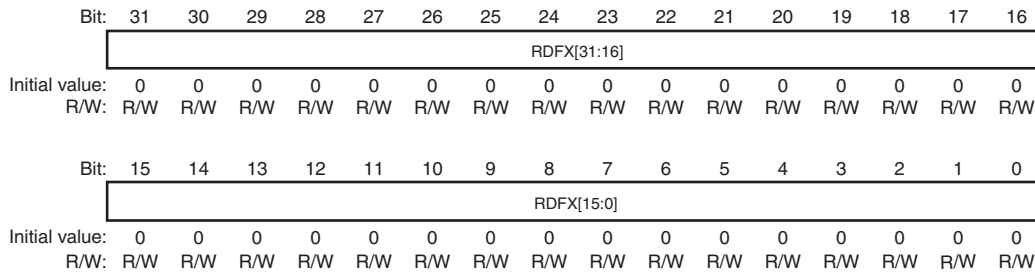

RDFAR stores the descriptor start address that is required when the E-DMAC fetches descriptor information from the receive descriptor. Which receive descriptor information is used for processing by the E-DMAC can be recognized by monitoring addresses displayed in this register. The address from which the E-DMAC is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the receive descriptor at which receive processing is to be started.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDFAR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDFAR[31:0]	All 0	R/W	Receive Descriptor Fetch Address Writing to these bits during the reception is prohibited.

26.3.44 Receive Descriptor Finished Address Register (RDFXR)

RDFXR stores the start address of the receive descriptor for which the E-DMAC has just completed the write-back processing. Up to which receive descriptor has been processed by the E-DMAC can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the descriptor immediately before the descriptor that is pointed to by the address in RDFAR.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDFX[31:0]	All 0	R/W	Receive Descriptor Finished Address Writing to these bits during the reception is prohibited.

26.3.45 Receive Descriptor Final Flag Register (RDFFR)

RDFFR indicates whether the receive descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in RDFXR is at the end of the receive descriptor queue (descriptor list).

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RDLF	0	R/W	Receive Descriptor Queue Last Flag Indicates whether the receive descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in RDFXR is at the end of the receive descriptor queue (descriptor list). 0: Not the last descriptor in the receive descriptor queue 1: Last descriptor in the receive descriptor queue

26.3.46 Transmit Descriptor Fetch Address Register (TDFAR)

TDFAR stores the descriptor start address that is required when the E-DMAC fetches descriptor information from the transmit descriptor. Which transmit descriptor information is used for processing by the E-DMAC can be recognized by monitoring addresses displayed in this register. The address from which the E-DMAC is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the transmit descriptor at which transmit processing is to be started.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDFAR[31:0]	All 0	R/W	Transmit Descriptor Fetch Address Writing to these bits during transmission is prohibited.

26.3.47 Transmit Descriptor Finished Address Register (TDFXR)

TDFXR stores the start address of the transmit descriptor for which the E-DMAC has just completed the write-back processing. Up to which transmit descriptor has been processed by the E-DMAC can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the transmit descriptor immediately before the descriptor that is pointed to by the address in TDFAR.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDFXR[31:0]	All 0	R/W	Transmit Descriptor Finished Address Writing to these bits during transmission is prohibited.

26.3.48 Transmit Descriptor Final Flag Register (TDFFR)

TDFFR indicates whether the transmit descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in TDFXR is at the end of the transmit descriptor queue (descriptor list).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TDLF	0	R/W	Transmit Descriptor Queue Last Flag Indicates whether the transmit descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in TDFXR is at the end of the transmit descriptor queue (descriptor list). 0: Not the last descriptor in the transmit descriptor queue 1: Last descriptor in the transmit descriptor queue

26.3.49 Overflow Alert FIFO Threshold Register (FCFTR)

FCFTR is a 32-bit readable/writable register that sets the flow control of the E-MAC. The threshold can be set by the size of the receive FIFO data (bits RFD[7:0]) and the number of receive frames (bits RFF[4:0]).

If the same receive FIFO size as set by the FIFO depth register (FDR) is set when flow control is turned on according to the RFD setting condition, flow control is turned on with (FIFO data size – 64) bytes. For instance, when the RFD bits in FDR is 7 and the RFD bits in this register is 7, flow control is turned on when (2,048 – 64) bytes of data is stored in the receive FIFO. The value set in the RFD bits in this register should be equal to or less than that set in the RFD bits in FDR. Flow control is turned on when either of the setting conditions of bits RFF[4:0] and bits RFD[7:0] is satisfied. Flow control is turned off when neither of the conditions is satisfied (release).

15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	RFD[7:0]	H'FF	R/W	Receive FIFO Overflow Alert Signal Output Threshold H'00: When (256 – 32) bytes of data is stored in the receive FIFO H'01: When (512 – 32) bytes of data is stored in the receive FIFO : : H'06: When (1,792 – 32) bytes of data is stored in the receive FIFO H'07: When (2,048 – 64) bytes of data is stored in the receive FIFO

26.3.50 Receive Data Padding Insert Register (RPADIR)

RPADIR is a 32-bit readable/writable register that inserts padding in receive data. To change the settings of this register, execute a software reset by means of the SWRT and SWRR bits in the E-DMAC mode register (EDMR) before making settings again.

	—	—	—	—	—	—	—	—	—	—	SB[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CSELB	1	R	Intelligent Checksum Calculation Operation Setting 0: The result of checksum calculation is not written back to the receive descriptor. 1: The result of checksum calculation is written back to the receive descriptor.
30	CSMD	1	R/W	Intelligent Checksum Calculation Mode Setting 0: After having skipped the number of bytes specified in SB[5:0], counting from the beginning of the MAC-layer packet, the checksum is calculated for all subsequent data 1: MAC- or IP-layer packets are detected and checksums are calculated for upper-layer protocol packets such as TCP or UDP.
29 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SB[5:0]*1	011010	R/W	Intelligent Checksum Calculation Skip Bytes These bits specify the number of bytes to be skipped for checksum calculation, counting from the beginning of the data received in the E-DMAC. When padding bytes are to be added, specify the checksum start position to cover the amount or extent of padding. H'00: 0 bytes (meaning checksum calculation is performed from the beginning of the packet.) H'02: 2 bytes : : H'1A: 26 bytes H'3E: 62 bytes

Note 1. These bits should only be set when CSEL is 1 and CSMD is 0; otherwise, set to H'00.

26.3.52 Intelligent Checksum Skipped Bytes Monitor Register (CSSBM)

CSSBM is a 32-bit readable register that holds the number of bytes that have been skipped in received packets being handled by the E-DMAC. The number of skipped bytes can be monitored through this register. The amount of data received in E-DMAC may not match the number of skipped bytes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SBM[5:0]	000000	R	Number of Skipped Bytes These bits are read-only. Writing is prohibited. These bits are initialized when the beginning of a packet for reception is detected.

Note: • This register is only valid when CSEL is 1 and CSMD is 0.

26.3.53 Intelligent Checksum Monitor Register (CSSMR)

CSSMR is a 32-bit register that holds the checksum value of received packets being handled by the E-DMAC. The checksum value can be monitored through this register. The amount of data received in E-DMAC may not match the number of skipped bytes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	CS[15:0]	000000	R	Intelligent Checksum Value These bits are read-only. Writing is prohibited. These bits are initialized when the beginning of a packet for reception is detected.

Note: • This register is only valid when CSEL = 1 and CSMD = 0.

26.4 Operation

The ETHER consists of the following three function units:

- DMA transfer controller (E-DMAC): DMA transfer between the transmit/receive buffer in the memory and the transmit/receive FIFO
- MAC controller (E-MAC): Transmission/reception processing between the transmit/receive FIFO and the MII
- Transfer Switching Unit (TSU): CAM processing

Using its direct memory access (DMA) function, the E-DMAC performs DMA transfer of frame data between a user-specified Ethernet frame transmission/reception data storage destination (accessible memory space: transmit buffer/receive buffer) and the transmit/receive FIFO in the E-DMAC. The user cannot read and write data from and to the transmit/receive FIFO directly via the CPU.

To enable the E-DMAC to perform DMA transfer, information (data) including a transmit/receive data storage address and so forth, referred to as a descriptor, is required. The E-DMAC reads transmit data from the transmit buffer or writes receive data to the receive buffer according to the descriptor information. By arranging multiple descriptors as a descriptor row (list) (to be placed in a readable/writable memory space), multiple Ethernet frames can be transmitted or received continuously.

The E-MAC constructs an Ethernet frame using the data written to the transmit FIFO and transmits the frame to the MII. It also performs a CRC check of an Ethernet frame received from the MII and deconstructs the frame to write to the receive FIFO. The E-MAC supports the MII format for interface to the PHI-LSI connected externally to this LSI. The TSU, which is placed between the E-DMAC and E-MAC, references the CAM entry table to select one of the following tasks according to the Ethernet frame destination address (DA) input to the E-MAC.

- Receives data and writes to the receive FIFO.
- Discards data.

Figure 26.2 shows the frame data path and an overview of each setting.

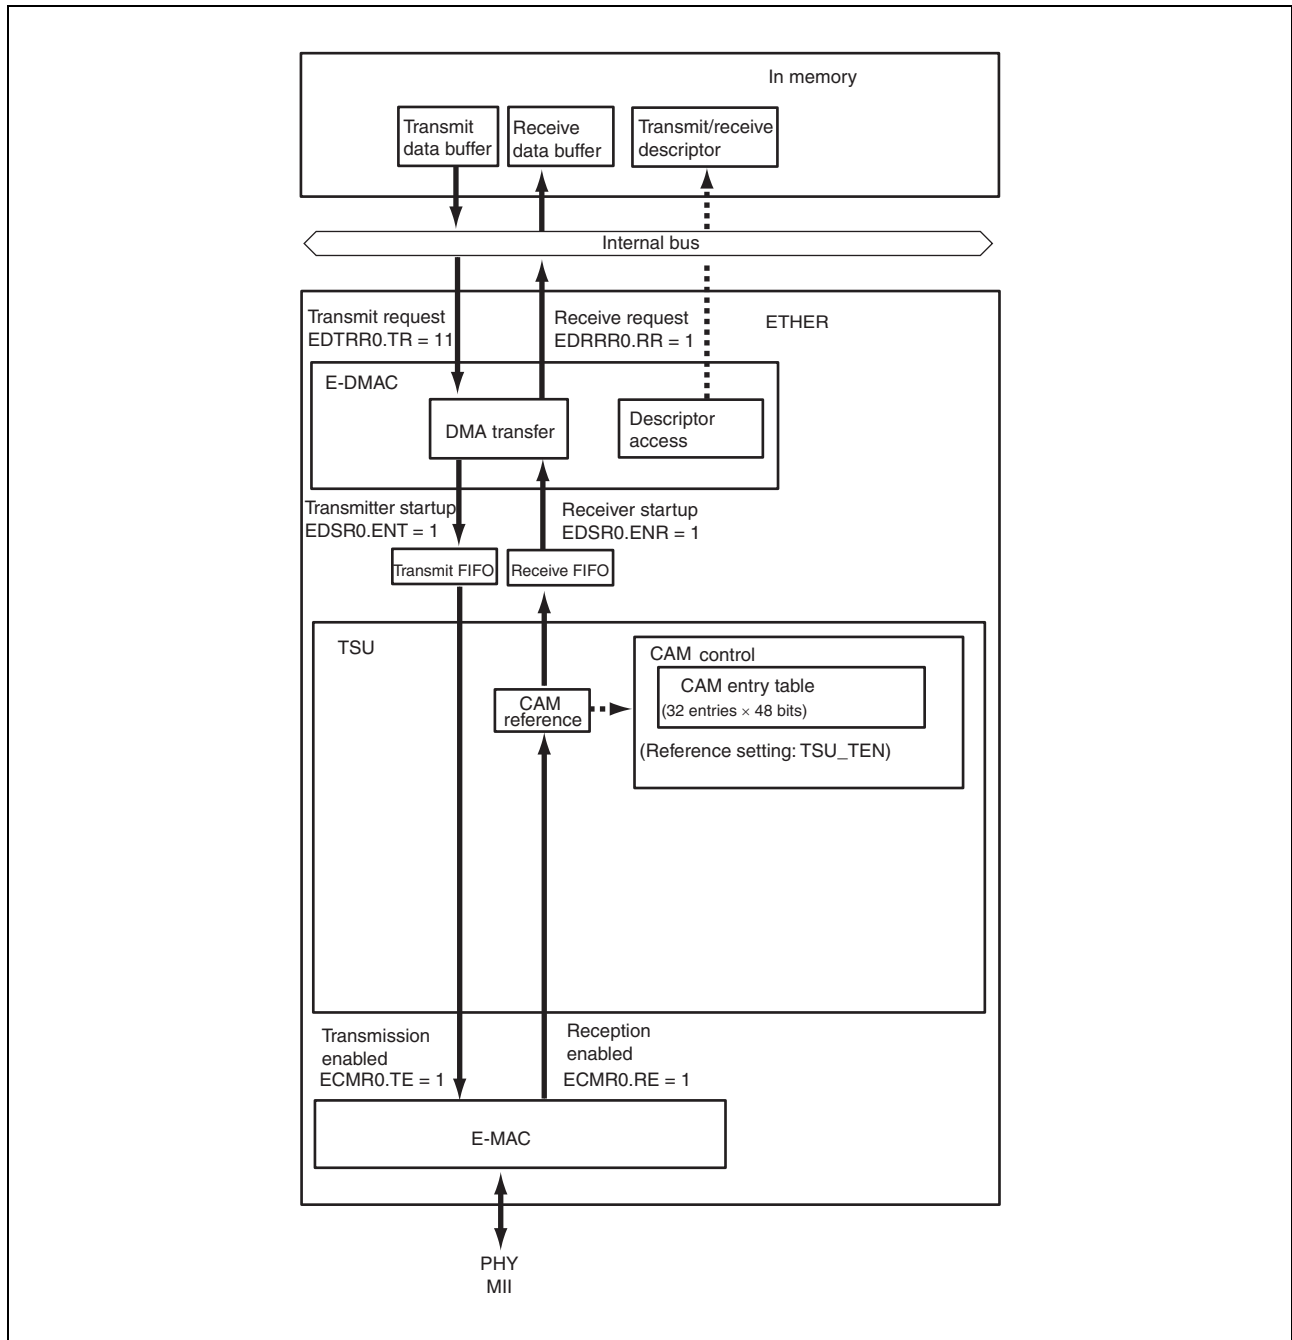

Figure 26.2 ETHER Data Path and Various Settings

26.4.1 Descriptors and Descriptor List

The E-DMAC performs DMA transfer according to the information (data), referred to as a descriptor, written in memory space. There are two types of descriptors: transmit descriptors and receive descriptors. Before a DMA transfer, DMA transfer information including a transmit/receive frame data storage address must be set by software.

The E-DMAC automatically starts reading a transmit/receive descriptor when the TR bits in EDTRR are set to 11 or the RR bit in EDRRR is set to 1, and performs DMA transfer of frame data between the transmit/receive buffer and transmit/receive FIFO according to the information stored in the descriptor. After completion of Ethernet frame transmission/reception, the E-DMAC disables the descriptor valid/invalid bit and reflects the result of transmission/reception in the status bits.

Descriptors are placed in a readable/writable memory space. The address of the start descriptor (descriptor to be read first by the E-DMAC) is set in TDLAR/RDLAR. When multiple descriptors are prepared as a descriptor row (descriptor list), the descriptors are placed in continuous addresses (memory) according to the descriptor length set in the DL0 and DL1 bits in EDMR.

(1) Transmit Descriptor

Figure 26.3 shows the configuration of a transmit descriptor and the relationship with a transmit buffer.

The data of a transmit descriptor consists of TD0, TD1, TD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DL0 and DL1 bits in EDMR. TD0 indicates whether the transmit descriptor is valid or invalid, and information about the descriptor configuration and status. TD1 indicates the length of data in a transmit buffer to be transferred (TDL) as specified by the descriptor. TD2 indicates the start address of a transmit buffer that holds data to be transferred (TBA).

Depending on the descriptor specification, one transmit descriptor can specify all transmit data of one frame (single-frame/single-buffer) or multiple descriptors can specify the transmit data of one frame (single-frame/multi-buffer). As an example of single-frame/multi-buffer operation, the data portion that is used in a fixed manner in each Ethernet frame transmission can be referenced by multiple descriptors. For example, multiple descriptors can share the destination address and transmit source address in an Ethernet frame, and the remaining data can be stored in each separate buffer.

Figure 26.3 Relationship between Transmit Descriptor and Transmit Buffer

(a) Transmit Descriptor 0 (TD0)

Before the TR bits in EDTRR are set to 11, the user sets whether the bits of the descriptor are valid or invalid bit and sets other descriptor configuration. After Ethernet frame transmission, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.

When using TD0, the user should write desired values to bits 31 to 28 and 26 according to the descriptor configuration. Bits 27 and 25 to 0 should be cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
31	TACT	0	R/W	<p>Transmit Descriptor Valid/Invalid Indicates whether the corresponding descriptor is valid or invalid. To make this bit valid, store transmit data in a transmit buffer (user-specified transmit data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer.</p> <p>0: Indicates that this transmit descriptor is invalid Indicates the initial setting state, the state after 0 is written, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed. If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the TR bit in EDTRR to 0, and halts transfer operation related to transmission by the E-DMAC.</p> <p>1: Indicates that this transmit descriptor is valid After the user writes 1 to this bit, this bit indicates that data is not transferred yet or data is being transferred. When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid.</p>
30	TDLE	0	R/W	<p>Transmit Descriptor List End Indicates whether the corresponding descriptor is the last descriptor of the descriptor row (descriptor list).</p> <p>0: Not last descriptor After transfer of the corresponding descriptor, the E-DMAC reads the next one in the list of continuous descriptors.</p> <p>1: Last descriptor After transfer of the corresponding descriptor, the E-DMAC reads the descriptor placed at the address indicated by TDLAR.</p>
29, 28	TFP[1:0]	00	R/W	<p>Transmit Frame Position These bits indicate whether information of this descriptor represents information about the start, middle, or end of the transmit frame.</p> <p>00: The information of the descriptor represents information about the middle of the frame.</p> <p>01: The information of the descriptor represents information about the end of the frame.</p> <p>10: The information of the descriptor represents information about the start of the frame.</p> <p>11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer)).</p> <p>Reference When one frame is divided for use, the method of specifying this bit for a descriptor row according to the number of divisions is described below.</p> <ul style="list-style-type: none"> • For single-frame/single-descriptor operation First descriptor: TFP[1:0] = 11 • For single-frame/two-descriptor operation First descriptor: TFP[1:0] = 10 Second descriptor: TFP[1:0] = 01 • For single-frame/three-descriptor operation First descriptor: TFP[1:0] = 10 Second descriptor: TFP[1:0] = 00 Third descriptor: TFP[1:0] = 01 <p>When the number of divisions is large, a descriptor row is configured by adding intermediate descriptors with TFP[1:0] = 00.</p>

Bit	Bit Name	Initial Value	R/W	Description
27	TFE	0	R/W	Transmit Frame Error Occurrence Indicates that an error occurred in the transmit frame. 0: The TFS11 to TFS0 bits are all 0 1: One of the TFS11 to TFS0 bits is 1 The TFS8 to TFS0 bits can be masked for each factor by using TRSCER. The TFS11 to TFS9 bits cannot be masked. This bit is set by the E-DMAC write-back operation.
26	TWBI	0	R/W	Write-Back Completion Interrupt Notification 0: Does not notify of a write-back completion interrupt 1: After a write-back operation to this descriptor is complete, this bit sets the TWB1 and TWB0 bits in EESR to 11 and notifies the CPU of a write-back completion interrupt. This bit is valid only for the descriptor including the end of transmit frame (TFP = 01 or 11). This bit is cleared to 0 by the E-DMAC write-back operation.
25 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	TFS [11:0]	All 0	R/W	Transmit Frame Status These bits indicate the status of the corresponding frame. A bit below, which is set by the E-DMAC write-back operation, indicates the occurrence of the corresponding event when set to 1. <ul style="list-style-type: none"> • TFS[11:10]: Reserved (The write value should always be 0.) • TFS[9]: Transmit FIFO underflow (Corresponding to the TUC bit in EESR) • TFS[8]: Detection of transmission abort (Corresponding to the TABT bit in EESR) • TFS[7:0]: Reserved (The write value should always be 0.)

(b) Transmit Descriptor 1 (TD1)

TD1 indicates the data length of the transmit buffer used by the corresponding descriptor.

The user should set TD1 before the start of a read by the E-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TDL [15:0]	All 0	R/W	Transmit Buffer Data Length (in bytes) These bits indicate the data length of the corresponding transmit buffer in bytes. The maximum length is between 64 Kbytes and 32 bytes (H'FFE0).
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(c) Transmit Descriptor 2 (TD2)

TD2 indicates the start address of the corresponding 32-bit width transmit buffer. An address value should be specified in a longword boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TBA [31:0]	All 0	R/W	Transmit Buffer Start Address These bits set the start address of the corresponding transmit buffer in a 16-bit boundary.

If descriptors are set below, the E-DMAC does not return to normal operation until a system reset is performed.

- TFP (transmit frame position) is not logically correct
 Example: The TFP bits are set to 11 in a descriptor (descriptor A) and the TFP bits are set to 01 in the next descriptor (descriptor B). This specification means that there is no descriptor indicating the start of the

transmit frame specified by descriptor B.

- TBL (transmit buffer length) is set to 0

When one transmit frame is divided into three parts or more with transmit descriptors, the E-DMAC performs the following write-back operation:

- A write-back operation is performed for a transmit descriptor including information for the start of the transmit frame (TFP = 10 or 11) and for a transmit descriptor including information for the end of the frame (TFP = 01 or 11).
- A write-back operation is not performed for a transmit descriptor for the middle of the frame (TFP = 00).

However, TFE (transmit frame error occurrence) or TFS (transmit frame status) is written only to a transmit descriptor including information for the end of the frame (TFP = 01 or 11) by a write-back operation.

Before changing a transmit descriptor with the software, make sure that a write-back operation has been performed (TACT = 0) for the transmit descriptor including information for the end of the frame (TFP = 01 or 11) to avoid overwriting (re-setting) an unprocessed transmit descriptor.

(2) Receive Descriptor

Figure 26.4 shows the relationship between a receive descriptor and receive buffer.

The data of a receive descriptor consists of RD0, RD1, RD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DL0 and DL1 bits in EDMR. RD0 indicates whether the receive descriptor is valid or invalid, and information about descriptor configuration and status. RD1 indicates the length of data that can be received in the receive buffer specified by the descriptor (RBL) and the length of the received frame data (RDL). RD2 indicates the start address of the receive buffer for storing receive data (RBA).

Depending on the descriptor specification, one receive descriptor can specify the storing of all receive data of one frame in a receive buffer (single-frame/single-buffer). All receive frames can be stored in a single buffer if RBL of each descriptor is set to more than 1514 bytes (maximum Ethernet frame length).

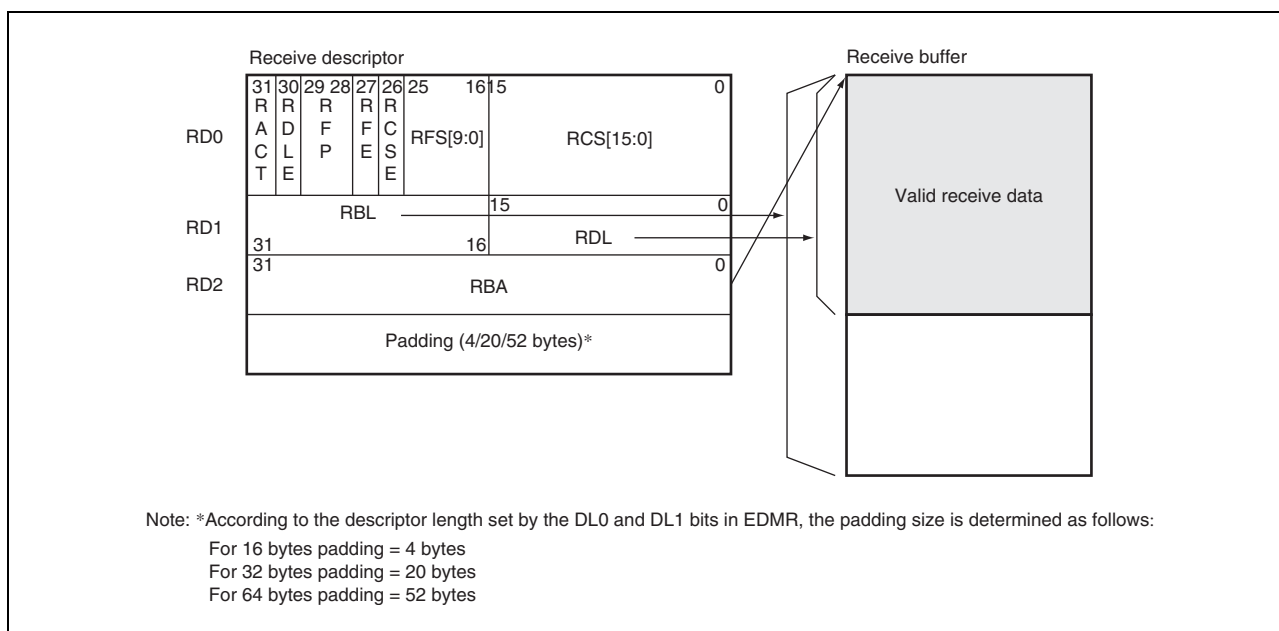

Figure 26.4 Relationship between Receive Descriptor and Receive Buffer

(a) Receive Descriptor 0 (RD0)

The user sets whether the bits of the descriptor are valid or invalid and whether the descriptor represents the end of the descriptor list in RD0 before the RR bit in EDRRR is set to 1 and the start of a read by the E-DMAC. After receive DMA transfer of an Ethernet frame by the E-DMAC, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.

When using RD0, the user should write desired values to bits 31 and 30 according to the descriptor configuration. Bits 29 to 0 should be cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
31	RACT	0	R/W	<p>Receive Descriptor Valid/Invalid</p> <p>Indicates whether this descriptor is valid or invalid. To make this bit valid, prepare a receive buffer (user-specified receive data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer.</p> <p>0: Indicates that this receive descriptor is invalid</p> <p>Indicates the initial setting state, the state after 0 is written to, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed</p> <p>If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the RR bit in EDRRR to 0, and halts transfer operation related to reception by the E-DMAC</p> <p>1: Indicates that this receive descriptor is valid</p> <p>Indicates that data is not transferred yet after the user writes 1 to this bit, or that data is being transferred</p> <p>When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid</p>
30	RDLE	0	R/W	<p>Receive Descriptor List End</p> <p>Indicates whether this descriptor is the last descriptor of the descriptor row (descriptor list).</p> <p>0: Not last descriptor</p> <p>After transfer of this descriptor, the E-DMAC reads the next one in the list of continuous descriptors</p> <p>1: Last descriptor</p> <p>After transfer of this descriptor, the E-DMAC reads the descriptor placed at the address indicated by RDLAR</p>
29, 28	RFP[1:0]	00	R/W	<p>Receive Frame Position 1, 0</p> <p>The E-DMAC indicates by write-back operation whether information of the corresponding descriptor represents information about the start, middle, or end of the receive frame.</p> <p>00: The information of the descriptor represents information about the middle of the frame</p> <p>01: The information of the descriptor represents information about the end of the frame</p> <p>10: The information of the descriptor represents information about the start of the frame</p> <p>11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer))</p> <p>Reference</p> <p>The relationship between a frame after reception of one frame and a descriptor is described below.</p> <p>When the receive buffer data length is less than the receive frame length, these bits are set to a value other than 11 after reception. When they are set so, reception processing should be started after a software reset.</p>
27	RFE	0	R/W	<p>Receive Frame Error Occurrence</p> <p>Indicates that an error occurred in the receive frame.</p> <p>0: RFS11 to RFS0 are all 0</p> <p>1: One of RFS11 to RFS0 is 0</p> <p>Each of RFS8 to RFS0 can be masked by using TRSCER. RFS11 to RFS9 cannot be masked.</p> <p>This bit is set by the E-DMAC write-back operation.</p>

Bit	Bit Name	Initial Value	R/W	Description
26	RCSE	0	R/W	Receive Packet Checksum Value Evaluation by Intelligent Checksum When CSEBL = 1 and CSMD = 1, the value of this bit is set as shown in Table 26.4, according to the receive packet and receive data. The information of this bit is invalid when operation is performed with a setting other than above.
25 to 16	RFS[9:0]	All 0	R/W	Receive Frame Status These bits indicate the error status during frame reception. RFS9: Receive FIFO overflow (corresponding to the RFOF bit in EESR) RFS8: Reserved (write value should be 0) RFS7: Multicast address frame received (corresponding to the RMAF bit in EESR) RFS6: CAM entry unregistered frame received (corresponding to the RUAF bit in EESR) RFS5: Reserved (write value should be 0) RFS4: Residual-bit frame receive error (corresponding to the RRF bit in EESR) RFS3: Long frame receive error (corresponding to the RTLf bit in EESR) RFS2: Short frame receive error (corresponding to the RTSF bit in EESR) RFS1: PHY-LSI receive error (corresponding to the PRE bit in EESR) RFS0: CRC error on receive frame (corresponding to the CERF bit in EESR)

(b) Receive Descriptor 1 (RD1)

In RD1, the user specifies the data length of a receive buffer usable by the corresponding descriptor. After reception of a frame, RD1 indicates the length of a frame received by the E-DMAC.

The user should set RD1 before the start of a read by the E-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	RBL [15:0]	All 0	R/W	Receive Buffer Data Length (in bytes, to be specified with a 32-byte boundary) These bits set the length of data that can be received by the corresponding receive buffer with an integral multiple of 32 bytes. The maximum receive buffer data length is between 64 Kbytes and 32 bytes (H'FFE0).
15 to 0	RDL [15:0]	All 0	R	Receive Data Length These bits indicate the data length of a receive frame stored in the receive buffer. Receive data transferred to the receive buffer does not include CRC data (4 bytes) placed at the end of a frame. As a receive frame length, the number of bytes (valid data bytes) not including CRC data are reported. In single-frame/multi-buffer (descriptor) operation, only the receive data length of the last descriptor is valid. The receive data length of an intermediate descriptor has no meaning. The maximum frame length that can be received is: When padding function is invalid: 64 Kbytes between 1 byte (H'FFFF) When padding function is valid: 64 Kbytes between 32 bytes (H'FFE0)

(c) Receive Descriptor 2 (RD2)

RD2 indicates the start address of the corresponding receive buffer. Set the start address of a receive buffer with a 32-byte boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RBA [31:0]	All 0	R/W	Receive Buffer Start Address These bits set the start address of the corresponding receive buffer with a 32-byte boundary.

The E-DMAC performs DMA transfer for a receive frame from the address specified by RBA (receive buffer address) to the receive buffer in 32-byte units. RBL (receive buffer length) must be set to be an integral multiple of 32 bytes.

If data to be transferred is less than 32 bytes, invalid data will be written to.

[Example]

When the receive frame length is 170 bytes and the required receive buffer capacity is 192 bytes (32 bytes × 6), the sixth DMA-transfer causes invalid data to be written to the receive buffer (In the 32-byte DMA data, the former 10 bytes are valid and the latter 22 bytes are invalid).

Padding of the value 0 can be inserted into only one position in the receive frame by setting RPADIR. The padding size can be selected from 1 byte to 31 bytes in byte units. When padding is inserted into a receive frame, a receive buffer area equal to the total of "receive frame length and padding size" is required. RPADIR setting is valid for all receive frames. RFE (receive frame error occurrence), PV (padding insertion), RFS (receive frame status) and RFS (receive frame status) are only set in the receive descriptor including information for the end of the frame (TFP = 01 or 11) by a write-back operation.

Before re-setting a receive descriptor with the software, completion of a write-back operation for the receive descriptor (RACT = 0) must be confirmed to avoid rewriting to (and re-setting) an unprocessed receive descriptor.

(3) Descriptor and Transmit/Receive Buffer

(a) Transmission

Each transmit descriptor specifies one transmit buffer. The E-DMAC transfers a transmit frame stored in a transmit buffer specified by a transmit descriptor to the transmit FIFO. Multiple transmit frames stored in transmit buffers specified by multiple descriptors can be connected into one transmit frame and transferred to the transmit FIFO.

Figure 26.5 shows the relationship between the transmit descriptors and transmit buffers.

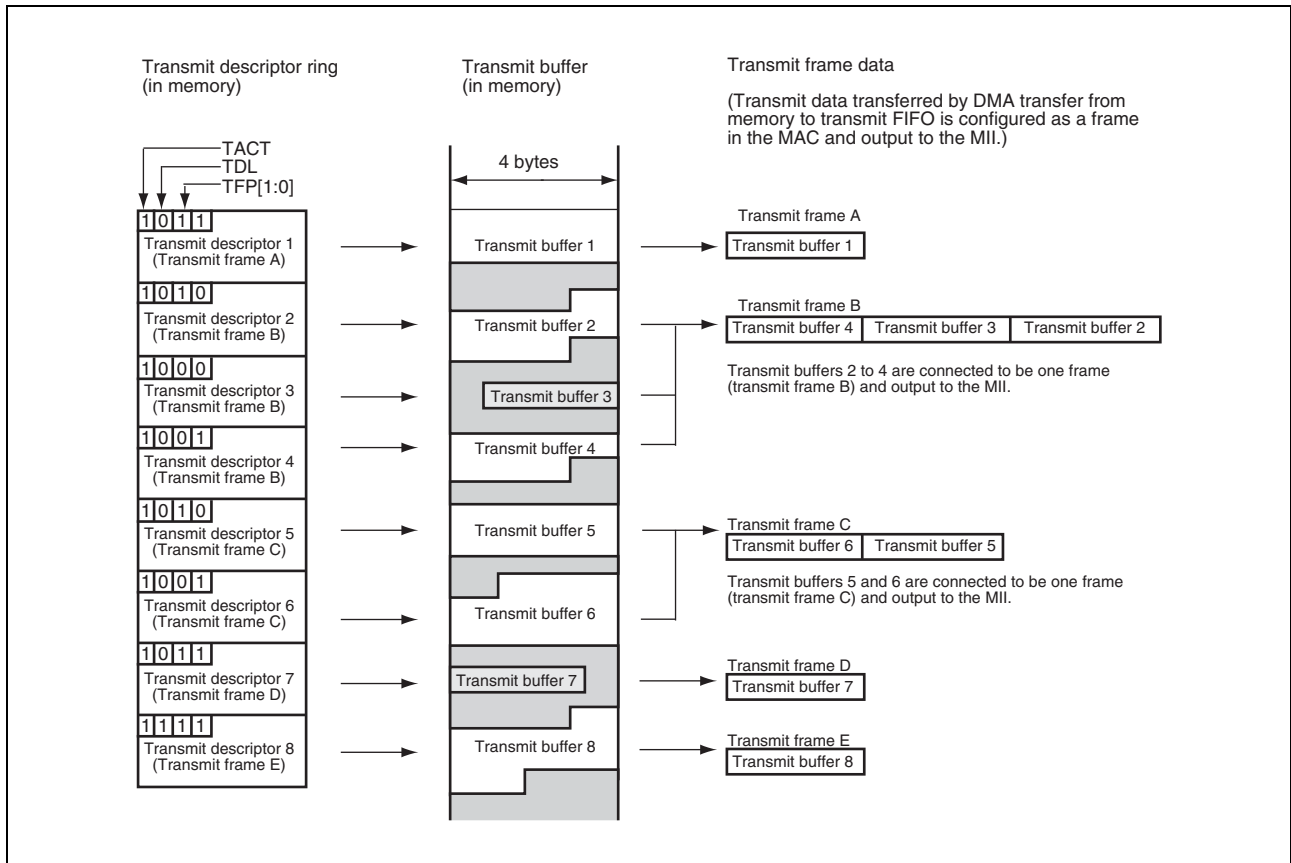

Figure 26.5 Relationship between Transmit Descriptor and Transmit Buffer

(b) Reception

Each receive descriptor specifies one receive buffer. The E-DMAC receives a receive frame from the receive FIFO and stores it in a receive buffer specified by a receive descriptor. If the receive frame size exceeds the receive buffer size, the remaining data of the receive frame can be stored in a different receive buffer specified by a different receive descriptor. Thus, one receive frame can be stored in multiple receive buffers.

Figure 26.6 shows the relationship between the receive descriptors and receive buffers.

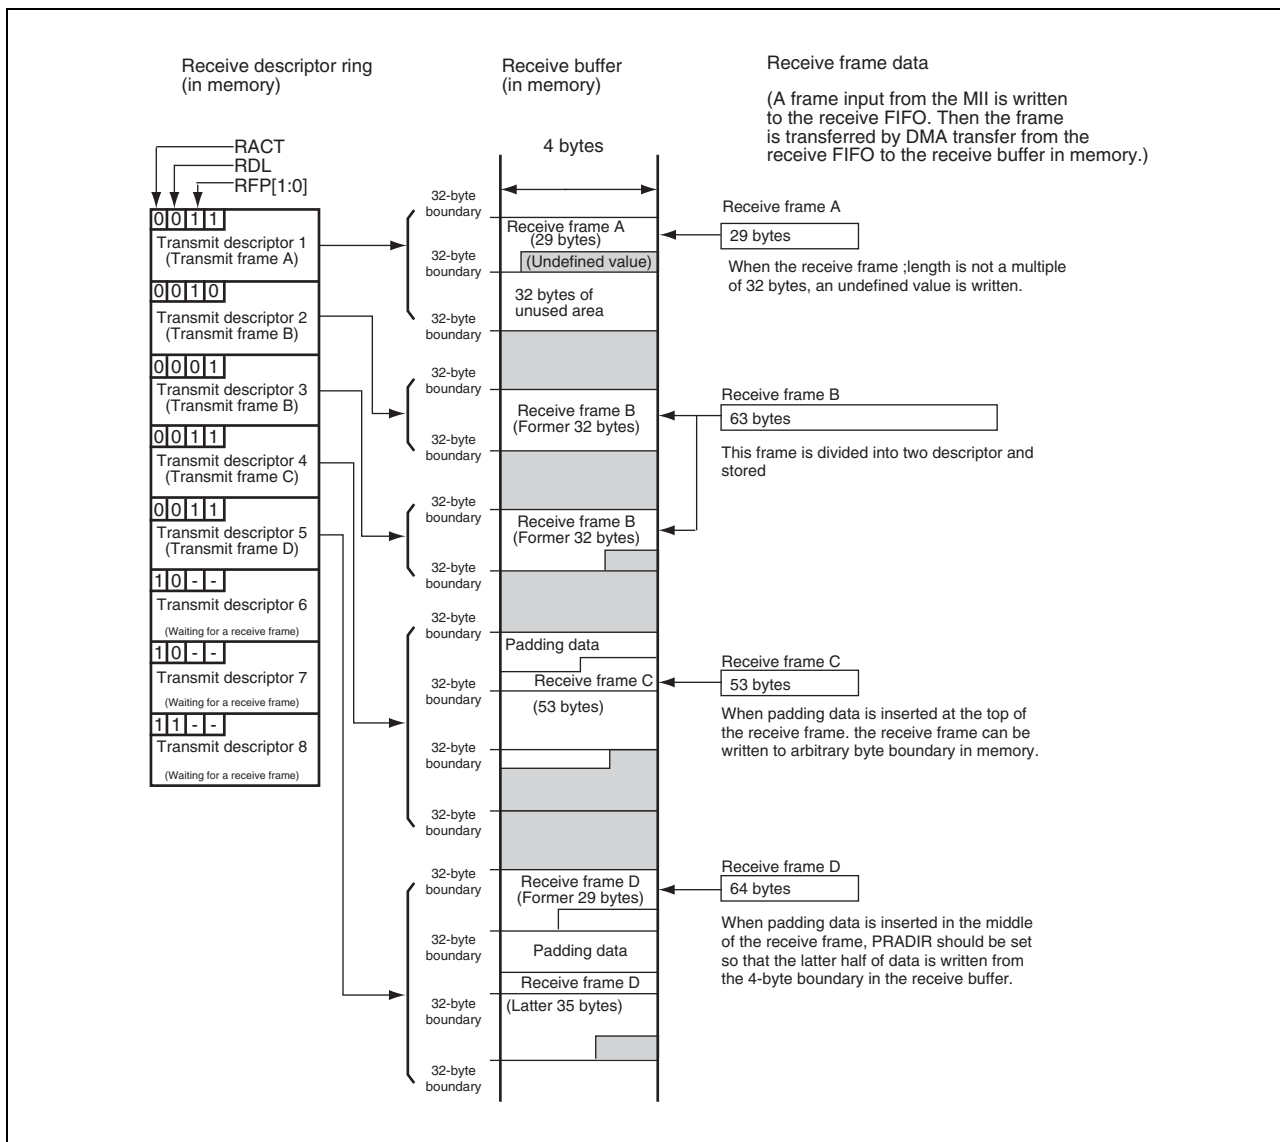

Figure 26.6 Relationship between Receive Descriptor and Receive Buffer

(4) Descriptor Pointer

The E-DMAC controls the transmit and receive descriptor addresses in memory and the processing priority by using the following registers.

1. Registers related to a transmit descriptor
 - TDLAR: Address of the start descriptor in a list of transmit descriptors.
 - TDFAR: Address of the transmit descriptor to be processed
 - TDFXR: Address of the transmit descriptor that finished processing (set by a write-back operation) last
 - TDFFR (DL bit): Indicates whether the TDLE value of the transmit descriptor specified by TDFXR is 1 or not.
2. Registers related to receive descriptor:
 - RDLAR: Address of the start descriptor in a list of receive descriptors.
 - RDFAR: Address of the receive descriptor to be processed
 - RDFXR: Address of the receive descriptor that finished processing (set by a write-back operation) last
 - RDFFR (DL bit): Indicates whether the RDLE value of the receive descriptor specified by RDFXR is 1 or not.

Transmit descriptors and receive descriptors have a ring structure. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 0, the next descriptor will be processed. The next descriptor is the transmit (receive) descriptor at the address obtained by adding the processed transmit (receive) descriptor address to the descriptor length specified by the DL bits in EDMR. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 1, the transmit descriptor indicated by TDLAR (RDLAR) will be processed next. **Figure 26.7** shows the relationship between the transmit/receive descriptor ring and read pointer.

The transmit descriptor list must be large enough to point to five or more transmit frames. If four or less transmit frames are pointed to in a list, E-DMAC operation is not guaranteed. Accordingly, do not set that all the transmit descriptors in a ring are used by four or less descriptors. The receive descriptor list does not have this restriction. For example, one receive frame can use all receive descriptors in a list.

In the initial setting, the start address of a descriptor list must be set to TDLAR (RDLAR) and TDFAR (RDFAR), and the end descriptor address of the descriptor list to TDFXR (RDFXR) by the software.

The E-DMAC updates TDFAR (RDFAR), TDFXR (RDFXR), and the DL bit in TDFFR (DL bit in RDFFR) each time a descriptor is processed.

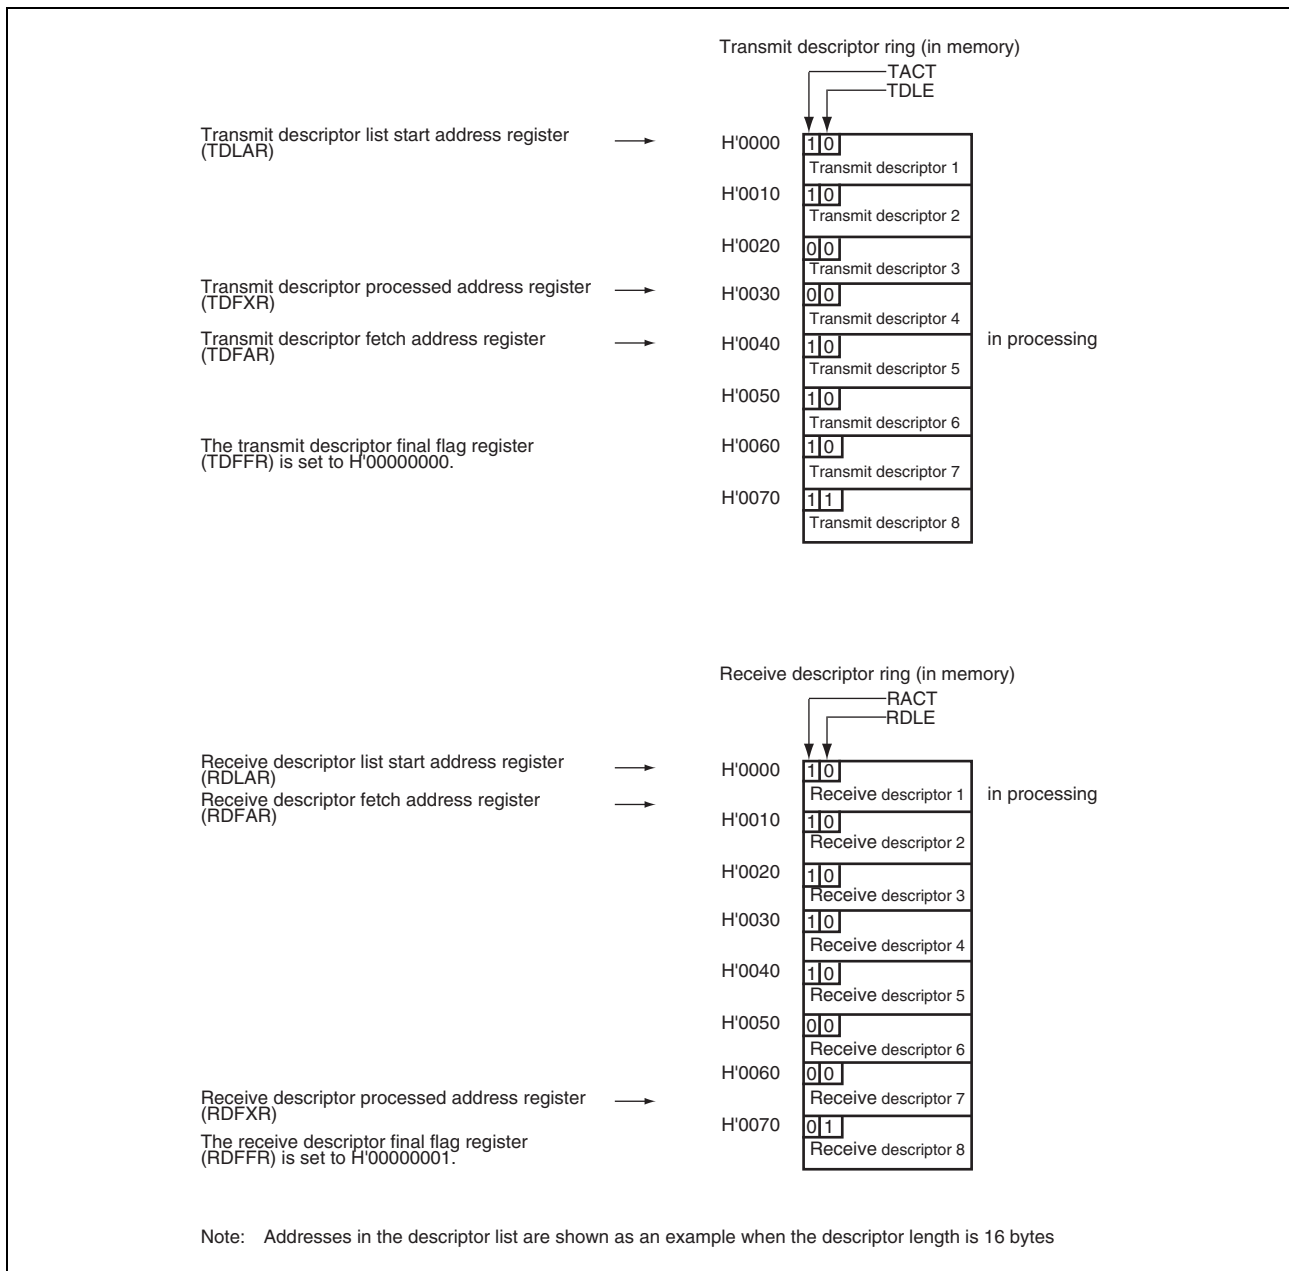

Figure 26.7 Relationship between Transmit/Receive Descriptor and Descriptor Pointing Registers

26.4.2 Transmission

(1) Transmission Procedure and Processing Flow

When 11 is written to the TR bits in EDTRR with the TE bit in ECMR set to 1 and there is empty space of 32 bytes or more in the transmit FIFO, the E-DMAC reads the descriptor following the previously used descriptor from the transmit descriptor list (or the descriptor indicated by TDLAR at the initial startup).

If the TACT bit of the read descriptor is set to 1 (valid), the E-DMAC sequentially reads transmit frame data from the transmit buffer start address specified by TD2 and transfers the data to the transmit FIFO. The E-DMAC configures a transmit frame and starts transmission to the MII. After DMA transfer of data equivalent to the buffer length specified in the descriptor, the following processing is carried out according to the TFP value.

- TFP = 10 (start of a frame)
Descriptor write-back (writing 0 to the TACT bit) is performed after completion of DMA transfer.
- TFP = 01 or 11 (end of a frame)
Descriptor write-back (writing 0 to the TACT bit and writing status) is performed after completion of frame transmission.
- TFP = 00 (frame continued)
Descriptor write-back is not performed. The TACT bit retains the value 1.

As long as the TACT bit of a read descriptor is set to 1 (valid), the reading of E-DMAC descriptors and the transmission of frames continue.

When a descriptor with the TACT bit cleared to 0 (invalid) is read, the E-DMAC performs the following processing and completes transmit processing.

- Clears the TR bits in EDTRR to 00.
- Writes the TC bits in EESR to 11 and generates an interrupt to the CPU.

The E-DMAC can store up to four frames of data in the transmit FIFO.

When the following conditions are satisfied, the E-MAC transmit processing section reads transmit data from the transmit FIFO to configure a frame and transmits the frame to the MII.

- The amount of data in the transmit FIFO exceeds the number of bytes specified by TFTR.
- One or more frame of data is stored in the transmit FIFO.
- The transmit FIFO has no space (full of transmit wait data for the MII).

Figure 26.8 shows an example of transmission flow.

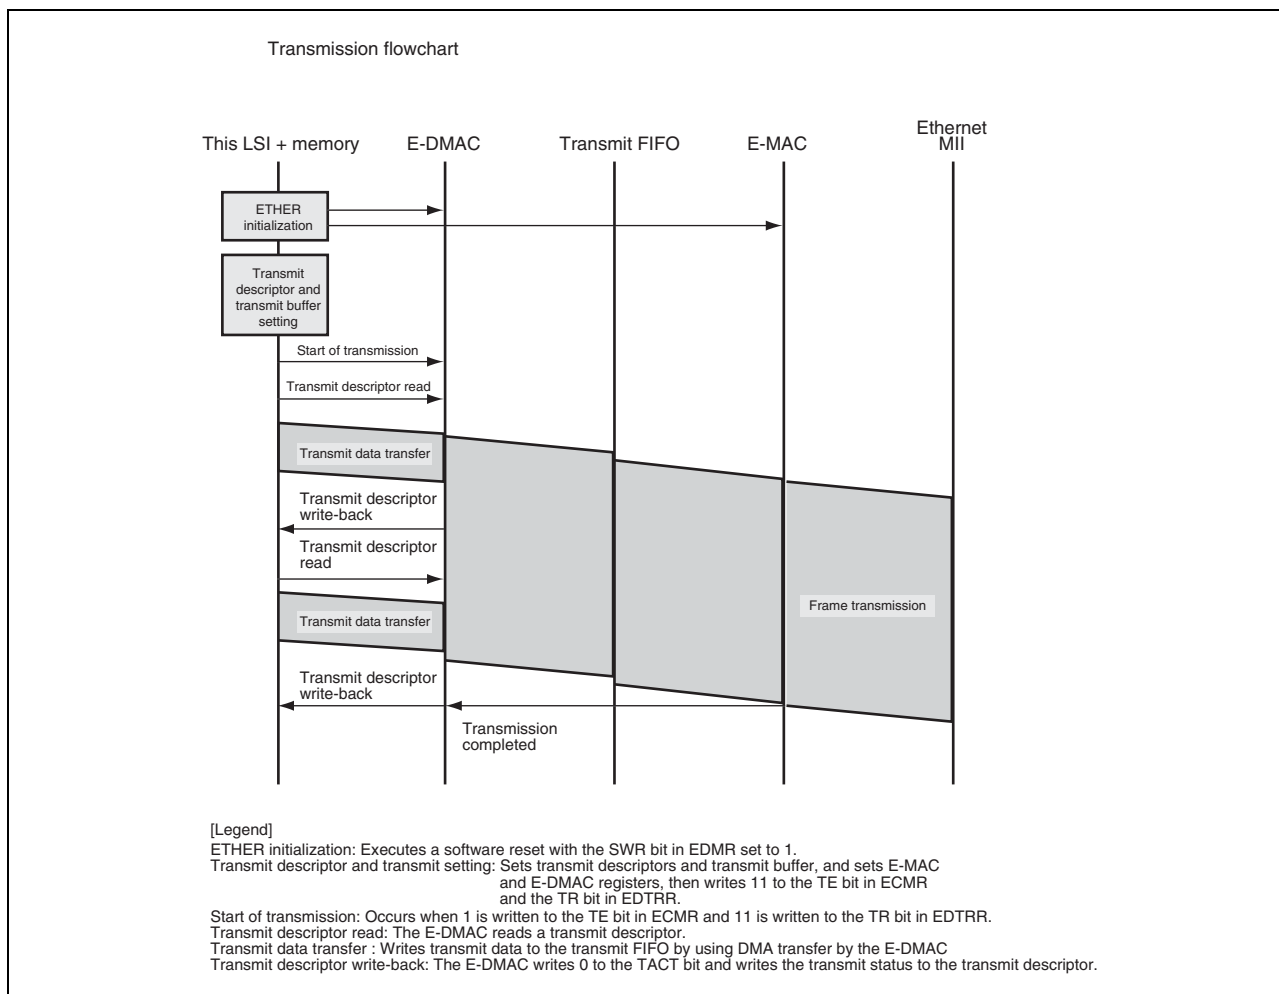

Figure 26.8 Sample Transmission Flowchart (Single-Frame/Two-Description)

Figure 26.9 shows the status change of the E-MAC transmitter.

1. When the TE bit in EDCMR is set, the transmitter enters the transmit idle state.
2. The preamble is sent as soon as a transmit request is issued by the E-DMAC.
3. The transmitter sends the SFD, data, and CRC sequentially. At the end of transmission, the transmit E-DMAC generates a transmission complete interrupt (TC).
4. After waiting for the frame interval time, the transmitter enters the idle state, and if there is more transmit data, continues transmitting.

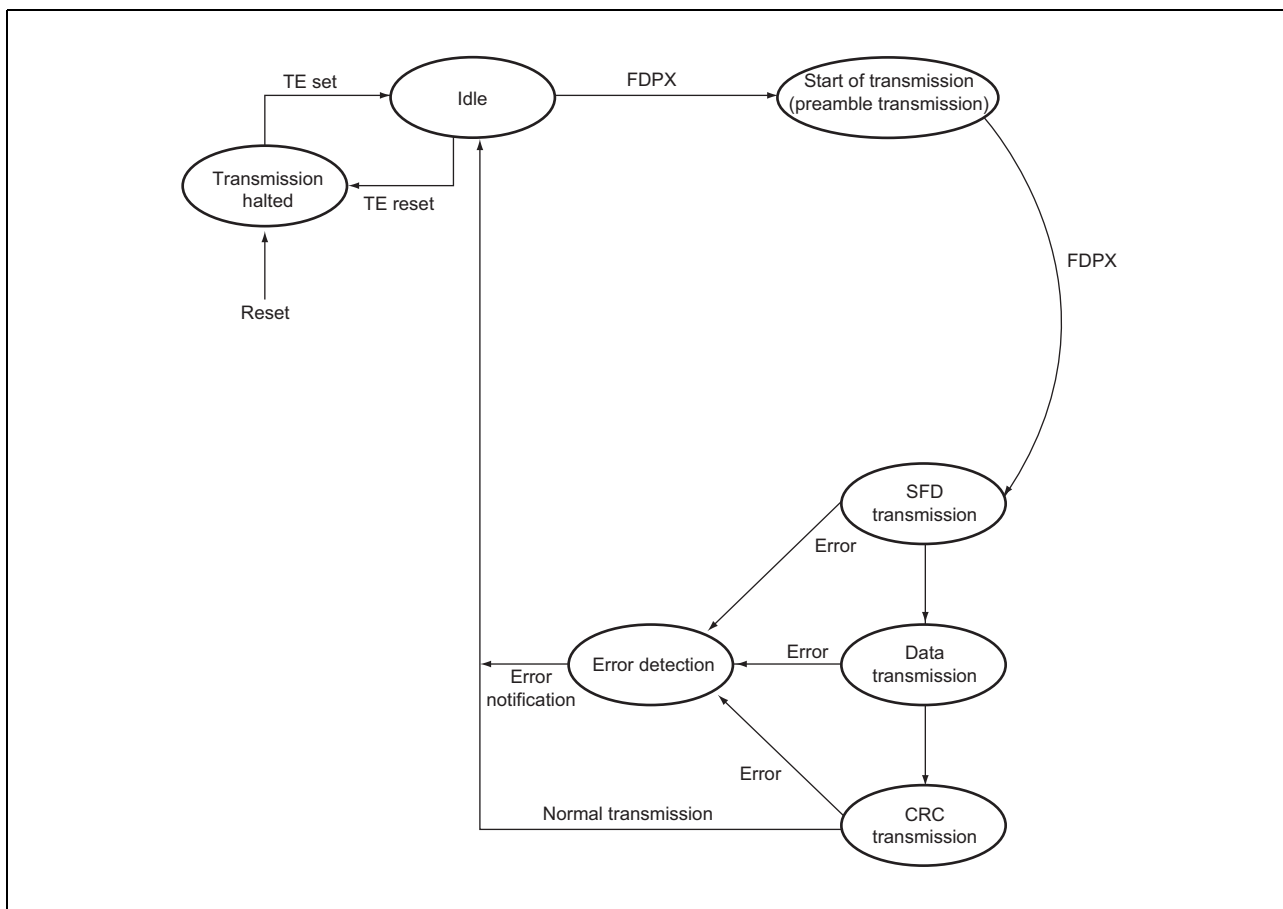

Figure 26.9 E-MAC Transmitter State Transitions

(2) Transmission Error Processing

(a) Transmission Abort

If a transmission error is detected during frame transmission from the transmit FIFO to the MII, transmission of the frame data is aborted. At this time, if DMA transfer of the appropriate frame from the transmit buffer to the transmit FIFO has not been completed, the DMA transfer is also aborted.

Following a write-back operation to the transmit descriptor related to the transmit frame aborted by a transmission error, 1 is written to the TABT bit in EESR and an interrupt is issued to the CPU. The subsequent transmit descriptors will be processed normally.

(b) Transmit FIFO Underflow

If the transmit FIFO is empty (transmit FIFO underflow) during frame transmission from the transmit FIFO to the MII, the E-MAC forcibly aborts transmission of the frame to the MII. At this time, the frame that the E-MAC receives from the E-DMAC is cut off halfway. Then, the E-MAC performs the following operation:

- Writes the TFUF bit in EESR to 1 and generates an interrupt to the CPU.
- Performs a write-back operation to the transmit descriptor corresponding to the transmit frame.
- Following the write-back operation, writes the TUC bit in EESR and generates an interrupt to the CPU.

The subsequent transmit descriptors operate normally.

The E-MAC waits to start frame transmission from the transmit FIFO to the MII until the data that was stored in the transmit FIFO exceeds the number of the bytes specified by TFTR. Through the effective use of TFTR, the transmit FIFO underflow counts can be controlled.

(c) Transmit Descriptor Empty

When the TFP bits of the descriptor previously processed are set to 00 or 10 and the TACT bit of the read transmit descriptor is set to 0 (invalid), a transmit descriptor empty state is determined and 1 is written to the TDE bit in EESR, and then an interrupt is issued to the CPU.

When a transmit descriptor state is empty, start transmission processing after a software reset.

26.4.3 Reception

(1) Reception Procedure and Processing Flow

The E-MAC receiver separates the frame from the MII into preamble, SFD, data and CRC, and transfers the fields from DA (destination address) to the data to the receive FIFO. Up to 24 frames can be written in the receive FIFO. Figure 26.10 shows the status change of the E-MAC receiver.

1. When the RE bit in ECMR is set to 1, the receiver enters the receive idle state.
2. When an SFD (start frame delimiter) is detected after a receive packet preamble, the receiver starts receive processing. A frame with an invalid pattern is discarded.
3. In normal mode, if the destination of the frame address is this LSI, the receiver starts data reception when broadcast or multicast transmission is specified. In promiscuous mode, data reception starts regardless of the frame type.
4. Following data reception from the MII, the receiver carries out a CRC check. The result is indicated as a status bit in the descriptor after the frame data has been written to the receive FIFO. Reports an error status in the case of an abnormality.

After one frame has been received, if the RE bit in ECMR is set to 1, the receiver prepares to receive the next frame.

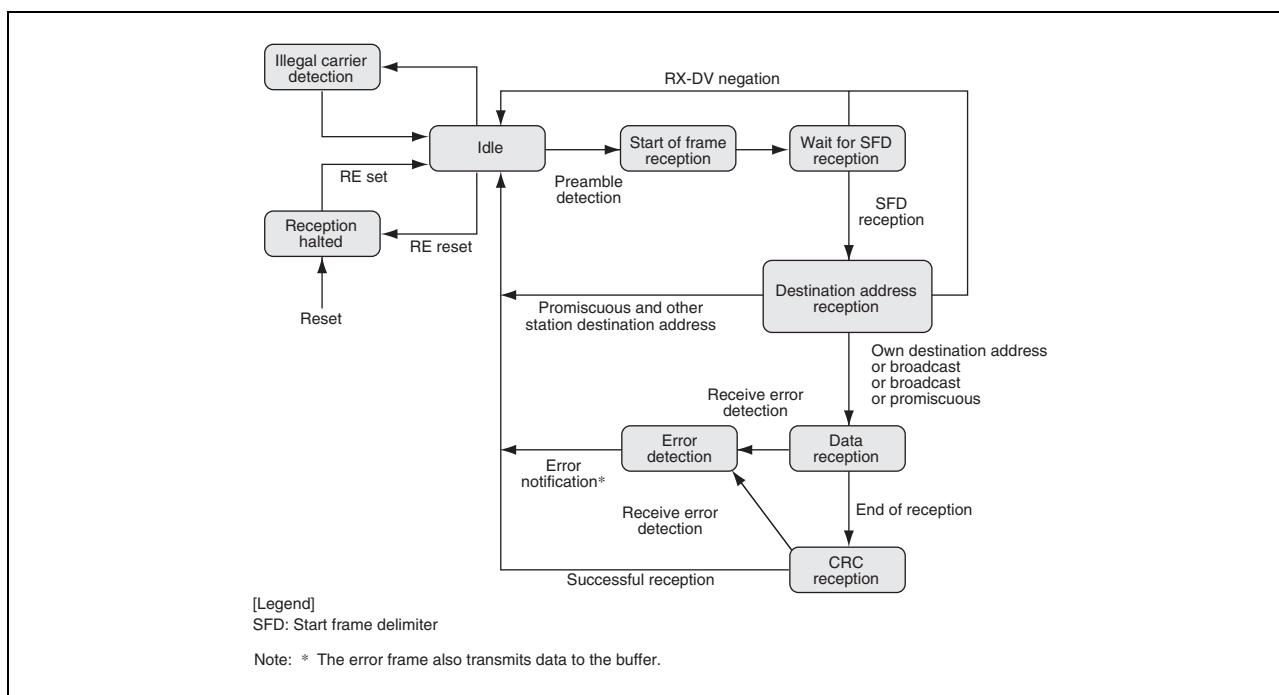

Figure 26.10 E-MAC Receiver State Transitions

CAM evaluation can be referenced during frame processing in reception (for details on the CAM function, refer to section 26.4.4, CAM Function).

When 1 is written to the RR bit in EDRRR while the RE bit in ECMR is set to 1, the E-DMAC reads the descriptor following the previously used descriptor from the receive descriptor list (or the descriptor indicated by RDLAR at the initial startup) then enters the receive wait state. If 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the E-DMAC transfers receive FIFO data to the receive buffer specified by RD2 according to the receive descriptor with the RACT bit set to 1 (valid).

If the data length of a received frame is longer than the buffer length specified by RD1, the E-DMAC performs a write-back operation to the descriptor (set RFP to 10 or 00) when the buffer is full, then reads the next descriptor. The E-DMAC then continues to transfer data to the receive buffer specified by the new RD2.

When the following conditions are satisfied, a write-back operation is performed for the descriptor (RFP = 11 or 01), 11 is written to the FR bits in EESR, and an interrupt is issued to the CPU.

- The receive buffer has been full during DMA transfer.
- DMA transfer to the receive buffer of the last byte of the receive frame has been completed.

After the reception processing of the frame, the next descriptor reading standby state begins. At this time, if 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the next receive descriptor process is performed continuously.

When the TACT bit of the read receive descriptor is 0 (invalid), the receive descriptor empty state is determined and the RDE bit in EESR is written to 1, and then an interrupt is issued to the CPU.

To receive frames continuously, set the RNC bit in RMCR to 1. The initial value is 0.

Figure 26.11 shows an example of reception flow.

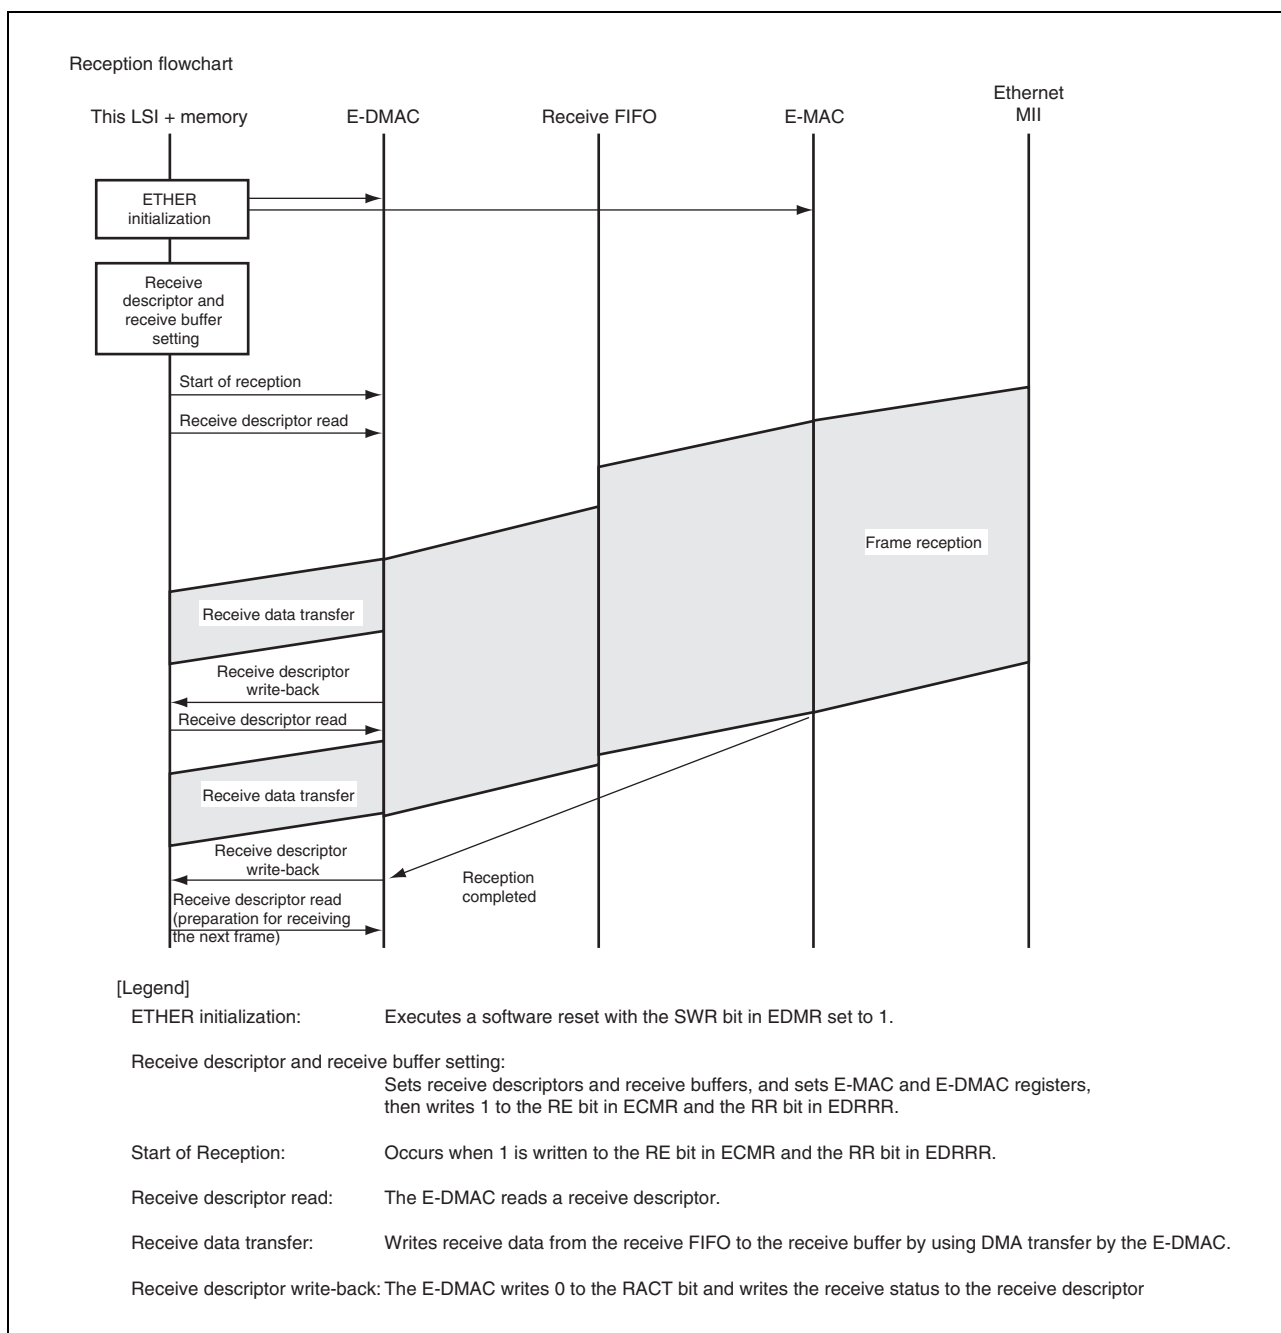

Figure 26.11 Sample Reception Flowchart (Single-Frame/Two-Descriptor)

(2) Reception Error Processing

(a) Reception Error

When a reception error occurs, the FR and RABT bits in EESR are set to 1 and an interrupt is issued to the CPU after a write-back operation for the receive descriptor related to the reception error frame.

If a reception error occurs when the length of the frame received from the MII is less than 32 bytes, DMA transfer to the receive buffer for the frame is not performed. At this time, the receive frame is discarded in the E-DMAC (flush function). However, if padding is inserted in the receive frame by RPADIR, the flush function is performed when the frame length including the padding bytes is less than 32 bytes.

(b) Receive FIFO Overflow

In any of the following cases, the E-MAC cannot receive frames from the MII because it has no space to store receive frames, and all the receive frames that have been transferred to the E-MAC will be discarded in the E-MAC (receive FIFO overflow).

- Receive FIFO is full of data waiting for DMA transfer (the receive FIFO has no space).
- The number of receive frames waiting for DMA transfer is 24 in total (the receive frame information managing area has no empty space; up to 24 frames can be managed).

If an overflow occurs due to the former case, the RFE bit in EESR is set to 1 and an interrupt is generated to the CPU. If an overflow occurs due to the latter case, the RFCOF bit in EESR is set to 1 and an interrupt is generated to the CPU. Each time a receive frame is discarded due to an overflow, RMFCR is incremented. However, RMFCR is not incremented for a receive frame that is cut off due to insufficient receive FIFO space. If a receive frame is cut off due to insufficient receive FIFO space (the frame is partially stored in the receive FIFO), the E-DMAC performs the following operation:

- Performs DMA transfers for the cut-off frame stored in the receive FIFO to the receive buffer.
- After the DMA transfer, performs a write-back operation on the receive descriptor.
- After the write-back operation, sets the ROC bit in EESR to 1 and generates an interrupt to the CPU.

When the receive FIFO is full of data waiting for DMA transfer, frame reception from the MII can be resumed if DMA transfer is performed from the receive FIFO to the receive buffer and 32 bytes or more of empty space is generated in the receive FIFO. When the number of receive frames waiting for DMA transfer is 24 in total, frame reception from the MII can be resumed if one or more frame has been DMA transferred from the receive FIFO to the receive buffer. For restarting frame reception from the MII, when the E-DMAC resumes frame reception from the MII, it only accepts from the start of the frame.

(c) Flow Control

When the amount of receive data or the number of receive frames in the receive FIFO leads to one of the following conditions, the E-DMAC notifies the E-MAC to control E-MAC writing to the receive FIFO.

- When the space used in the receive FIFO exceeds the data amount specified by FCFTR
- When the number of receive frames in the receive FIFO exceeds the value specified by FCFTR

The threshold of the receive data amount can be set in a range from 256 to 65536 bytes in 256-byte units.

The threshold of receive frames can be set in a range from 1 to 24 frames (by the frame) in frame units.

(d) Receive Descriptor Empty

When the RACT bit of the read descriptor is 0 (invalid), the receive descriptor empty state is determined and DMA transfer is stopped. Then the following operation is performed.

- Writes the RR bit in EDRRR to 0
- Sets the RDE bit in EESR to 1 and generates an interrupt to the CPU.

To resume the DMA transfer to the receive buffer, the interrupt source needs to be cleared by software, the receive descriptor needs to be re-set and the RR bit in EDRRR should be set to 1.

Even if receive descriptor is empty, frame reception from the MII to the receive FIFO is continued if there is empty space left in the receive FIFO and receive frame information management area. Therefore, even if a receive descriptor empty state is determined, the DMA transfer can be performed without discarding the frames received from the MII if DMA transfer to the receive buffer can be resumed before an overflow occurs.

26.4.4 CAM Function

Frames input to the E-MAC are grouped into the following four types; unicast for this LSI, broadcast, multicast, and unicast to other destinations. The MAC addresses of unicast for this LSI and broadcast are fixed, and determined only by register settings. Consequently, only multicast and unicast to other destinations determine whether to receive or not by using the CAM (unicast frames whose destination MAC addresses match this LSI are called unicast frames to this LSI, and those that do not are called unicast frames to other destinations).

Furthermore, the evaluation of reception of unicast to other destinations and multicast frames by using CAM are performed by referencing the registered MAC addresses of the CAM entry table in the TSU. By using this function, receive FIFO overflow can be prevented caused by accumulation of frame data not required for reception, and CPU processing for determining reception can be reduced.

The on-chip CAM has entry tables which can register the MAC address of 32 entries, the details of which can be set by TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31. The setting to enable/disable referencing of the on-chip CAM entry table is performed by the CAM entry table enable setting register which sets whether to perform CAM evaluation or not. When on-chip CAM entry table referencing is enabled, the destination address in the frame and MAC address registered in the CAM entry table are compared, and it is determined whether to transfer the frames input to the E-MAC to E-DMAC (have E-DMAC receive the frames) or discard the frames. Table 26.4 shows the processing method of frames (receive or discard) in reception from E-MAC to E-DMAC.

Table 26.4 Receive Frame Processing

CAM Entry Table Referencing Results	Types of Frame	Normal Mode		Promiscuous Mode	
		MCT = 0	MCT = 1	MCT = 0	MCT = 1
CAM hit (when addresses match)	Frame to this LSI	Discarded		Discarded	
	Broadcast frame	Discarded		Discarded	
	Multicast frame	Discarded	Received	Discarded	Received
	Frames having destinations other than this LSI	Received		Discarded	
CAM mishit (when addresses do not match)	Frames to this LSI	Received		Received	
	Broadcast frame	Received		Received	
	Multicast frame	Received	Discarded	Received	Discarded
	Frames having destinations other than this LSI	Discarded		Received	

[Legend]

MCT (Bit 13 in ECMR): Multicast receive mode (0: Receive when CAM mishit/1: Receive when CAM hit)

26.4.5 Transmit Processing of Multi-Buffer Frame (Single-Frame/Multi-Descriptor)

(1) Multi-Buffer Frame Transmit Processing

If an error occurs during multi-buffer frame transmission, the processing shown in Figure 26.12 is carried out by the E-DMAC.

In the figure where the transmit descriptor is shown as inactive (TACT bit = 0), buffer data has already been transmitted successfully, and where the transmit descriptor is shown as active (TACT bit = 1), buffer data has not been transmitted. If a frame transmit error occurs in the first descriptor part where the transmit descriptor is active (TACT bit = 1), transmission is halted, and the TACT bit is cleared to 0, immediately. The next descriptor is then read, and the position within the transmit frame is determined on the basis of bits TFP1 and TFP0 (continuing [B'00] or end [B'01]). In the case of a continuing descriptor, the TACT bit is cleared to 0, and the next descriptor is read immediately. If the descriptor is the final descriptor, not only is the TACT bit cleared to 0, but write-back is also performed to the TFE and TFS bits at the same time. Data in the buffer is not transmitted between the occurrence of an error and write-back to the final descriptor. If error interrupts are enabled in EESIPR, an interrupt is generated immediately after the final descriptor write-back.

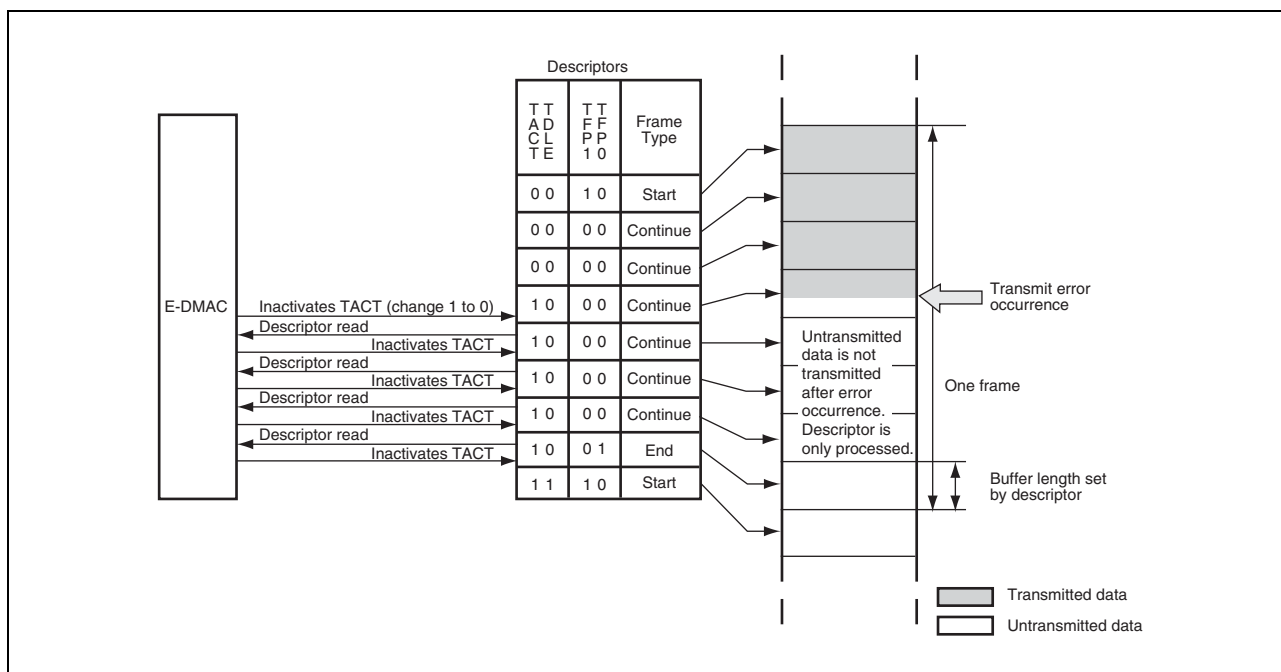

Figure 26.12 E-DMAC Operation after Transmit Error

26.4.6 Padding Insertion in Receive Data

In the E-DMAC, one to three bytes of padding can be inserted in any byte position of receive data to improve software handling capability. By using this function, for instance, inserting 2-byte padding after the MAC header (14 bytes) of Ethernet frame enables data following the MAC header to set in 4-byte boundary.

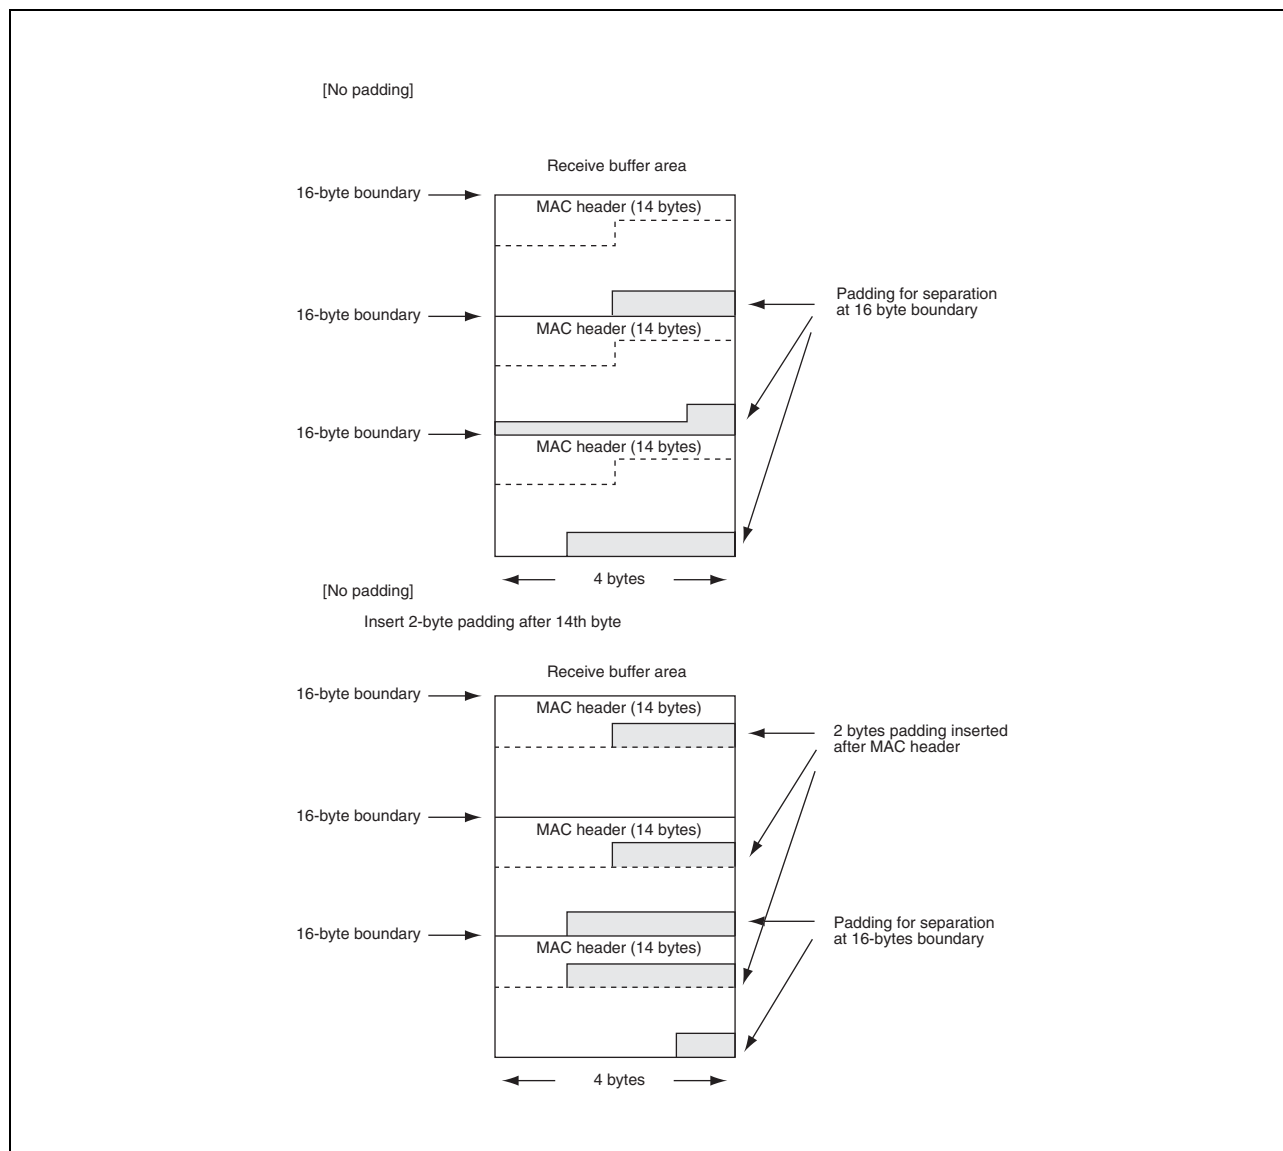

Figure 26.13 Padding Insertion in Receive Data

26.4.7 Interrupt Processing

(1) Interrupt Sources

The ETHER issues one type of interrupt to the CPU: receive/transmit interrupts (ETHERI).

ETHERI interrupts are generated in correspondence with the transmit/receive operation. When an interrupt source is generated, it is set in EESR0 and an interrupt is issued to the CPU. For some interrupt sources, the EESR0 setting and an interrupt to the CPU are performed after a write-back operation to a descriptor is completed, not immediately after the interrupt source is detected. Interrupt sources other than the E-MAC status register source (ECI bit) are cleared by writing a 1 to the corresponding source bit. The E-MAC status register source (ECI bit) is cleared by writing a 1 to the corresponding source bit in ECSR. Interrupt source bits retain the values until they are cleared. ETHERI interrupt source is allowed to issue interrupts by setting the corresponding bit in EESIPR0. Each E-MAC state register source (ECI bit) is allowed to issue an interrupt by setting the corresponding bit in ECSIPR. In the initial value, interrupts are disabled. Table 26.5 shows these three interrupts, interrupt sources, interrupt status registers and bits set at interrupt occurrence and interrupt generation timing.

Table 26.5 List of ETHER Interrupts

Interrupt	Interrupt Source	Register and Bit	Interrupt Generation Timing
Transmit/ receive interrupt (ETHERI)	Write-back completed	EESR0.TWB	After write-back
	Transmit underflow frame write-back completed	EESR0.TUC	After write-back
	Receive underflow frame write-back completed	EESR0.ROC	After write-back
	Transmission abort detection	EESR0.TABT	After write-back
	Reception abort detection	EESR0.RABT	After write-back
	Receive frame counter overflow	EESR0.RFCOF	When the interrupt source is detected
	E-MAC status register source	EESR0.ECI	When the interrupt source is detected
	Frame transmission completed	EESR0.TUC	After write-back
	Transmit descriptor empty	EESR0.TDE	When the interrupt source is detected
	Transmit FIFO underflow	EESR0.TFUF	When the interrupt source is detected
	Frame reception	EESR0.FR	After write-back
	Receive descriptor empty	EESR0.RDE	When the interrupt source is detected
	Receive FIFO overflow	EESR0.RFOF	When the interrupt source is detected
	Receive Multicast Address Frame	EESR0.RMAF	After write-back
	Receive Residual-Bit Frame	EESR0.RRF	After write-back
	Receive Too-Long Frame	EESR0.RTLF	After write-back
	Receive Too-Short Frame	EESR0.RTSF	After write-back
	PHY-LSI Receive Error	EESR0.PRE	After write-back
	CRC Error on Received Frame	EESR0.CERF	After write-back

26.4.8 Activation Procedure

The ETHER should be activated by the following procedure:

(1) Reset

1. Perform a power-on reset.
2. Set the ET_TXCLK and ET_RXCLK pins and supply the clock signal (for details on pin function settings, see section 41, Ports).
3. Start the E-DMAC transmitter and receiver (activation of descriptor engine).
—Set ENT to 1 and ENR to 1 in EDSR.
4. Perform a software reset.
—Set SWRR to 1 and SWRT to 1 in EDMR simultaneously.
5. Initialize the descriptor entry table.
6. Confirm cancellation of the software reset.
—Check that the SWRR and SWRT bits in EDMR are cleared to 0.

(2) Pin Settings

See section 41, Ports.

(3) Registration of Descriptor Ring

The address of a descriptor ring configured in memory is registered in the descriptor entry table.

1. Transmit descriptor setting
—Set TDLAR.
—Set TDFAR.
—Set TDFXR.
—Set TDFFR. When the descriptor indicated by TDFXR is the last descriptor in the descriptor list, set H'00000001.
2. Receive descriptor setting
—Set RDLAR.
—Set RDFAR.
—Set RDFXR.
—Set RDFFR. When the descriptor indicated by RDFXR is the last descriptor in the descriptor list, set H'00000001.

(4) Register Settings

The following registers should be set as necessary.

1. E-DMAC related registers
—Set EDMR: Operating mode, etc.
—Set EESIPR: Interrupt masks
—Set TRSCER: Error masks
—Set TFTR: Transmit FIFO threshold
—Set FDR: External FIFO size
—Set RMCR: Reset method for reception activation
—Set RPADIR: Padding insertion into receive data
—Set FCFTR: Receive BSY output threshold
2. E-MAC related registers
—Set ECMR setting: Transmission/reception specifications
—Set ECSIPR setting: Interrupt masks
—Set MAHR: MAC address
—Set MALR: MAC address

- Set RFLR: Maximum receive frame length
- Set APR: TIME parameter value of an automatic pause frame
- Set MPR: TIME parameter value of a manual PAUSE frame
- Set TPAUSER: Upper limit of automatic PAUSE frame retransmission

(5) Activation

1. Start the E-DMAC transmission/reception function
 - Set the TR bits in EDTRR to 11.
 - Set the RR bit in EDRRR to 1.
2. Start the E-MAC transmission/reception function
 - Set the TE and RE bits in ECMR to 1.

26.4.9 Flow Control

The ETHER supports flow control functions conforming to IEEE802.3x for full-duplex operation. The flow control can be applied to both receive and transmit operations. When transmitting PAUSE frames, flow control can be performed by the following two procedures:

(1) Automatic PAUSE Frame Transmission

For receive frames, PAUSE frames are automatically transmitted when the number of data written to the receive FIFO reaches the value set in FCFTR. The TIME parameter included in the PAUSE frame is set by APR. The automatic PAUSE frame transmission is repeated until the number of data in the receive FIFO becomes less than the value set in FCFTR as the receive data is read from the FIFO. Using TPAUSER, the upper limit of retransmission counts of the PAUSE frames can also be set in the range from 1 to 65535. In this case, PAUSE frame transmission is repeated until the number of receive FIFO data becomes less than the FCFTR value, or the number of transmits reaches the value set by TPAUSER. The transmission counter is cleared to 0 when the next PAUSE frame is transmitted after the number of data in the receive FIFO becomes less than the FCFTR value.

The automatic PAUSE frame transmission is enabled when the TXF bit in ECMR is 1.

(2) Manual PAUSE Frame Transmission

PAUSE frames are transmitted by directives from the software. When writing the Timer value to MPR, manual PAUSE frame transmission is started. With this method, PAUSE frame transmission is carried out only once.

(3) PAUSE Frame Reception

The next frame is not transmitted until the time indicated by the Timer value elapses after receiving a PAUSE frame. However, the transmission of the current frame is continued. A received PAUSE frame is valid only when the RXF bit in ECMR is set to 1. The number of times of PAUSE frame receptions is counted.

(4) 0-Time PAUSE Frame Control

Flow control is performed using a PAUSE frame with the TIME parameter value set to 0. The PAUSE frame with the TIME parameter set to 0 can be enabled or disabled by the ZPF bit in ECMR.

- When PAUSE frame control with the TIME parameter value set to 0 is enabled
A PAUSE frame with the TIME parameter value set to 0 is transmitted when the number of data in the receive FIFO is less than the FCFTR value before the time indicated by the TIME parameter value has not elapsed. When a PAUSE frame with the time indicated by the TIME parameter value set to 0 is received, the transmit standby state is canceled.
- When PAUSE frame control with the TIME parameter value set to 0 is disabled
A PAUSE frame with the TIME parameter value set to 0 is not transmitted. When a PAUSE frame with the TIME parameter value set to 0 is received, the PAUSE frame is discarded.

26.4.10 Intelligent Checksum Calculation Function

This function accelerates checksum calculation on received packets, and provides the following two modes.

- MAC/IP packet analyzing intelligent checksum calculation mode
- All-data intelligent checksum calculation mode with bytes to be skipped specified

(1) MAC/IP Packet Analyzing Intelligent Checksum Calculation Mode (CSEBL = 1 and CSMD = 1 in CSMR)

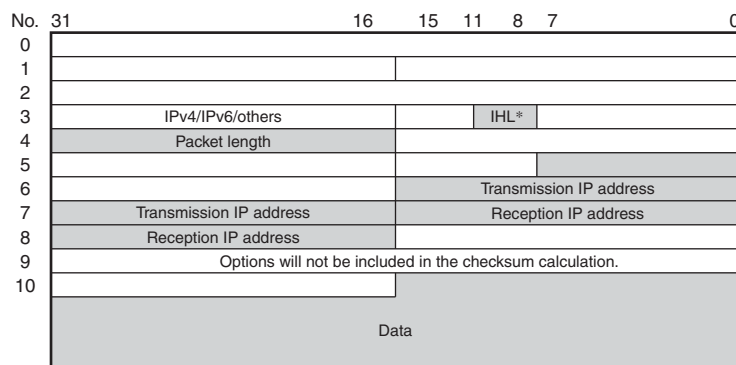

In this mode, the checksum of received packets indicated in the table is calculated. However, if a MAC packet payload includes padding data in fields other than those for the IP packet itself because there is too little data for a full packet, it is not included in the checksum.

IPver	Items
IPv4	Option present
	Option not present
	Fragment* ¹
IPv6	Extension header not present
	Hop-by-hop options extension header length
	Routing extension header length
	Fragment extension header length* ¹
	Destination options header length
	AH extension header length
	ESP extension header length* ²
Extension header length for mobile IPv6* ²	

Note 1. This packet is to be checksummed, however, the RCS[15:0] bits and RCSE bit in RD0 are to be undefined even if the data is successfully received.

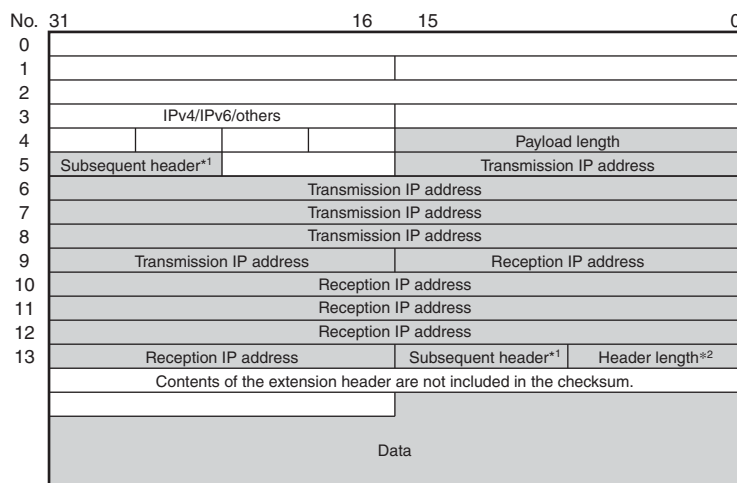

Note 2. The RD0.RCSE bit is set to 1 without calculating the value of the RD0.RCS[15:0] bits.

The shaded regions of the following figure indicate the parts of an IPv4 packet which are used to obtain the checksum.

Note: * After conversion to octet units, this is subtracted in the checksum calculation.
In the calculation: {8'h00, protocol no.[7:0]}

The shaded regions of the following figure indicate the parts of an IPv6 packet which are used to obtain the checksum.

Notes: *1 Only included in the checksum when the header is for the TCP or UDP. Calculation coverage is extended to {8'h00, protocol No.[7:0]} when the checksum is taken.
 *2 After conversion to octet units, this is subtracted in the checksum calculation.

(2) All-Data Intelligent Checksum Calculation Mode with Bytes to be Skipped Specified (CSELB = 1 and CSMD = 0 in CSMR)

After having skipped the number of bytes specified in the SB[5:0] bits in CSMR, counting from the beginning of the packet, the checksum is calculated for all subsequent data (e.g. 14 bytes may be skipped).

26.5 Connection to PHY-LSI

26.5.1 MII Frame Transmission/Reception Timing

Each MII frame transmission/reception timing is shown in Figure 26.14 to Figure 26.17.

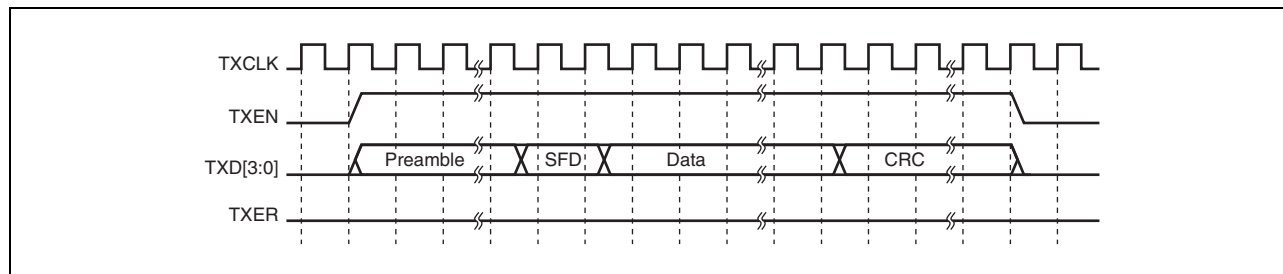

Figure 26.14 MII Frame Transmit Timing (Normal Transmission)

Figure 26.15 MII Frame Receive Timing (Normal Reception)

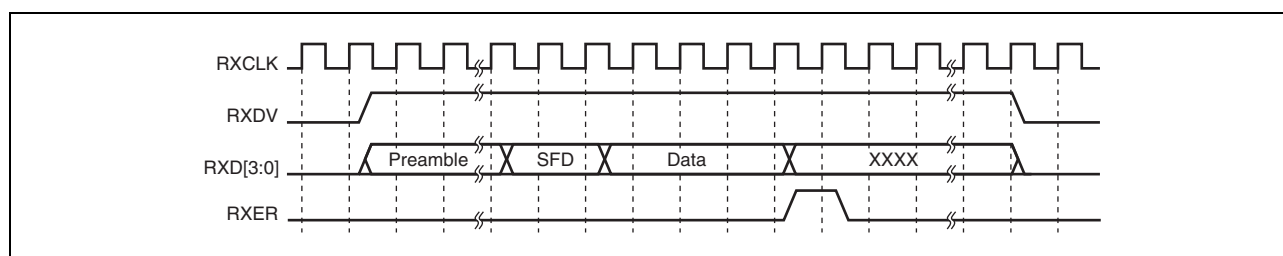

Figure 26.16 MII Frame Receive Timing (Reception Error (1))

Figure 26.17 MII Frame Receive Timing (Reception Error (2))

26.5.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(1) MII Management Frame Format

Figure 26.18 shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

[Legend]

PRE: 32 consecutive 1s
 ST: Write of 01 indicating start of frame
 OP: Write of code indicating access type
 PHYAD: Write of 0001 if the PHY-LSI address is 1 (sequential write starting with the MSB). This bit changes depending on the PHY-LSI address.
 REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB). This bit changes depending on the PHY-LSI register address.
 TA: Time for switching data transmission source on MII interface
 (a) Write: 10 written
 (b) Read: Bus release (notation: Z0) performed
 DATA: 16-bit data. Sequential write or read from MSB
 (a) Write: 16-bit data write
 (b) Read: 16-bit data read
 IDLE: Wait time until next MII management format input
 (a) Write: Independent bus release (notation: X) performed
 (d) Read: Bus already released in TA: control unnecessary

Figure 26.18 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 26.19 (1) to Figure 26.19 (4) show the MII register access timing. The timing will differ depending on the PHY-LSI type.

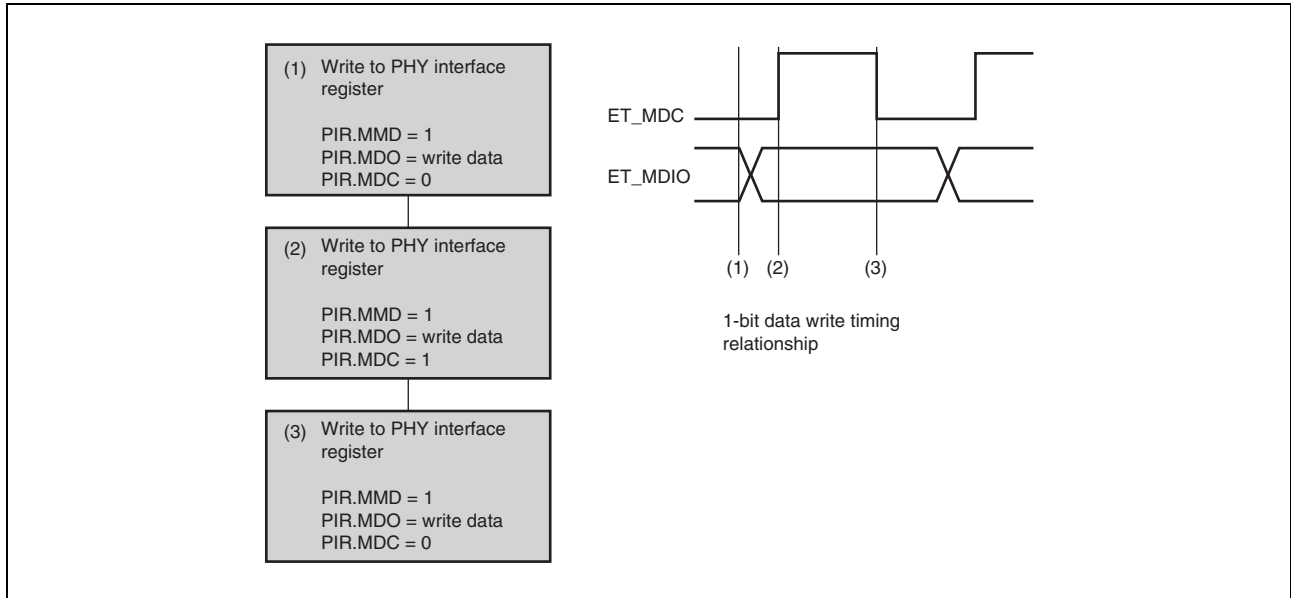

Figure 26.19 (1) 1-Bit Data Write Flowchart

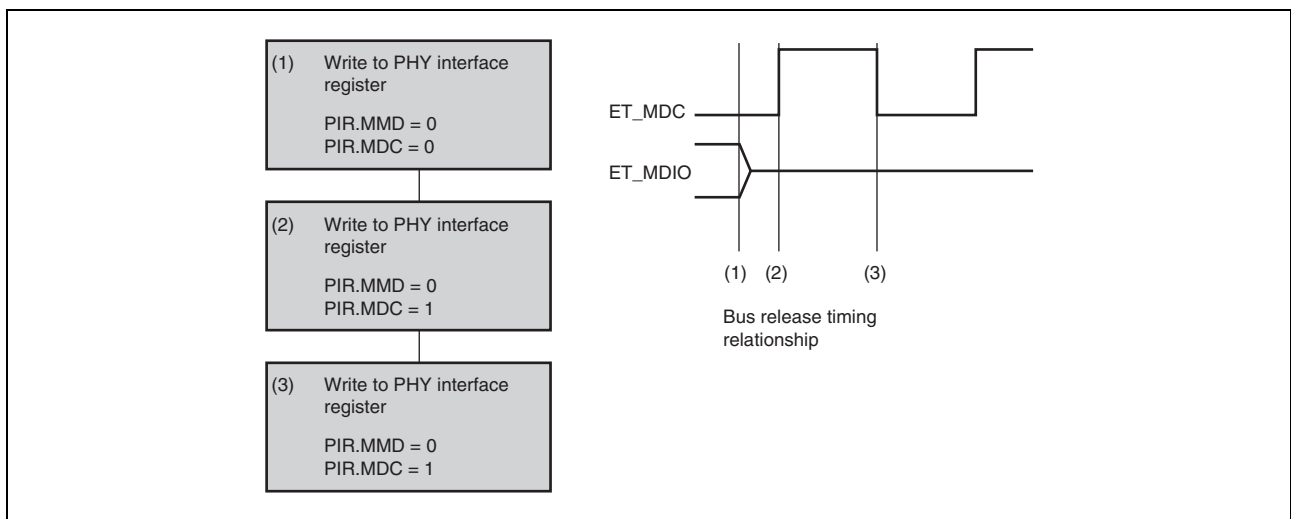

Figure 26.19 (2) Bus Release Flowchart (TA in Read in Figure 26.18)

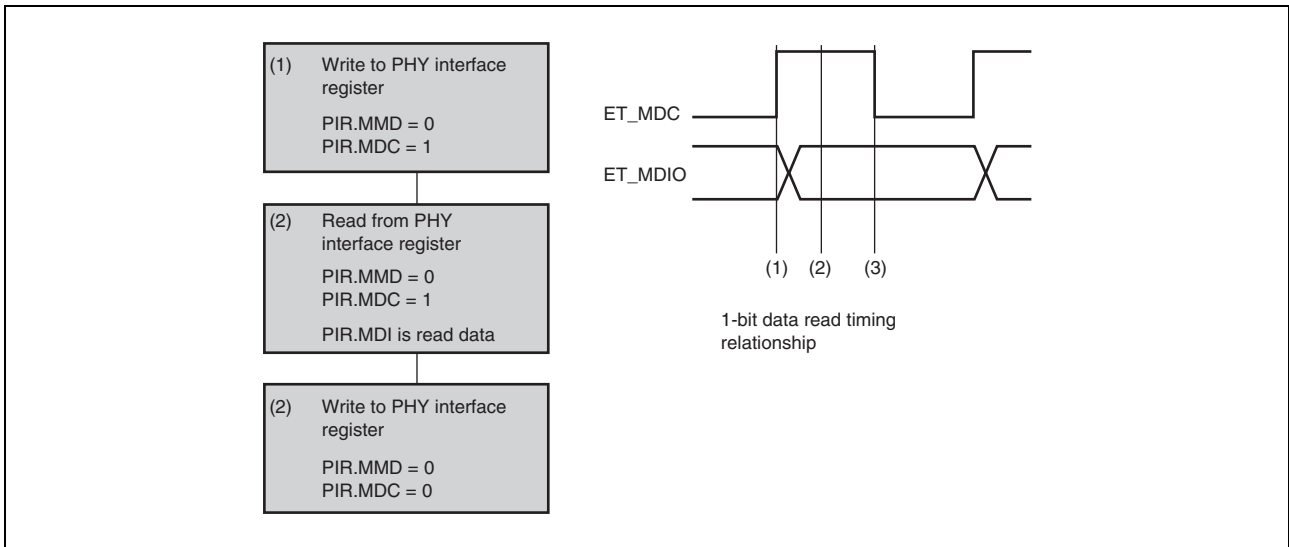

Figure 26.19 (3) 1-Bit Data Read Flowchart

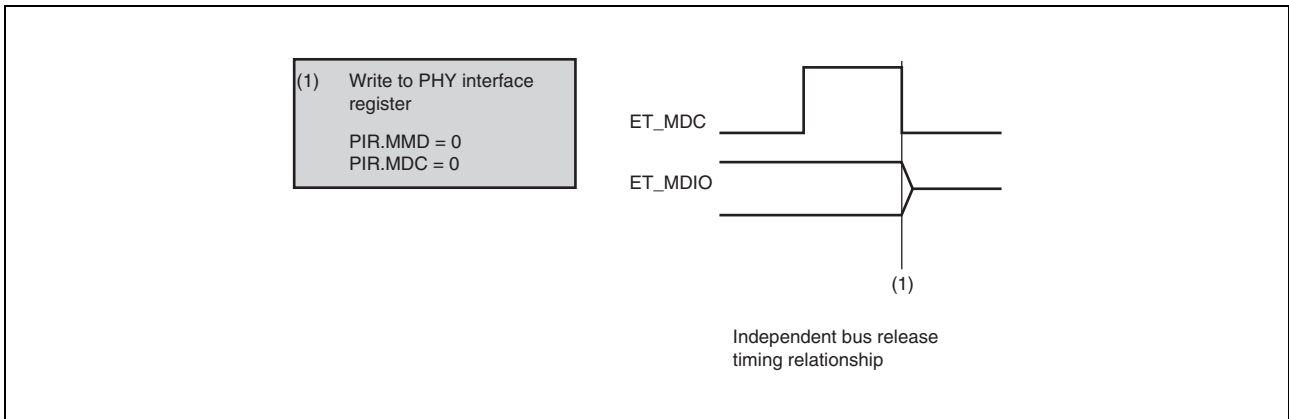

Figure 26.19 (4) Independent Bus Release Flowchart (IDLE in Write in Figure 26.18)

26.6 Usage Notes

26.6.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 26.20 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 26.21 shows schematics of Ethernet frames to which the checksum data has been added.

Note: • Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

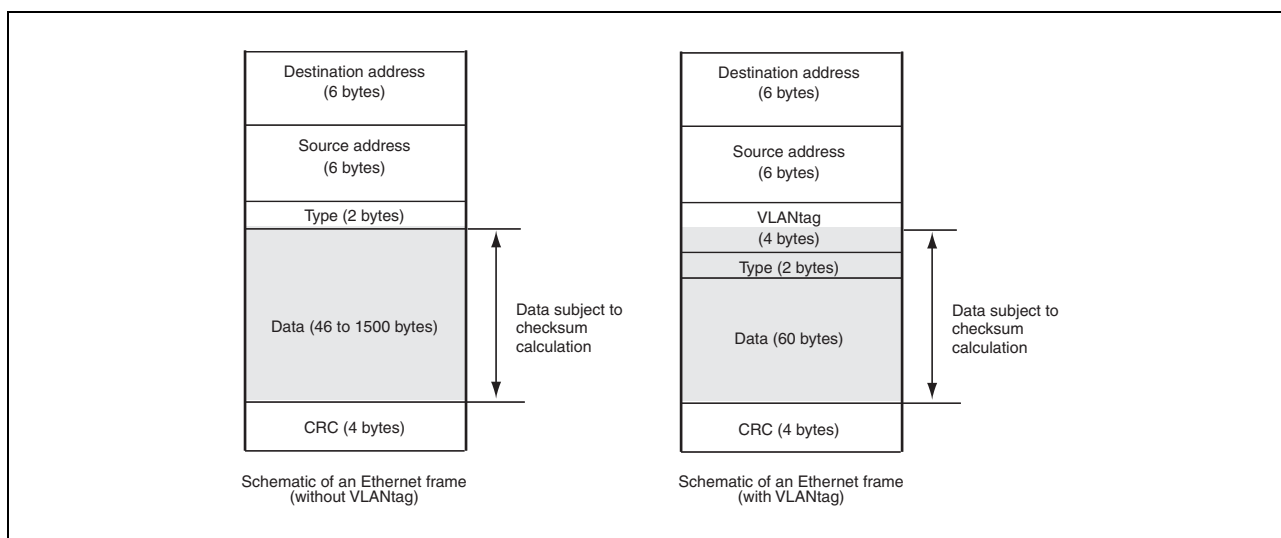

Figure 26.20 Data Subject to Checksum Calculation

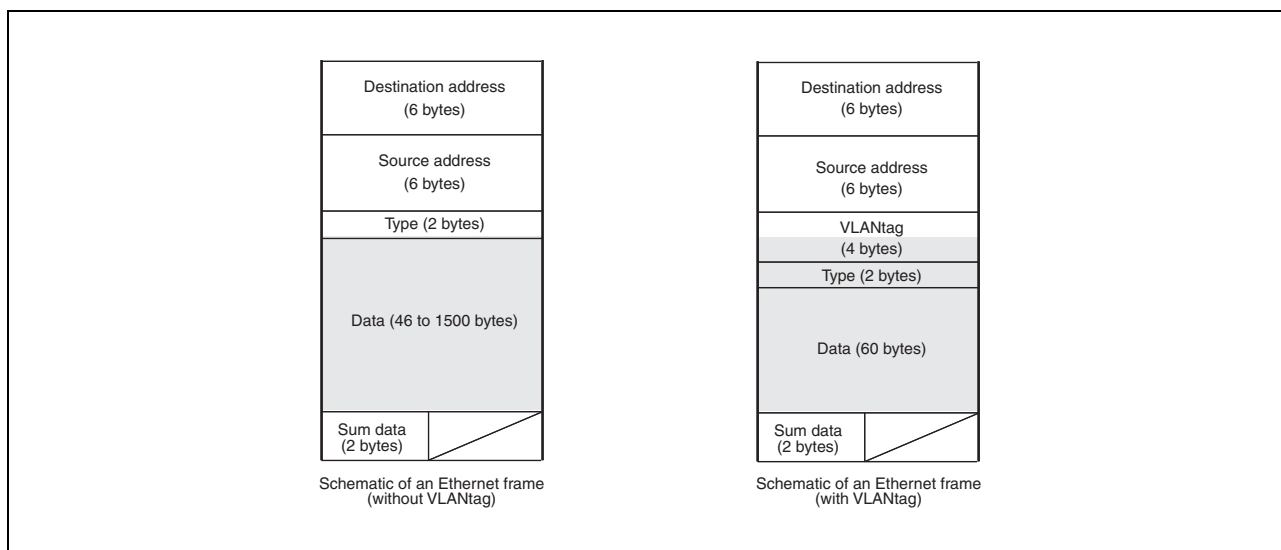

Figure 26.21 Data after Checksum Data Addition

26.6.2 Notes on Using the Intelligent Checksum Function

Checksum calculation using the intelligent checksum function is not affected by padding insertion specified by the receive data padding insert register (RPADIR). This is because checksum calculation is performed when transferring receive data from E-MAC to E-DMAC, while padding of receive data is performed when transferring receive data from E-DMAC to the receive buffer in memory.

27. A/D Converter

This LSI includes a 12-bit successive-approximation A/D converter allowing selection of up to eight analog input channels.

27.1 Features

- Resolution: 12 bits
- Input channels: Eight channels
- Minimum conversion time: 5.0 μ s per channel
- Absolute accuracy: ± 11 LSB
- Operating modes: Three
 - Single mode: A/D conversion on one channel
 - Multi mode: A/D conversion on one to four channels or on one to eight channels
 - Scan mode: Continuous A/D conversion on one to four channels or on one to eight channels
- Data registers: Eight
Conversion results are held in a 16-bit data register for each channel
- Sample-and-hold function
- A/D conversion start methods: Three methods
 - Software
 - Conversion start trigger from the multi-function timer pulse unit 2
 - External trigger signal
- Interrupt source: Two sources
An A/D conversion end interrupt (ADI) request can be generated on completion of A/D conversion.
An over-limit interrupt (LMTI) request can be generated when a result of conversion exceeds the upper or lower limit for each channel.*

Note: * This is only available when 10-bit precision is in use.

- Module standby mode can be set

Figure 27.1 shows a block diagram of the A/D converter.

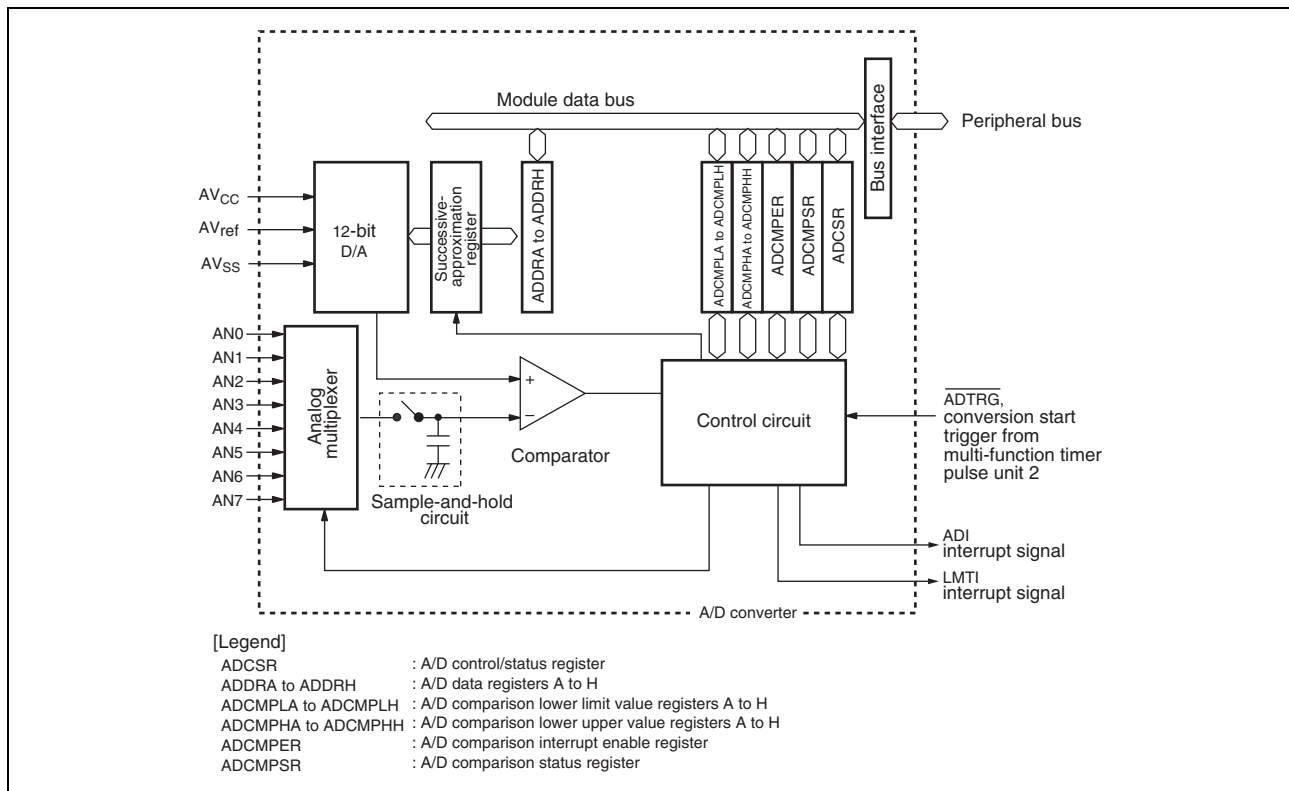

Figure 27.1 Block Diagram of A/D Converter

27.2 Input/Output Pins

Table 27.1 shows the A/D converter pins.

Table 27.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Analog power supply pin	AVcc	Input	Analog power supply pin
Analog ground pin	AVss	Input	Analog ground pin and A/D conversion reference ground
Analog reference voltage pin	AVref	Input	A/D converter reference voltage pin
Analog input pin 0	AN0	Input	Analog input
Analog input pin 1	AN1	Input	
Analog input pin 2	AN2	Input	
Analog input pin 3	AN3	Input	
Analog input pin 4	AN4	Input	
Analog input pin 5	AN5	Input	
Analog input pin 6	AN6	Input	
Analog input pin 7	AN7	Input	
A/D external trigger input pin	$\overline{\text{ADTRG}}$	Input	External trigger input to start A/D conversion

27.3 Register Descriptions

The A/D converter has the following registers.

Table 27.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
A/D data register A	ADDRA	R	H'0000	H'E8005800	16
A/D data register B	ADDRB	R	H'0000	H'E8005802	16
A/D data register C	ADDRC	R	H'0000	H'E8005804	16
A/D data register D	ADDRD	R	H'0000	H'E8005806	16
A/D data register E	ADDRE	R	H'0000	H'E8005808	16
A/D data register F	ADDRF	R	H'0000	H'E800580A	16
A/D data register G	ADDRG	R	H'0000	H'E800580C	16
A/D data register H	ADDRH	R	H'0000	H'E800580E	16

27.3.1 A/D Data Registers A to H (ADDRA to ADDRH)

The eight A/D data registers, ADDRA to ADDRH, are 16-bit read-only registers that store the results of A/D conversion. An A/D conversion produces 12-bit data, which is transferred for storage into bits 15 to 4 of the ADDR corresponding to the selected channel. Bits 3 to 0 of ADDR are reserved bits that are always read as 0.

Access to ADDR in 8-bit units is prohibited. ADDR must always be accessed in 16-bit units.

Table 27.3 indicates the correspondence between analog input channels and ADDR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 4		All 0	R	Bit Data (12bits)
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Table 27.3 Correspondence between Analog Input Channels and ADDR

Analog Input Channel	A/D Data Register where Conversion Result is Stored
AN0	ADDRA
AN1	ADDRB
AN2	ADDRC
AN3	ADDRD
AN4	ADDRE
AN5	ADDRF
AN6	ADDRG
AN7	ADDRH

27.3.2 A/D Comparison Upper Limit Value Registers A to H (ADCMPHA to ADCMPHH)

ADCMPH is a 16-bit readable/writable register that holds the upper limit value to be compared with an A/D conversion result. Eight registers, ADCMPHA to ADCMPHH, are provided.

On completion of A/D conversion on each channel, the A/D conversion result is compared with the data stored in the corresponding upper limit value register. When the result is greater than the upper limit value, the corresponding bit in the A/D comparison status register (ADCMPSTR) is set. Comparison with the upper limit value is performed only when the corresponding bit in the A/D comparison interrupt enable register (ADCMPER) is set.

Access to ADCMPH in 8-bit units is prohibited. ADCMPH must always be accessed in 16-bit units.

Table 27.4 indicates the correspondence between the ADDR registers and the ADCMPH/ADCMPL registers.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6		All 0	R/W	Comparison Upper Limit Value (10 bits)
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

27.3.3 A/D Comparison Lower Limit Value Registers A to H (ADCMPLA to ADCMPLH)

ADCMPL is a 16-bit readable/writable register that holds the lower limit value to be compared with an A/D conversion result. Eight registers, ADCMPLA to ADCMPLH, are provided.

On completion of A/D conversion on each channel, the A/D conversion result is compared with the data stored in the corresponding lower limit value register. When the result is smaller than the lower limit value, the corresponding bit in the A/D comparison status register (ADCMPSR) is set. Comparison with the lower limit value is performed only when the corresponding bit in the A/D comparison interrupt enable register (ADCMPIER) is set.

Access to ADCMPL in 8-bit units is prohibited. ADCMPL must always be accessed in 16-bit units.

Table 27.4 indicates the correspondence between the ADDR registers and the ADCMPH/ADCMPL registers.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6		All 0	R/W	Comparison Lower Limit Value (10 bits)
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Table 27.4 Correspondence between ADDR and ADCMPH/ADCMPL Registers

ADDR where Conversion Result is Stored	ADCMPH/ADCMPL (Target for Comparison)
ADDRA	ADCMPHA/ADCMPLA
ADDRB	ADCMPHB/ADCMPLB
ADDRC	ADCMPHC/ADCMPLC
ADDRD	ADCMPHD/ADCMPLD

27.3.4 A/D Control/Status Register (ADCSR)

ADCSR is a 16-bit readable/writable register that selects the operating mode, controls the A/D converter, and enables or disables starting of A/D conversion by external trigger input.

Bit: 15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

[Legend]

x: Don't care

Note 1. Only 0 can be written to clear the flag after 1 is read.

Note 2. Clear the ADST to stop A/D conversion before transition to software standby mode or module standby mode.

Note 3. Set the A/D conversion time to at least the minimum value to obtain the absolute accuracy specified for the A/D converter.

Note 4. t_{cyc} indicates a cycle time of the peripheral clock 1 (P1 ϕ).

27.3.5 A/D Comparison Interrupt Enable Register (ADCMPER)

ADCMPER is a 16-bit readable/writable register that enables or disables comparison between the A/D data register (ADDR) that holds the A/D conversion result on each channel and the A/D comparison upper/lower limit value register (ADCMPLH/ADCMPL), and enables or disables interrupt request.

27.3.6 A/D Comparison Status Register (ADCMPSR)

ADCMPSR is a 16-bit read-only register that indicates the results of comparison between the A/D data register (ADDR) that holds an A/D conversion result on each channel and the A/D comparison upper/lower limit value register (ADCMPL/ADCMPL).

The bits in this register are valid only when the comparison and an LMTI interrupt are enabled in the A/D comparison interrupt enable register (ADCMPIER). When they are disabled, the bits are always in the cleared state.

When an A/D conversion result exceeds the upper or lower limit value, the corresponding bit is set to 1.

27.4 Operation

The A/D converter uses the successive-approximation method, and the resolution is 12 bits. It has three operating modes: single mode, multi mode, and scan mode. Switching the operating mode or analog input channels must be done while the ADST bit in ADCSR is 0 to prevent incorrect operation. The ADST bit can be set at the same time as the operating mode or analog input channels are changed.

27.4.1 Single Mode

Single mode should be selected when only A/D conversion on one channel is required.

In single mode, A/D conversion is performed once for the specified one analog input channel, as follows:

1. A/D conversion for the selected channel starts when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed, the A/D conversion result is transferred to the A/D data register corresponding to the channel.
3. After A/D conversion has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the mode or channel selection is switched.

Typical operations when a single channel (AN1) is selected in single mode (MDS[2] = 0) are described next. Figure 27.2 shows a timing diagram for this example (the bits which are set in this example belong to ADCSR).

1. Single mode is selected, input channel AN1 is selected (CH[2:0] = 001), the A/D interrupt is enabled (ADIE = 1), and A/D conversion is started (ADST = 1).
2. When A/D conversion is completed, the A/D conversion result is transferred into ADDR0. At the same time the ADF flag is set to 1, the ADST bit is cleared to 0, and the A/D converter becomes idle.
3. Since ADF = 1 and ADIE = 1, an ADI interrupt is requested.
4. The A/D interrupt handling routine starts.
5. The routine reads ADF = 1, and then writes 0 to the ADF flag.
6. The routine reads and processes the A/D conversion result (ADDR0).
7. Execution of the A/D interrupts handling routine ends. Then, when the ADST bit is set to 1, A/D conversion starts and steps 2 to 7 are executed.

Figure 27.2 Example of A/D Converter Operation (Single Mode, One Channel (AN1) Selected)

27.4.2 Multi Mode

Multi mode should be selected when performing A/D conversion once on one or more channels.

In multi mode, A/D conversion is performed once for a maximum of eight specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, ..., AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle. If the ADST bit is cleared to 0 during A/D conversion, A/D conversion is halted and the A/D converter becomes idle. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

A/D conversion is to be performed once on all the specified channels. The conversion results are transferred for storage into the A/D data registers (ADDR) corresponding to the channels.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1.

A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels (AN0 to AN2) are selected in multi mode are described next. Figure 27.3 shows a timing diagram for this example.

1. Multi mode is selected (MDS[2] = 1, MDS[1] = 0), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDR0.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and the ADST bit is cleared to 0.
6. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested.

Figure 27.3 Example of A/D Converter Operation (Multi Mode, Three Channels (AN0 to AN2) Selected)

27.4.3 Scan Mode

Scan mode is useful for monitoring analog inputs in a group of one or more channels at all times. In scan mode, A/D conversion is performed sequentially for a maximum of eight specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, ..., AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated. The A/D converter starts A/D conversion again from the channel with the lowest number.
4. The ADST bit is not cleared automatically, so steps 2. and 3. are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion halts and the A/D converter becomes idle. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels (AN0 to AN2) are selected in scan mode are described as follows. Figure 27.4 shows a timing diagram for this example.

1. Scan mode is selected (MDS[2] = 1, MDS[1] = 1), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDRA.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all the selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and conversion of the first channel (AN0) starts again. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested after A/D conversion of the third channel.
6. The ADST bit is not cleared automatically, so steps 2. to 4. are repeated as long as the ADST bit remains set to 1. When steps 2. to 4. are repeated, the ADF flag is kept to 1. When the ADST bit is cleared to 0, A/D conversion stops. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

If both the ADF flag and ADIE bit are set to 1 while steps 2. to 4. are repeated, an ADI interrupt is requested at all times. To generate an interrupt on completing conversion of the third channel, clear the ADF bit to 0 after an interrupt is requested.

Figure 27.4 Example of A/D Converter Operation (Scan Mode, Three Channels (AN0 to AN2) Selected)

27.4.4 A/D Converter Activation by External Trigger or Multi-Function Timer Pulse Unit 2

The A/D converter can be independently activated by an external trigger or an A/D conversion request from the multi-function timer pulse unit 2. To activate the A/D converter by an external trigger or the multi-function timer pulse unit 2, set the A/D trigger enable bits (TRGS[3:0]). When an external trigger or an A/D conversion request from the multi-function timer pulse unit 2 is generated with this bit setting, the ADST bit is set to 1 to start A/D conversion. The channel combination is determined by bits CH2 to CH0 in ADCSR. The timing from setting of the ADST bit until the start of A/D conversion is the same as when 1 is written to the ADST bit by software.

27.4.5 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at the A/D conversion start delay time (t_D) after the ADST bit in ADCSR is set to 1, then starts conversion. Figure 27.5 shows the A/D conversion timing. Table 27.5 indicates the A/D conversion time.

As indicated in Figure 27.5, the A/D conversion time (t_{CONV}) includes t_D and the input sampling time (t_{SPL}). The length of t_D varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in Table 27.5.

In multi mode and scan mode, the values given in Table 27.5 apply to the first conversion. In the second and subsequent conversions, time is the values given in Table 27.6.

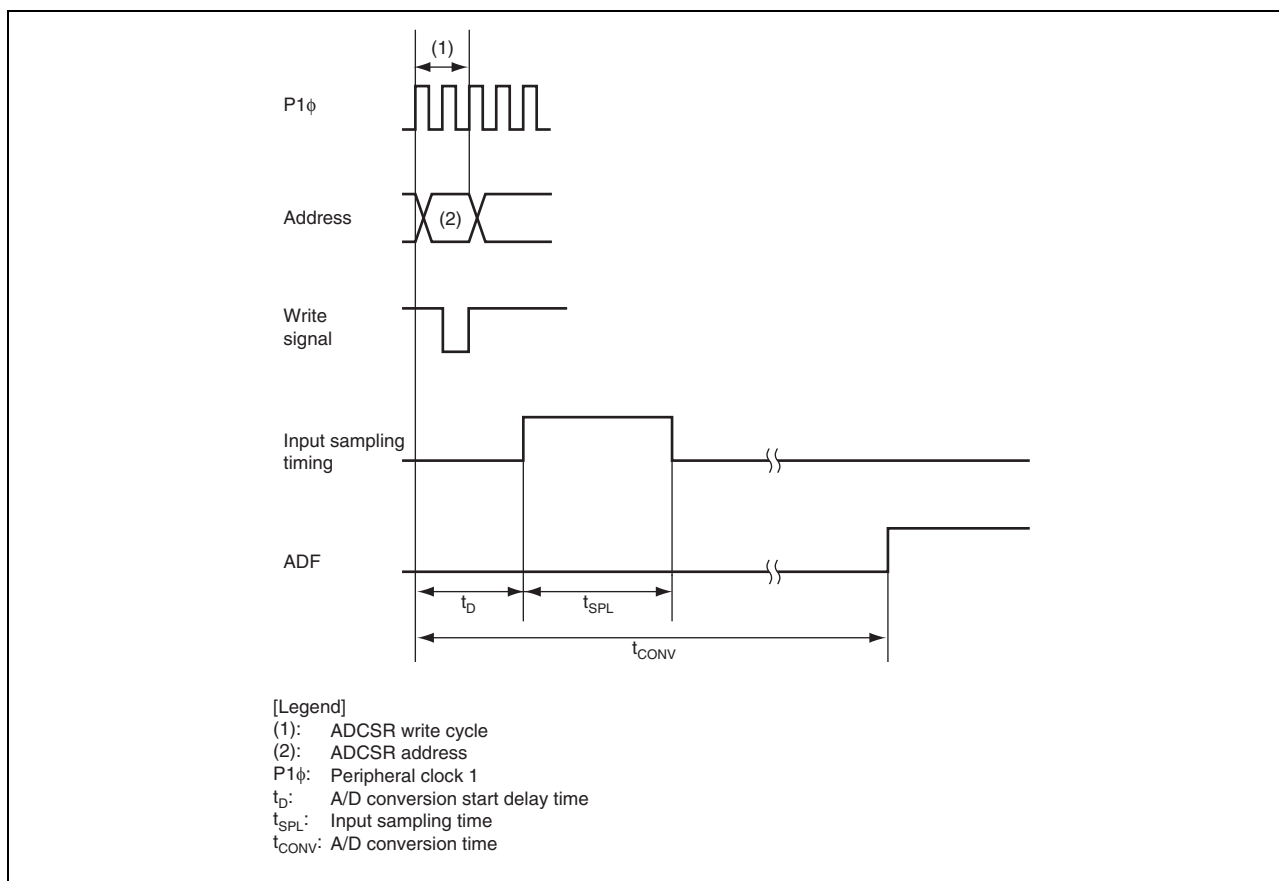

Figure 27.5 A/D Conversion Timing

Table 27.5 A/D Conversion Time (Single Mode)

Item	Symbol	CKS2 = 0												CKS2 = 1

Table 27.6 A/D Conversion Time (Multi Mode and Scan Mode)

CKS1	CKS0	Conversion Time (t_{cyc})
0	0	240 (constant)
	1	280 (constant)
1	0	320 (constant)
	1	360 (constant)

Note: Values in the table are represented in terms of t_{cyc} . t_{cyc} indicates a cycle time of the peripheral clock 1 (P1 ϕ).

27.4.6 External Trigger Input Timing

A/D conversion can also be externally triggered. When the TRGS[3:0] bits in ADCSR are set to B'1001, an external trigger is input to the $\overline{\text{ADTRG}}$ pin. The ADST bit in ADCSR is set to 1 at the falling edge of the $\overline{\text{ADTRG}}$ pin, thus starting A/D conversion. Other operations, regardless of the operating mode, are the same as when the ADST bit has been set to 1 by software. Figure 27.6 shows the timing.

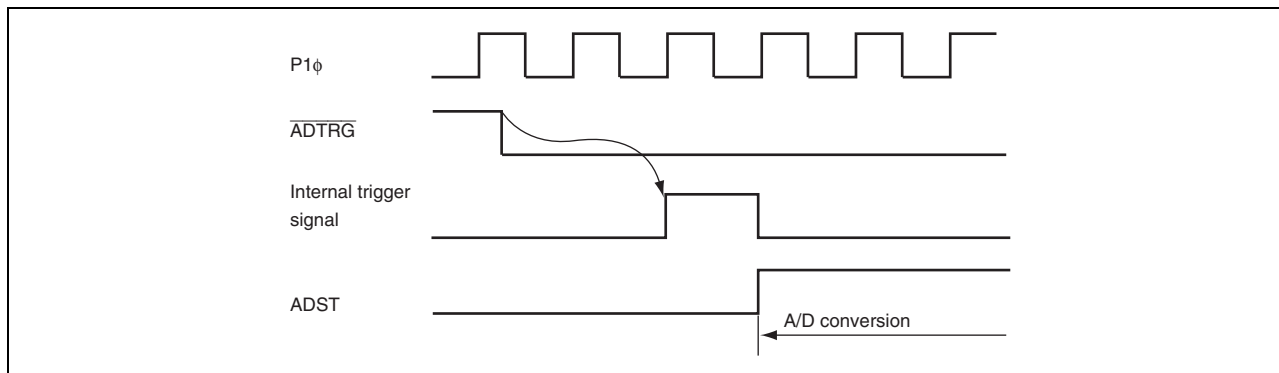

Figure 27.6 External Trigger Input Timing

27.5 Interrupt Sources and DMA Transfer Request

The A/D converter generates an A/D conversion end interrupt (ADI) and an over-limit interrupt (LMTI). The direct memory access controller can be activated by an ADI interrupt request depending on the setting of the direct memory access controller.

Table 27.7 shows the relationship between interrupt sources and the DMA transfer request.

Table 27.7 Relation between Interrupt Sources and DMA Transfer Request

Name	Interrupt Source	Interrupt Flag	Direct Memory Access Controller Activation
ADI	A/D conversion end	ADF in ADCSR	Possible
LMTI	Conversion result exceeding the limit value	HOVRA to HOVRH and LUDRA to LUDRH in ADCMPSR	Impossible

(a) ADI Interrupt

The A/D converter generates an A/D conversion end interrupt (ADI) at the end of A/D conversion. An ADI interrupt request is generated if the ADIE bit is set to 1 when the ADF bit in ADCSR is set to 1 on completion of A/D conversion. Note that the direct memory access controller can be activated by an ADI interrupt depending on the setting of the direct memory access controller. In this case, an interrupt is not issued to the CPU. If the setting to activate the direct memory access controller has not been made, an interrupt request is sent to the CPU. Having the converted data read by the direct memory access controller in response to an ADI interrupt enables continuous conversion to be achieved without imposing a load on software.

In single mode, set the direct memory access controller so that DMA transfer initiated by an ADI interrupt is performed only once. In the case of A/D conversion on multiple channels in scan mode or multi mode, setting the DMA transfer count to one causes DMA transfer to finish after transferring only one channel of data. To make the direct memory access controller transfer all conversion data, set the ADDR where A/D conversion data is stored as the transfer source address, and the number of converted channels as the transfer count.

When the direct memory access controller is activated by ADI, the ADF bit in ADCSR is automatically cleared to 0 when data is transferred by the direct memory access controller.

(b) LMTI Interrupt

An A/D conversion result is compared with the upper or lower limit value on each channel, and if the result exceeds the limit, the over-limit interrupt (LMTI) is generated. While the HLMEN bit in ADCMPER is 1, a conversion result is compared with the upper limit in ADCMPH the instant the conversion value is determined. When the value exceeds the upper limit, the corresponding bit in ADCMPSR is set to 1, which causes an LMTI interrupt to be generated. In the same way, while the LLMEN bit in ADCMPER is 1, a conversion result is compared with the lower limit. If it exceeds the limit, an LMTI interrupt request is generated.

The ADCMPSR register can be referenced in the LMTI interrupt handling to identify the channel causing over-limit value and to know whether the result has exceeded the upper limit value or the lower one.

27.6 Definitions of A/D Conversion Accuracy

The A/D converter compares an analog value input from an analog input channel with its analog reference value and converts it to 10-bit digital data. The absolute accuracy of this A/D conversion is the deviation between the input analog value and the output digital value. It includes the following errors:

- Offset error
- Full-scale error
- Quantization error
- Nonlinearity error

These four error quantities are explained below with reference to Figure 27.7. In the figure, the 12-bit A/D converter is illustrated as the 3-bit A/D converter for explanation. Offset error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from the minimum (zero voltage) B'000000000000 (000 in the figure) to B'000000000001 (001 in the figure) (Figure 27.7, item (1)). Full-scale error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from B'111111111110 (110 in the figure) to the maximum B'111111111111 (111 in the figure) (Figure 27.7, item (2)). Quantization error is the intrinsic error of the A/D converter and is expressed as 1/2 LSB (Figure 27.7, item (3)). Nonlinearity error is the deviation between actual and ideal A/D conversion characteristics between zero voltage and full-scale voltage (Figure 27.7, item (4)). Note that it does not include offset, full-scale, or quantization error.

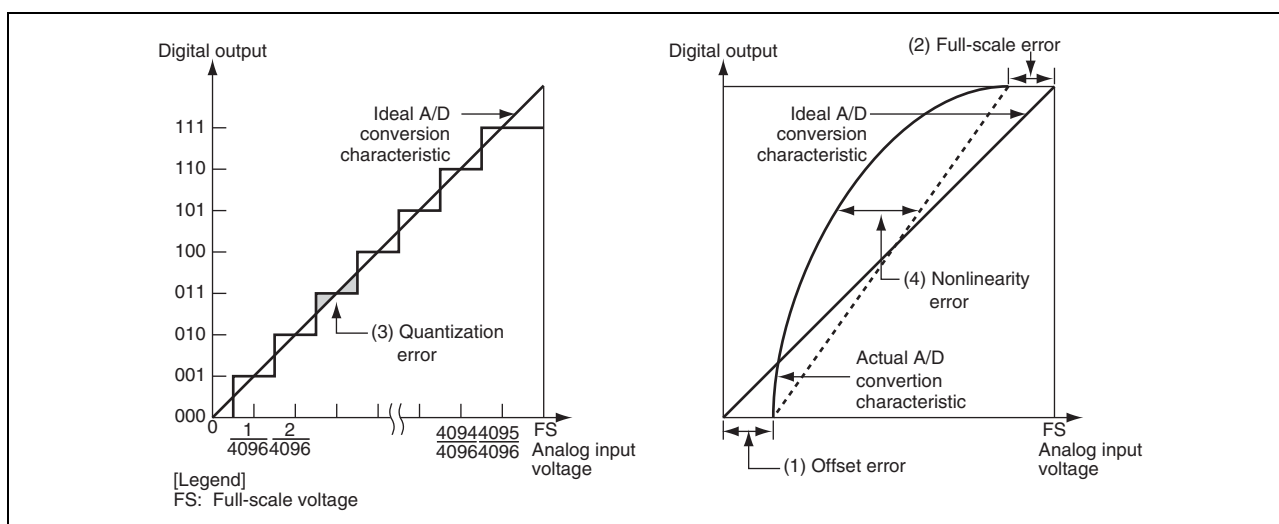

Figure 27.7 Definitions of A/D Conversion Accuracy

27.7 Usage Notes

When using the A/D converter, note the following points.

27.7.1 Module Standby Mode Setting

Operation of the A/D converter can be disabled or enabled using the standby control register. The initial setting is for operation of the A/D converter to be halted. Register access is enabled by clearing module standby mode. For details, see section 42, Power-Down Modes.

27.7.2 Setting Analog Input Voltage

Using the LSI outside the following voltage ranges may impair the LSI reliability.

1. Analog input range

During A/D conversion, voltages on the analog input pins AN_n should not go beyond the following range: $AV_{SS} \leq AN_n \leq AV_{CC}$ ($n = 0$ to 7).

2. AV_{CC} and AV_{SS} input voltages

Input voltages AV_{CC} and AV_{SS} should be $PV_{CC} - 0.3 \text{ V} \leq AV_{CC} \leq PV_{CC}$ and $AV_{SS} = V_{SS}$. Do not leave the AV_{CC} and AV_{SS} pins open even when the A/D converter is not in use and in software standby mode. When not in use, connect AV_{CC} to the power supply (PV_{CC}) and AV_{SS} to the ground (V_{SS}).

3. Setting range of AV_{ref} input voltage

Set the reference voltage range of the AV_{ref} pin as $3.0 \text{ V} \leq AV_{ref} \leq AV_{CC}$.

27.7.3 Notes on Board Design

In board design, digital circuitry and analog circuitry should be as mutually isolated as possible, and layout in which digital circuit signal lines and analog circuit signal lines cross or are in close proximity should be avoided as far as possible. Failure to do so may result in incorrect operation of the analog circuitry due to inductance, adversely affecting A/D conversion values.

Digital circuitry must be isolated from the analog input signals (AN₀ to AN₇), analog reference voltage (AV_{ref}), and analog power supply (AV_{CC}) by the analog ground (AV_{SS}). Also, the analog ground (AV_{SS}) should be connected at one point to a stable digital ground (V_{SS}) on the board.

27.7.4 Processing of Analog Input Pins

To prevent damage from voltage surges at the analog input pins (AN0 to AN7), connect an input protection circuit like the one shown in Figure 27.8. The circuit shown also includes a CR filter to suppress noise. This circuit is shown as an example; the circuit constants should be selected according to actual application conditions.

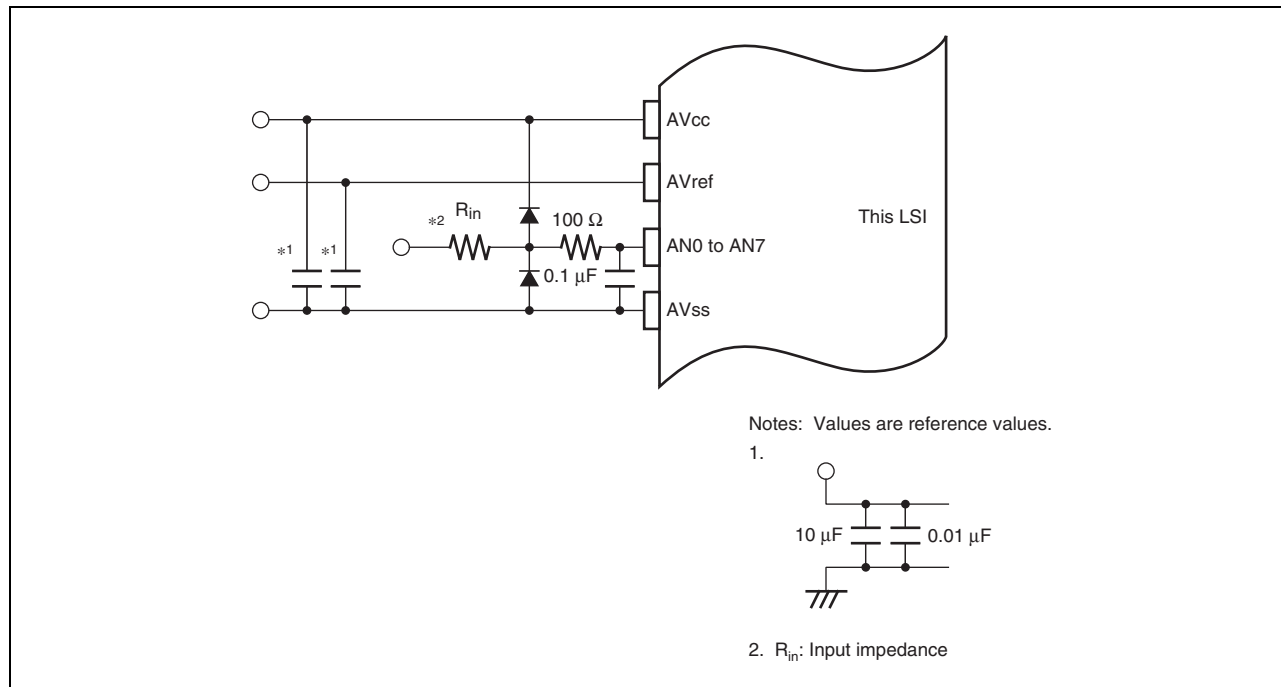

Figure 27.8 Example of Analog Input Protection Circuit

27.7.5 Permissible Signal Source Impedance

This LSI's analog input is designed such that conversion precision is guaranteed for an input signal for which the signal source impedance is 3 k Ω or less. This specification is provided to enable the A/D converter's sample-and-hold circuit input capacitance to be charged within the sampling time; if the sensor output impedance exceeds 3 k Ω , charging may be insufficient and it may not be possible to guarantee A/D conversion precision. However, for A/D conversion in single mode with a large capacitance provided externally for A/D conversion in single mode, the input load will essentially comprise only the internal input resistance of 1 k Ω , and the signal source impedance is ignored. However, as a low-pass filter effect is obtained in this case, it may not be possible to follow an analog signal with a large differential coefficient (e.g., 5 mV/ μ s or greater) (see Figure 27.9). When converting a high-speed analog signal or performing A/D conversion in scan mode, a low-impedance buffer should be inserted.

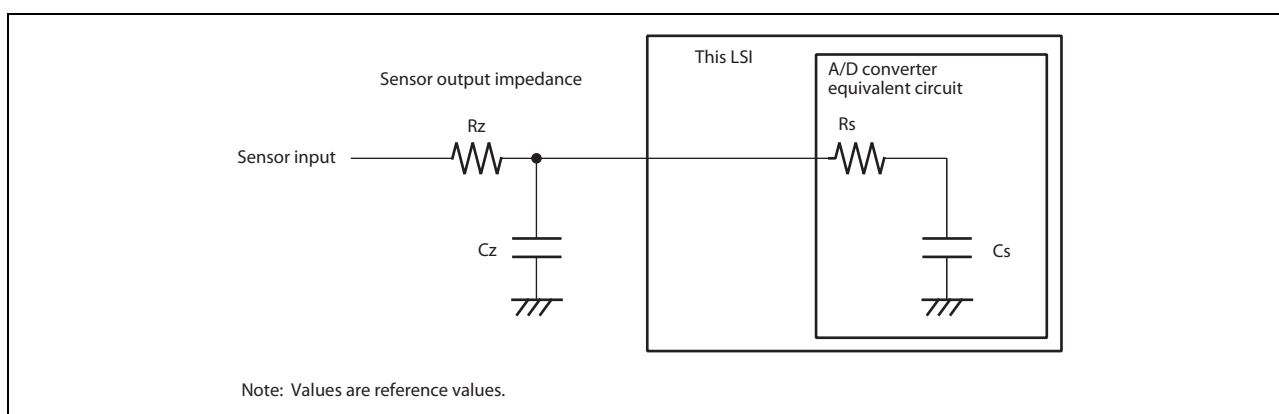

Figure 27.9 Example of Analog Input Circuit

Table 27.8 Analog Input Pin Ratings

Item	Symbol	Min.	Max.	Unit
Permissible Signal Source Impedance	Rz	—	3	k Ω
Low-Pass Filter	Cz	—	0.1	μ F
Equivalent Circuit of A/D Converter	Rs	—	1	k Ω
	Cs	—	20	pF

27.7.6 Influences on Absolute Precision

Adding capacitance results in coupling with GND, and therefore noise in GND may adversely affect absolute precision. Be sure to connect AVss, etc. to an electrically stable GND. Care is also required to insure that filter circuits do not communicate with digital signals on the mounting board (i.e., acting as antennas).

27.7.7 Usage Note on Port Pins

The analog input pins (AN0 to AN7) are multiplexed with general-purpose I/O port pin functions (pins P1_8 to P1_15) and the latter can be used as digital inputs. Do not use these general-purpose I/O port pins as digital inputs while the A/D converter is in use with 12-bit precision.

28. USB2.0 Host/Function Module

This LSI includes a two-channel USB 2.0 host/function module. This module is a USB controller which provides capabilities as a USB host controller and USB function controller.

This module supports high-speed transfer, full-speed transfer, and low-speed transfer defined by USB (Universal Serial Bus) Specification 2.0, when used as the host controller, and supports high-speed transfer and full-speed transfer defined by USB (Universal Serial Bus) Specification 2.0, when used as the function controller.

This module supports all of the transfer types defined by the USB Specification. This module has an 8-Kbyte buffer memory for data transfer, providing a maximum of 16 pipes. Any endpoint numbers can be assigned to PIPE1 to PIPE15, based on the peripheral devices or user system for communication.

28.1 Features

(1) Host Controller and Function Controller Supporting USB High-Speed Operation

- The USB host controller and USB function controller are incorporated.
- The USB host controller and USB function controller can be switched by register settings.
- On-chip USB transceiver

(2) All Types of USB Transfers Supported

All types of USB transfers including isochronous transfer are supported.

- Control transfer
- Bulk transfer
- Interrupt transfer (high bandwidth transfers not supported)
- Isochronous transfer (high bandwidth transfers not supported)

(3) Internal Bus Interfaces

- Two DMA interfaces available for each channel

(4) Pipe Configuration

- Up to 8 Kbytes of buffer memory for USB communications are supported for each channel
- Up to sixteen pipes can be selected for each channel (including the default control pipe)
- Programmable pipe configuration
- Endpoint numbers can be assigned flexibly to PIPE1 to PIPE15.
- Transfer conditions that can be set for each pipe:
 - PIPE0: Control transfer, 256-byte fixed single buffer
 - PIPE1 and PIPE2: Bulk transfer or isochronous transfer can be selected, continuous transfer mode, programmable buffer size (up to 2 Kbytes: double buffer can be specified)
 - PIPE3 to PIPE5: Bulk transfer, continuous transfer mode, programmable buffer size (up to 2 Kbytes: double buffer can be specified)
 - PIPE6 to PIPE8: Interrupt transfer, 64-byte fixed single buffer
 - PIPE9: Bulk transfer (only when the function controller mode is selected)
Interrupt transfer (only when the host controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified only when bulk transfer has been selected)
 - PIPE10: Bulk transfer or interrupt transfer can be selected (only when the function controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified only when bulk transfer has been selected)

PIPE11 to PIPE15: Bulk transfer (only when the function controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified)

(5) Features of the USB Host Controller

- High-speed transfer (480 Mbps), full-speed transfer (12 Mbps), and low-speed transfer (1.5 Mbps) are supported.
- Communications with multiple peripheral devices connected via a single HUB
- Automatic response to the reset handshake
- Automatic scheduling for SOF and packet transmissions
- Programmable intervals for isochronous and interrupt transfers

(6) Features of the USB Function Controller

- High-speed transfer (480 Mbps) and full-speed transfer (12 Mbps) are supported.
- Automatic recognition of high-speed operation or full-speed operation based on automatic response to the reset handshake
- Control transfer stage monitoring function
- Device state monitoring function
- Auto response function for SET_ADDRESS request
- NAK response interrupt function (NRDY)
- SOF interpolation function

(7) Other Features

- Transfer ending function using transaction count
- BRDY interrupt event notification timing change function (BFRE)
- Function that automatically clears the buffer memory after the data for the pipe specified at the Dx FIFO port has been read (DCLRM)
- NAK setting function for response PID generated by end of transfer (SHTNAK)

28.2 Input/Output Pins

Table 28.1 shows the pin configuration.

Table 28.1 Pin Configuration

Channel	Name	Pin Name	I/O	Function
0	USB D+ data	DP0	Input/ Output	The D+ input/output pin of the on-chip USB transceiver Connect this pin to the D+ pin of the USB bus.
	USB D- data	DM0	Input/ Output	The D- input/output pin of the on-chip USB transceiver Connect this pin to the D- pin of the USB bus.
	VBUS input	VBUS0	Input	A pin for monitoring connection of the USB cable Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin. When it is not connected to the Vbus pin of the USB, It should be fixed to 5 V. Also supply 5 V to this pin when the host controller mode is selected. Note: This module is not capable of supplying Vbus power to connected peripheral devices.
1	USB D+ data	DP1	Input/ Output	The D+ input/output pin of the on-chip USB transceiver Connect this pin to the D+ pin of the USB bus.
	USB D- data	DM1	Input/ Output	The D- input/output pin of the on-chip USB transceiver Connect this pin to the D- pin of the USB bus.
	VBUS input	VBUS1	Input	A pin for monitoring connection of the USB cable Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin. When it is not connected to the Vbus pin of the USB, It should be fixed to 5 V. Also supply 5 V to this pin when the host controller mode is selected. Note: This module is not capable of supplying Vbus power to connected peripheral devices.
Common	Reference input	REFRIN	Input	A pin for connecting the reference resistor Connect this pin to the USBAPVss pin through a resistor with a value of $5.6\text{ k}\Omega \pm 1\%$.
	USB crystal oscillator/external clock	USB_X1	Input	Connect this pin to the crystal oscillator for USB. An external clock can also be input to the USB_X1 pin.
		USB_X2	Output	
	Transceiver digital core power*	USBDVcc	Input	Power supply for the module's digital core
	Transceiver digital core ground*	USBDVss	Input	Ground for the module's digital core
	Transceiver digital pin power source*	USBDPVcc	Input	Power supply for pins
	Transceiver digital pin ground*	USBDPVss	Input	Ground for pins
	Transceiver analog pin power source	USBAPVcc	Input	Power supply for pins
	Transceiver analog pin ground*	USBAPVss	Input	Ground for pins
	Transceiver analog core power	USBAVcc	Input	Power supply for the module's digital core
Transceiver analog core ground*	USBAVss	Input	Ground for the module's digital core	
Power source for the UTMI module*	USBVcc	Input	Power supply for operation at 480 MHz	
Ground for the UTMI module*	USBVss	Input	Power supply for operation at 480 MHz	

Note: *These pins are not present on products in the BGA package.

28.3 Register Descriptions

Table 28.2 shows the register configuration of this module.

Table 28.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Address	Access Size
0	System configuration control register_0	SYSCFG0_0	R/W	H'E801 0000	16

28.3.1 System Configuration Control Register (SYSCFG0)

SYSCFG is a register that enables high-speed operation, selects the host controller mode or function controller mode, controls the DP and DM pins, and enables operation of this module.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	HSE	DCFM	DRPD	DPRPU	—	UCK SEL	UPLLE	USBE
Initial value:	—	—	—	—	—	—	—	0	0	0	1	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7	HSE	0	R/W	High-Speed Operation Enable 0: High-speed operation is disabled When the function controller mode is selected: Only full-speed operation is enabled. When the host controller mode is selected: Full-speed or low-speed operation is enabled. 1: High-speed operation is enabled (communication speed is detected by this module) (1) When the host controller mode is selected When HSE = 0, the USB port performs low-speed or full-speed operation. Set HSE to 0 when connection of a low-speed peripheral device to the USB port has been detected. When HSE = 1, this module executes the reset handshake protocol, and automatically allows the USB port to perform high-speed or full-speed operation according to the protocol execution result. This bit should be modified after detecting device connection (after detecting the ATTCH interrupt) and before executing a USB bus reset (before setting USBRST to 1). (2) When the function controller mode is selected When HSE = 0, this module performs full-speed operation. When HSE = 1, this module executes the reset handshake protocol, and automatically performs high-speed or full-speed operation according to the protocol execution result. This bit should be modified while DPRPU is 0.
6	DCFM	0	R/W	Controller Mode Select Selects the host controller mode or function controller mode. 0: Function controller mode is selected. 1: Host controller mode is selected. This bit should be modified while DPRPU and DRPD are 0.
5	DRPD	1	R/W	D+/D- Line Resistor Control Enables or disables pulling down D+ and D- lines when the host controller mode is selected. 0: Pulling down the lines is disabled. 1: Pulling down the lines is enabled. This bit should be set to 1 if the host controller mode is selected, and should be set to 0 if the function controller mode is selected.

Bit	Bit Name	Initial Value	R/W	Description
4	DPRPU	0	R/W	D+ Line Resistor Control Enables or disables pulling up D+ line when the function controller mode is selected. 0: Pulling up the line is disabled. 1: Pulling up the line is enabled. Setting this bit to 1 when the function controller mode is selected allows this module to pull up the D+ line, thus notifying the USB host of connection. Modifying this bit from 1 to 0 allows this module to cancel pulling up the D+ line, thus notifying the USB host of disconnection. This bit should be set to 1 if the function controller mode is selected, and should be set to 0 if the host controller mode is selected.
3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2	UCKSEL*1	0	R/W	Input Clock Selection Selects the clock to be supplied to this module from 48-MHz USB_X1 or 12-MHz EXTAL. 0: The 48-MHz USB_X1 clock is selected. 1: The 12-MHz EXTAL clock is selected. This bit should be modified while SUSPMODE.SUSPM for channel 0 and channel 1 is 0. Set this bit to 0 when this module is to enter software standby or USB standby mode. Note that this bit is available only in channel 0 (SYSCFG0_0). Make the required setting for SYSCFG0_0 to use channel 1.
1	UPLLE*1	0	R/W	USB Internal PLL Operation Enable Enables or disables operation of the internal PLL of the USB block. 0: Disables operation of the internal PLL. 1: Enables operation of the internal PLL. This bit should be modified while SUSPMODE.SUSPM for channel 0 and channel 1 is 0. Set this bit to 0 when this module is to enter software standby or USB standby mode. Note that this bit is available only in channel 0 (SYSCFG0_0). Make the required setting for SYSCFG0_0 to use channel 1.
0	USBE	0	R/W	USB Module Operation Enable Enables or disables operation of this module. 0: USB module operation is disabled. 1: USB module operation is enabled. Modifying this bit from 1 to 0 initializes some register bits as listed in Table 28.3 and Table 28.4. This bit should be modified while SUSPMODE.SUSPM is 1. When the host controller mode is selected, this bit should be set to 1 after setting DPRD to 1, eliminating LNST bit chattering, and checking that the USB bus has been settled.

Note: • Writing to this register is possible even while the clock supply to this module is stopped (SUSPM = 0).

Note 1. UCKSEL and UPLLE are available only in channel 0 (SYSCFG0_0).

Table 28.3 Register Bits Initialized by Writing USBE = 0 (when Function Controller Mode is Selected)

Register Name	Bit Name	Remarks
SYSSTS0	LNST	The value is retained when the host controller mode is selected.
DVSTCTR0	RHST	
INTSTS0	DVSQ	The value is retained when the host controller mode is selected.
USBADDR	USBADDR	The value is retained when the host controller mode is selected.
USEREQ	BRequest, bmRequestType	The values are retained when the host controller mode is selected.
USBVAL	wValue	The value is retained when the host controller mode is selected.
USBINDX	wIndex	The value is retained when the host controller mode is selected.
USBLENG	wLength	The value is retained when the host controller mode is selected.

Table 28.4 Register Bits Initialized by Writing USBE = 0 (when Host Controller Mode is Selected)

Register Name	Bit Name	Remarks
DVSTCTR	RHST	
FRMNUM	FRNM	The value is retained when the function controller mode is selected.
UFRMNUM	UFRNM	The value is retained when the function controller mode is selected.

28.3.2 CPU Bus Wait Setting Register (BUSWAIT)

BUSWAIT is a register that specifies the number of wait cycles to be inserted during an access from the CPU to this module.

This register can be modified even when the SUSPM bit in SUSPMODE is 0.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BWAIT[5:0]					
Initial value:	—	—	0	0	1	1	1	1	—	—	0	0	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 0.
7, 6	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
5 to 0	BWAIT[5:0]	001111	R/W	CPU Bus Wait Specifies the number of wait cycles to be inserted during an access to this module. 000000: 0 wait cycles (2 access cycles) : 000010: 2 wait cycles (4 access cycles) : 000100: 4 wait cycles (6 access cycles) : 001111: 15 wait cycles (17 access cycles) (initial value) : 111111: 63 wait cycles (65 access cycles) There is the following constraint imposed on the cycle period required to access SYSSTS0 and the subsequent registers of this module: Wait constraint: The cycle period required to consecutively access registers of this controller must be at least 67 ns. To satisfy this constraint, it is necessary to exercise wait control according to the frequency of peripheral clock 1 (P1 ϕ). The initial value is 17 clock cycles. Select an appropriate value. This setting is also applied to the accesses to the FIFO port registers. The maximum access speeds for the FIFO ports are as follows: MBW = 10 (32-bit width): up to 60 MBytes/sec MBW = 01 (16-bit width): up to 30 MBytes/sec MBW = 00 (8-bit width): up to 15 MBytes/sec

28.3.3 System Configuration Status Register (SYSSTS0)

SYSSTS is a register that monitors the line status (D+ and D- lines) of the USB data bus.

This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	HTACT	SOFEA	—	—	—	LNST[1:0]	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	HTACT	Undefined	R	USB Host Sequencer Status Monitor Indicates the status of the host sequencer. 0: Stopped 1: Running This bit is set to 0 when the host sequencer in this controller is completely stopped. Make sure that the HTACT bit is set to 0 to put this controller in the USB suspended state by setting the UACT bit to 0 and stop the clock by setting the SUSPM bit to 0 in the host-mode communication state.
5	SOFEA	Undefined	R	SOF Active Monitor when the Host Controller Mode Is Selected Indicates the SOF output status. 0: SOF output stopped 1: SOF output in progress This bit allows checking if the last SOF has been output after setting the UACT bit to 0 when putting this controller in the USB suspended state with the host controller mode selected. To set the SUSPM bit to 0 (to stop the clock) after stopping this controller by setting the USBE bit to 0 in the host-mode communication state, make sure that both the HTACT bit and the SOFEA bit are set to 0.
4 to 2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	LNST[1:0]	Undefined	R	USB Data Line Status Monitor Indicates the status of the USB data bus lines (D+ and D-) as shown in Table 28.5. These bits should be read after setting DPRPU to 1 to notify connection when the function controller mode is selected; whereas after setting DRPD to 1 to enable pulling down the lines when the host controller mode is selected.

Table 28.5 USB Data Bus Line States

LNST[1]	LNST[0]	During Low-Speed Operation (Only when Host Controller Mode is Selected)	During Full-Speed Operation	During High-Speed Operation	During Chirp Operation
0	0	SE0	SE0	Squelch	Squelch
0	1	K state	J state	UnSquelch	Chirp J
1	0	J state	K state	Invalid	Chirp K
1	1	SE1	SE1	Invalid	Invalid

[Legend]

Chirp: The reset handshake protocol (RHSP) is being executed in high-speed operation enabled state (the HSE bit in SYSCFG is set to 1).

Squelch: SE0 or idle state

UnSquelch: High-speed J state or high-speed K state

Chirp J: Chirp J state

Chirp K: Chirp K state

28.3.4 Device State Control Register 0 (DVSTCTR0)

DVSTCTR is a register that controls and confirms the state of the USB data bus.

This register is initialized by a power-on reset. After a USB bus reset, only the WKUP bit is initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WKUP	RWUPE	USBRST	RESUME	UACT	—	RHST[2:0]		
Initial value:	—	—	—	—	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R/W*1	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	WKUP	0	R/W*1	Wakeup Output Enables or disables outputting the remote wakeup signal (resume signal) to the USB bus when the function controller mode is selected. 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output. This module controls the output time of a remote wakeup signal. When this bit is set to 1, this module clears this bit to 0 after outputting the 10-ms K state. According to the USB Specification, the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is output. If this module writes 1 to this bit right after detection of suspended state, the K state will be output after 2 ms. Do not write 1 to this bit unless the device state is in the suspended state (the DVSQ bits in the INTSTS0 register are set to 1xx) and the USB host enables the remote wakeup signal. When this bit is set to 1, the internal clock must not be stopped even in the suspended state (write 1 to this bit while SUSPMODE.SUSPM is 1). This bit should be set to 0 if the host controller mode is selected.
7	RWUPE	0	R/W	Remote Wakeup Detection Enable Enables or disables the downstream port peripheral device to use the remote wakeup function (resume signal output) when the host controller mode is selected. 0: Downstream port remote wakeup is disabled. 1: Downstream port remote wakeup is enabled. With this bit set to 1, on detecting the resume signal (K-state for 2.5 μs) to the downstream port when the remote wakeup signal has been detected, this module performs the resume process (drives the port to the K-state). With this bit set to 0, this module ignores the detected remote wakeup signal (K-state) from the peripheral device connected to the downstream port. While this bit is 1, the internal clock should not be stopped even in the suspended state (SUSPMODE.SUSPM should be set to 1). Also note that the USB bus should not be reset from the suspended state (USBRST should not be set to 1); it is prohibited by USB Specification 2.0. This bit should be set to 0 if the function controller mode is selected.

Bit	Bit Name	Initial Value	R/W	Description
6	USBRST	0	R/W	<p>Bus Reset Output Controls the USB bus reset signal output when the host controller mode is selected.</p> <p>0: USB bus reset signal is not output. 1: USB bus reset signal is output.</p> <p>When the host controller mode is selected, setting this bit to 1 allows this module to drive the USB port to SE0 to reset the USB bus. Here, this module performs the reset handshake protocol if the HSE bit is 1. This module continues outputting SE0 while USBRST is 1 (until 0 is written to USBRST). Ensure the period over which USBRST being set to 1 (= USB bus reset period) conforms to the USB Specification 2.0. Even if 1 is written to this bit during communication (UACT = 1) or during the resume process (RESUME = 1), this module does not start the USB bus reset process until both UACT and RESUME become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset process (writing 0 to USBRST). This bit should be set to 0 if the function controller mode is selected.</p>
5	RESUME	0	R/W	<p>Resume Output Controls the resume signal output when the host controller mode is selected.</p> <p>0: Resume signal is not output. 1: Resume signal is output.</p> <p>Setting this bit to 1 allows this module to drive the port to the K-state and output the resume signal. The controller sets this bit to 1 when detecting a remote wakeup signal while the RWUPE bit is set to 1 and the controller is in the USB suspended state. This module continues outputting K-state while RESUME is 1 (until 0 is written to RESUME). Ensure the period over which RESUME being set to 1 (= resume period) conforms to the USB Specification 2.0. This bit should only be set to 1 in the suspended state. Write 1 to the UACT bit simultaneously with the end of the resume process (writing 0 to RESUME). This bit should be set to 0 if the function controller mode is selected.</p>
4	UACT	0	R/W	<p>USB Bus Enable Enables operation of the USB bus (controls the SOF or μSOF packet transmission to the USB bus) when the host controller mode is selected.</p> <p>0: Downstream port is disabled (SOF/μSOF transmission is disabled). 1: Downstream port is enabled (SOF/μSOF transmission is enabled).</p> <p>With this bit set to 1, this module puts the USB port to the USB-bus enabled state and performs SOF output and data transmission and reception. This module starts outputting SOF/μSOF within 1 (μ) frame after 1 is written to UACT. With this bit set to 0, this module enters the idle state after outputting SOF/μSOF. This module sets this bit to 0 on any of the following conditions.</p> <ul style="list-style-type: none"> • A DTCH interrupt is detected during communication (while UACT = 1). • An EOFERR interrupt is detected during communication (while UACT = 1). <p>Writing 1 to this bit should be done at the end of the USB bus reset process (writing 0 to USBRST) or at the end of the resume process from the suspended state (writing 0 to RESUME). This bit should be set to 0 if the function controller mode is selected.</p>

Reserved	0101 to 0111	1110 to 1111

28.3.6 DMA_n-FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG)

D0FBCFG is a register that controls bus access to the DMA0-FIFO and D1FBCFG is a register that controls bus access to the DMA1-FIFO. Note that the setting of this register is invalid when the DMA0-FIFO bus or DMA1-FIFO bus is connected to the local bus.

These registers are initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	DFACC[1:0]	00	R/W	DMA _x FIFO Access Mode Specifies the access mode of the FIFO port. 00: Cycle steal mode (initial value) 01: 16-byte continuous access mode 10: 32-byte continuous access mode 11: Setting prohibited These bits specify a DMA transfer mode. (a) In cycle steal mode, use the DxFIFO port to access the FIFO buffer. (b) In 16-byte/32-byte continuous access mode, use the DxFIFO continuous transfer port to access the FIFO buffer. The MBW bit in DxFIFOSEL can be set to 10 (32-bit width) only.
11 to 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	TENDE	0	R/W	TEND _x _N Signal Enable Enables or disables the TEND _x _N signal for input. 0: TEND _x _N signal is disabled. 1: TEND _x _N signal is enabled. This bit determines whether or not to enable the TEND input for FIFO write accesses by DMA. Set this bit to 0 when the DFACC bits are set to 01 or 10.
3 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

28.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO)

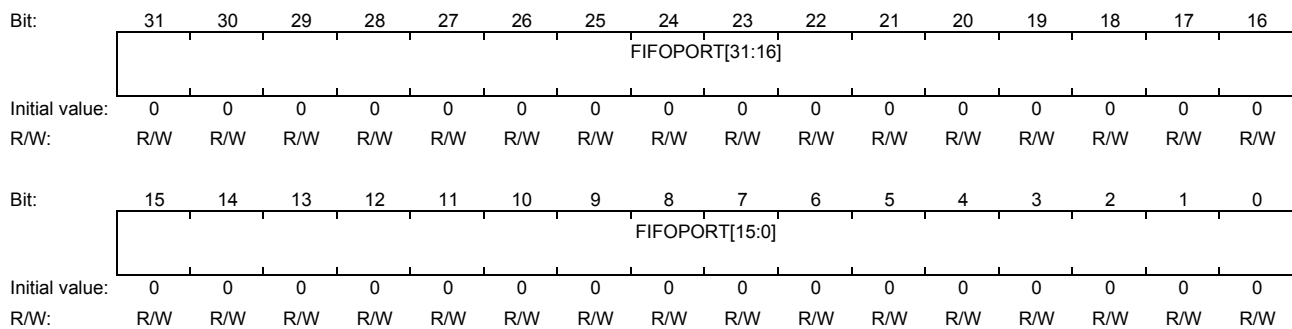

CFIFO, D0FIFO, and D1FIFO are port registers that are used to read data from the FIFO buffer memory and write data to the FIFO buffer memory.

There are three FIFO ports: the CFIFO, D0FIFO and D1FIFO ports. There are also Dx FIFO continuous transfer ports for continuous transfer. Each FIFO port is configured of a port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer memory and writing of data to the FIFO buffer memory, a select register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that is used to select the pipe assigned to the FIFO port, and a control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR).

Each FIFO port has the following characteristics.

- Access to the FIFO buffer for the DCP should be performed through the CFIFO port.
- Access to the FIFO buffer by DMA transfer should be performed through the D0FIFO or D1FIFO port when the DFACC bits are set to 00 (cycle steal mode).
- Access to the FIFO buffer by DMA transfer should be performed through D0FIFO or D1FIFO continuous transfer ports when the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode).
- The D1FIFO or D0FIFO port can be accessed by the CPU.
- When using functions specific to the FIFO port, the pipe number (selected pipe) specified by the CURPIPE bits cannot be changed (when the DMA transfer function is used, etc.).
- Registers configuring a FIFO port do not affect other FIFO ports.
- The same pipe should not be assigned to two or more FIFO ports.
- There are two FIFO buffer states: the access right is on the CPU side and it is on the SIE side. When the FIFO buffer access right is on the SIE side, the FIFO buffer cannot be accessed from the CPU.

These registers are initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	All 0	R/W	<p>FIFO Port</p> <p>Accessing these bits allow reading the received data from the FIFO buffer or writing the transmit data to the FIFO buffer.</p> <p>These bits can be accessed only while the FRDY bit in each FIFO port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1 (or this module is asserting the UCL_Dx_DREQ signal).</p> <p>The valid bits in this register depend on the settings of the MBW bits (access bit width setting) and BIGEND bit (endian setting) as shown in Table 28.7 to Table 28.9.</p>

Table 28.7 Endian Operation in 32-Bit Access

0	N+0 address	Writing: invalid, reading: prohibited* ¹		
1	Writing: invalid, reading: prohibited* ¹			N+0 address

Note 1. Reading data from the invalid bits in a word or byte unit is prohibited.

28.3.8 FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL)

CFIFOSEL, D0FIFOSEL and D1FIFOSEL are registers that assign the pipe to the FIFO port, and control access to the corresponding port.

The same pipe should not be specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL and D1FIFOSEL. When the CURPIPE bits in D0FIFOSEL and D1FIFOSEL are cleared to B'0000, no pipe is selected.

The pipe number should not be changed while the DMA transfer is enabled.

These registers are initialized by a power-on reset.

28.3.9 FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR)

CFIFOCTR, D0FIFOCTR and D1FIFOCTR are registers that determine whether or not writing to the buffer memory has been finished, the buffer accessed from the CPU has been cleared, and the FIFO port is accessible. CFIFOCTR, D0FIFOCTR, and D1FIFOCTR are used for the corresponding FIFO ports.

These registers are initialized by a power-on reset.

13	FRDY	0	R	<p>FIFO Port Ready</p> <p>Indicates whether the FIFO port can be accessed.</p> <p>0: FIFO port access is disabled.</p> <p>1: FIFO port access is enabled.</p> <p>In the following cases, this module sets FRDY to 1 but data cannot be read via the FIFO port because there is no data to be read. In these cases, set BCLR to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.</p> <ul style="list-style-type: none"> • A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty. • A short packet is received and the data is completely read while BFRE is 1.
12	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
11 to 0	DTLN[11:0]	H'000	R	<p>Receive Data Length</p> <p>Indicates the length of the receive data.</p> <p>While the FIFO buffer is being read, these bits indicate the different values depending on the RCNT bit value as described below.</p> <ul style="list-style-type: none"> • When RCNT = 0: <ul style="list-style-type: none"> The length of received data is set in these bits, and the value is retained until all received data has been read from a single FIFO buffer plane. While BFRE is 1, these bits retain the length of the receive data until BCLR is set to 1 even after all the data has been read. • When RCNT = 1: <ul style="list-style-type: none"> This module decrements the value indicated by these bits each time data is read from the FIFO buffer. (The value is decremented by one when MBW is 00, by two when MBW is 01, and by four when MBW is 10.) <p>This module sets these bits to 0 when all the data has been read from one FIFO buffer plane. However, in double buffer mode, if data has been received in one FIFO buffer plane before all the data has been read from the other plane, this module sets these bits to indicate the length of the receive data in the latter plane when all the data has been read from the former plane.</p> <p>Note: When reading these bits during FIFO buffer reading while RCNT = 1, note that these bits are updated within ten bus cycles after a read cycle for the FIFO port.</p>

Note 1. Only 0 can be read and 1 can be written to.

Note 2. Only 1 can be written to.

28.3.10 Interrupt Enable Register 0 (INTENB0)

INTENB0 is a register that enables various interrupts. On detecting the interrupt corresponding to the bit in this register which has been set to 1, this module generates the USB interrupt.

This module sets 1 to each status bit in INTSTS0 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB0 (regardless of whether the interrupt output is enabled or disabled). While the status bit in INTSTS0 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB0 is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
15	VBSE	0	R/W	VBUS Interrupt Enable Enables or disables the USB interrupt request when the VBINT interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
14	RSME	0	R/W	Resume Interrupt Enable* ¹ Enables or disables the USB interrupt request when the RESM interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
13	SOFE	0	R/W	Frame Number Update Interrupt Enable Enables or disables the USB interrupt request when the SOFR interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
12	DVSE	0	R/W	Device State Transition Interrupt Enable* ¹ Enables or disables the USB interrupt request when the DVST interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
11	CTRE	0	R/W	Control Transfer Stage Transition Interrupt Enable* ¹ Enables or disables the USB interrupt request when the CTRT interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
10	BEMPE	0	R/W	Buffer Empty Interrupt Enable Enables or disables the USB interrupt request when the BEMP interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
9	NRDYE	0	R/W	Buffer Not Ready Response Interrupt Enable Enables or disables the USB interrupt request when the NRDY interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
8	BRDYE	0	R/W	Buffer Ready Interrupt Enable Enables or disables the USB interrupt request when the BRDY interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. The RSME, DVSE, and CTRE bits can be set to 1 only when the function controller mode is selected; do not set these bits to 1 to enable the corresponding interrupt output when the host controller mode is selected.

28.3.11 Interrupt Enable Register 1 (INTENB1)

INTENB1 is a register that enables various interrupts when the host controller mode is selected.

On detecting the interrupt corresponding to the bit in this register which has been set to 1, this module generates the USB interrupt.

This module sets 1 to each status bit in INTSTS1 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB1 (regardless of whether the interrupt output is enabled or disabled).

While the status bit in INTSTS1 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB1 is changed from 0 to 1.

When the function controller mode is selected, the interrupts should not be enabled.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
6	EOFERRE	0	R/W	EOF Error Detection Interrupt Enable Enables or disables the USB interrupt request when the EOFERR interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
5	SIGNE	0	R/W	Setup Transaction Error Interrupt Enable Enables or disables the USB interrupt request when the SIGN interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
4	SACKE	0	R/W	Setup Transaction Normal Response Interrupt Enable Enables or disables the USB interrupt request when the SACK interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
3 to 1	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note 1. The INTENB1 register bits can be set to 1 only when the host controller mode is selected; do not set these bits to 1 to enable the corresponding interrupt output when the function controller mode is selected.

28.3.12 BRDY Interrupt Enable Register (BRDYENB)

BRDYENB is a register that enables or disables the BRDY bit in INTSTS0 to be set to 1 when the BRDY interrupt is detected for each pipe.

On detecting the BRDY interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPEBRDY bit in BRDYSTS and the BRDY bit in INTSTS0, and generates the BRDY interrupt.

While at least one PIPEBRDY bit in BRDYSTS indicates 1, this module generates the BRDY interrupt when the corresponding interrupt enable bit in BRDYENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBRDYE	H'0000	R/W	BRDY Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

28.3.13 NRDY Interrupt Enable Register (NRDYENB)

NRDYENB is a register that enables or disables the NRDY bit in INTSTS0 to be set to 1 when the NRDY interrupt is detected for each pipe.

On detecting the NRDY interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPENRDY bit in NRDYSTS and the NRDY bit in INTSTS0, and generates the NRDY interrupt.

While at least one PIPENRDY bit in NRDYSTS indicates 1, this module generates the NRDY interrupt when the corresponding interrupt enable bit in NRDYENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPENRDYE	H'0000	R/W	NRDY Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

28.3.14 BEMP Interrupt Enable Register (BEMPENB)

BEMPENB is a register that enables or disables the BEMP bit in INTSTS0 to be set to 1 when the BEMP interrupt is detected for each pipe.

On detecting the BEMP interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPEBEMP bit in BEMPSTS and the BEMP bit in INTSTS0, and generates the BEMP interrupt.

While at least one PIPEBEMP bit in BEMPSTS indicates 1, this module generates the BEMP interrupt when the corresponding interrupt enable bit in BEMPENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBEMPE	H'0000	R/W	BEMP Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

28.3.15 SOF Output Configuration Register (SOFCFG)

SOFCFG is a register that specifies the transaction-enabled time and BRDY interrupt status clear timing. This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TRNEN SEL	—	BRDY M	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	0	—	0	0	0	0	0	—	—
R/W:	R	R	R	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	TRNENSEL	0	R/W	Transaction-Enabled Time Select Selects the transaction-enabled time either for full-speed or low-speed communication, where is the time in which this module issues tokens in a frame. 0: For non-low-speed communication 1: For low-speed communication This bit is valid only when the host controller mode is selected. Even when the host controller mode is selected, the setting of this bit has no effect on the transaction-enabled time during high-speed communication. This bit should be set to 0 when the function controller mode is selected.
7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	BRDYM	0	R/W	BRDY Interrupt Status Clear Timing for Each Pipe Specifies the timing for clearing the BRDY interrupt status for each pipe. 0: Clears the status by writing 0 to this bit. 1: This module automatically clears the status when data has been read from the FIFO buffer or data has been written to the FIFO buffer.
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

28.3.16 Interrupt Status Register 0 (INTSTS0)

INTSTS0 is a register that indicates the status of the various interrupts detected.

This register is initialized by a power-on reset. By a USB bus reset, the DVST and DVSQ[2:0] bits are initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ[2:0]			VALID	CTSQ[2:0]		
Initial value:	0	0	0	0/1 ^{*1}	0	0	0	0	0/1 ^{*3}	0 ^{*2}	0 ^{*2}	0/1 ^{*2}	0	0	0	0
R/W:	R/W ^{*7}	R/W ^{*7}	R/W ^{*7}	R/W ^{*7}	R/W ^{*7}	R	R	R	R	R	R	R	R/W ^{*7}	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0	R/W ^{*7}	VBUS Interrupt Status ^{*4*5} 0: VBUS interrupts not generated 1: VBUS interrupts generated This module sets this bit to 1 when a change in the value input to the VBUS pin (high to low or low to high) is detected. The module indicates the VBUS pin input value in the VBSTS bit. When a VBINT interrupt is generated, the VBSTS bit is read several times to remove the chattering effect until the same value is read repeatedly from the bit.
14	RESM	0	R/W ^{*7}	Resume Interrupt Status ^{*4*5*6} 0: Resume interrupts not generated 1: Resume interrupts generated When the function controller mode is selected, this module sets this bit to 1 on detecting the falling edge of the signal on the DP pin in the suspended state (DVSQ = 1XX). When the host controller mode is selected, the read value is invalid.
13	SOFR	0	R/W ^{*7}	Frame Number Refresh Interrupt Status ^{*4} 0: SOF interrupts not generated 1: SOF interrupts generated (1) When the host controller mode is selected This module sets this bit to 1 on updating the frame number when the UACT bit is set to 1. (This interrupt is detected every 1 ms.) (2) When the function controller mode is selected This module sets this bit to 1 on updating the frame number. (This interrupt is detected every 1 ms.) This module can detect an SOFR interrupt through the internal interpolation function even when a damaged SOF packet is received from the USB host.
12	DVST	0/1 ^{*1}	R/W ^{*7}	Device State Transition Interrupt Status ^{*4*6} 0: Device state transition interrupts not generated 1: Device state transition interrupts generated When the function controller mode is selected, this module updates the DVSQ value and sets this bit to 1 on detecting a change in the device state. When this interrupt is generated, clear the status before this module detects the next device state transition. When the host controller mode is selected, the read value is invalid.
11	CTRT	0	R/W ^{*7}	Control Transfer Stage Transition Interrupt Status ^{*4*6} 0: Control transfer stage transition interrupts not generated 1: Control transfer stage transition interrupts generated When the function controller mode is selected, this module updates the CTSQ value and sets this bit to 1 on detecting a change in the control transfer stage. When this interrupt is generated, clear the status before this module detects the next control transfer stage transition. When the host controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
10	BEMP	0	R	<p>Buffer Empty Interrupt Status</p> <p>0: BEMP interrupts not generated 1: BEMP interrupts generated</p> <p>This module sets this bit to 1 when at least one PIPEBEMP bit in BEMPSTS is set to 1 among the PIPEBEMP bits corresponding to the PIPEBEMPE bits in BEMPENB to which 1 has been set (when this module detects the BEMP interrupt status in at least one pipe among the pipes for which the BEMP interrupt notification is enabled). For the conditions for PIPEBEMP status assertion, refer to section 28.4.2 (4) BEMP Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPEBEMP bits corresponding to the PIPEBEMPE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.</p>
9	NRDY	0	R	<p>Buffer Not Ready Interrupt Status</p> <p>0: NRDY interrupts not generated 1: NRDY interrupts generated</p> <p>This module sets this bit to 1 when at least one PIPENRDY bit in NRDYSTS is set to 1 among the PIPENRDY bits corresponding to the PIPENRDYE bits in NRDYENB to which 1 has been set (when this module detects the NRDY interrupt status in at least one pipe among the pipes for which the NRDY interrupt notification is enabled). For the conditions for PIPENRDY status assertion, refer to section 28.4.2 (3) NRDY Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPENRDY bits corresponding to the PIPENRDYE bits to which 1 has been set. For the conditions for PIPEBRDY status assertion, refer to section 28.4.2 (2) BRDY Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPEBRDY bits corresponding to the PIPEBRDYE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.</p>
7	VBSTS	0/1 ³	R	<p>VBUS Input Status</p> <p>0: The VBUS pin is low level. 1: The VBUS pin is high level.</p>
6 to 4	DVSQL[2:0]	000/001 ²	R	<p>Device State</p> <p>000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state</p> <p>When the host controller mode is selected, the read value is invalid.</p>
3	VALID	0	R/W ⁷	<p>USB Request Reception</p> <p>0: Not detected 1: Setup packet reception</p> <p>When the host controller mode is selected, the read value is invalid.</p>
2 to 0	CTSQQ[2:0]	000	R	<p>Control Transfer Stage</p> <p>000: Idle or setup stage 001: Control read data stage 010: Control read status stage 011: Control write data stage 100: Control write status stage 101: Control write (no data) status stage 110: Control transfer sequence error 111: Setting prohibited</p> <p>When the host controller mode is selected, the read value is invalid.</p>

- Note 1. This bit is initialized to B'0 by a power-on reset and B'1 by a USB bus reset.
- Note 2. These bits are initialized to B'000 by a power-on reset and B'001 by a USB bus reset.
- Note 3. This bit is 1 when the level of the VBUS pin input is high and 0 when low.
- Note 4. To clear the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
- Note 5. A change in the status indicated by the VBINT and RESM bits can be detected by this module even while the clock supply is stopped, and the interrupts are output when the corresponding interrupt enable bits are enabled. Clearing the status should be done after enabling the clock supply.
- Note 6. A change in the status of the RESM, DVST, and CTRT bits occurs only when the function controller mode is selected; disable the corresponding interrupt enable bits (set to 0) when the host controller mode is selected.
- Note 7. Only 0 can be written to.

28.3.17 Interrupt Status Register 1 (INTSTS1)

INTSTS1 is a register that is used to confirm interrupt status.

The various interrupts indicated by the bits in this register should be enabled only when the host controller mode is selected.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BCHG	—	DTCH	ATTCH	—	—	—	—	EOFER R	SIGN	SACK	—	—	—	—
Initial value:	0	0	—	0	0	—	0	0	—	0	0	0	—	—	—	0
R/W:	R	R/W*	R	R/W*	R/W*	R	R	R	R	R/W*	R/W*	R/W*	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	BCHG	0	R/W*	USB Bus Change Interrupt Status Indicates the status of the USB bus change interrupt. 0: BCHG interrupts not generated 1: BCHG interrupts generated This module detects the BCHG interrupt when a change in the full-speed or low-speed signal level occurs on the USB port (a change from J-state, K-state, or SE0 to J-state, K-state, or SE0), and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. This module sets the LNST bits in SYSSTS to indicate the current input state of the USB port. When the BCHG interrupt is generated, the LNST bits are read several times to remove the chattering effect until the same value is read repeatedly from the bits. A change in the USB bus state can be detected even while the internal clock supply is stopped. When the function controller mode is selected, the read value is invalid.
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	DTCH	0	R/W*	USB Disconnection Detection Interrupt Status Indicates the status of the USB disconnection detection interrupt when the host controller mode is selected. 0: DTCH interrupts not generated 1: DTCH interrupts generated This module detects the DTCH interrupt on detecting USB bus disconnection, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. This module detects bus disconnection based on USB Specification 2.0. After detecting the DTCH interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Software should terminate all the pipes in which communications are currently carried out for the USB port and make a transition to the wait state for bus connection to the USB port (wait state for ATTCH interrupt generation). (1) Modifies the UACT bit to 0. (2) Puts the port into the idle state. When the function controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
11	ATTCH	0	R/W*	<p>ATTCH Interrupt Status</p> <p>Indicates the status of the ATTCH interrupt when the host controller mode is selected.</p> <p>0: ATTCH interrupts not generated 1: ATTCH interrupts generated</p> <p>This module detects the ATTCH interrupt on detecting J-state or K-state of the full-speed or low-speed level signal for 2.5 μs, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt.</p> <p>Specifically, this module detects the ATTCH interrupt on any of the following conditions.</p> <ul style="list-style-type: none"> • K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 μs. • J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 μs. <p>When the function controller mode is selected, the read value is invalid.</p>
10	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
9, 8	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
7	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
6	EOFERR	0	R/W*	<p>EOF Error Detection Interrupt Status</p> <p>Indicates the status of the EOFERR interrupt when the host controller mode is selected.</p> <p>0: EOFERR interrupt not generated 1: EOFERR interrupt generated</p> <p>This module detects the EOFERR interrupt on detecting that communication is not completed at the EOF2 timing prescribed by USB Specification 2.0, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the EOFERR interrupt.</p> <p>After detecting the EOFERR interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Software should terminate all the pipes in which communications are currently carried for the USB port and perform re-enumeration of the USB port.</p> <p>(1) Modifies the UACT bit to 0. (2) Puts the port into the idle state.</p> <p>When the function controller mode is selected, the read value is invalid.</p>
5	SIGN	0	R/W*	<p>Setup Transaction Error Interrupt Status</p> <p>Indicates the status of the setup transaction error interrupt when the host controller mode is selected.</p> <p>0: SIGN interrupts not generated 1: SIGN interrupts generated</p> <p>This module detects the SIGN interrupt when ACK response is not returned from the peripheral device three consecutive times during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the SIGN interrupt.</p> <p>Specifically, this module detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions.</p> <ul style="list-style-type: none"> • Timeout is detected when the peripheral device has returned no response. • A damaged ACK packet is received. • A handshake other than ACK (NAK, NYET, or STALL) is received. <p>When the function controller mode is selected, the read value is invalid.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	SACK	0	R/W*	Setup Transaction Normal Response Interrupt Status Indicates the status of the setup transaction normal response interrupt when the host controller mode is selected. 0: SACK interrupts not generated 1: SACK interrupts generated This module detects the SACK interrupt when ACK response is returned from the peripheral device during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the SACK interrupt. When the function controller mode is selected, the read value is invalid.
3 to 1	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note 1. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

Note 2. A change in the status indicated by the BCHG bit can be detected by this module even while the clock supply is stopped, and the interrupt is output when the corresponding interrupt enable bit is enabled. Clearing the status should be done after enabling the clock supply.

No interrupts other than BCHG can be detected while the clock supply is stopped.

* Only 0 can be written to.

28.3.18 BRDY Interrupt Status Register (BRDYSTS)

BRDYSTS is a register that indicates the BRDY interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBRDY	H'0000	R/W*1	BRDY Interrupt Status for each Pipe*2 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.

Note 2. To clear the status indicated by the bits in this register when BRDYM is 0, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

* 1. Only 0 can be written to.

* 2. When BRDYM is 0, clearing this bit should be done before accessing the FIFO.

28.3.19 NRDY Interrupt Status Register (NRDYSTS)

NRDYSTS is a register that indicates the NRDY interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPENRDY	H'0000	R/W*	NRDY Interrupt Status for each Pipe 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.

Note 2. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

* Only 0 can be written to.

28.3.20 BEMP Interrupt Status Register (BEMPSTS)

BEMPSTS is a register that indicates the BEMP interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBEMP	H'0000	R/W*	BEMP Interrupt Status for each Pipe 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.

Note 2. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

* Only 0 can be written to.

28.3.21 Frame Number Register (FRMNUM)

FRMNUM is a register that determines the source of isochronous error notification and indicates the frame number. This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVRN	CRCE	—	—	—											
Initial value:	0	0	—	—	—	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0	R/W*1	<p>Overrun/Underrun Detection Status</p> <p>Indicates whether an overrun/underrun error has been detected in the pipe during isochronous transfer. On detecting either error, this module simultaneously generates the internal NRDY interrupt request. For details, refer to section 28.4.2, Interrupt Functions.</p> <p>0: No error 1: An error occurred</p> <p>This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register.</p> <p>(1) When the host controller mode is selected This module sets this bit to 1 on any of the following conditions.</p> <ul style="list-style-type: none"> For the isochronous transfer pipe in the transmitting direction, the time to issue an OUT token comes before all the transmit data has been written to the FIFO buffer. For the isochronous transfer pipe in the receiving direction, the time to issue an IN token comes when no FIFO buffer planes are empty. <p>(2) When the function controller mode is selected This module sets this bit to 1 on any of the following conditions.</p> <ul style="list-style-type: none"> For the isochronous transfer pipe in the transmitting direction, the IN token is received before all the transmit data has been written to the FIFO buffer. For the isochronous transfer pipe in the receiving direction, the OUT token is received when no FIFO buffer planes are empty. <p>Note: This bit should be used for debugging. When designing a system, control the timing so that neither overrun nor underrun occurs.</p>
14	CRCE	0	R/W*1	<p>Receive Data Error</p> <p>Indicates whether a CRC error or bit stuffing error has been detected in the pipe during isochronous transfer. On detecting either error, this module simultaneously generates the internal NRDY interrupt request. For details, refer to section 28.4.2, Interrupt Functions.</p> <p>0: No error 1: An error occurred</p> <p>This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register.</p>
13 to 11	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
10 to 0	FRNM[10:0]	H'000	R	<p>Frame Number</p> <p>This module sets these bits to indicate the latest frame number, which is updated every time an SOF packet is issued or received (every 1 ms). When reading these bits, repeat reading until the same value is read twice.</p>

Note 1. Only 0 can be written to.

28.3.22 μ Frame Number Register (UFRMNUM)

UFRMNUM is a register that indicates the μ frame number.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UFRNM[2:0]		
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	UFRNM[2:0]	000	R	μ Frame The μ frame number can be confirmed. This module sets these bits to indicate the μ frame number during high-speed operation. During operation other than high-speed operation, this module sets these bits to B'000. When reading these bits, repeat reading until the same value is read twice.

28.3.23 USB Address Register (USBADDR)

USBADDR is a register that indicates the USB address. This register is valid only when the function controller mode is selected. When the host controller mode is selected, peripheral device addresses should be set using the DEVSEL bits in PIPEMAXP.

This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	USBADDR[6:0]						
Initial value:	—	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6 to 0	USBADDR[6:0]	H'00	R	USB Address When the function controller mode is selected, these bits indicate the USB address assigned by the host when the SET_ADDRESS request is successfully processed. When the function controller mode is selected, these bits indicate H'00 upon detection of a USB bus reset signal. When the host controller mode is selected, the read value is invalid.

28.3.24 USB Request Type Register (USBREQ)

USBREQ is a register that stores setup requests for control transfers.

When the function controller mode is selected, the values of bRequest and bmRequestType that have been received are stored. When the host controller mode is selected, the values of bRequest and bmRequestType to be transmitted are set. This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	BREQUEST[7:0]	H'00	R/W*1	Request These bits store the USB request bRequest value. (1) When the host controller mode is selected The USB request data value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request data value received during the setup transaction. Writing to these bits is invalid.
7 to 0	BMREQUEST TYPE[7:0]	H'00	R/W*1	Request Type These bits store the USB request bmRequestType value. (1) When the host controller mode is selected The USB request type value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request type value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.25 USB Request Value Register (USBVAL)

USBVAL is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wValue that has been received is stored. When the host controller mode is selected, the value of wValue to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WVALUE[15:0]	H'0000	R/W*1	Value These bits store the USB request wValue value. (1) When the host controller mode is selected The USB request wValue value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wValue value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.26 USB Request Index Register (USBINDX)

USBINDX is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wIndex that has been received is stored. When the host controller mode is selected, the value of wIndex to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WINDEX[15:0]	H'0000	R/W*1	Index These bits store the USB request wIndex value. (1) When the host controller mode is selected The USB request wIndex value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wIndex value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.27 USB Request Length Register (USBLENG)

USBLENG is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wLength that has been received is stored. When the host controller mode is selected, the value of wLength to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WLENGTH[15:0]	H'0000	R/W*1	Length These bits store the USB request wLength value. (1) When the host controller mode is selected The USB request wLength value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wLength value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.28 DCP Configuration Register (DCPCFG)

DCPCFG is a register that specifies the data transfer direction for the default control pipe (DCP).

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	DIR	0	R/W	Transfer Direction When the host controller mode is selected, this bit sets the transfer direction of data stage and status stage for control transfers. 0: Data receiving direction 1: Data transmitting direction When the function controller mode is selected, this bit should be cleared to 0.
3 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

28.3.29 DCP Maximum Packet Size Register (DCPMAXP)

DCPMAXP is a register that specifies the maximum packet size for the DCP.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	DEVSEL[3:0]				—	—	—	—	—	MXPS[6:0]							
Initial value:	0	0	0	0	—	—	—	—	—	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	<p>Device Select When the host controller mode is selected, these bits specify the communication target peripheral device address for control transfers. 0000: Address 0000 0001: Address 0001 : : 1001: Address 1001 1010: Address 1010 Others: Setting prohibited These bits should be set after setting the DEVADDn register corresponding to the value to be set in these bits. For example, before setting DEVSEL to 0010, the DEVADD2 register should be set first. These bits should be set while CSSTS is 0, PID is NAK, and SUREQ is 0. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. When the function controller mode is selected, these bits should be set to B'0000.</p>
11 to 7	—	Undefined	R	<p>Reserved The read value is undefined. The write value should always be 0.</p>
6 to 0	MXPS[6:0]	H'40	R/W	<p>Maximum Packet Size Specifies the maximum data payload (maximum packet size) for the DCP. These bits are initialized to H'40 (64 bytes). These bits should be set to the value based on the USB Specification. These bits should be set while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. While MXPS is 0, do not write to the FIFO buffer or do not set PID to BUF.</p>

28.3.30 DCP Control Register (DCPCTR)

DCPCTR is a register that is used to confirm the buffer memory status, change and confirm the data PID sequence bit, and set the response PID for the DCP.

This register is initialized by a power-on reset. The CCPL and PID[1:0] bits are initialized by a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	SURE Q	CSCLR	CSSTS	SURE QCLR	—	—	SQCLR	SQSET	SQMO N	PBUSY	PINGE	—	CCPL	PID[1:0]	
Initial value:	0	0	0	0	0	—	—	0	0	1	0	0	—	0	0	0
R/W:	R	R/W ²	R/W ^{*1}	R	R/W ^{*1}	R	R	R/W ^{*1}	R/W ^{*1}	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	<p>Buffer Status</p> <p>Indicates whether DCP FIFO buffer access is enabled or disabled.</p> <p>0: Buffer access is disabled.</p> <p>1: Buffer access is enabled.</p> <p>The meaning of the BSTS bit depends on the ISEL bit setting as follows.</p> <ul style="list-style-type: none"> • When ISEL = 0, BSTS indicates whether the received data can be read from the buffer. • When ISEL = 1, BSTS indicates whether the data to be transmitted can be written to the buffer.
14	SUREQ	0	R/W ^{*2}	<p>Setup Token Transmission</p> <p>Transmits the setup packet by setting this bit to 1 when the host controller mode is selected.</p> <p>0: Writing invalid</p> <p>1: Transmits the setup packet.</p> <p>After completing the setup transaction process, this module generates either the SACK or SIGN interrupt and clears this bit to 0.</p> <p>This module also clears this bit to 0 when the SUREQCLR bit is set to 1.</p> <p>Before setting this bit to 1, set the DEVSEL bits, USBREQ register, USBVAL register, USBINDX register, and USBLENG register appropriately to transmit the desired USB request in the setup transaction.</p> <p>Before setting this bit to 1, check that the PID bits for the DCP are set to NAK. After setting this bit to 1, do not modify the DEVSEL bits, USBREQ register, USBVAL register, USBINDX register, or USBLENG register while the setup transaction is in progress (SUREQ = 1).</p> <p>Write 1 to this bit only when transmitting the setup token; for the other purposes, write 0.</p> <p>When the function controller mode is selected, be sure to write 0 to this bit.</p>
13	CSCLR	0	R/W ^{*1}	<p>C-SPLIT Status Clear for Split Transaction</p> <p>When the host controller mode is selected, setting this bit to 1 clears the CSSTS bit to 0 for the transfer using the split transaction. In this case, the next DCP transfer restarts with the S-SPLIT.</p> <p>0: Writing invalid</p> <p>1: Clears the CSSTS bit to 0.</p> <p>When this bit is set to 1, this module clears the CSSTS bit to 0.</p> <p>For the transfer using the split transaction, to restart the next transfer with the S-SPLIT forcibly, set this bit to 1. However, for the normal split transaction, this module automatically clears the CSSTS bit to 0 upon completion of the C-SPLIT; therefore, clearing the CSSTS bit is not necessary.</p> <p>Controlling the CSSTS bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected.</p> <p>Setting this bit to 1 while CSSTS is 0 has no effect.</p> <p>When the function controller mode is selected, be sure to write 0 to this bit.</p>

Bit	Bit Name	Initial Value	R/W	Description
12	CSSTS	0	R	<p>COMPLETE SPLIT (C-SPLIT) Status of Split Transaction</p> <p>Indicates the C-SPLIT status of the split transaction when the host controller mode is selected.</p> <p>0: START-SPLIT (S-SPLIT) transaction being processed or the device not using the split transaction being processed</p> <p>1: C-SPLIT transaction being processed</p> <p>This module sets this bit to 1 upon start of the C-SPLIT and clears this bit to 0 upon detection of C-SPLIT completion.</p> <p>When the function controller mode is selected, the read value is invalid.</p>
11	SUREQCLR	0	R/W ^{*1}	<p>SUREQ Bit Clear</p> <p>When the host controller mode is selected, setting this bit to 1 clears the SUREQ bit to 0.</p> <p>0: Writing invalid</p> <p>1: Clears the SUREQ bit to 0.</p> <p>This bit always indicates 0.</p> <p>Set this bit to 1 when communication has stopped with SUREQ being 1 during the setup transaction. However, for normal setup transactions, this module automatically clears the SUREQ bit to 0 upon completion of the transaction; therefore, clearing the SUREQ bit is not necessary.</p> <p>Controlling the SUREQ bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected.</p> <p>When the function controller mode is selected, be sure to write 0 to this bit.</p>
10, 9	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
8	SQCLR	0	R/W ^{*1}	<p>Toggle Bit Clear</p> <p>Specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during the DCP transfer.</p> <p>0: Writing invalid</p> <p>1: Specifies DATA0.</p> <p>This bit always indicates 0.</p> <p>Do not set the SQCLR and SQSET bits to 1 simultaneously.</p> <p>Set this bit to 1 while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits.</p> <p>Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>
7	SQSET	0	R/W ^{*1}	<p>Toggle Bit Set</p> <p>Specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during the DCP transfer.</p> <p>0: Writing invalid</p> <p>1: Specifies DATA1.</p> <p>Do not set the SQCLR and SQSET bits to 1 simultaneously.</p> <p>Set this bit to 1 while CSSTS is 0 and PID is NAK.</p> <p>Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>
6	SQMON	1	R	<p>Sequence Toggle Bit Monitor</p> <p>Indicates the expected value of the sequence toggle bit for the next transaction during the DCP transfer.</p> <p>0: DATA0</p> <p>1: DATA1</p> <p>This module allows this bit to toggle upon normal completion of the transaction. However, this bit is not allowed to toggle when a DATA-PID disagreement occurs during the transfer in the receiving direction.</p> <p>When the function controller mode is selected, this module sets this bit to 1 (specifies DATA1 as the expected value) upon normal reception of the setup packet.</p> <p>When the function controller mode is selected, this module does not reference to this bit during the IN/OUT transaction of the status stage, and does not allow this bit to toggle upon normal completion.</p>

Bit	Bit Name	Initial Value	R/W	Description
5	PBUSY	0	R	<p>Pipe Busy</p> <p>Indicates whether or not the actual communication state of the DCP has entered the NAK state when the PID bits for the DCP are changed from BUF to NAK.</p> <p>0: Has not finished the transition to NAK 1: Has finished the transition to NAK</p> <p>This module modifies this bit from 0 to 1 upon start of the USB transaction for the DCP, and modifies the bit from 1 to 0 upon completion of one transaction.</p> <p>Reading this bit after PID has been set to NAK allows checking whether modification of the pipe settings is possible.</p> <p>For details, refer to section 28.4.3 (1) Pipe Control Register Switching Procedures.</p>
4	PINGE	0	R/W	<p>PING Token Issue Enable</p> <p>When the host controller mode is selected, setting this bit to 1 allows this module to issue the PING token during transfers in the transmitting direction and start a transfer in the transmitting direction with the PING transaction.</p> <p>0: Disables issuing PING token. 1: Enables normal PING operation.</p> <p>When having detected the ACK handshake during PING transactions, this module performs the OUT transaction as the next transaction.</p> <p>When having detected the NAK handshake or NYET handshake during OUT transactions, this module performs the PING transaction as the next transaction.</p> <p>When the host controller mode is selected, setting this bit to 0 prevents this module from issuing the PING token during transfers in the transmitting direction and only allows this module to perform OUT transactions for the transfers in the transmitting direction.</p> <p>This bit should be modified while CSSTS is 0 and PID is NAK.</p> <p>Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>When the function controller mode is selected, be sure to write 0 to this bit.</p>
3	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
2	CCPL	0	R/W	<p>Control Transfer End Enable</p> <p>When the function controller mode is selected, setting this bit to 1 enables the status stage of the control transfer to be completed.</p> <p>0: Completion of control transfer is disabled. 1: Completion of control transfer is enabled.</p> <p>In function controller mode, when this bit is set to 1 while the corresponding PID bits are set to BUF, this module completes the control transfer status stage.</p> <p>Specifically, during control read transfer, this module transmits the ACK handshake in response to the OUT transaction from the USB host, and outputs the zero-length packet in response to the IN transaction from the USB host during control write or no-data control transfer. However, on detecting the SET_ADDRESS request, this module operates in auto response mode from the setup stage up to the status stage completion irrespective of the setting of this bit.</p> <p>This module modifies this bit from 1 to 0 on receiving the new setup packet.</p> <p>1 cannot be written to this bit while VALID is 1.</p> <p>When the host controller mode is selected, be sure to write 0 to this bit.</p>

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	<p>Response PID Controls the response type of this module during control transfer.</p> <p>00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response</p> <p>(1) When the host controller mode is selected Modify the setting of these bits from NAK to BUF using the following procedure.</p> <ul style="list-style-type: none"> When the transmitting direction is set Write all the transmit data to the FIFO buffer while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the OUT transaction (or PING transaction). When the receiving direction is set Check that the FIFO buffer is empty (or empty the buffer) while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the IN transaction. <p>This module modifies the setting of these bits as follows.</p> <ul style="list-style-type: none"> This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times. This module also sets PID to STALL (11) on receiving the STALL handshake. <p>Even if the PID bits are modified to NAK after this module has issued S-SPLIT of the split transaction for the selected pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. This module sets PID to NAK upon completion of C-SPLIT.</p> <p>(2) When the function controller mode is selected This module modifies the setting of these bits as follows.</p> <ul style="list-style-type: none"> This module modifies PID to NAK on receiving the setup packet. Here, this module sets VALID to 1. The setting of PID cannot be modified until VALID is set to 0. This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. This module sets PID to STALL (1x) on detecting the control transfer sequence error. This module sets PID to NAK on detecting the USB bus reset. <p>This module does not reference to the setting of the PID bits while the SET_ADDRESS request is processed (auto processing).</p>

Note 1. Only 0 can be read and 1 can be written to.

Note 2. Only 1 can be written to.

28.3.31 Pipe Window Select Register (PIPESEL)

PIPE1 to PIPE9 should be set using PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN.

After selecting the pipe using PIPESEL, functions of the pipe should be set using PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set regardless of the pipe selection in PIPESEL.

This register is initialized by a power-on reset.

3 to 0	PIPESEL[3:0]	0000	R/W	Pipe Window Select When a value between 0001 and 1111 is set in these bits, the information and settings for the corresponding pipe can be read from the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. 0000: No pipe selected 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9 1010: PIPE10 1011: PIPE11 1100: PIPE12 1101: PIPE13 1110: PIPE14 1111: PIPE15 Others: Setting prohibited When 0000 is set in these bits, 0 is read from all of the bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Writing to the bits in these registers is invalid.

28.3.32 Pipe Configuration Register (PIPECFG)

PIPECFG is a register that specifies the transfer type, buffer memory access direction, and endpoint numbers for PIPE1 to PIPE15. It also selects continuous or non-continuous transfer mode, single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

This register is initialized by a power-on reset.

However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>Do not make the settings such that the combination of the set values in the DIR and EPNUM bits should be the same for two or more pipes (EPNUM = 0000 can be set for all the pipes).</p>

28.3.33 Pipe Buffer Setting Register (PIPEBUF)

PIPEBUF is a register that specifies the buffer size and buffer number for PIPE1 to PIPE9.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14 to 10	BUFSIZE[4:0]	H'00	R/W	<p>Buffer Size Specifies the size of the buffer for the pipe selected by the PIPESEL bits (selected pipe) in terms of blocks, where one block comprises 64 bytes. 00000 (H'00): 64 bytes 00001 (H'01): 128 bytes : : 11111 (H'1F): 2 Kbytes</p> <p>When the DBLB bit is set to 1, this module assigns two planes of the FIFO buffer size specified by the BUFSIZE bits to the selected pipe. Specifically, the following expression determines the FIFO buffer size assigned to the selected pipe by this module. (BUFSIZE + 1) × 64 × (DBLB + 1) [bytes] The valid value for these bits depends on the selected pipe.</p> <ul style="list-style-type: none"> • PIPE1 to PIPE5 and PIPE9 to PIPE15: Any value from H'00 to H'1F is valid. • PIPE6 to PIPE8: H'00 should be set. <p>When used with CNTMD = 1, set an integral multiple of the maximum packet size to the BUFSIZE bits. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>
9, 8	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BUFNMB[7:0]	H'00	R/W	<p>Buffer Number</p> <p>The first block number in the FIFO buffer to be allocated for the selected pipe should be set in these bits. The FIFO buffer blocks allocated for the selected pipe by this module are determined as follows: Block number: BUFNMB to block number of $(BUFNMB + (BUFSIZE + 1) \times (DBLB + 1) - 1)$</p> <p>These bits should be set to a value from H'04 to H'7F. BUFNMB = H'00 is used exclusively for DCP. BUFNMB = H'04 is used exclusively for PIPE6. When PIPE6 is not used, H'04 can be used for other pipes. When PIPE6 is selected, writing to these bits is invalid and H'04 is automatically assigned by this module. BUFNMB = H'05 is used exclusively for PIPE7. When PIPE7 is not used, H'05 can be used for other pipes. When PIPE7 is selected, writing to these bits is invalid and H'05 is automatically assigned by this module. BUFNMB = H'06 is used exclusively for PIPE8. When PIPE8 is not used, H'06 can be used for other pipes. When PIPE8 is selected, writing to these bits is invalid and H'06 is automatically assigned by this module. BUFNMB = H'07 is used exclusively for PIPE9. When PIPE9 is not used, H'07 can be used for other pipes. When PIPE9 is selected, writing to these bits is valid and H'07 is assigned as the initial value by this module.</p> <p>Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p>

28.3.34 Pipe Maximum Packet Size Register (PIPEMAXP)

PIPEMAXP is a register that specifies the maximum packet size for PIPE1 to PIPE15.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	<p>Device Select</p> <p>When the host controller mode is selected, these bits specify the USB address of the communication target peripheral device.</p> <p>0000: Address 0000 0001: Address 0001 0010: Address 0010 : : 1010: Address 1010 Others: Setting prohibited</p> <p>These bits should be set after setting the address to the DEVADDn (n = 0 to A) register corresponding to the value to be set in these bits. For example, before setting DEVSEL to 0010, the DEVADD2 address should be set first.</p> <p>Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>When the function controller mode is selected, these bits should be set to B'0000.</p>
11	—	Undefined	R	<p>Reserved</p> <p>The read value is undefined. The write value should always be 0.</p>
10 to 0	MXPS[10:0]	*1	R/W	<p>Maximum Packet Size</p> <p>Specifies the maximum data payload (maximum packet size) for the selected pipe. The valid value for these bits depends on the pipe as follows.</p> <p>PIPE1, PIPE2: 1 byte (H'001) to 1,024 bytes (H'400) PIPE3 to PIPE5: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), and 512 bytes (H'200) (Bits [2:0] are not available.) PIPE6 to PIPE8: 1 byte (H'001) to 64 bytes (H'040) PIPE9 (when in host controller mode): 1 byte (H'001) to 64 bytes (H'040) PIPE9 (when in function controller mode): 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), 512 bytes (H'200) (Bits [2:0] are not available.) PIPE10 to PIPE15: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), 512 bytes (H'200) (Bits [2:0] are not available.)</p> <p>These bits should be set to the appropriate value for each transfer type based on the USB Specification.</p> <p>For split transactions using the isochronous pipe, these bits should be set to 188 bytes or less.</p> <p>Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits.</p> <p>Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>While MXPS is 0, do not write to the FIFO buffer or set PID to BUF.</p>

Note 1. The initial value of MXPS is H'000 when no pipe is selected with the PIPESEL bits in PIPESEL and H'040 when a pipe is selected with the PIPESEL bits in PIPESEL.

28.3.35 Pipe Timing Control Register (PIPEPERI)

PIPEPERI is a register that selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfer, and sets the interval error detection interval for PIPE1 to PIPE15.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
Initial value:	—	—	—	0	—	—	—	—	—	—	—	—	—	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	IFIS	0	R/W	<p>Isochronous IN Buffer Flush Specifies whether to flush the buffer when the pipe selected by the PIPESEL bits is used for isochronous IN transfers. 0: The buffer is not flushed. 1: The buffer is flushed.</p> <p>When the function controller mode is selected and the selected pipe is for isochronous IN transfers, this module automatically clears the FIFO buffer when this module fails to receive the IN token from the USB host within the interval set by the IITV bits in terms of (μ) frames. In double buffer mode (DBLB = 1), this module only clears the data in the plane used earlier. This module clears the FIFO buffer on receiving the SOF packet immediately after the (μ) frame in which this module has expected to receive the IN token. Even if the SOF packet is corrupted, this module also clears the FIFO buffer at the right timing to receive the SOF packet by using the internal interpolation. When the host controller mode is selected, set this bit to 0. When the selected pipe is not for the isochronous transfer, set this bit to 0.</p>
11 to 3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	IITV[2:0]	000	R/W	<p>Interval Error Detection Interval Specifies the interval error detection timing for the selected pipe in terms of frames, which is expressed as n-th power of 2 (n is the value to be set). As described later, the detailed functions are different in host controller mode and in function controller mode. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Before modifying these bits after USB communication has been completed with these bits set to a certain value, set PID to NAK and then set ACLRM to 1 to initialize the interval timer. The IITV bits are invalid for PIPE3 to PIPE5 and PIPE10 to PIPE15; set these bits to 000 for these pipes.</p>

28.3.36 PIPEn Control Registers (PIPEnCTR) (n = 1 to F)

PIPEnCTR is a register that is used to confirm the buffer memory status for the corresponding pipe, change and confirm the data PID sequence bit, determine whether auto response mode is set, determine whether auto buffer clear mode is set, and set a response PID for PIPE1 to PIPE15. This register can be set regardless of the pipe selection in PIPESEL. These registers are initialized by a power-on reset. The PID[1:0] bits are initialized by a USB bus reset.

(1) PIPEnCTR (n = 1 to 5, 9, A to F)

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	<p>Response PID</p> <p>Specifies the response type for the next transaction of the pertinent pipe.</p> <p>00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response</p> <p>The default setting of these bits is NAK. Modify the setting to BUF to use the pertinent pipe for USB transfer. Table 28.12 and Table 28.13 show the basic operation (operation when there are no errors in the transmitted and received packets) of this module depending on the PID bit setting. Some registers require these bits to be set to NAK before their settings can be changed by software. Set these bits to NAK by software when changing such kind of registers. To confirm which registers apply to this, reference the descriptions of bits. After modifying the setting of these bits from BUF to NAK during USB communication using the pertinent pipe, check that PBUSY is 0 to see if USB communication using the pertinent pipe has actually entered the NAK state. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.</p> <p>Even if the PID bits are modified to NAK after S-SPLIT of the split transaction has been issued for the pertinent pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes.</p> <ul style="list-style-type: none"> • This module modifies the setting of these bits as follows. <ul style="list-style-type: none"> This module sets PID to NAK on recognizing the completion of the transfer when the pertinent pipe is in the receiving direction and the SHTNAK bit for the selected pipe has been set to 1. • This module sets PID to STALL (11) on receiving the data packet with the payload exceeding the maximum packet size of the pertinent pipe. • This module sets PID to NAK on detecting a USB bus reset when the function controller mode is selected. • This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times when the host controller mode is selected. • This module sets PID to STALL (11) on receiving the STALL handshake when the host controller mode is selected. <p>To specify each response type, set these bits as follows.</p> <ul style="list-style-type: none"> • To make a transition from NAK (00) to STALL, set 10. • To make a transition from BUF (01) to STALL, set 11. • To make a transition from STALL (11) to NAK, set 10 and then 00. • To make a transition from STALL to BUF, set 00 (NAK) and then 01 (BUF).

Note 1. Only 0 can be read and 1 can be written to.

Note 2. Only 1 can be written to.

Table 28.10 Meaning of BSTS Bit

DIR Bit	BFRE Bit	DCLRM Bit	Meaning of BSTS Bit	
0	0	0	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.	
		1	Setting prohibited	
	1	0	1: The received data can be read from the FIFO buffer. 0: The BCLR bit has been set to 1 after the received data has been completely read from the FIFO buffer.	
		1	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.	
	1	0	0	1: The transmit data can be written to the FIFO buffer. 0: The transmit data has been completely written to the FIFO buffer.
			1	Setting prohibited
1		0	Setting prohibited	
		1	Setting prohibited	

Table 28.11 Contents Cleared by This Module by Setting ACLRM = 1

No.	Contents Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Contents is Necessary
1	All the contents in the FIFO buffer assigned to the pertinent pipe (all the information in two FIFO buffer planes in double buffer mode)	
2	The interval count value when the pertinent pipe is for isochronous transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	FIFO buffer toggle control	When the DBLB setting is modified
5	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

Table 28.12 Operation of This Module Depending on PID Setting (when Host Controller Mode is Selected)

PID	Transfer Type (TYPE Bits)	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.
01 (BUF)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Issues tokens while UACT is 1 and the FIFO buffer corresponding to the pertinent pipe is ready for transmission and reception. Does not issue tokens while UACT is 0 or the FIFO buffer corresponding to the pertinent pipe is not ready for transmission or reception.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Issues tokens irrespective of the status of the FIFO buffer corresponding to the pertinent pipe when the UACT bit is set to 1. Does not issue tokens when the UACT bit is set to 0.
10 (STALL) or 11 (STALL)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.

Table 28.13 Operation of This Module Depending on PID Setting (when Function Controller Mode is Selected)

PID	Transfer Type (TYPE Bits)	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Returns NAK in response to the token from the USB host.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Returns nothing in response to the token from the USB host.
01 (BUF)	Bulk (TYPE = 01)	Receiving direction (DIR = 0)	Receives data and returns ACK or NYET in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready. Returns ACK in response to the PING token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready.
		Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready.
	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Returns NAK if not ready.
	Isochronous (TYPE = 11)	Receiving direction (DIR = 0)	Receives data in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Discards data if not ready.
		Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Transmits the zero-length packet if not ready.
10 (STALL) or 11 (STALL)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Returns STALL in response to the token from the USB host.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Returns nothing in response to the token from the USB host.

Note 1. Only 0 can be read and 1 can be written to.

Table 28.14 Contents Cleared by This Module by Setting ACLRM = 1

No.	Contents Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Contents is Necessary
1	All the contents in the FIFO buffer assigned to the selected pipe	
2	When the host controller mode is selected, the interval count value when the selected pipe is for interrupt transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

28.3.37 PIPE_n Transaction Counter Enable Registers (PIPE_nTRE) (n = 1 to 5, 9, and A to F)

PIPE_nTRE is a register that enables or disables the transaction counter corresponding to PIPE1 to PIPE5, and clears the transaction counter.

These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W*	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9	TRENB	0	R/W	Transaction Counter Enable Enables or disables the transaction counter. 0: The transaction counter is disabled. 1: The transaction counter is enabled. For the pipe in the receiving direction, setting this bit to 1 after setting the total number of the packets to be received in the TRNCNT bits allows this module to control hardware as described below on having received the number of packets equal to the set value in the TRNCNT bits. <ul style="list-style-type: none"> • In continuous transmission/reception mode (CNTMD = 1), this module switches the FIFO buffer to the CPU side even if the FIFO buffer is not full on completion of reception. • While SHTNAK is 1, this module modifies the PID bits to NAK for the corresponding pipe on having received the number of packets equal to the set value in the TRNCNT bits. • While DENDE is 1 and PKTMD is 0, the DEND signal is asserted on having received the number of packets equal to the set value in the TRNCNT bits and the last data is to be read. • While BFRE is 1, this module asserts the BRDY interrupt on having received the number of packets equal to the set value in the TRNCNT bits and then reading out the last received data. For the pipe in the transmitting direction, set this bit to 0. When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.
8	TRCLR	0	R/W*	Transaction Counter Clear When this bit is set to 1, this module clears the current counter value of the transaction counter corresponding to the pertinent pipe and then sets this bit to 0. 0: Invalid 1: The current counter value is cleared.
7 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. Modify each bit in this register while CSSTS is 0 and PID is NAK. Before modifying each bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

* Only 0 can be read and 1 can be written to.

28.3.38 PIPEn Transaction Counter Registers (PIPEnTRN) (n = 1 to 5, 9, and A to F)

PIPEnTRN is a transaction counter corresponding to PIPE1 to PIPE5, 9, and A to F.

These registers are initialized by a power-on reset, but retain the set value by a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT[15:0]	H'0000	R/W	<p>Transaction Counter</p> <p>When written to: Specifies the total number of packets to be received by the pertinent pipe (number of transactions).</p> <p>When read from: Indicates the specified number of transactions if TRENB is 0. Indicates the number of currently counted transaction if TRENB is 1.</p> <p>This module increments the value of these bits by one when all of the following conditions are satisfied on receiving the packet.</p> <ul style="list-style-type: none"> • TRENB is 1. • (TRNCNT setting \neq current counter value + 1) on receiving the packet. • The payload of the received packet agrees with the set value in the MXPS bits. <p>This module clears the value of these bits to 0 when any of the following conditions are satisfied.</p> <ul style="list-style-type: none"> • All the following conditions are satisfied. <ul style="list-style-type: none"> TRENB is 1. (TRNCNT setting = current counter value + 1) on receiving the packet. The payload of the received packet agrees with the set value in the MXPS bits. • All the following conditions are satisfied. <ul style="list-style-type: none"> TRENB is 1. This module has received a short packet. • The following condition is satisfied. <ul style="list-style-type: none"> TRCLR is 1. <p>For the pipe in the transmitting direction, set these bits to 0. When the transaction counter is not used, set these bits to 0. Modify these bits while CSSTS is 0, PID is NAK, and TRENB is 0. Before modifying these bits after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. To modify the value of these bits, set TRCLR to 1 before setting TRENB to 1.</p>

28.3.39 Device Address n Configuration Registers (DEVADDn) (n = 0 to 9, and A)

DEVADDn is a register that specifies the USB address and port number of the hub to which the communication target peripheral device is connected and also specifies the USB transfer speed of the communication target peripheral device. These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	UPPHUB[3:0]				HUBPORT[2:0]			USBSPD[1:0]		—	—	—	—	—	—
Initial value:	—	0	0	0	0	0	0	0	0	0	—	—	—	—	—	—
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14 to 11	UPPHUB[3:0]	0000	R/W	Address of Hub to which Communication Target is Connected Specifies the USB address of the hub to which the communication target peripheral device is connected. 0000: The peripheral device is directly connected to the port of this module. 0001 to 1010: USB address of the hub 1011 to 1111: Setting prohibited
10 to 8	HUBPORT[2:0]	000	R/W	Port Number of Hub to which Communication Target is Connected Specifies the port number of the hub to which the communication target peripheral device is connected. 000: The peripheral device is directly connected to the port of this module. 001 to 111: Port number of the hub
7, 6	USBSPD[1:0]	00	R/W	Transfer Speed of the Communication Target Device Specifies the USB transfer speed of the communication target peripheral device. 00: DEVADDn register is not used. 01: Low speed 10: Full speed 11: High speed
5 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. When the host controller mode is selected, the bits in this register should be set before starting communication using each pipe.

(1) When the host controller mode is selected, this module refers to the settings of the UPPHUB bits and HUBPORT bits to generate packets for split transactions.

(2) When the host controller mode is selected, this module refers to the setting of the USBSPD bits to generate packets.

Note 2. The bits in this register should be modified while no valid pipes are using the settings of this register. Valid pipes refer to the ones satisfying both of conditions (1) and (2) below.

(1) This register is selected by the DEVSEL bits as the communication target.

(2) The PID bits are set to BUF for the pertinent pipe or the pertinent pipe is the DCP with SUREQ being 1.

Note 3. When the function controller mode is selected, set all the bits in this register to 0.

28.3.40 UTMI Suspend Mode Register (SUSPMODE)

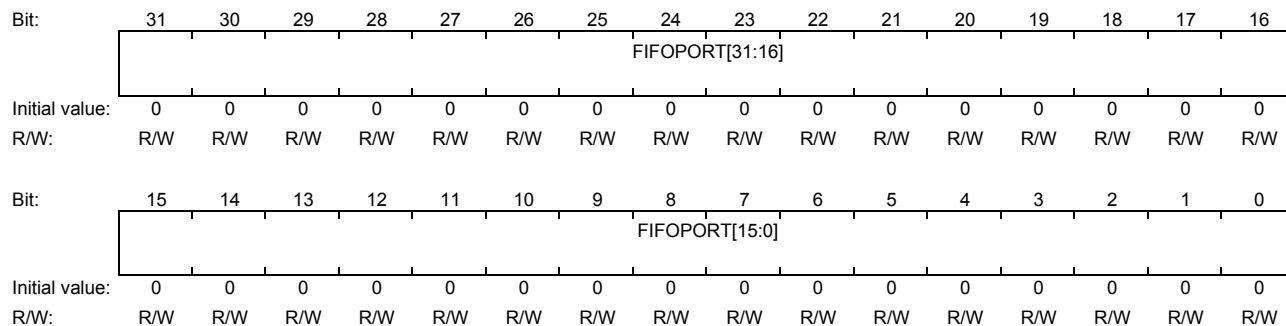

SUSPMODE is a register that specifies the SuspendM signal to be sent to the UTMI.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SUSP M	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14	SUSPM	0	R/W	SuspendM Control Enables or disables the clock to be supplied to this module. 0: The clock supplied to this module is disabled. 1: The clock supplied to this module is enabled. This module controls clock output by using the SuspendM signal. The clock to the LINK is stopped, when the SuspendM signal is low. Writing to the registers of this module is impossible when the SUSPM bit is set to 0 (the clock to this module is stopped). Reading the registers is possible. Note that writing to the following registers is possible even when the SUSPM bit is set to 0. - SYSCFG0 - BUSWAIT - INTENB1* - SUSPMODE Note: * Writing to bit 0 in INTENB1 is only possible when the SUSPM bit is set to 0. When setting this bit to 1, wait for at least 1 ms after setting the UPLLE bit to 1. Set this bit to 0 when this module is to enter software standby or USB standby mode.
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

28.3.41 D0FIFO Continuous Transfer Port Register n (D0FIFOBn)
 D1FIFO Continuous Transfer Port Register n (D1FIFOBn) (n = 0 to 7)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	H'0000 0000	R/W	FIFO Port Accessing these bits allows reading the received data from the FIFO buffer or writing the transmit data to the FIFO buffer. When the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode), use the DxFIFO continuous transfer port registers to access the Dx FIFO buffer.

28.4 Operation

28.4.1 System Control and Oscillation Control

This section describes the register operations that are necessary to the initial settings of this module, and the registers necessary for power consumption control.

(1) Resets

Table 28.15 lists the types of resets for this module. For the initialized states of the registers following the reset operations, see section 28.3, Register Descriptions.

Table 28.15 Types of Reset

Name	Operation
Power-on reset	Low level input from the $\overline{\text{RES}}$ pin
USB bus reset	Automatically detected by this module from the D+ and D- lines when the function controller mode is selected

(2) Controller Mode Selection

This module can select the host controller mode or function controller mode using the DCFM bit in SYSCFG0. Changing the DCFM bit should be done in the initial settings immediately after a power-on reset or in the D+ pull-up disabled (DPRPU = 0) and D+ /D- pull-down disabled (DRPD = 0) state.

(3) USB Data Bus Resistor Control

This module controls switching between a pull-up resistor for the D+ signal and a pull-down resistor for the D+ and D- signals for the Renesas USB 2.0 PHY port. The DPRPU and DRPD bits of the SYSCFG0 register are used to make the pull-up and pull-down resistor settings.

When the function controller mode is selected, set the DPRPU bit of the SYSCFG0 register to 1, which pulls up the D+ signal, after connection to a USB host is recognized.

When disconnection from the USB host is recognized, set the DPRPU and DCFM bits according to the procedure below.

1. Set the DPRPU bit to 0.
2. Wait for at least 1 μs (1000 ns).
3. Set the DCFM bit to 1.
4. Wait for at least 200 ns.
5. Set the DCFM bit to 0.

This module incorporates the terminating resistor for the D+ and D- signals during high-speed operation and the output resistor for the signals during full-speed operation. This module automatically switches the resistor after connection with the host controller or peripheral device upon the detection of a reset handshake, suspend, and resume event.

When the function controller mode is selected and the DPRPU bit in SYSCFG0 is cleared to 0 during communication with the host controller, the pull-up resistor (or the terminating resistor) of the USB data line is disabled, making it possible to notify the USB host of the device disconnection.

(4) Selecting the Input Clock

This module can select the signal on USB_X1 or EXTAL as an input clock. The UCKSEL bit of the SYSCFG0 register for channel 0 is used to select the input clock. The UCKSEL bit should be set while supply of the clock signal to the USB module is stopped (SUSPM = 0 for channel 0 and channel 1).

(5) Setting the Clock Supply for the USB Module

Set the UCKSEL bit of the SYSCFG0 register to the target input clock and then set clock supply by following the appropriate procedure below.

Example 1: When the clock supply is enabled by the initial setting immediately after a power-on reset,

1. set the UPLLE bit to 1,
2. wait for 1 ms, and
3. set the SUSPM bit to 1.

Example 2: When the clock supply is stopped in the suspended state,

1. set the SUSPM bit to 0 and
2. set the UPLLE bit to 0.

Example 3: When the clock supply is enabled after recovery from the suspended state,

1. set the UPLLE bit to 1,
2. wait for 1 ms, and
3. set the SUSPM bit to 1.

Note: • During high-speed operation when the function controller mode is selected, set the SUSPM bit to 1 within 2.5 ms of this module resuming operation from the suspended state due to a USB reset.

28.4.2 Interrupt Functions

(1) Overview of Interrupt Functions

Table 28.16 lists the interrupt generation conditions for this module.

Table 28.16 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Mode That Generates the Interrupt	Related Status
VBINT	VBUS interrupt	<ul style="list-style-type: none"> When a change in the state of the VBUS input pin has been detected (low to high or high to low) 	Host, function	VBSTS
RESM	Resume interrupt	<ul style="list-style-type: none"> When a change in the state of the USB bus has been detected in the suspended state (J-state to K-state or J-state to SE0) 	Function	—
SOFR	Frame number update interrupt	When the host controller mode is selected: <ul style="list-style-type: none"> When an SOF packet with a different frame number has been transmitted When the function controller mode is selected: <ul style="list-style-type: none"> If SOFRM = 0, reception of an SOF packet with a different frame number If SOFRM = 1, reception of an SOF packet with the microframe number 0 was not possible because it was corrupted. 	Host, function	—
DVST	Device state transition interrupt	<ul style="list-style-type: none"> When a device state transition is detected A USB bus reset detected The suspended state detected SET_ADDRESS request received SET_CONFIGURATION request received 	Function	DVSTQ
CTRT	Control transfer stage transition interrupt	<ul style="list-style-type: none"> When a stage transition is detected in control transfer Setup stage completed Control write transfer status stage transition Control read transfer status stage transition Control transfer completed A control transfer sequence error occurred 	Function	CTSQ
BEMP	Buffer empty interrupt	<ul style="list-style-type: none"> When transmission of all of the data in the buffer memory has been completed and the buffer has become empty When an excessive maximum packet size error has been detected 	Host, function	PIPEBEMP
NRDY	Buffer not ready interrupt	When the host controller mode is selected: <ul style="list-style-type: none"> When STALL is received from the peripheral side for the issued token When a response cannot be received correctly from the peripheral side for the issued token (No response is returned three consecutive times or a packet reception error occurred three consecutive times.) When an overrun/underrun occurred during isochronous transfer When the function controller mode is selected: <ul style="list-style-type: none"> Reception of a token while PID = BUF and the buffer memory is not ready for transmission or reception When a CRC error or a bit stuffing error occurred during data reception in isochronous transfer When an interval error occurred during data reception in isochronous transfer 	Host, function	PIPENRDY
BRDY	Buffer ready interrupt	<ul style="list-style-type: none"> When the buffer is ready (reading or writing is enabled) 	Host, function	PIPEBRDY
BCHG	Bus change interrupt	<ul style="list-style-type: none"> When a change of USB bus state is detected 	Host	—
DTCH	Device disconnection detection	<ul style="list-style-type: none"> When disconnection of a peripheral device connected to this LSI's USB port is detected. 	Host	—
ATTCH	Device connection detection	<ul style="list-style-type: none"> When J-state or K-state is detected on the USB port for 2.5 μs. Used for checking whether a peripheral device is connected. 	Host	—

Table 28.16 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Mode That Generates the Interrupt	Related Status
EOFERR	EOF error detection	<ul style="list-style-type: none"> When EOF error of a peripheral device is detected 	Host	—
SACK	Normal setup operation	<ul style="list-style-type: none"> When the normal response (ACK) for the setup transaction is received 	Host	—
SIGN	Setup error	<ul style="list-style-type: none"> When a setup transaction error (no response or ACK packet corruption) is detected three consecutive times. 	Host	—

Figure 28.1 shows a diagram relating to interrupts of this module.

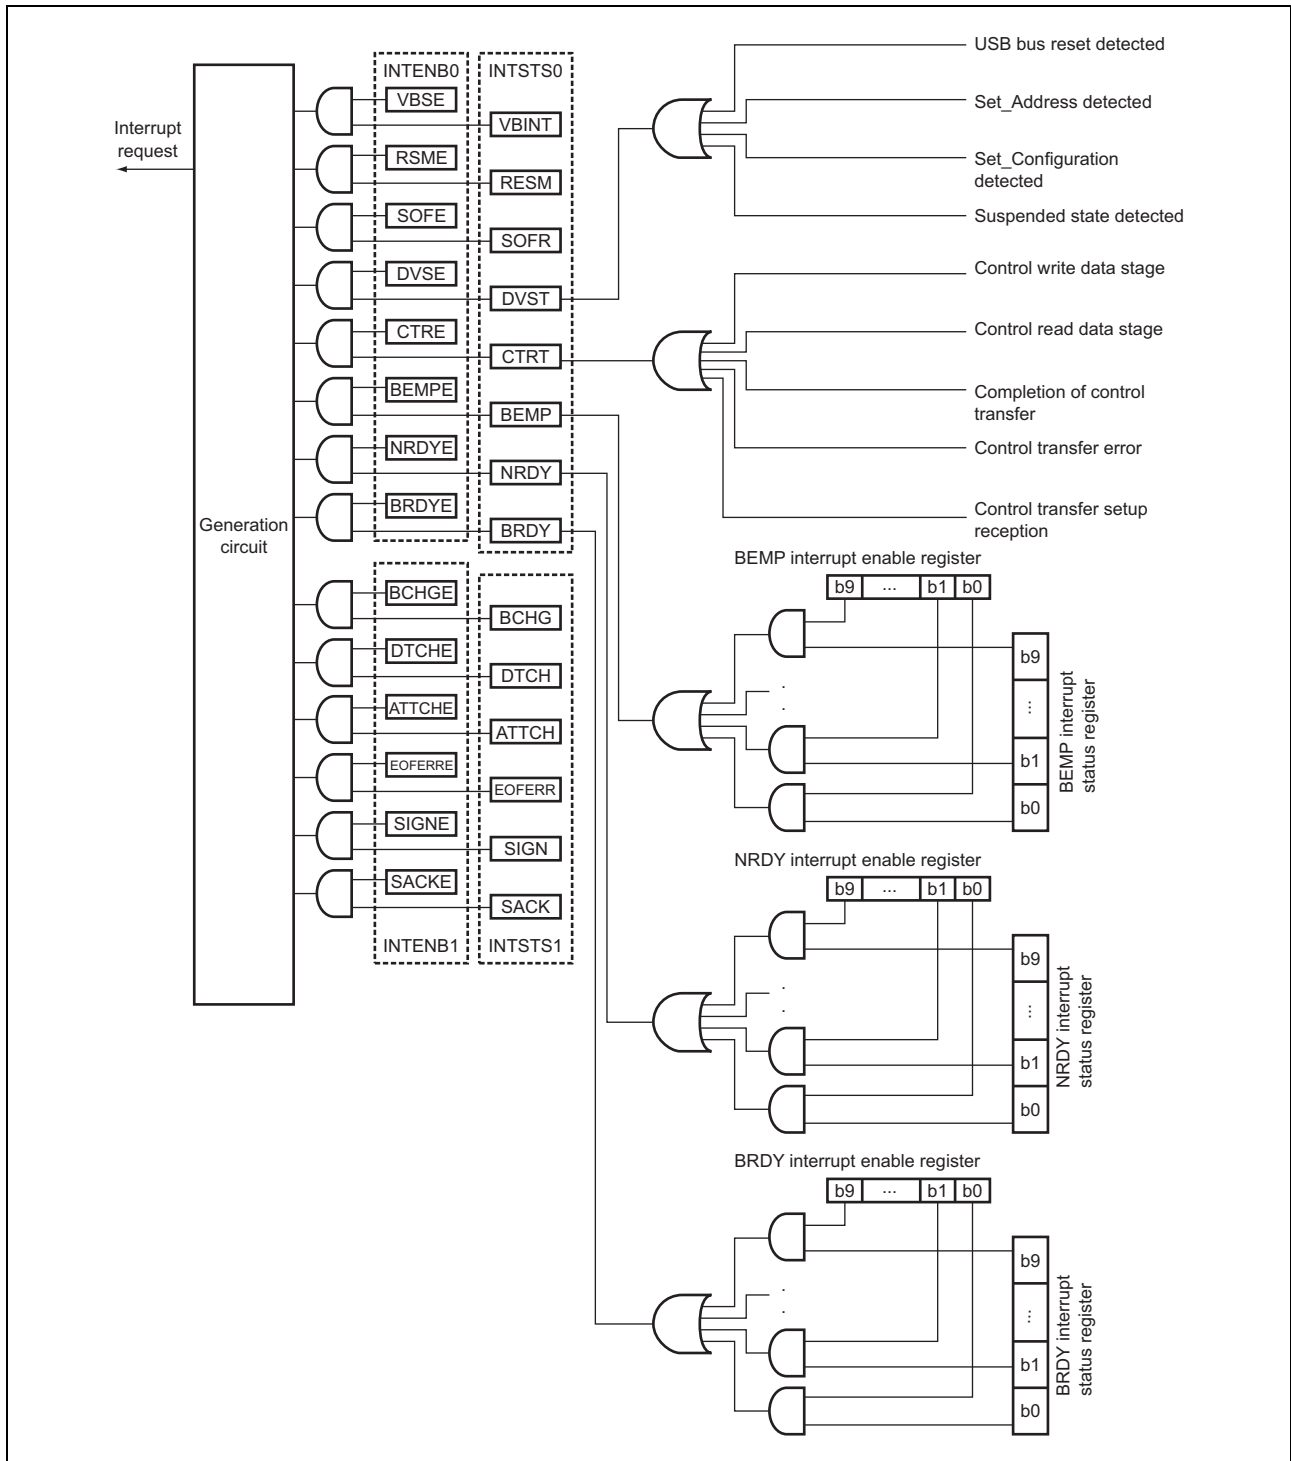

Figure 28.1 Items Relating to Interrupts

(2) BRDY Interrupt

The BRDY interrupt is generated when either of the host controller mode or function controller mode is selected. When each pipe satisfies the following conditions, this module sets 1 to a corresponding bit in BRDYSTS. Under this condition, if the PIPEBRDYE bit in BRDYENB that corresponds to the pipe is set to 1 and the BRDYE bit in INTENB0 is set to 1, this module sets the BRDY bit in INTSTS0 to 1, allowing the BRDY interrupt to be generated.

The conditions for generating and clearing the BRDY interrupt depend on the settings of the BRDYM bit and BFRE bit for the pertinent pipe as described below.

(a) When BRDYM Bit is 0 and BFRE Bit is 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, this module generates the internal BRDY interrupt request trigger and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.

1. For the pipe in the transmitting direction

- When the DIR bit is changed from 0 to 1.
- When packet transmission is completed using the pertinent pipe when write-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).
In continuous transmission/reception mode, the request trigger is generated on completion of transmitting data of one plane of the FIFO buffer.
- When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode.
The request trigger is not generated until completion of writing data to the currently-written FIFO buffer plane even if transmission to the other FIFO buffer is completed.
- When the hardware flushes the buffer of the pipe for isochronous transfers.
- When 1 is written to the ACLRM bit, which causes the FIFO buffer to make transition from the write-disabled to write-enabled state.

The request trigger is not generated for the DCP (that is, during data transmission for control transfers).

2. For the pipe in the receiving direction

- When packet reception is completed successfully thus enabling the FIFO buffer to be read when read-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).
The request trigger is not generated for the transaction in which DATA-PID disagreement occurs.
In continuous transmission/reception mode, the request trigger is not generated when the data is of the specified maximum packet size and the buffer has available space.
When a short packet is received, the request trigger is generated even if the FIFO buffer has available space.
- When the transaction counter is used, the request trigger is generated on receiving the specified number of packets.
In this case, the request trigger is generated even if the FIFO buffer has available space.
When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode.
The request trigger is not generated until completion of reading data from the currently-read FIFO buffer plane even if reception by the other FIFO buffer is completed.

When the function controller mode is selected, the BRDY interrupt is not generated in the status stage of control transfers.

The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit in the BRDYSTS register. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.

Be sure to clear the BRDY status before accessing the FIFO buffer.

(b) When BRDYM Bit is 0 and BFRE Bit is 1

With these settings, this module generates the BRDY interrupt on completion of reading all the data for a single transfer using the pipe in the receiving direction, and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.

On any of the following conditions, this module determines that the last data for a single transfer has been received.

- When a short packet including a zero-length packet is received.
- When the transaction counter register (TRNCNT bits) is used and the number of packets specified by the TRNCNT bits is completely received.

When the pertinent data is completely read out after any of the above determination conditions has been satisfied, this module determines that all the data for a single transfer has been completely read out.

When a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data for a single transfer has been completely read out upon the FRDY and DTLN bits of the FIFO port control register being set to 1 and 0, respectively. In this case, to start the next transfer, write 1 to the BCLR bit in the corresponding FIFOCTR register.

With these settings, this module does not detect the BRDY interrupt for the pipe in the transmitting direction.

The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.

In this mode, the BFRE bit setting should not be modified until all the data for a single transfer has been processed.

When it is necessary to modify the BFRE bit before completion of processing, all the FIFO buffers for the pertinent pipe should be cleared using the ACLRM bit.

(c) When the BRDYM bit is 1 and the BFRE bit is 0

With these settings, the PIPEBRDY values are linked to the BSTS bit settings for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by this module depending on the FIFO buffer status.

1. For the pipe in the transmitting direction

The BRDY interrupt status bits are set to 1 when the FIFO buffer is write-enabled and are set to 0 when write-disabled.

However, the BRDY interrupt is not generated if the DCP in the transmitting direction is write-enabled.

2. For the pipe in the receiving direction

The BRDY interrupt status bits are set to 1 when the FIFO buffer is read-enabled and are set to 0 when all the data have been read (read-disabled).

When a zero-length packet is received when the FIFO buffer is empty, the pertinent bit is set to 1 and the BRDY interrupt continues to be effective until BCLR = 1 is written.

With this setting, the PIPEBRDY bit cannot be cleared to 0. When BRDYM is set to 1, all of the BFRE bits (for all pipes) should be cleared to 0.

(3) NRDY Interrupt

On generating the internal NRDY interrupt request for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPENRDY bit in NRDYSTS to 1. If the corresponding bit in NRDYENB is set to 1, this module sets the NRDY bit in INTSTS0 to 1, allowing the NRDY interrupt to be generated.

The following describes the conditions on which this module generates the internal NRDY interrupt request for a given pipe.

However, the internal NRDY interrupt request is not generated during setup transaction execution when the host controller mode is selected. During setup transactions when the host controller mode is selected, the SACK or SIGN interrupt is detected.

The internal NRDY interrupt request is not generated during status stage execution of the control transfer when the function controller mode is selected.

(a) If Host Controller Mode is Selected when Connection is Used in which No Split Transactions Occur

1. For the pipe in the transmitting direction

On any of the following conditions, this module detects the NRDY interrupt.

- For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.

In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1.

- During communications other than setup transactions using the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.

- During communications other than setup transactions, when the STALL handshake is received from the peripheral device (including the STALL handshake in response to PING in addition to the STALL handshake in response to OUT).

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL (11).

2. For the pipe in the receiving direction

- For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.

In this case, this module discards the received data for the IN token, setting the PIPENRDY bit of the corresponding pipe and the OVRN bit to 1.

When a packet error is detected in the received data for the IN token, this module also sets the CRCE bit to 1.

- For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.

- For the pipe for isochronous transfers, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device.

In this case, this module sets the corresponding PIPENRDY bit to 1. (The setting of the PID bits of the corresponding pipe is not modified.)

- For the pipe for isochronous transfers, when a CRC error or a bit stuffing error is detected in the received data packet.

In this case, this module sets the corresponding PIPENRDY bit and CRCE bit to 1.

- When the STALL handshake is received.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL.

(b) If Host Controller Mode is Selected when Connection is Used in which Split Transactions Occur

1. For the pipe in the transmitting direction

- For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.

In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the start-split transaction (S-SPLIT).

- For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the S-SPLIT or complete-split transaction (C-SPLIT) (when timeout is detected before detection of the handshake packet from the HUB) and 2) an error is detected in the packet from the HUB.

In this case, this module sets the PIPENRDY bit of the corresponding pipe to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.

If the NRDY interrupt is detected when the C-SPLIT is issued, this module clears the CSSTS bit to 0.

- When the STALL handshake is received in response to the C-SPLIT.

In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.

This interrupt is not detected for setup transactions.

- For the pipe for interrupt transfers when the NYET is received in response to the C-SPLIT and the microframe number = 4.

In this case, this module sets the corresponding PIPENRDY bit to 1 and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

2. For the pipe in the receiving direction

- For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.

In this case, this module discards the received data for the IN token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the S-SPLIT.

- For the pipes for bulk transfers, or the transfers other than setup transactions with the DCP, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module at the issuance of S-SPLIT or C-SPLIT (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK. When the condition is generated during the C-SPLIT transaction, this module clears the CSSTS bit to 0.

- During the C-SPLIT transaction for the pipe for isochronous transfers or interrupt transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.

On generating this condition for the pipe for interrupt transfers, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to NAK and clears the CSSTS bit to 0.

On generating this condition for the pipe for isochronous transfers, this module sets the corresponding PIPENRDY

bit to 1 and CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

- During the C-SPLIT transaction, when the STALL handshake is received for the pipe for the transfers other than isochronous transfers.

In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.

- During the C-SPLIT transaction, when the NYET handshake is received for the pipe for the isochronous transfers or interrupt transfers and the microframe number = 4.

In this case, this module sets the corresponding PIPENRDY bit for the pipe to 1, sets the CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

(c) When Function Controller Mode is Selected

1. For the pipe in the transmitting direction

- On receiving an IN token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no data to be transmitted in the FIFO buffer.

In this case, this module generates an NRDY interrupt request at the reception of the IN token, setting the PIPENRDY bit to 1. For the pipe for the isochronous transfers in which an interrupt is generated, this module transmits a zero-length packet, setting the OVRN bit to 1.

2. For the pipe in the receiving direction

- On receiving an OUT token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no space available in the FIFO buffer.

For the pipe for the isochronous transfers in which an interrupt is generated, this module generates an NRDY interrupt request at the reception of the OUT token, setting the PIPENRDY bit to 1 and OVRN bit to 1.

For the pipe for the transfers other than isochronous transfers in which an interrupt is generated, this module generates an NRDY interrupt request when a NAK handshake is transferred after the data following the OUT token was received, setting the PIPENRDY bit to 1.

However, during re-transmission (due to DATA-PID disagreement), the NRDY interrupt request is not generated.

In addition, if an error occurs in the DATA packet, the NRDY interrupt request is not generated.

- On receiving a PING token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no space available in the FIFO buffer.

In this case, this module generates an NRDY interrupt request at the reception of the PING token, setting the PIPENRDY bit to 1.

- For the pipe for isochronous transfers, when the PID bits are set to 01 (BUF) for the pertinent pipe and a token is not received normally within an interval frame.

In this case, this module generates an NRDY interrupt request at the reception of an SOF, and sets the PIPENRDY bit to 1.

(4) BEMP Interrupt

On detecting the BEMP interrupt for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPEBEMP bit in BEMPSTS to 1. If the corresponding bit in BEMPENB is set to 1, this module sets the BEMP bit in INTSTS0 to 1, allowing the USB interrupt to be generated.

The following describes the conditions on which this module generates the internal BEMP interrupt request.

1. For the pipe in the transmitting direction, when the FIFO buffer of the corresponding pipe is empty on completion of transmission (including zero-length packet transmission). In single buffer mode, the internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for the pipe other than DCP. However, the internal BEMP interrupt request is not generated on any of the following conditions.

- When writing data to the FIFO buffer on the CPU side is started on completion of transmitting data of one plane in double buffer mode.
- When the buffer is cleared (emptied) by setting the ACLRM or BCLR bit to 1.
- When IN transfer (zero-length packet transmission) is performed during the control transfer status stage in function controller mode.

2. For the pipe in the receiving direction

When the successfully-received data packet size exceeds the specified maximum packet size. In this case, this module generates the BEMP interrupt request, setting the corresponding PIPEBEMP bit to 1, and discards the received data and modifies the setting of the PID bits of the corresponding pipe to STALL (11).

Here, this module returns no response when used as the host controller, and returns STALL response when used as the function controller.

However, the internal BEMP interrupt request is not generated on any of the following conditions.

- When a CRC error or bit stuffing error is detected in the received data.
- When a setup transaction is being performed.

Writing 0 to the PIPEBEMP bit clears the status; writing 1 to the PIPEBEMP bit has no effect.

(5) Device State Transition Interrupt (Function Controller Mode)

Figure 28.2 shows a diagram of how this module handles the device state transitions. This module monitors device states and generates device state transition interrupts. However, recovery from the suspended state (resume signal detection) is detected by means of the resume interrupt. The device state transition interrupts can be enabled or disabled individually by using INTENB0. The device state after a transition can be confirmed by using the DVSQ bits in INTSTS0.

When making a transition to the default state, the device state transition interrupt is generated after the reset handshake protocol has been completed.

Device state can be monitored only when the function controller mode is selected. Also, the device state transition interrupts can be generated only when the function controller mode is selected.

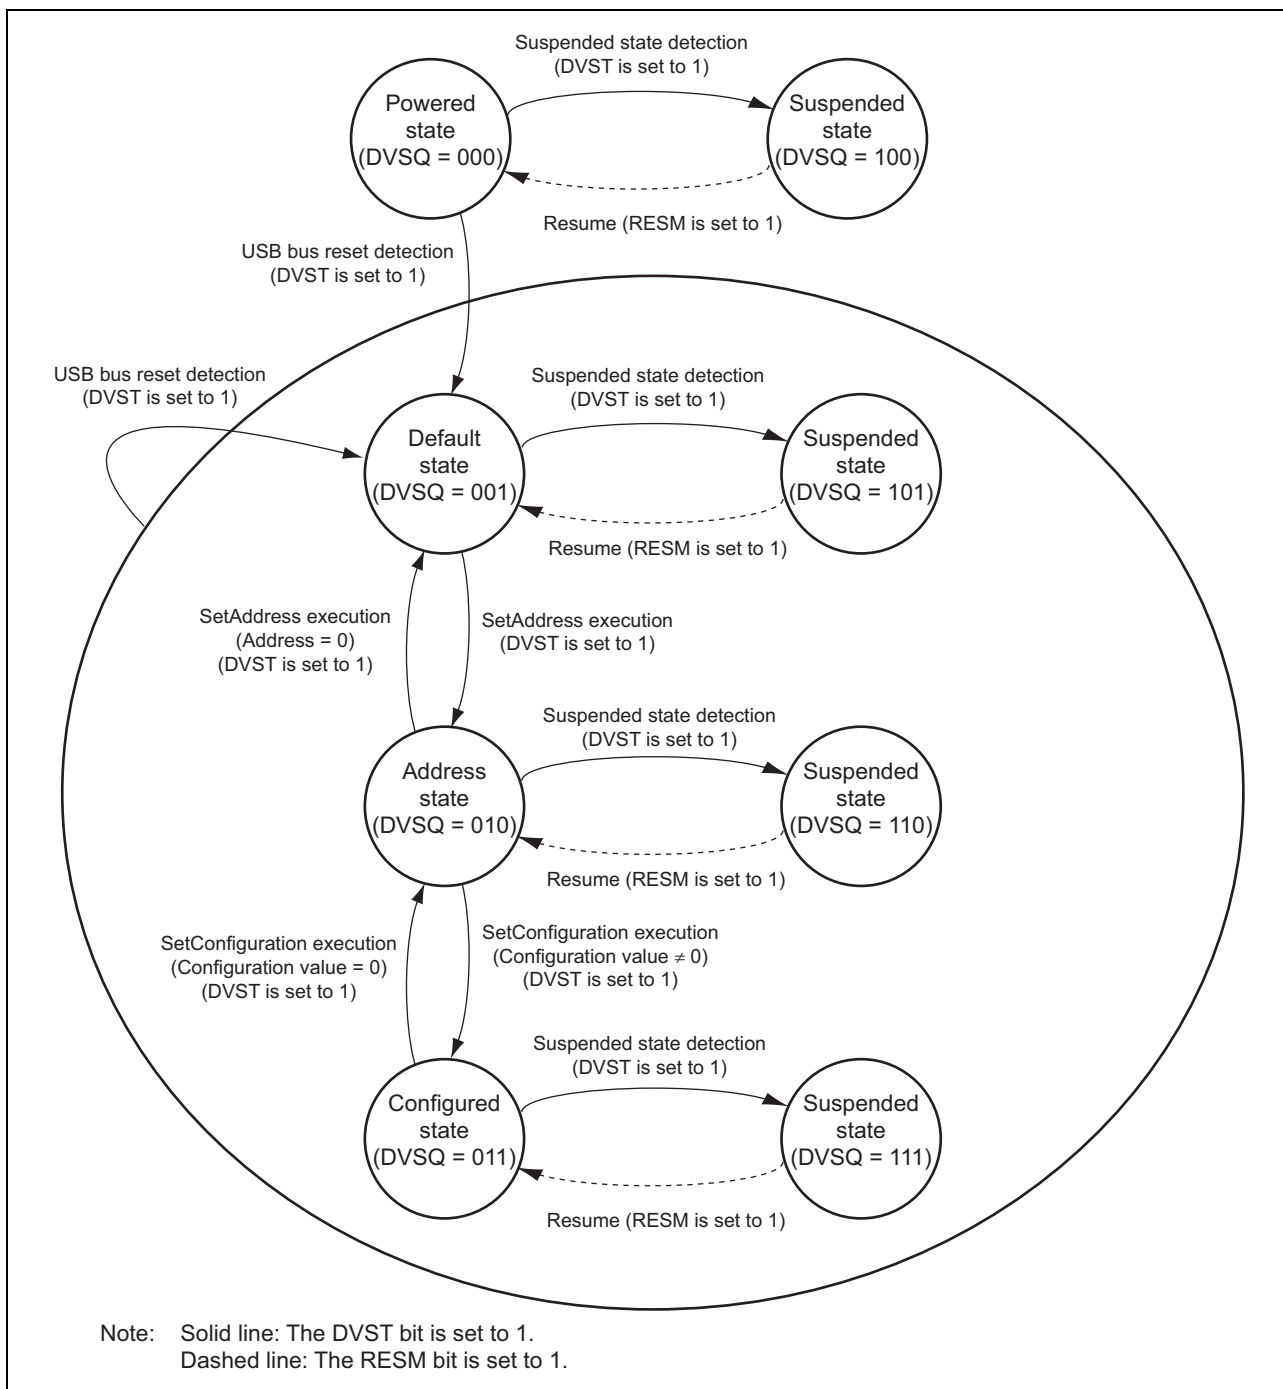

Figure 28.2 Device State Transitions

(6) Control Transfer Stage Transition Interrupt (Function Controller Mode)

Figure 28.3 shows a diagram of how this module handles the control transfer stage transition. This module monitors the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled individually using INTENB0. The control transfer stage after a transition can be confirmed using the CTSQ bits in INTSTS0.

The control transfer stage transition interrupts are generated only when the function controller mode is selected.

The control transfer sequence errors are described below. If an error occurs, the PID bits in DCPCTR are set to B'1x (STALL).

1. During control read transfers
 - At the IN token of the data stage, an OUT or PING token is received when there have been no data transfers at all.
 - An IN token is received at the status stage
 - A packet is received at the status stage for which the data packet is DATAPID = DATA0
2. During control write transfers
 - At the OUT token of the data stage, an IN token is received when there have been no ACK response at all
 - A packet is received at the data stage for which the first data packet is DATAPID = DATA0
 - At the status stage, an OUT or PING token is received
3. During control write no-data transfers
 - At the status stage, an OUT or PING token is received

At the control write transfer data stage, if the number of receive data exceeds the wLength value of the USB request, it cannot be recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (SERR = 1), the CTSQ = 110 value is retained until CTRT = 0 is written from the system (the interrupt status is cleared). Therefore, while CTSQ = 110 is being retained, the CTRT interrupt that indicates completion of the setup stage will not be generated even if a further USB request is received (this module retains the indication of completion of the setup stage, and after the interrupt status flag has been cleared, a CTRT interrupt is generated).

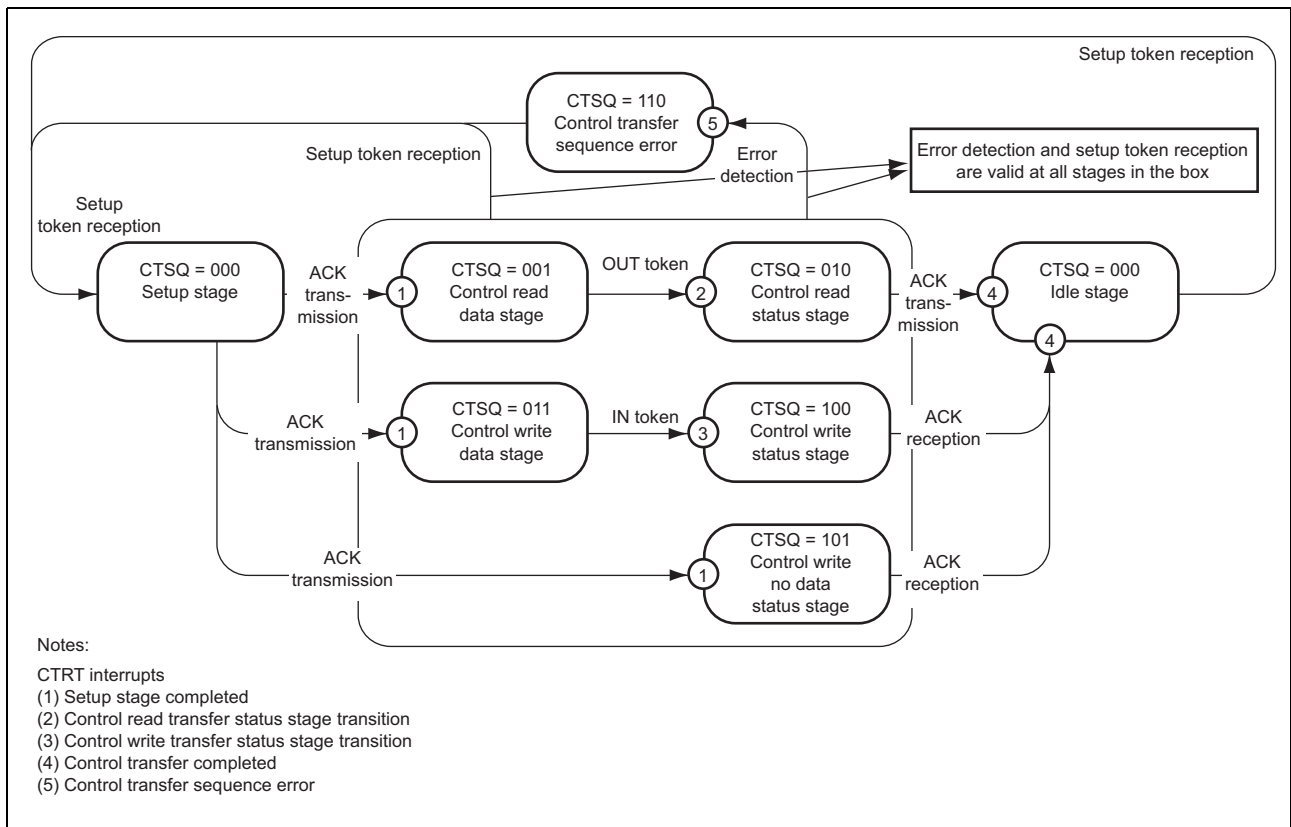

Figure 28.3 Control Transfer Stage Transitions

28.4.3 Pipe Control

Table 28.17 lists the pipe setting items of this module. With USB data transfer, data transmission has to be carried out using the logic pipe called the endpoint. This module has 16 pipes that are used for data transfer. Settings should be entered for each of the pipes in conjunction with the specifications of the system.

Table 28.17 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks
DCPCFG PIPECFG	TYPE	Specifies the transfer type	PIPE1 to PIPE15: Can be set
	BFRE	Selects the BRDY interrupt mode	PIPE1 to PIPE5, PIPE11 to PIPE15: Can be set
	DBLB	Selects a double buffer	PIPE1 to PIPE5, PIPE11 to PIPE15: Can be set PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected).
	CNTMD	Selects continuous transfer or non-continuous transfer	PIPE1 and PIPE2, PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected). PIPE3 to PIPE5, PIPE11 to PIPE15: Can be set
	DIR	Selects transfer direction	IN or OUT can be set
	EPNUM	Endpoint number	PIPE1 to PIPE15: Can be set A value other than 0000 should be set when the pipe is used.
	SHTNAK	Selects disabled state for pipe when transfer ends	PIPE1 and PIPE2, PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected) PIPE3 to PIPE5, PIPE11 to PIPE15: Can be set
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Cannot be set (fixed at 256 bytes) PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set (a maximum of 2 Kbytes can be specified) PIPE6 to PIPE8: Cannot be set (fixed at 64 bytes)
	BUFNMB	Buffer memory number	DCP: Cannot be set (areas fixed at H'0 to H'3) PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set (can be specified in areas H'7 to H'7F) PIPE6 to PIPE8: Cannot be set (areas fixed at H'4 to H'6)
DCPMAXP PIPEMAXP	DEVSEL	Selects a device	Referenced only when the host controller mode is selected.
	MXPS	Maximum packet size	Compliant with the USB standard.
PIPEPERI	IFIS	Buffer flush	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE15: Cannot be set
	IITV	Interval counter	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE5: Cannot be set PIPE6 to PIPE9: Can be set (only when the host controller mode has been selected) PIPE10 to PIPE15: Can be set

Table 28.17 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks
DCPCTR PIPEnCTR	BSTS	Buffer status	For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit.
	INBUFM	IN buffer monitor	Mounted for only PIPE3 to PIPE5 and PIPE9 to PIPE15.
	SUREQ	Setup request	Can be set only for the DCP. Can be controlled only when the host controller mode has been selected.
	SUREQCLR	SUREQ clear	Can be set only for the DCP. Can be controlled only when the host controller mode has been selected.
	CSCLR	CSSTS clear	Can be controlled only when the host controller mode has been selected.
	CSSTS	SPLIT status indication	Can be referenced only when the host controller mode has been selected.
	ATREPM	Auto response mode	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set Can be set only when the function controller mode has been selected.
	ACLRM	Auto buffer clear	PIPE1 to PIPE15: Can be set
	SQCLR	Sequence clear	Clears the data toggle bit
	SQSET	Sequence set	Sets the data toggle bit
	SQMON	Sequence monitor	Monitors the data toggle bit
	PBUSY	Pipe busy confirmation	
	PID	Response PID	
PIPEnTRE	TRENB	Transaction counter enable	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set
	TRCLR	Current transaction counter clear	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set
PIPEnTRN	TRNCNT	Transaction counter	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set

(1) Pipe Control Register Switching Procedures

The following bits in the pipe control registers are only modifiable when USB communication is disabled (PID = NAK): Figure 28.4 shows the procedure for modifying the pipe control registers from the USB communication enabled (PID = BUF) state.

[Bits that should not be set in the USB communication enabled (PID = BUF) state]

- All bits in DCPCFG and DCPMAXP
- The SQCLR and SQSET bits in DCPCTR
- All bits in PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI
- The ATREPM, ACLRM, SQCLR, and SQSET bits in PIPExCTR
- All bits in PIPExTRE and PIPExTRN
- All bits in DEVADDx

In addition to the settings described for the CSCLR bit and all bits in DEVADDx, the settings for each bit described in section 28.3, Register Descriptions must also be complied with.

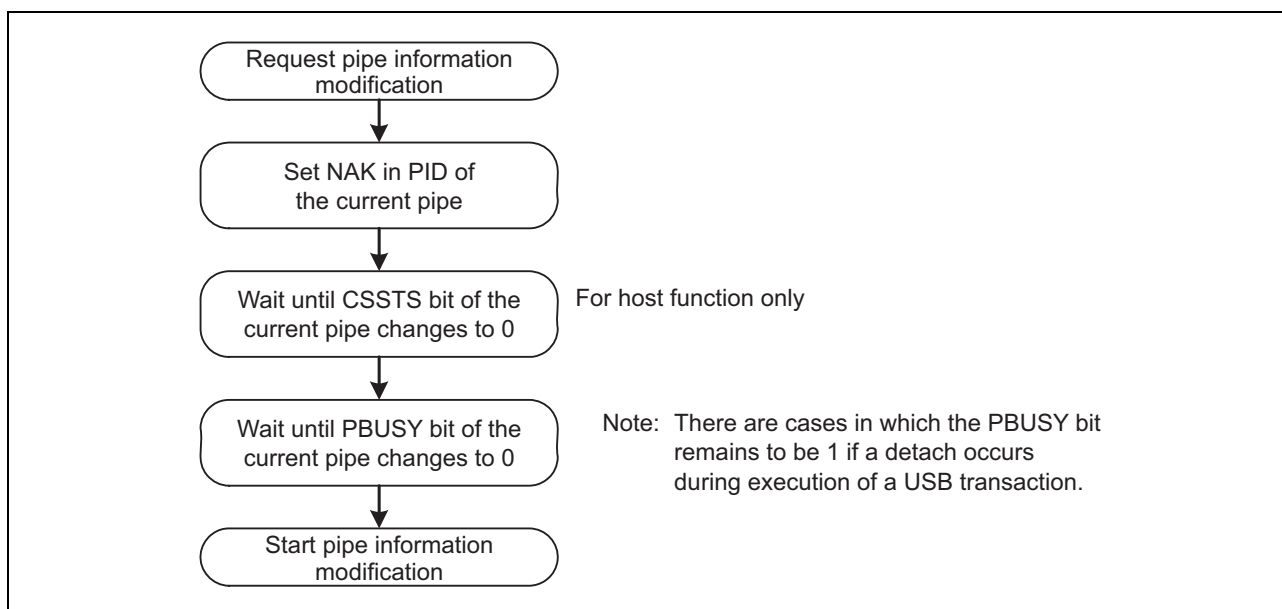

Figure 28.4 Procedure for Modifying Pipe Information from USB Communication Enabled (PID = BUF) State

The following bits in the pipe control registers are only modifiable when the pertinent pipe has not been specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

[Bits that should not be set when the pertinent pipe is specified by the CURPIPE bits in FIFO port select registers]

- All bits in DCPCFG and DCPMAXP
- All bits in PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI
- The ACLRM bit in PIPExCTR

In order to modify pipe information, the CURPIPE bits should be set to the pipes other than the pipe to be modified. For the DCP, the buffer should be cleared using BCLR after the pipe information is modified.

(2) Maximum Packet Size Setting

The MXPS bits in DCPMAXP and PIPEMAXP are used to specify the maximum packet size for each pipe. DCP, PIPE1 to PIPE5, and PIPE11 to PIPE15 can be set to any of the maximum packet sizes defined by the USB Specification. For PIPE6 to PIPE10, 64 bytes are the upper limit of the maximum packet size. The maximum packet size should be set before beginning the transfer (PID = BUF).

- DCP: 64 should be set when using high-speed operation.
- DCP: Select and set 8, 16, 32, or 64 when using full-speed operation.
- PIPE1 to PIPE5: 512 should be set when using high-speed bulk transfer.
- PIPE1 to PIPE5: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer.
- PIPE1 and PIPE2: Set a value between 1 and 1024 when using high-speed isochronous transfer.
- PIPE1 and PIPE2: Set a value between 1 and 1023 when using full-speed isochronous transfer.
For details, see [section 28.4.9, Isochronous Transfers \(PIPE1 and PIPE2\)](#).
- PIPE6 to PIPE8: Set a value between 1 and 64.
- PIPE9: 64 should be set when using interrupt transfer (only when the host controller mode has been selected).
512 should be set when using high-speed bulk transfer (only when the function controller mode has been selected).
Select and set 8, 16, 32, or 64 when using full-speed bulk transfer (only when the function controller mode has been selected).
- PIPE10 to PIPE15: 512 should be set when using high-speed bulk transfer (only when the function controller mode has been selected).
- PIPE10 to PIPE15: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer (only when the function controller mode has been selected).

The high bandwidth transfers used with interrupt transfers and isochronous transfers are not supported.

(3) Response PID

The PID bits in DCPCTR and PIPEnCTR are used to set the response PID for each pipe.

The following shows this module operation with various response PID settings:

1. Response PID settings when the host controller mode is selected

The response PID is used to specify the execution of transactions.

- NAK setting: Using pipes is disabled. No transaction is executed.
- BUF setting: Transactions are executed based on the status of the buffer memory.
 - For OUT direction: If there are transmit data in the buffer memory, an OUT token is issued.
 - For IN direction: If there is an area to receive data in the buffer memory, an IN token is issued.
- STALL setting: Using pipes is disabled. No transaction is executed.

Note: • Setup transactions for the DCP are set with the SUREQ bit.

2. Response PID settings when the function controller mode is selected

The response PID is used to specify the response to transactions from the host.

- NAK setting: The NAK response is always returned in response to the generated transaction.
- BUF setting: Responses are made to transactions based on the status of the buffer memory.
- STALL setting: The STALL response is always returned in response to the generated transaction.

Note: • For setup transactions, an ACK response is always returned, regardless of the PID setting, and the USB request is stored in registers USBREQ, USBVAL, USBINDEX, and USBLENG.

This module may carry out writing to the PID bits, depending on the results of the transaction. Writing to the PID bits by this module is carried out in the following cases.

1. When the host controller mode has been selected and the response PID is set by this module

- NAK setting: In the following cases, PID = NAK is set and issuing of tokens is automatically stopped:
 - For transfer that is not isochronous, any combination of the following two items occurring three consecutive times in response to transmitted tokens
 - 1) no response being returned or 2) a reception error such as a CRC error or a bit stuffing error
 - For isochronous transfer, a reception error such as a CRC error or a bit stuffing error occurring three consecutive times in response to transmitted tokens
 - Reception of a short packet at the stage of control read transfer data when the setting of the SHTNAK bit in PIPECFG is 1
 - If a short packet is received when the SHTNAK bit in PIPECFG has been set to 1 for bulk transfer.
 - If counting by the transaction counter ends while the SHTNAK bit in PIPECFG is set to 1 during bulk transfer.
- BUF setting: There is no BUF writing by this module.
- STALL setting: In the following cases, PID = STALL is set and issuing of tokens is automatically stopped:
 - When STALL is received in response to the transmitted token.
 - When the size of the receive data packet exceeds the maximum packet size.

2. When the function controller mode has been selected and the response PID is set by this module

- NAK setting: When the setup token is received normally (DCP only).
 - If counting by the transaction counter ends or a short packet is received while the SHTNAK bit in PIPECFG is set to 1 during bulk transfer.
- BUF setting: There is no BUF writing by this module.
- STALL setting: When a maximum packet size exceeded error has been detected in the receive data packet.
 - When a control transfer sequence error has been detected.

(4) Data PID Sequence Bit

This module automatically toggles the sequence bit in the data PID when data is transferred normally in the control transfer data stage, bulk transfer and interrupt transfer. The sequence bit of the data PID that is to be transmitted for the next transaction can be confirmed with the SQMON bit in DCPCTR or PIPEnCTR. When data is transmitted, the sequence bit switches at the timing at which the ACK handshake is received. When data is received, the sequence bit switches at the timing at which the ACK handshake is transmitted. The SQCLR and SQSET bits in DCPCTR or PIPEnCTR can be used to change the data PID sequence bit.

When the function controller mode has been selected and control transfer is used, this module automatically sets the sequence bit when a stage transition is made. The data PID sequence bit becomes DATA1 when the setup stage ends and this module does not reference the sequence bit and responds with PID = DATA1 in the status stage. Therefore, settings are not required. However, when the host controller mode has been selected and control transfer is used, the sequence bit should be set at the stage transition.

For the ClearFeature request transmission or reception, the data PID sequence bit should be set, regardless of whether the host controller mode or function controller mode is selected.

With pipes for which isochronous transfer has been set, sequence bit operation cannot be carried out using the SQSET bit.

28.4.4 FIFO Buffer Memory

This section describes the operation of the FIFO buffers incorporated in this module. Unless specifically specified, the buffer operation is the same regardless of whether the host controller mode or function controller mode is selected.

(1) FIFO Buffer Memory Allocation

Figure 28.5 shows an example of a FIFO buffer memory map for this module. The FIFO buffer memory is an area shared by the CPU and this module. In the FIFO buffer memory status, there are times when the access right to the buffer memory is allocated to the user system (CPU side), and times when it is allocated to this module (SIE side). Independent FIFO buffer memory areas should be set for each pipe. Each memory area can be set using the first block number and the number of blocks (specified using the BUFNMB and BUFSIZE bits in PIPEBUF), where one block comprises 64 bytes.

When continuous transfer mode has been selected using the CNTMD bit in PIPECFG, the BUFSIZE bits should be set so that the buffer memory size should be an integral multiple of the maximum packet size. When double buffer mode has been selected using the DBLB bit in PIPECFG, two planes of the memory area specified using the BUFSIZE bits in PIPEBUF can be assigned to a single pipe.

Moreover, three FIFO ports are used for access to the FIFO buffer memory (reading and writing data). A pipe is assigned to the FIFO port by specifying the pipe number using the CURPIPE bits in CFIFOSEL/DnFIFOSEL.

The FIFO buffer status of each pipe can be confirmed using the BSTS bit in DCPCTR or the BSTS and INBUFM bits in PIPECTR. Also, the access right of the FIFO port can be confirmed using the FRDY bit in CFIFOCTR or DnFIFOCTR.

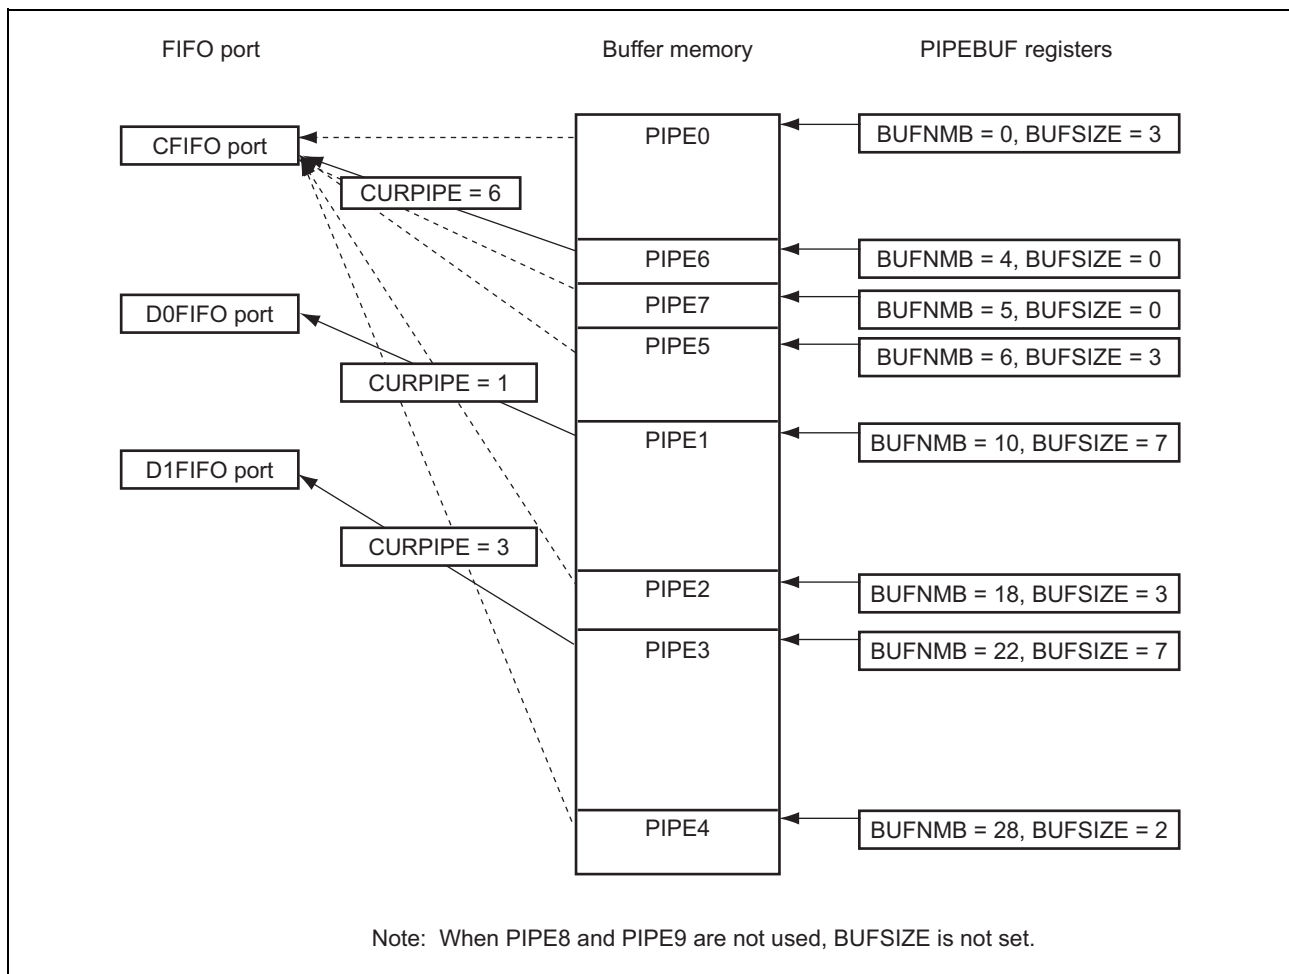

Figure 28.5 Example of a FIFO Buffer Memory Map

(a) FIFO Buffer Clearing

Table 28.18 shows the clearing of the FIFO buffer memory by this module. The FIFO buffer memory can be cleared using the BCLR, DCLRM, and ACLRM bits.

Table 28.18 List of FIFO Buffer Clearing Methods

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR DnFIFOCTR	DnFIFOSEL	PIPEnCTR
Function	Clears the FIFO buffer memory on the CPU side	In this mode, after the data of the specified pipe has been read, the FIFO buffer memory is cleared automatically.	This is the auto buffer clear mode, in which all of the received packets are discarded.
Clearing method	Cleared by writing 1	1: Mode valid 0: Mode invalid	1: Mode valid 0: Mode invalid

Table 28.19 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled

Continuous or Non-Continuous Transfer Mode	When Reading Data or Transmitting Data is Enabled
Non-continuous transfer (CNTMD = 0)	<p>In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in the following case.</p> <ul style="list-style-type: none"> This module receives one packet. <p>In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases.</p> <ul style="list-style-type: none"> Data of the maximum packet size is written to the FIFO buffer. Data of the short packet size (including 0-byte data) is written to the FIFO buffer and then 1 is written to BVAL.
Continuous transfer (CNTMD = 1)	<p>In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in any of the following cases.</p> <ul style="list-style-type: none"> The number of the data bytes received in the FIFO buffer assigned to the selected pipe becomes the same as the number of assigned data bytes $((\text{BUFSIZE} + 1) \times 64)$. This module receives a short packet other than a zero-length packet. This module receives a zero-length packet when data is already stored in the FIFO buffer assigned to the selected pipe. This module receives the number of packets equal to the transaction counter value specified for the selected pipe. <p>In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases.</p> <ul style="list-style-type: none"> The number of the data bytes written to the FIFO buffer becomes the same as the number of data bytes in a single FIFO buffer plane assigned to the selected pipe. A number of data bytes less than the size of a single FIFO buffer (including 0 bytes of data) assigned to the selected pipe being written to the FIFO buffer and then 1 being written to BVAL A number of data bytes less than the size of a single FIFO buffer (including 0 bytes of data) assigned to the selected pipe being written to the FIFO buffer and then the DENDx_N signal being asserted at the same time as writing of the final byte

28.4.5 FIFO Port Functions

This section describes the FIFO port functions. Table 28.20 shows the settings for the FIFO port functions of this module. In write access, writing data until the buffer is full (or the maximum packet size for non-continuous transfers) automatically enables sending of the data to the USB bus. To enable sending of data before the buffer is full (or before the maximum packet size for non-continuous transfers), the BVAL bit in CFIFOCTR/DnFIFOCTR must be set to end the writing (TEND signal for DMA transfers). Also, to send a zero-length packet, the BCLR bit in the same register must be used to clear the buffer and then the BVAL bit is set in order to end the writing.

In read access, reception of new packets is automatically enabled if all of the data has been read. Data cannot be read when a zero-length packet has been received (DTLN = 0), so the BCLR bit in the same register must be used to clear the buffer. The length of the data being received can be confirmed using the DTLN bit in CFIFOCTR/DnFIFOCTR.

Table 28.20 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
CFIFOSEL/ DnFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Buffer memory rewind (re-read, rewrite)	
	DCLRM	Automatically clears data received for a specified pipe after the data has been read	For DnFIFO only
	DREQE	Asserts the DREQ signal	For DnFIFO only
	MBW	FIFO port access bit width	
	BIGEND	Selects FIFO port endian	
	ISEL	FIFO port access direction	For DCP only
	CURPIPE	Selects the current pipe	
CFIFOCTR/ DnFIFOCTR	BVAL	Ends writing to the buffer memory	
	BCLR	Clears the buffer memory on the CPU side	
	FRDY	Monitors whether the FIFO port is ready for access	
	DTLN	Checks the length of received data	

(a) FIFO Port Selection

Table 28.21 shows the pipes that can be selected with each FIFO port. The pipe to be accessed is selected using the CURPIPE bits in CFIFOSEL/DnFIFOSEL. After the pipe is selected, whether the CURPIPE value for the pipe which was written last can be correctly read should be checked. (If the previous pipe number is read, it indicates that the pipe switching is being executed by this module.) Then, the FIFO port can be accessed after FRDY = 1 is checked. Figure 28.6 shows the procedure for pipe switching during access to the FIFO port.

Also, the bus width to be accessed should be selected using the MBW bit. The buffer memory access direction conforms to the DIR bit in PIPEnCFG. The ISEL bit determines this only for the DCP.

Table 28.21 FIFO Port Access Categorized by Pipe

Pipe	Access Method	Port that can be Used
DCP	CPU access	CFIFO port register
PIPE1 to PIPE15	CPU access	CFIFO port register
	DMA access	D0FIFO/D1FIFO port register

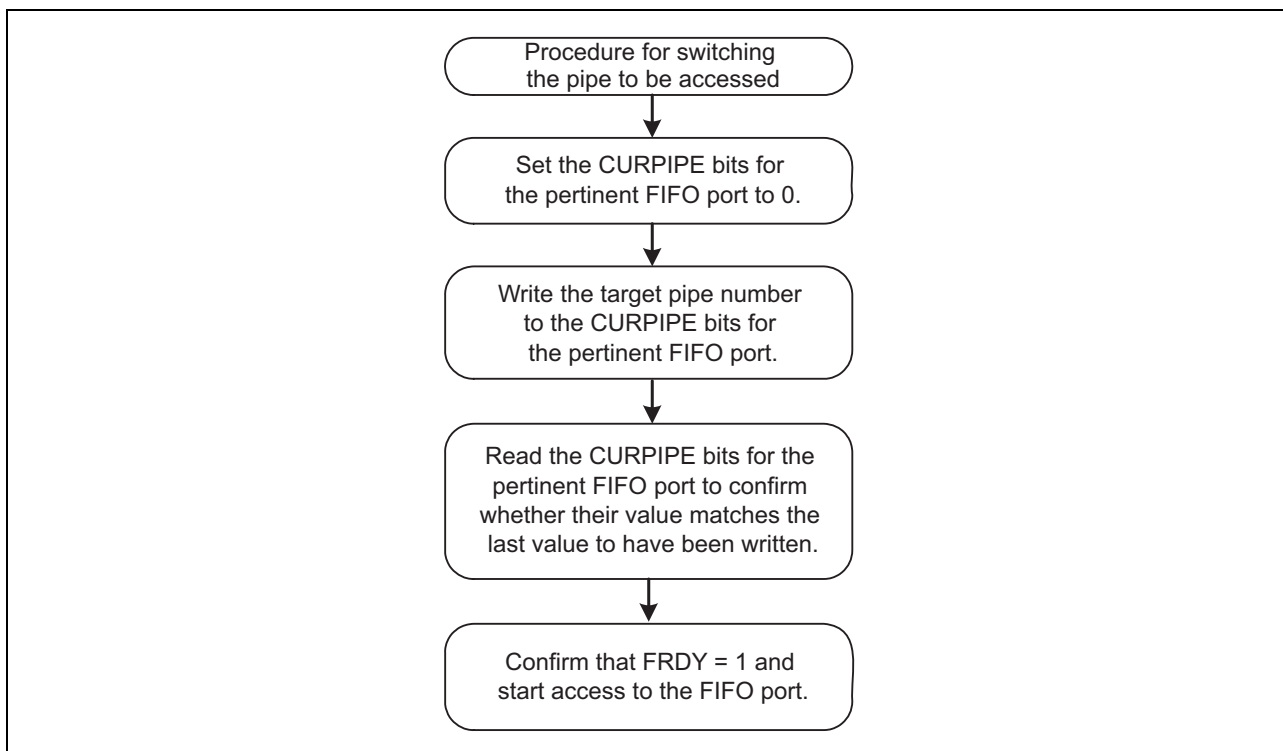

Figure 28.6 Procedure for Pipe Switching during Access to the FIFO Port

(b) DnFIFO Auto Clear Mode (D0FIFO/D1FIFO Port Reading Direction)

If 1 is set for the DCLRM bit in DnFIFOSEL, the module automatically clears the buffer memory of the selected pipe when reading of the data from the buffer memory has been completed.

Table 28.22 shows the packet reception and buffer memory clearing processing for each of the various settings. As shown in Table 28.22, the buffer clear conditions depend on the value set to the BFRE bit. Using the DCLRM bit eliminates the need for the buffer to be cleared even if a situation occurs that necessitates clearing of the buffer. This makes it possible to carry out DMA transfers without involving software.

This function can be set only in the buffer memory reading direction.

Table 28.22 Packet Reception and Buffer Memory Clearing Processing

Buffer Status when Packet is Received	Register Setting			
	DCLRM = 0		DCLRM = 1	
	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Zero-length packet reception	Needs to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Normal short packet reception	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Transaction count ended	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared

(c) Timing Selection Function for BRDY Interrupts

The BFRE bit of the PIPECFG register can be used to select non-generation of the BRDY interrupt when a data packet with the maximum packet size has been received.

For DMA transfer, this function enables the generation of an interrupt only when the last of the data have been received. Reception of the last of the data indicates either that a short packet was received or completion of counting by the transaction counter. If BFRE = 1, a BRDY interrupt is generated after the received data have been read. The length of the data packet that was last to have been received before the BRDY interrupt was generated can be confirmed by reading the DTLN bits of the DnFIFOCTR register.

Table 28.23 shows the times at which a BRDY interrupt is generated by this module.

Table 28.23 Times BRDY Interrupts are Generated

Buffer Status when Packet is Received	Register Setting	
	BFRE = 0	BFRE = 1
Buffer full (normal packet reception)	When a packet is received	No interrupt is generated.
Zero-length packet reception	When a packet is received	When a packet is received
Normal short packet reception	When a packet is received	When received data have been read from buffer memory
Transaction count ended	When a packet is received	When received data have been read from buffer memory

The BFRE bit function is only valid for the reading of buffer memory. In the case of writing, the value of the BFRE bit should always be 0.

28.4.6 Control Transfers (DCP)

Data transfers of the data stage of control transfers are done using the default control pipe (DCP). The DCP buffer memory is a 64-byte single buffer, and is a fixed area that is shared for both control reading and control writing. The buffer memory can be accessed through the CFIFO port.

(1) Control Transfers when the Host Controller Mode is Selected

(a) Setup Stage

USBREQ, USBVAL, USBINDX, and USBLENG are the registers that are used to transmit a USB request for setup transactions. Writing setup packet data to the registers and writing 1 to the SUREQ bit in DCPCTR transmits the specified data for setup transactions. Upon completion of transactions, the SUREQ bit is cleared to 0 by this module. The above USB request registers should not be modified while SUREQ = 1. The device address for setup transactions is specified using the DEVSEL bits in DCPMAXP.

When the data for setup transactions has been sent, a SIGN or SACK interrupt request is generated according to the response received from the peripheral device (SIGN or SACK bit in INTSTS1), by means of which the result of the setup transactions can be confirmed.

A data packet of DATA0 (USB request) is transmitted as the data packet for the setup transactions regardless of the setting of the SQMON bit in DCPCTR.

(b) Data Stage

Data transfers are done using the DCP buffer memory.

The access direction of the DCP buffer memory should be specified using the ISEL bit in CFIFOSEL. The transfer direction should be specified using the DIR bit in DCPCFG.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Accordingly, transaction should be done by setting the data PID to DATA1 by using the SQSET bit in DCPCTR, and setting the response PID to BUF by using the PID bits in DCPCTR. Completion of data transfer is detected using the BRDY and BEMP interrupts.

The data in multiple packets can be transferred in continuous transfer mode. For continuous transfer in the receiving direction, however, note that a BRDY interrupt is only generated when the buffer memory is full or a short packet is received (when the number of bytes of data is an integer multiple of the maximum packet size and no greater than 256 bytes).

For control write transfers, when the number of data bytes to be sent is the integral multiple of the maximum packet size, a zero-length packet must be sent at the end.

(c) Status Stage

Zero-length packet data transfers are done in the direction opposite to that in the data stage. As with the data stage, data transfers are done using the DCP buffer memory. Transactions are done in the same manner as the data stage.

For the data packets of the status stage, the data PID must be transferred as DATA1. The data PID should be set to DATA1 using the SQSET bit in DCPCTR.

For reception of a zero-length packet, the received data length must be confirmed using the DTLN bits in CFIFOCTR after the BRDY interrupt is generated, and the buffer memory must then be cleared using the BCLR bit.

(2) Control Transfers when the Function Controller Mode is Selected

(a) Setup Stage

This module always sends an ACK response in response to a setup packet that is normal with respect to this module. The operation of this module in the setup stage is noted below.

(i) When a new setup packet is received, this module sets the following registers:

- Set the VALID bit in INTSTS0 to 1.
- Set the PID bits in DCPCTR to NAK.
- Set the CCPL bit in DCPCTR to 0.

(ii) When a data packet is received right after the setup packet, the USB request parameters are stored in USBREQ, USBVAL, USBINDX, and USBLENG.

Response processing with respect to the control transfer should always be carried out after first setting VALID = 0. In the VALID = 1 state, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the function of the VALID bit, this module is able to interrupt the processing of a request currently being processed if a new USB request is received during a control transfer, and can send a response in response to the newest request.

Also, this module automatically judges the direction bit (bit 8 of the bmRequestType) and the request data length (wLength) of the USB request that was received, and then distinguishes between control read transfers, control write transfers, and control write no-data transfers, and monitors the stage transition. For a wrong sequence, the sequence error of the control transfer stage transition interrupt is generated. For information on the stage control of this module, see Figure 28.3.

(b) Data Stage

Data transfers corresponding to USB requests that have been received should be done using the DCP. Before accessing the DCP buffer memory, the access direction should be specified using the ISEL bit in CFIFOSEL.

Transaction should be done by setting the response PID to BUF by using the PID bits in DCPCTR.

Completion of data transfer is detected using the BRDY interrupt for control write transfers and BEMP interrupt for control read transfers, respectively.

With control write transfers during high-speed operation, the NYET handshake response is carried out based on the state of the buffer memory.

(c) Status Stage

Control transfers are terminated by setting the CCPL bit to 1 with the PID bits in DCPCTR set to BUF.

After the above settings have been entered, this module automatically executes the status stage in accordance with the data transfer direction determined at the setup stage. The specific procedure is as follows.

- For control read transfers
This module receives a zero-length packet from the USB host controller and transmits an ACK response.
- For control write transfers and no-data control transfers
This module transmits a zero-length packet and receives an ACK response from the USB host controller.

(d) Control Transfer Auto Response Function

This module automatically responds to a normal SET_ADDRESS request. If any of the following errors occur in the SET_ADDRESS request, a response is necessary.

- bmRequestType ≠ H'00
- wIndex ≠ H'00
- wLength ≠ H'00
- wValue > H'7F
- DVSQ = B'011 (Configured)

For all requests other than the SET_ADDRESS request, corresponding responses are required.

28.4.7 Bulk Transfers (PIPE1 to PIPE5, PIPE9 to PIPE15)

The buffer memory specifications for bulk transfers (single/double buffer setting, or continuous/non-continuous transfer mode setting) can be selected. The maximum size that can be set for the buffer memory is 2 Kbytes. The buffer memory state is controlled by this module, with a response sent automatically for a PING packet/NYET handshake.

(1) PING Packet Control when the Host Controller Mode is Selected

This module automatically sends a PING packet in the OUT direction at a specific timing.

On receiving an ACK handshake in the initial state in which PING packet sending mode is set, this module sends an OUT packet as noted below. Reception of an NAK or NYET handshake returns this module to PING packet sending mode. This control also applies to the control transfers in the data stage and status stage.

<Starts sending an OUT data>

1. Sets OUT data sending mode.
2. Sends a PING packet.
3. Receives an ACK handshake.
4. Sends an OUT data packet.
5. Receives an ACK handshake.
(Repeats steps 4 and 5.)
6. Sends an OUT data packet.
7. Receives an NAK/NYET handshake.
8. Sends a PING packet.

This module is returned to PING packet sending mode by a power-on reset, receiving an NYET/NAK handshake, clearing the sequence toggle bit (SQCLR), and setting the buffer clear bit (ACLRM) in PIPEnCTR.

(2) NYET Handshake Control when the Function Controller Mode is Selected

Table 28.24 lists responses to tokens received in bulk or control transfer. The NYET response of this module is made when there is only enough space in the buffer memory for one packet when an OUT token for such transfer is received. When a short packet is received, an ACK response will be produced instead of an NYET response even if the above condition holds.

Table 28.24 NYET Handshake Responses

Value Set for PID Bits in DPCPTR	Buffer Memory State	Received Token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY	OUT/PING	ACK	If an OUT token is received, a data packet is received.*1
	RCV-BRDY	OUT	NYET	A data packet is received.*2
	RCV-BRDY	OUT (Short)	ACK	A data packet is received.*2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/DATA1	A data packet is transmitted.
	TRN-NRDY	IN	NAK	

[Legend]

RCV-BRDY*1:When an OUT/PING token is received, there is space in the buffer memory for two or more packets.

RCV-BRDY*2:When an OUT token is received, there is only enough space in the buffer memory for one packet.

RCV-NRDY:When a PING token is received, there is no space in the buffer memory.

TRN-BRDY:When an IN token is received, there is data to be transmitted in the buffer memory.

TRN-NRDY:When an IN token is received, there is no data to be transmitted in the buffer memory.

28.4.8 Interrupt Transfers (PIPE6 to PIPE9, PIPE10)

When the function controller mode is selected, this module carries out interrupt transfers in accordance with the timing controlled by the host controller. For interrupt transfers, PING packets are ignored (no responses are sent), and the ACK, NAK, and STALL responses are carried out without an NYET handshake response being made.

When the host controller mode is selected, this module can set the timing of issuing a token using the interval counter. At this time, this module issues an OUT token even in the OUT direction, without issuing a PING token.

This module does not support high bandwidth transfers of interrupt transfers.

(1) Interval Counter during Interrupt Transfers when the Host Controller Mode is Selected

(a) Operation Outline

For interrupt transfers, intervals between transactions are set in the IITV bits in PIPEPERI. This module issues an interrupt transfer token based on the specified intervals.

(b) Counter Initialization

This module initializes the interval counter under the following conditions.

- Power-on reset:
The IITV bits are initialized.
- Buffer memory initialization using the ACLRM bit:
The IITV bits are not initialized but the count value is. Setting the ACLRM bit to 0 starts counting from the value set in the IITV bits.

Note that the interval counter is not initialized in the following case.

- USB bus reset, USB suspended:
The IITV bits are not initialized. Setting 1 to the UACT bit starts counting from the value before entering the USB bus reset state or USB suspended state.

(c) Operation when Transmission/Reception is Impossible at Token Issuance Timing

This module cannot issue tokens even at token issuance timing in the following cases. In such a case, this module attempts transactions at the subsequent interval.

- When the PID is set to NAK or STALL.
- When the buffer memory is full at the token sending timing in the receiving (IN) direction.
- When there is no data to be sent in the buffer memory at the token sending timing in the sending (OUT) direction.

28.4.9 Isochronous Transfers (PIPE1 and PIPE2)

This module has the following functions pertaining to isochronous transfers.

- Notification of isochronous transfer error information
- Interval counter (specified by the IITV bits)
- Isochronous IN transfer data setup control (IDLTY function)
- Isochronous IN transfer buffer flush function (specified by the IFIS bit)
- SOF pulse output function

This module does not support the high bandwidth transfers of isochronous transfers.

(1) Error Detection with Isochronous Transfers

This module has a function for detecting the error information in isochronous transfers noted below. Table 28.25 and Table 28.26 show the priority in which errors are confirmed and the interrupts that are generated.

1. PID errors
 - If the PID of the packet being received is illegal
2. CRC errors and bit stuffing errors
 - If an error occurs in the CRC of the packet being received, or the bit stuffing is illegal
3. Exceeded maximum packet size
 - The data size of the received packet exceeded the specified maximum packet size.
4. Overrun and underrun errors
 - When host controller mode is selected
 - When using isochronous IN transfers (reception), the IN token was transmitted but there was not enough space in the buffer memory.
 - When using isochronous OUT transfers (transmission), the OUT token was transmitted, but the data was not in the buffer memory.
 - When function controller mode is selected
 - When using isochronous IN transfers (transmission), the IN token was received but the data was not in the buffer memory.
 - When using isochronous OUT transfers (reception), the OUT token was received, but there was not enough space in the buffer memory.
5. Interval errors

When function controller mode is selected, interval errors occur in following cases.

- During an isochronous IN transfer, the IN token could not be received during the interval frame.
- During an isochronous OUT transfer, the OUT token could not be received during the interval frame.

Table 28.25 Error Detection when a Token is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated in both cases when the host controller mode is selected and the function controller mode is selected (ignored as a corrupted packet).
2	CRC error and bit stuffing errors	No interrupts are generated in both cases when the host controller mode is selected and the function controller mode is selected (ignored as a corrupted packet).
3	Overflow and underrun errors	An NRDY interrupt is generated and the OVRN bit is set in both host controller mode and function controller mode. When the function controller mode is selected, a zero-length packet is transmitted in response to IN token. However, no data packet is received in response to OUT token.
4	Interval errors	An NRDY interrupt is generated when the function controller mode is selected. It is not generated in the host controller mode.

Table 28.26 Error Detection when a Data Packet is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated (ignored as a corrupted packet)
2	CRC error and bit stuffing errors	An NRDY interrupt is generated and the CRCE bit is set in both host controller mode and function controller mode.
3	Maximum packet size exceeded error	A BEMP interrupt is generated to set the PID bits to STALL in both cases when the host controller mode is selected and the function controller mode is selected.

(2) DATA-PID

This module does not support high bandwidth transfers. When the function controller mode is selected, this module operates as follows in response to the received PID.

1. IN direction
 - DATA0: Sent as data packet PID
 - DATA1: Not sent
 - DATA2: Not sent
 - mData: Not sent
2. OUT direction (when using full-speed operation)
 - DATA0: Received normally as data packet PID
 - DATA1: Received normally as data packet PID
 - DATA2: Packets are ignored
 - mData: Packets are ignored
3. OUT direction (when using high-speed operation)
 - DATA0: Received normally as data packet PID
 - DATA1: Received normally as data packet PID
 - DATA2: Received normally as data packet PID
 - mData: Received normally as data packet PID

(3) Interval Counter

(a) Operation Outline

The isochronous interval can be set using the IITV bits in PIPEPERI. The interval counter enables the functions shown in Table 28.27 when the function controller mode is selected. When the host controller mode is selected, this module generates the token issuance timing. When the host controller mode is selected, the interval counter operation is the same as the interrupt transfer operation. Refer to section 28.4.8 (1) Interval Counter during Interrupt Transfers when the Host Controller Mode is Selected.

Table 28.27 Functions of the Interval Counter when the Function Controller Mode is Selected

Transfer Direction	Function	Conditions for Detection
IN	Transmission buffer flush function	When an IN token cannot be normally received in the interval frame during an isochronous IN transfer
OUT	Notifies that a token not being received	When an OUT token cannot be normally received in the interval frame during an isochronous OUT transfer

The interval count is carried out when an SOF is received or for interpolated SOFs, so the isochronism can be maintained even if an SOF is damaged. The frame interval that can be set is the 2^{IITV} frames or 2^{IITV} μ frames.

(b) Interval Counter Initialization when the Function Controller Mode is Selected

This module initializes the interval counter under the following conditions.

- Power-on reset
The IITV bits are initialized.
- Buffer memory clearing using the ACLRM bit
The IITV bits are not initialized but the count value is.
- USB bus reset

After the interval counter has been initialized, the counter is started under the following condition 1 or 2 when a packet has been transferred normally.

1. An SOF is received following transmission of data in response to an IN token, in the PID = BUF state.
2. An SOF is received after data following an OUT token is received in the PID = BUF state.

The interval counter is not initialized under the conditions below.

1. When the PID bits are set to NAK or STALL
The interval timer does not stop. This module attempts the transactions at the subsequent interval.
2. The USB bus is reset or USB operations are suspended
The IITV bits are not initialized. When the SOF has been received, the counter is restarted from the value prior to the reception of the SOF.

(c) Interval Counting and Transfer Control when the Host Controller Mode is Selected

The IITV bits can be set when the selected pipe is for isochronous or interrupt transfers. This module controls the interval between token issuance operations based on the IITV bit setting. Specifically, this module issues a token for the selected pipe once every 2^{IITV} (μ) frames.

This module counts the interval every 1-ms frame for the pipes used for communications with the full-speed or low-speed peripheral devices connected to a high-speed HUB.

This module starts counting the token issuance interval at the (μ) frame following the (μ) frame in which the PID bits are

set to BUF.

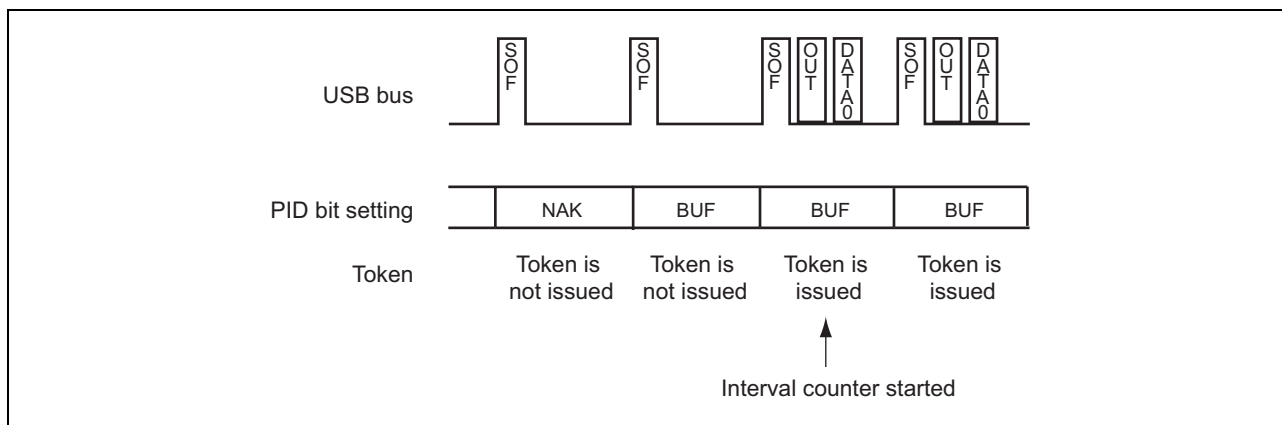

Figure 28.7 Token Issuance when IITV = 0

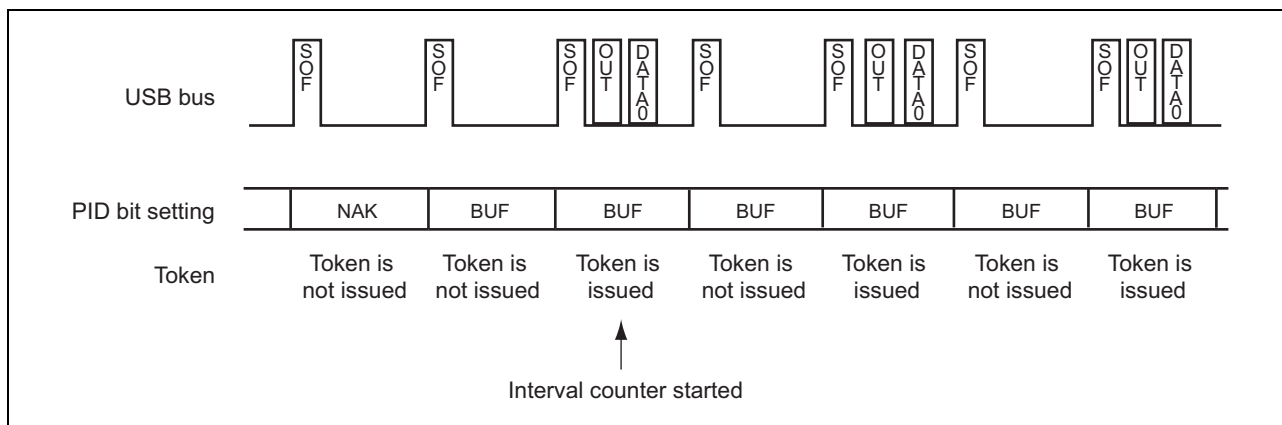

Figure 28.8 Token Issuance when IITV = 1

When the selected pipe is for isochronous transfers, this module carries out the operation below in addition to controlling token issuance interval. This module issues a token even when the NRDY interrupt generation condition is satisfied.

1. When the selected pipe is for isochronous IN transfers

This module generates the NRDY interrupt when this module issues the IN token but does not receive a packet successfully from a peripheral device (no response or packet error).

This module sets the OVRN bit to 1 generating the NRDY interrupt when the time to issue an IN token comes in a state in which this module cannot receive data because the FIFO buffer is full (because reading data from the FIFO buffer is slow).

2. When the selected pipe is for isochronous OUT transfers

This module sets the OVRN bit to 1 generating the NRDY interrupt and transmitting a zero-length packet when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer (because writing data to the FIFO buffer is slow).

The token issuance interval is reset by a power-on reset or when the ACLRM bit is set to 1.

(d) Interval Counting and Transfer Control when the Function Controller Mode is Selected

The IITV bits can be set when the selected pipe is for isochronous transfers.

1. When the selected pipe is for isochronous OUT transfers

This module generates the NRDY interrupt when it fails to receive a data packet within the interval set for (μ) frames by the IITV bits.

This module generates the NRDY interrupt when this module fails to receive a data packet because of a CRC error or other errors contained in the packet, or because of the FIFO buffer being full (because reading data from the FIFO buffer is slow).

This module generates the NRDY interrupt on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the interrupt to be generated at the timing to receive the SOF packet. However, when the IITV bits are set to the value other than 0, this module generates the NRDY interrupt on receiving an SOF packet for every interval after starting interval counting operation. When the PID bits are set to NAK after starting the interval timer, this module does not generate the NRDY interrupt on receiving an SOF packet.

The interval counting starts at the different timing depending on the IITV bit setting as follows.

- When IITV = 0: The interval counting starts at the (μ) frame following the (μ) frame in which the PID bits for the selected pipe are set to BUF.

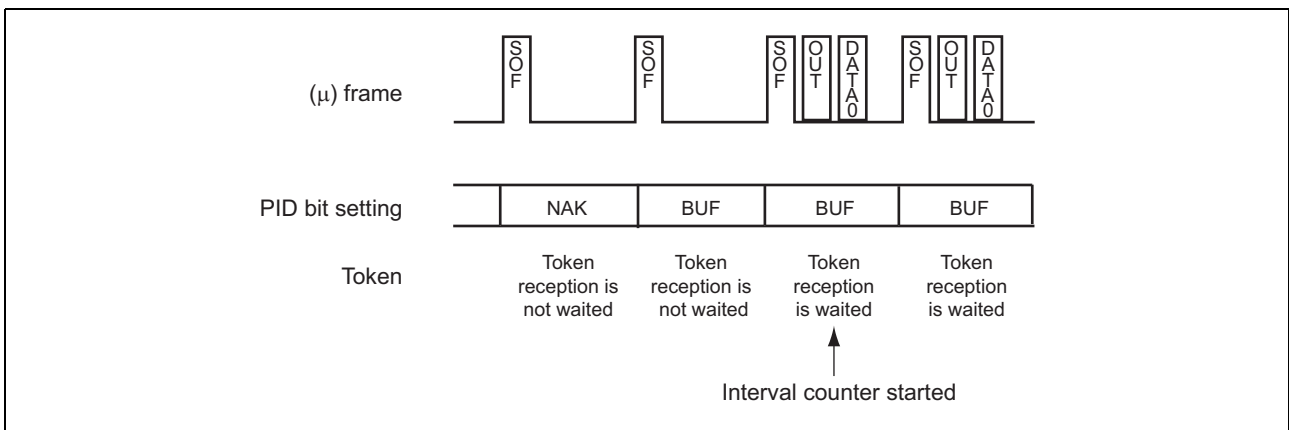

Figure 28.9 Relationship between (μ) Frames and Expected Token Reception when IITV = 0

- When IITV ≠ 0: The interval counting starts on completion of successful reception of the first data packet after the PID bits for the selected pipe have been modified to BUF.

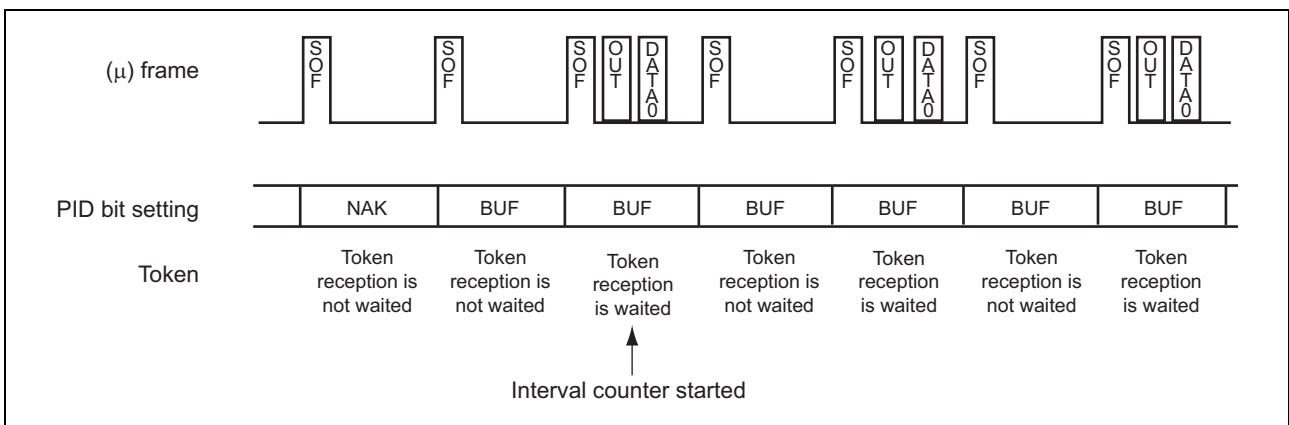

Figure 28.10 Relationship between (μ) Frames and Expected Token Reception when IITV = 1

- When the selected pipe is for isochronous IN transfers
 - The IFIS bit should be 1 for this use. When IFIS = 0, this module transmits a data packet in response to the received IN token irrespective of the IITV bit setting.
 - When IFIS = 1, this module clears the FIFO buffer when this module fails to receive an IN token within the interval set for (μ) frames by the IITV bits in a state in which there is data to be transmitted in the FIFO buffer.
 - This module also clears the FIFO buffer when this module fails to receive an IN token successfully because of a bus error such as a CRC error contained in the token.

This module clears the FIFO buffer on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the FIFO buffer to be cleared at the timing to receive the SOF packet.

The interval counting starts at the different timing depending on the IITV bit setting (similar to the timing during OUT transfers).

The clearing conditions for the interval counter are any of the following in function controller mode.

- When a power-on-reset is applied to this module (the value set in the IITV bits is also cleared to 0).
- When the ACLRM bit is set to 1.
- When this module detects a USB bus reset.

(4) Setup of Data to be Transmitted using Isochronous Transfer when the Function Controller Mode is Selected

With isochronous data transmission using this module in function controller mode, after data has been written to the buffer memory, a data packet can be sent with the next frame in which an SOF packet is detected. This function is called the isochronous transfer transmission data setup function. This function enables identification of the frame that has started being transmitted.

When a double buffer is in use as the buffer memory, transmission from only one of the two buffers will be possible even after the writing of data to both buffers has been completed; the given buffer memory will be that to which the writing of data was completed first. For this reason, even if multiple IN tokens are received in a single frame, the only buffer memory that can be sent is one packet's worth of data.

When an IN token is received, if the buffer memory is in the transmission enabled state, this module transmits the data as a normal response. If the buffer memory is not in the transmission enabled state, however, a zero-length packet is sent and an underrun error occurs.

Figure 28.11 shows an example of transmission using the isochronous transfer transmission data setup function with this module, when IITV = 0 (every frame) has been set.

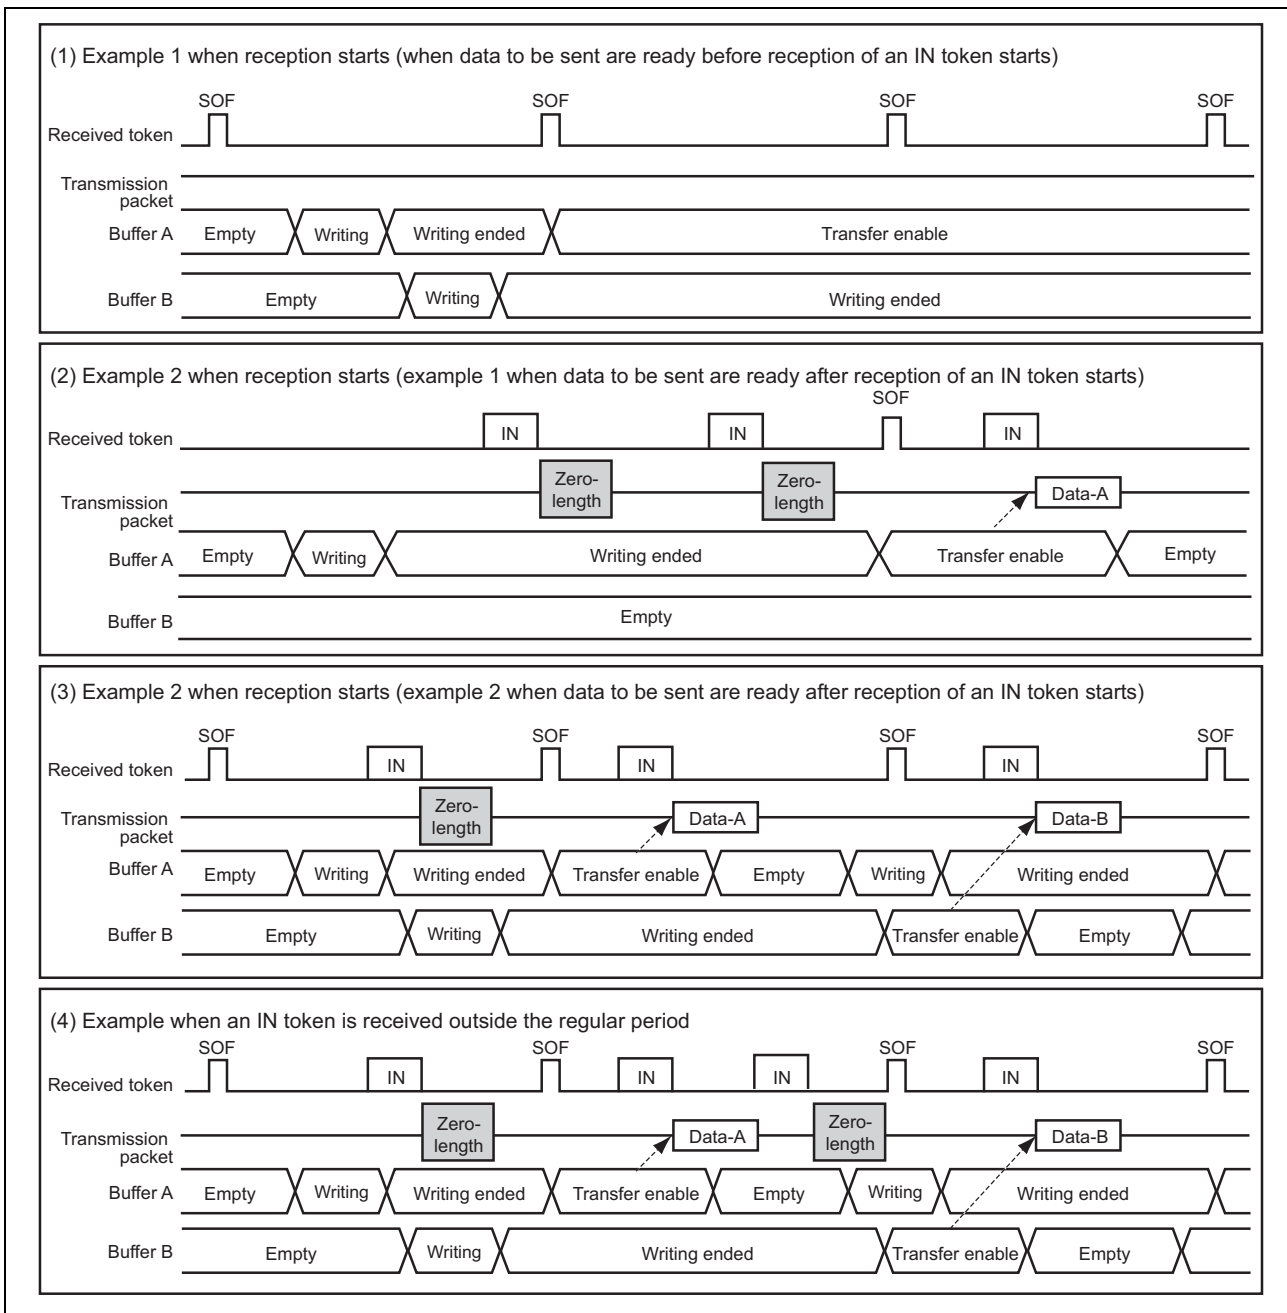

Figure 28.11 Example of Data Setup Function Operation

(5) Isochronous Transfer Transmission Buffer Flush when the Function Controller Mode is Selected

When the function controller mode is selected and an SOF packet or a μ SOF packet of the next frame is received without receiving an IN token in the interval frame during isochronous data transmission, this module operates as if a corrupted IN token was received, and clears the buffer for which transmission is enabled, putting that buffer in the writing enabled state.

If a double buffer is being used and writing to both buffers has been completed, data are considered to have been sent from the buffer memory that was cleared in the same interval frame, and transmission is enabled for the buffer memory that is not discarded with SOF or μ SOF packets reception.

The timing at which the buffer flush function is activated varies depending on the value set for the IITV bits.

- If IITV = 0
The buffer flush operation starts from the next frame after the pipe becomes valid.
- In any cases other than IITV = 0
The buffer flush operation is carried out subsequent to the first normal transaction.

Figure 28.12 shows an example of the buffer flush function of this module. When an unanticipated token is received prior to the interval frame, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

Figure 28.12 Example of Buffer Flush Function Operation

Figure 28.13 shows an example of this module generating an interval error. There are five types of interval errors, as shown below. The interval error is generated at the timing indicated by (1) in the figure, and the buffer flush function is activated.

If an interval error occurs during an IN transfer, the buffer flush function is activated; and if it occurs during an OUT transfer, an NRDY interrupt is generated.

The OVRN bit should be used to distinguish between NRDY interrupts such as received packet errors and overrun errors.

In response to tokens that are shaded in the figure, responses occur based on the buffer memory status.

1. IN direction
 - If the buffer is in the transmission enabled state, the data is transferred as a normal response.
 - If the buffer is in the transmission disabled state, a zero-length packet is sent and an underrun error occurs.
2. OUT direction
 - If the buffer is in the reception enabled state, the data is received as a normal response.
 - If the buffer is in the reception disabled state, the data is discarded and an overrun error occurs.

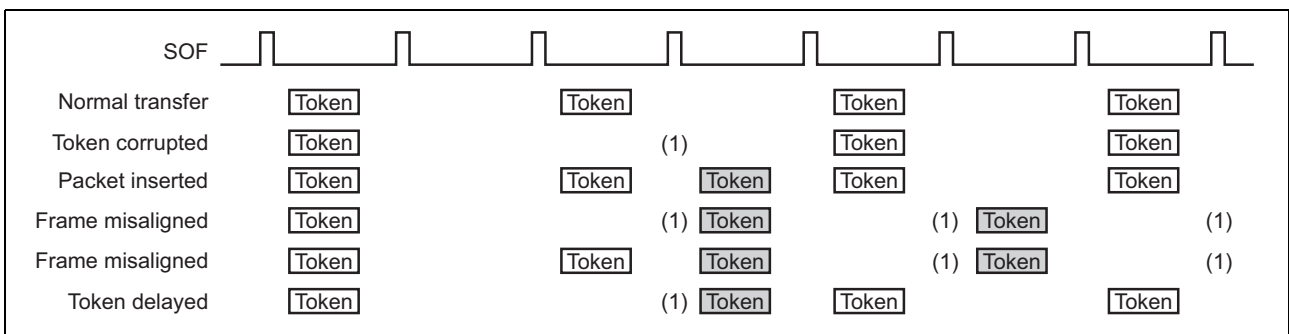

Figure 28.13 Example of an Interval Error being Generated when IITV = 1

28.4.10 SOF Interpolation Function

When the function controller mode is selected and if an SOF packet could not be received at intervals of 1 ms (when using full-speed operation) or 125 μ s (when using high-speed operation) because of corruption or missing, this module interpolates the SOF. The SOF interpolation operation begins when both the USBE bit in SYSCFG and the SUSPM bit in SUSPMODE have been set to 1 and an SOF packet is received. The interpolation function is initialized under the following conditions.

- Power-on reset
- USB bus reset
- Suspended state detected

Also, the SOF interpolation operates under the following specifications.

- Frame interval (125 μ s or 1 ms) conforms to the results of the reset handshake protocol.
- The interpolation function is not activated until an SOF packet is received.
- After the first SOF packet is received, either 125 μ s or 1 ms is counted with an internal clock of 48 MHz, and interpolation is carried out.
- After the second and subsequent SOF packets are received, interpolation is carried out at the previous reception interval.
- Interpolation is not carried out in the suspended state or while a USB bus reset is being received. (With suspended transitions in high-speed operation, interpolation continues for 3 ms after the last packet is received.)

This module supports the following functions based on the SOF reception. These functions also operate normally with SOF interpolation, if the SOF packet was missing.

- Refreshing of the frame number and micro-frame number
- SOFR interrupt and μ SOF lock
- SOF pulse output
- Isochronous transfer interval count

If an SOF packet is missing when full-speed operation is being used, the FRNM bits in FRMNUM are not refreshed. If a μ SOF packet is missing during high-speed operation, the UFRNM bits in UFRMNUM are refreshed. However, if a μ SOF packet for UFRNM = 000 is missing, the FRNM bits are not refreshed. In this case, the FRNM bits are not refreshed even if successive μ SOF packets other than UFRNM = 000 are received normally.

29. Video Display Controller 5 (1): Overview

29.1 Features

The video display controller 5 consists of the following six blocks. For the image synthesis, one plane of video image + two graphics planes, or three graphics planes can be selected.

1. Input controller: Input video image selection, sync signal adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix
2. Scaler: Scale up, scale down, and rotation of input video images using the frame buffer, and repeated recording of the specified number of fields in the frame buffer
3. Image quality improver: Black stretch, LTI/sharpness, and YCbCr ↔ GBR conversion using a color matrix
4. Image synthesizer: Synthesis of one plane of video image + two graphics planes, or three graphics planes
5. Output controller: Brightness/contrast adjustment, gamma correction, dither processing, output format conversion, control signal output for TFT-LCD panel
6. System controller: Interrupt control, panel clock control, CLUT table select signal status flag output

The functions of video display controller 5 are listed in Table 29.1.

Table 29.1 Features of Video Display Controller 5

Item	Function
Operating frequency	Video input clock: 27/54 MHz (for video image), 87 MHz or less (for RGB/YCbCr video image) Panel clock: 87 MHz or less (depends on the panel specifications)
Input video image specification	<ul style="list-style-type: none"> • 8-bit input conforming to ITU-R BT.656 standard (27 MHz, interlace signal) • 8-bit input conforming to ITU-R BT.656 extended standard (27 MHz, progressive signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (27 MHz, interlace signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (54 MHz, progressive signal) *1 • 16-bit input conforming to ITU-R BT.601 extended standard (13.5 MHz, interlace signal) *1 • Digital pin input: YCbCr422, YCbCr444, RGB888, RGB666, and RGB565 video image • Digital pin input size: Maximum input video image size to be set *2: 1440 pixels × 1024 lines (horizontal × vertical) <p>Notes:1. The ITU-R BT.656 and 601 standards do not include the description regarding the progressive signal. LCD0_CLK	Output	Panel clock 0	Panel output 0 clock pin
LCD0_DATA 23 to LCD0_DATA 0	Output	Video image data 0 for panel	Panel output 0 video image data pin
LCD0_TCON 6 to LCD0_TCON 0	Output	Control signal 0 for panel	Panel output 0 timing control pin
LCD0_EXTCLK	Input	Panel clock source 0	Panel clock source 0 input pin

29.4 Clocks

There are two clocks to be mainly used by the video display controller 5: the video image clock and pixel clock.

The video image clock is used while the video image is processed in the input controller, passed to the scale-down control block in the scaler, and then written to the buffer (internal bus write control). The DV_CLK clock is used as the video image clock.

The pixel clock is used in graphics read-out processing by the scaler (internal bus read controller) through output controller processing. When the parallel RGB output is selected in the output controller, the frequencies of the pixel clock and panel clock (LCD_CLK) are the same. The panel clock can be selected from the video clock, LCD_EXTCLK, and peripheral bus clock 1 (P1 ϕ) with SYSCNT_PANEL_CLK.PANEL_ICKSEL[1:0] of the system controller. When the serial RGB output (3/4 speed mode) is selected in the output controller, the pixel clock frequency is 1/3 or 1/4 the panel clock (LCD_CLK) frequency.

29.5 Hsync and Vsync Signals

Hsync and Vsync signals to be used in the logic stage following the scale-up control block of the scaler are generated by the synchronization control block of the scaler. Since the Hsync and Vsync signals are used as the reference signals for the LCD TCON, which generates various panel driving timings, they are also the reference signals for the control signals (LCD_TCON6 to LCD_TCON0 pins) passed to the panel.

The output Hsync signal always operates at a free-running frequency, and the horizontal period is set with SC_SCL0_FRC4.SC_RES_FH[10:0]. On the other hand, the output Vsync signal is selected from the external input and free-running Vsync signals with SC_SCL0_FRC3.SC_RES_VS_SEL of the scaler.

29.5.1 External Input Vsync

(1) Operation Outline

In this mode, the output Vsync signal is generated according to an external input Vsync signal. When displaying video image input from a digital pin on the panel and the pointer buffer is not in use, always use this mode. However, the output Hsync signal is free running even in this mode. Figure 29.4 shows the timing of external input Vsync signal.

Figure 29.4 External Input Vsync Timing

(2) Notes

When Vsync is externally input, generation of the output Vsync signal is based on the external Vsync signal. That is, the output Vsync signal follows the input Vsync signal, so if an unstable Vsync signal is input, the output Vsync signal will also be unstable.

Since the output Hsync signal is generated according to the frequency generated by a free-running clock and the Vsync signal is generated from the video input as a base, the signals will not be in synchronization. This module adjusts the timing between these signals by adjusting the output Vsync signal so that it stays in time with the output Hsync signal. Therefore, even if the input Vsync signal is stable, the timing of the output Vsync signal may be increased or decreased by up to one line to stay in synchronization with the timing of the output Hsync signal.

Figure 29.5 Detailed Timing Chart for Generation of the Output Vsync Signal

29.5.2 Free-Running Vsync

(1) Operation Outline

In this mode, the Vsync signal is generated according to the pixel clock (free running). The vertical period is selected with SC_SCL0_FRC4.SC_RES_FV[10:0]. The output Hsync signal is also free running. Figure 29.6 shows the timing.

Figure 29.6 Free Running Vsync Timing

(2) Pointer Buffers

In free-running vertical synchronization mode, output of the input video image to a panel may lead to flicker in the output video image. This occurs when the input and output vertical sync signals are not in synchronization. To prevent this, use the pointer buffers to adjust the timing between the input and output video images in frame units. If the input Vsync signal is faster than the output Vsync signal, frames from the input video image are skipped in the output image for display. On the other hand, when the input Vsync signal is slower than the output Vsync signal, frames from the input video image are repeated. However, when the difference in timing between the input and output Vsync signals is too large, the pointer buffers cannot deal with the difference, so flicker may occur. As more buffers are used, the pointer buffers can deal with larger differences in frequency.

Figure 29.7 Timing when the Input Vsync Signal is Faster than the Output Vsync Signal

Figure 29.8 Timing when the Input Vsync Signal is Slower than the Output Vsync Signal

29.5.3 Usage Note on Changing Vsync Signal Selections

When the Vsync signal selection is changed, the output Vsync signal is discontinuous, resulting in disordered panel display. In this case, perform the mute processing according to the panel specification as necessary and change the Vsync signal selection.

30. Video Display Controller 5 (2): Input Controller

30.1 Input Controller Functions

30.1.1 Overview of Functions

The input controller performs the on/off control of input supplied via the external input pins, and subjects the signals to synchronization adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix.

The functional block diagram of the input controller is shown below.

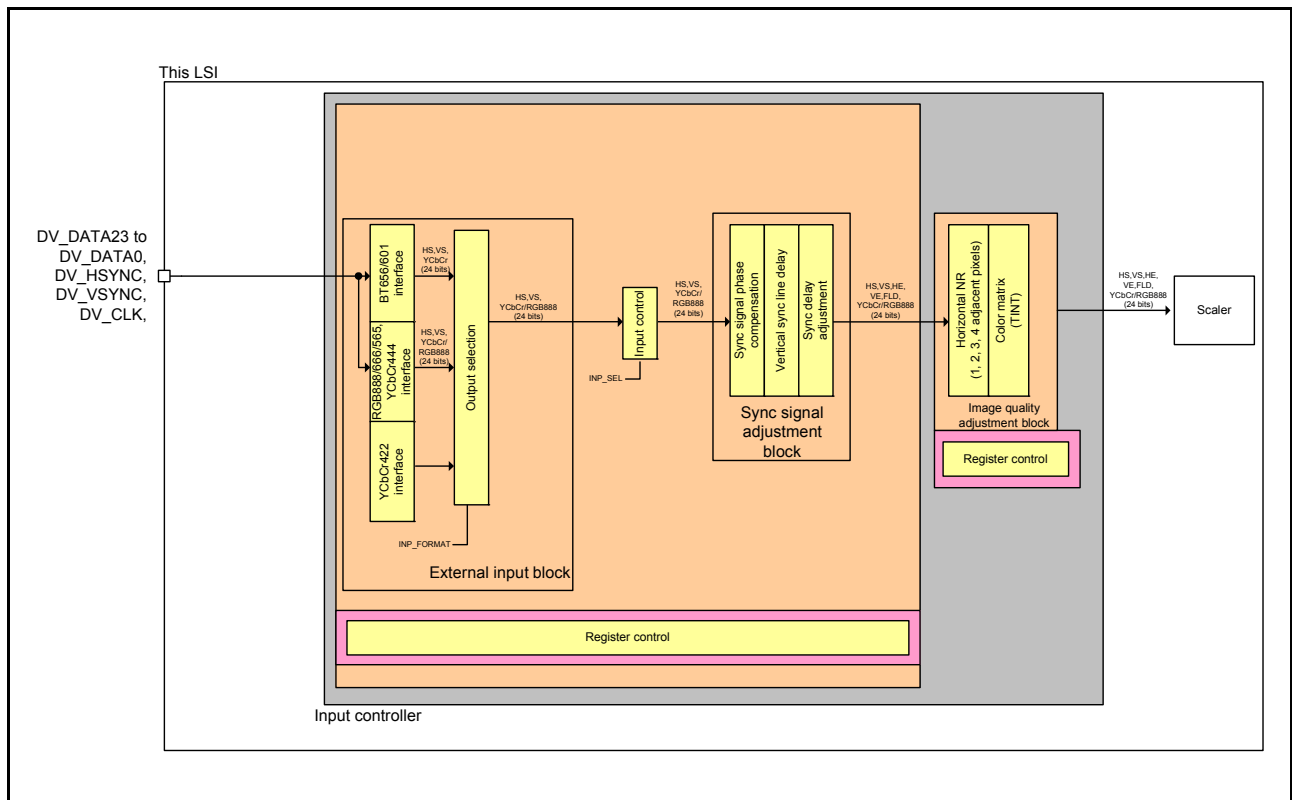

Figure 30.1 Functional Block Diagram of Input Controller

30.1.2 Updating Registers of External Signal Input Block and Sync Signal Adjustment Block

The control registers of the external input block and sync signal adjustment block are updated by setting the relevant update control bit to 1.

For the control registers other than the IMGCNT_DRC_REG register of the image quality adjustment block, the update timing is controlled using the Vsync signal.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 30.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
INP_UPDATE	INP_EXT_UPDATE	0	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
INP_UPDATE	INP_IMG_UPDATE	0	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.
IMGCNT_UPDATE	IMGCNT_VEN	0	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

30.1.3 Controlling Input

The input controller performs the on/off control of input supplied via the external input pins.

Table 30.2 Input Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_SEL	0	On/Off Control of Input Supplied via External Input Pin 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on.

30.1.4 Controlling Externally Input Video Signals

The externally input video image signals in the YCbCr444, RGB888, RGB666, RGB565, BT656 (extended), BT601 (extended), YCbCr422 (the 16-bit data format of the BT601 standard) formats can be handled.

The BT656 signals can be used for the 525-line and 59.94-Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94-Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) BT656-extended progressive signals.

The BT601 signals can be used for the 8-bit data line 525-line and 59.94 Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94 Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) extended progressive signals.

The YCbCr422 signals can be used for the 16-bit data line 525-line and 59.94-Hz (13.5-MHz) or the 625-line and 50.00-Hz (13.5-MHz) BT601 interlace signals.

The above signals can be selected by the INP_FORMAT[2:0] bits. Bit endian change and B/R signal swap are controlled by setting the INP_ENDIAN_ON and INP_SWAP_ON bits.

Table 30.3 Externally Input Video Signal Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_FORMAT[2:0]	000	External Input Format Select 0: YCbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	0	External Input Bit Endian Change On/Off Control 0: Off 1: On
INP_EXT_SYNC_CNT	INP_SWAP_ON	0	External Input B/R Signal Swap On/Off Control 0: Off 1: On

30.1.5 Selecting Clock Edge for Externally Input Signals

The clock edge for receiving the video image signals, Vsync signals, and Hsync signals is individually selected with the INP_PXD_EDGE, INP_VS_EDGE, INP_HS_EDGE bits.

Table 30.4 Externally Input Clock Edge Selection

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_PXD_EDGE	0	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_VS_EDGE	0	Clock Edge Select for Capturing External Input Vsync Signal DV_VSYNC 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_HS_EDGE	0	Clock Edge Select for Capturing External Input Hsync Signal DV_HSYNC 0: Rising edge 1: Falling edge

Figure 30.2 shows the typical input timing of externally input signals.

The input signals can be received at the rising edge of the clock signal DV_CLK when the INP_PXD_EDGE, INP_VS_EDGE, and INP_ES_EDGE bits are 0.

Figure 30.2 Typical Input Timing of Externally Input Signals (Clock Phase)

30.1.6 Externally Input Sync Signal Inversion Control

Inversion of polarity of the Vsync and Hsync signals can be controlled by the INP_VS_INV and INP_HS_INV bits.

Table 30.5 Sync Signal Inversion Control

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_VS_INV	0	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
INP_EXT_SYNC_CNT	INP_HS_INV	0	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)

30.1.7 Bit Allocation of Externally Input Video Image Signals

Allocation of the externally input video image signal pins DV_DATA to the signals in each format is described below.

(1) YCbCr444/RGB888 Input

When the external input is of YCbCr444/RGB888 format, the video image signal pins DV_DATA are allocated to the internal signals Y/GOUT, Cb/BOUT, Cr/ROUT, as shown in Table 30.6.

Table 30.6 Bit Allocation of DV_DATA Pin Inputs when the External Input is of YCbCr444/RGB888

INP_FORMAT[2:0]	0	0	0	0
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA23	Cr/ROUT[7]	Cb/BOUT[7]	Cr/ROUT[0]	Cb/BOUT[0]
DV_DATA22	Cr/ROUT[6]	Cb/BOUT[6]	Cr/ROUT[1]	Cb/BOUT[1]
DV_DATA21	Cr/ROUT[5]	Cb/BOUT[5]	Cr/ROUT[2]	Cb/BOUT[2]
DV_DATA20	Cr/ROUT[4]	Cb/BOUT[4]	Cr/ROUT[3]	Cb/BOUT[3]
DV_DATA19	Cr/ROUT[3]	Cb/BOUT[3]	Cr/ROUT[4]	Cb/BOUT[4]
DV_DATA18	Cr/ROUT[2]	Cb/BOUT[2]	Cr/ROUT[5]	Cb/BOUT[5]
DV_DATA17	Cr/ROUT[1]	Cb/BOUT[1]	Cr/ROUT[6]	Cb/BOUT[6]
DV_DATA16	Cr/ROUT[0]	Cb/BOUT[0]	Cr/ROUT[7]	Cb/BOUT[7]
DV_DATA15	Y/GOUT[7]	Y/GOUT[7]	Y/GOUT[0]	Y/GOUT[0]
DV_DATA14	Y/GOUT[6]	Y/GOUT[6]	Y/GOUT[1]	Y/GOUT[1]
DV_DATA13	Y/GOUT[5]	Y/GOUT[5]	Y/GOUT[2]	Y/GOUT[2]
DV_DATA12	Y/GOUT[4]	Y/GOUT[4]	Y/GOUT[3]	Y/GOUT[3]
DV_DATA11	Y/GOUT[3]	Y/GOUT[3]	Y/GOUT[4]	Y/GOUT[4]
DV_DATA10	Y/GOUT[2]	Y/GOUT[2]	Y/GOUT[5]	Y/GOUT[5]
DV_DATA9	Y/GOUT[1]	Y/GOUT[1]	Y/GOUT[6]	Y/GOUT[6]
DV_DATA8	Y/GOUT[0]	Y/GOUT[0]	Y/GOUT[7]	Y/GOUT[7]
DV_DATA7	Cb/BOUT[7]	Cr/ROUT[7]	Cb/BOUT[0]	Cr/ROUT[0]
DV_DATA6	Cb/BOUT[6]	Cr/ROUT[6]	Cb/BOUT[1]	Cr/ROUT[1]
DV_DATA5	Cb/BOUT[5]	Cr/ROUT[5]	Cb/BOUT[2]	Cr/ROUT[2]
DV_DATA4	Cb/BOUT[4]	Cr/ROUT[4]	Cb/BOUT[3]	Cr/ROUT[3]
DV_DATA3	Cb/BOUT[3]	Cr/ROUT[3]	Cb/BOUT[4]	Cr/ROUT[4]
DV_DATA2	Cb/BOUT[2]	Cr/ROUT[2]	Cb/BOUT[5]	Cr/ROUT[5]
DV_DATA1	Cb/BOUT[1]	Cr/ROUT[1]	Cb/BOUT[6]	Cr/ROUT[6]
DV_DATA0	Cb/BOUT[0]	Cr/ROUT[0]	Cb/BOUT[7]	Cr/ROUT[7]

(2) RGB666 Input

When the external input is of RGB666 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 30.7.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB666 interface with the following formulae.

$$G[7:0] = GOUT[7:2] \times 255 \div 63$$

$$B[7:0] = BOUT[7:2] \times 255 \div 63$$

$$R[7:0] = ROUT[7:2] \times 255 \div 63$$

Table 30.7 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB666

INP_FORMAT[2:0]	1	1	1	1
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA17	ROUT[7]	BOUT[7]	ROUT[2]	BOUT[2]
DV_DATA16	ROUT[6]	BOUT[6]	ROUT[3]	BOUT[3]
DV_DATA15	ROUT[5]	BOUT[5]	ROUT[4]	BOUT[4]
DV_DATA14	ROUT[4]	BOUT[4]	ROUT[5]	BOUT[5]
DV_DATA13	ROUT[3]	BOUT[3]	ROUT[6]	BOUT[6]
DV_DATA12	ROUT[2]	BOUT[2]	ROUT[7]	BOUT[7]
DV_DATA11	GOUT[7]	GOUT[7]	GOUT[2]	GOUT[2]
DV_DATA10	GOUT[6]	GOUT[6]	GOUT[3]	GOUT[3]
DV_DATA9	GOUT[5]	GOUT[5]	GOUT[4]	GOUT[4]
DV_DATA8	GOUT[4]	GOUT[4]	GOUT[5]	GOUT[5]

DV_DATA3	BOUT[5]	ROUT[5]	BOUT[4]	ROUT[4]
DV_DATA2	BOUT[4]	ROUT[4]	BOUT[5]	ROUT[5]
DV_DATA1	BOUT[3]	ROUT[3]	BOUT[6]	ROUT[6]
DV_DATA0	BOUT[2]	ROUT[2]	BOUT[7]	ROUT[7]

(3) RGB565 Input

When the external input is of RGB565 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 30.8.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB565 interface with the following formulae.

$$G[7:0] = GOUT[7:2] \times 255 \div 63$$

$$B[7:0] = BOUT[7:3] \times 255 \div 31$$

$$R[7:0] = ROUT[7:3] \times 255 \div 31$$

Table 30.8 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB565

DV_DATA0	BOUT[3]	ROUT[3]	BOUT[7]	ROUT[7]

(4) BT656/BT601 Input

When the external input is of BT656 or BT601 format, the video image signal pins DV_DATA are allocated to the internal signal BTOUT, as shown in Table 30.9.

The internal signal BTOUT to which the video image signal pins DV_DATA are allocated is expanded to the YCbCr signal.

For expansion to the YCbCr signal, see section 30.1.12, BT656/BT601/YCbCr422 Format Setting.

Table 30.9 Bit Allocation of DV_DATA Pin Inputs When the External Input is of BT656 or BT601

Figure 30.10 SAV/EAV Code in BT656 Format (525 Lines/59.94 Hz)

30.1.11 BT656 Progressive Format

This product can be connected with devices which output data in the BT656 progressive format. Because the standard for the BT656 format does not include description of output in the progressive format, there is no guarantee that this product is connected with devices which output data in the progressive format. The following description shows how to generate a vertical/horizontal synchronization signal by decoding the SAV/EAV code input via the BT656 interface of this module. Confirm the connection with devices which output data in the BT656 progressive format in accordance with this section.

(1) SAV/EAV Code

The SAV/EAV code consists of four words. When the first word is set to FF and the second and third words are set to 00, timing signals are generated by decoding the value of the fourth word (XY).

For bit information, see Table 30.12 in section 30.1.10, SAV/EAV Code in BT656 Format. This product does not refer to the parity bits (P3 to P0).

(2) Vertical/Horizontal Synchronization Signal

Based on the SAV/EAV code, the vertical/horizontal synchronization signal is generated.

(a) Vertical Synchronization Signal

The vertical synchronization signal is output when the value of the V bit is changed from 0 to 1 in the BT656 format. The timing of the output varies with the setting of INP_EXT_SYNC_CNT.INP_F525_625 setting and the value of the F bit in the BT656 format.

Table 30.14 lists the timing.

Table 30.14 Timing of Delay for Output of Vertical Synchronization Signal

INP_EXT_SYNC_CNT. INP_F525_625	F Bit in BT656 Format	Output Timing	Remark
0: 525 lines	0 (Field 1)	2.5 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 2
	1 (Field 2)	3 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 1
1: 625 lines	0 (Field 1)	2.5 lines after setting of V bit	625 lines, vertical synchronization signal for field 2
	1 (Field 2)	3 lines after setting of V bit to 1 is detected	625 lines, vertical synchronization signal for field 1

(b) Horizontal Synchronization Signal

Based on the setting of the INP_EXT_SYNC_CNT.INP_H_EDGE_SEL bit, the horizontal synchronization signal is output.

(c) Timing Example of 525-Line Interface Input in BT656 Format

Figure 30.11 and Figure 30.12 show examples of the timing of vertical/horizontal synchronization signal extracted from 525-line interlaced input in the BT656 format.

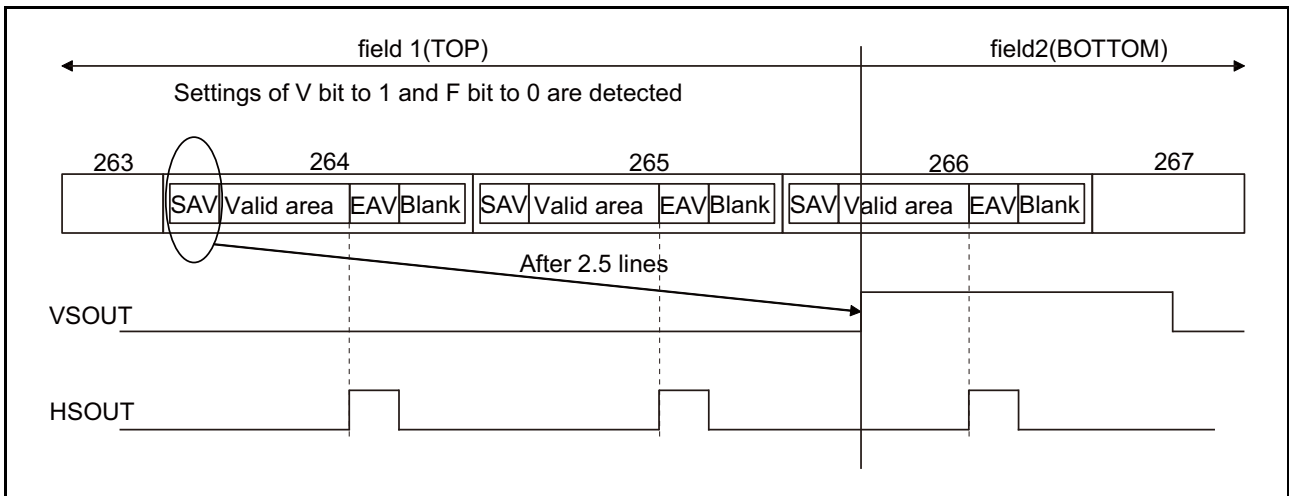

Figure 30.11 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Top to Bottom)

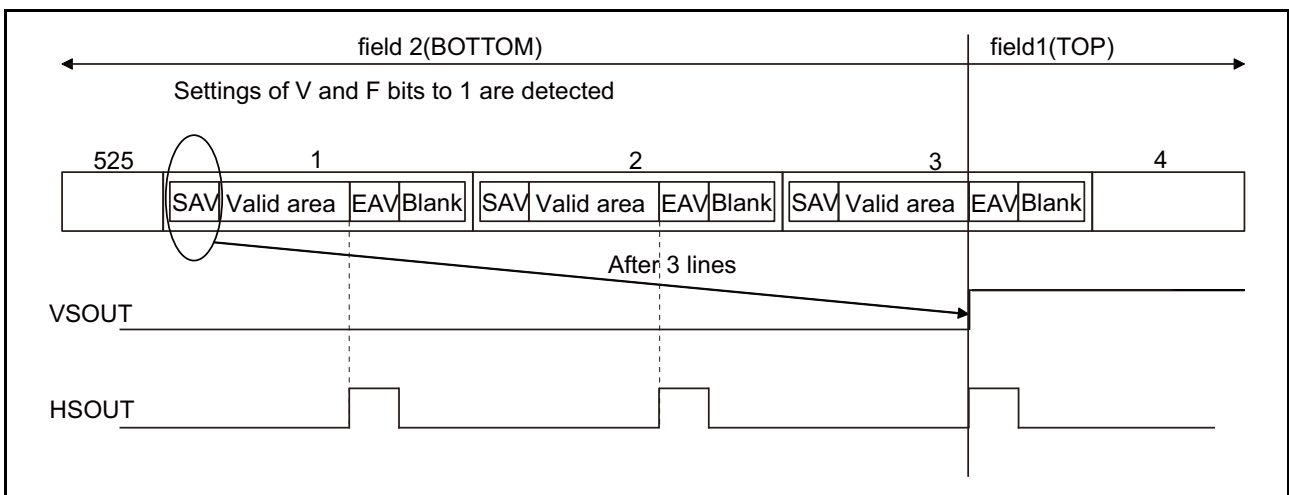

Figure 30.12 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Bottom to Top)

(3) Example of Timing for Progressive Input in BT656 Format

Figure 30.13 shows an example of the SAV/EAV code in 525-line progressive input in the BT656 format.

Figure 30.14 shows the vertical/horizontal synchronization signal extracted from 525-line progressive input in the BT656 format. The field is detected as field 1 in this example, because the value of the F bit is set to 0 when that of the V bit is changed from 0 to 1. The field is regarded as the bottom field. The vertical synchronization signal is output 2.5 lines after the detection of the SAV code.

		One Horizontal Period

Figure 30.13 SAV/EAV Code in BT656 Progressive Format (525 Lines, 59.94 Hz)

Figure 30.14 Vertical/Horizontal Synchronization Signal in BT656 Format (525 Lines, Progressive)

30.1.12 BT656/BT601/YCbCr422 Format Setting

The BT656 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The BT601 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The YCbCr422 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format in the 16-bit data-bus format of the BT601 standard.

The Vsync signal timing for the 525-line BT656 format and 625-line BT656 format are different.

The operating mode is set by the INP_F525_625 bit.

Table 30.15 Operating Mode Setting for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_F525_625	0	Number of Lines for BT656 Input of External Input System 0: 525 lines 1: 625 lines

When the interlace signals are to be input in BT656/BT601/YCbCr422 format, half of 2fH phase timings of the Vsync signal and the Hsync signal are set with the INP_FH50[9:0] bits.

The INP_FH50[9:0] bits are also used for the vertical synchronous phase adjustment block. Therefore, for bit description, see Table 30.20.

When the external input is of BT656 format, the reference point of the Hsync signal is set with the INP_H_EDGE_SEL bit.

Table 30.16 Hsync Signal Reference Selection for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	0	Hsync Signal Reference Select for BT656 Format of External Input System 0: EAV 1: SAV

When the external input is of BT656/BT601 format, the internal signal BTOUT[7:0], which is input from the DV_DATA pins and allocated, is expanded to the 24-bit YCbCr signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

Figure 30.15 YCbCr Data Expansion for BT656/BT601 Input

Table 30.17 Data String Start Timing Selection for BT656/BT601 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Y/Cb/Y/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Y/Cr/Y 1: Y/Cr/Y/Cb 2: Cr/Y/Cb/Y 3: Y/Cb/Y/Cr

When the external input is in YCbCr422 format, the input from the DV_DATA pins is allocated to the internal Y[7:0] and CbCr[7:0] signals, and the CbCr[7:0] are expanded to a 16-bit signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

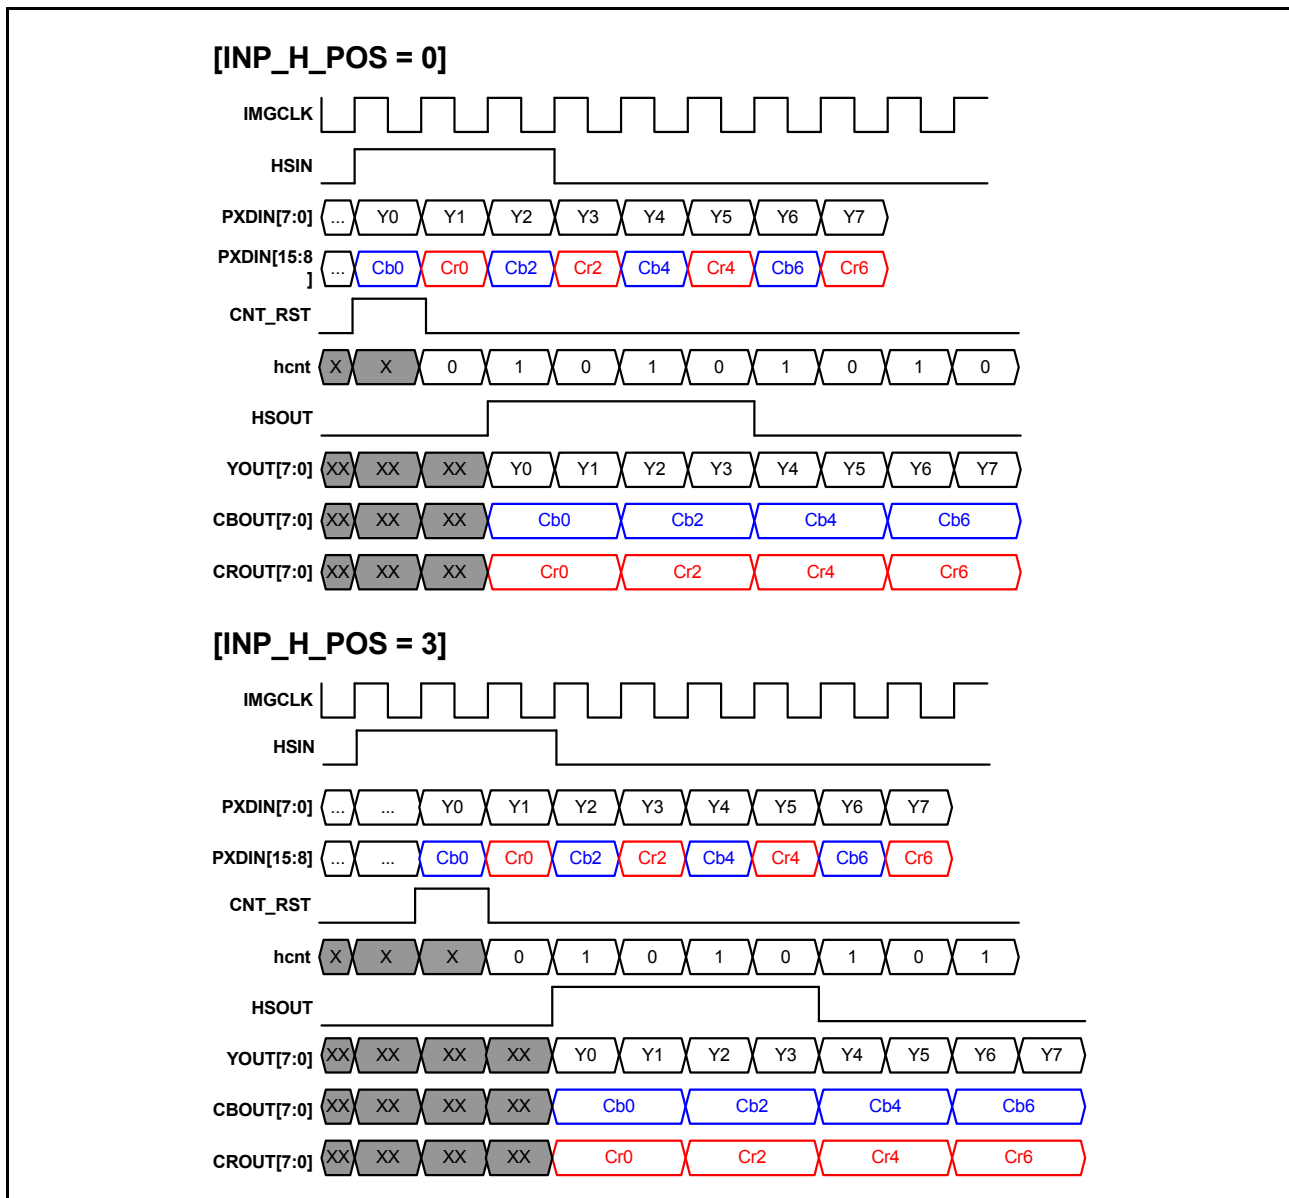

Figure 30.16 YCbCr Data Expansion for YCbCr422 Input

Table 30.18 Data String Start Timing Selection for YCbCr422 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Cb/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Cr 3: Cr/Cb 1, 2: Setting prohibited

30.1.13 YCbCr444/RBG888/666/565 Input Timing

The YCbCr444/RGB888/666/565 format can be used for the progressive YCbCr/RGB signal.

The sync signal width (H_SYNC, V_SYNC), sync signal polarity (H_POL, V_POL), valid period start position (H_BP, V_BP), valid period end position (H_FP, V_FP), and valid period video width (H_ACTIVE, V_ACTIVE) are shown in Table 30.19.

Table 30.19 YCbCr/RGB Signal Reception Timing

Item	Description
External input clock	Maximum external input clock frequency: 87.00 MHz
Vsync signal width (V_SYNC)	Minimum Vsync signal width: 1 CLK
Vsync signal polarity (V_POL)	Positive or negative polarity is selected by the relevant registers.
Vertical valid period start position (V_BP)	From Vsync reference to the head of the video image: 5 lines or more
Vertical valid period video width (V_ACTIVE)	Maximum vertical valid period: 1024 lines
Vertical valid period end position (V_FP)	From the end of the video image to the Vsync reference: 4 lines or more ^{Note 1.}
Hsync signal width (H_SYNC)	Minimum Hsync signal width: 1 CLK
Hsync signal polarity (H_POL)	Positive or negative polarity is selected by the relevant registers.
Horizontal valid period start position (H_BP)	From Hsync reference to the head of the video image: 16 CLK or more ^{Note 2.}
Horizontal valid period video width (H_ACTIVE)	Maximum horizontal valid period: 1440 pixels
Horizontal valid period end position (H_FP)	From the end of the video image to the Hsync reference: 16 CLK or more
Number of vertical lines (V_BP+V_ACTIVE+V_FP)	Between vertical synchronization signals: at least 2047 lines
Number of horizontal pixels (H_BP+H_ACTIVE+H_FP)	Between horizontal synchronization signals: at least 2047 cycles of the pixel clock

Note 1. When V_FP is below four lines, the setting of INP_DLY_ADJ.INP_VS_DLY_L[2:0] should be adjusted so that V_FP is at least four lines.

Note 2. When H_FP is below 16 cycles, the settings of INP_DLY_ADJ.INP_VS_DLY[7:0], INP_HS_DLY[7:0], and INP_FLD_DLY[7:0] should be adjusted so that H_FP is at least 16 cycles of the pixel clock.

Figure 30.17 YCbCr/RGB Signal Reception Timing

30.1.14 Field Differentiation and Vsync Signal Phase Adjustment

The phase of the input Vsync signal and Hsync signal is detected and the field of the interlace signal is determined. When the reference point of the Vsync signal is detected within ± 0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace top field. When the reference point of the Vsync signal is detected outside ± 0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace bottom field.

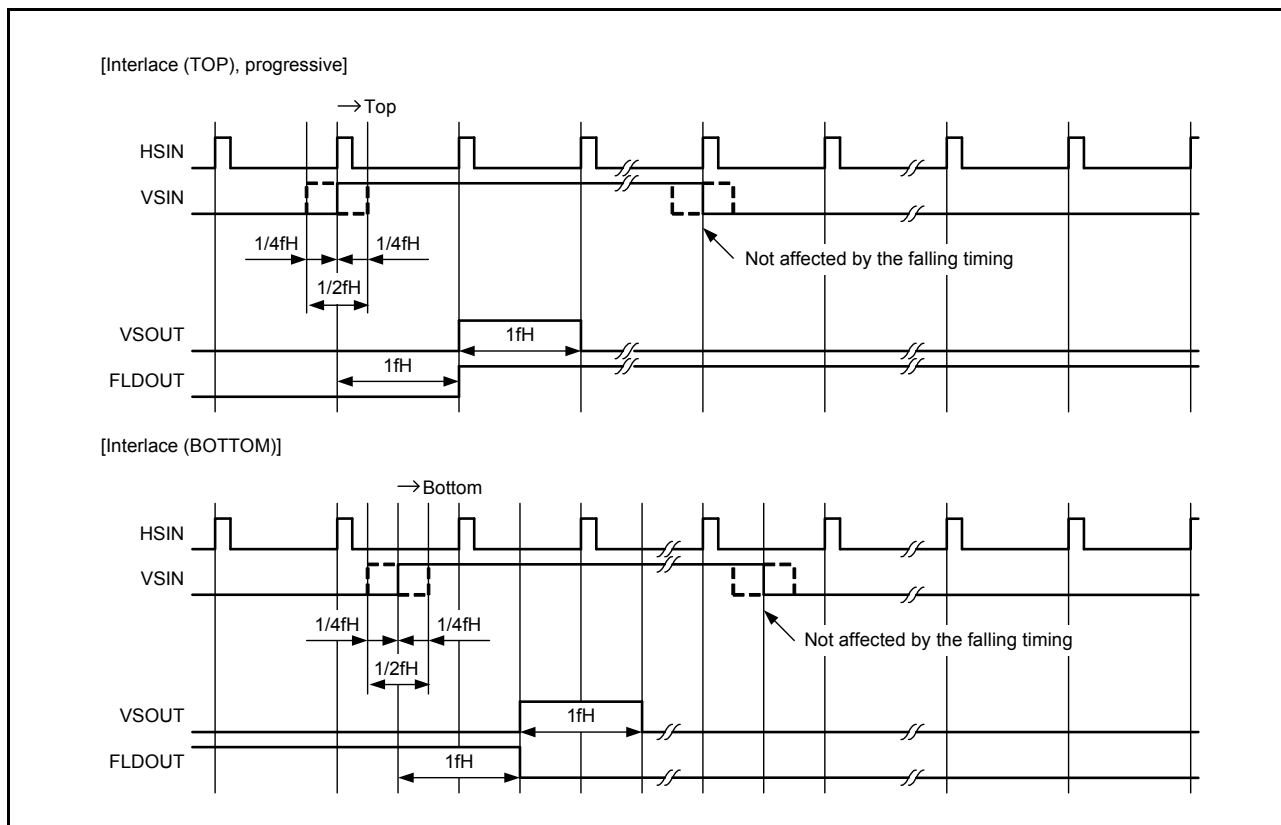

Figure 30.18 Vsync Signal Phase Adjustment

The timings of 1/2fH Vsync signal phase and 1/4fH Vsync signal phase are set with INP_FH50[9:0] and INP_FH25[9:0], respectively.

Table 30.20 Vsync Signal Phase Timing Setting

Register Name	Bit Name	Initial Value	Description
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	858	Vsync Signal 1/2fH Phase Timing Should be 1/2 the horizontal cycle.
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	429	Vsync Signal 1/4fH Phase Timing Should be 1/4 the horizontal cycle.

30.1.15 Vsync Signal Delay Adjustment in Line Units

The Vsync signal line delay adjust block can delay the Vsync signal and the field differentiation signal in line units.

When a video signal with a short vertical front porch is input, the vertical front porch is adjusted.

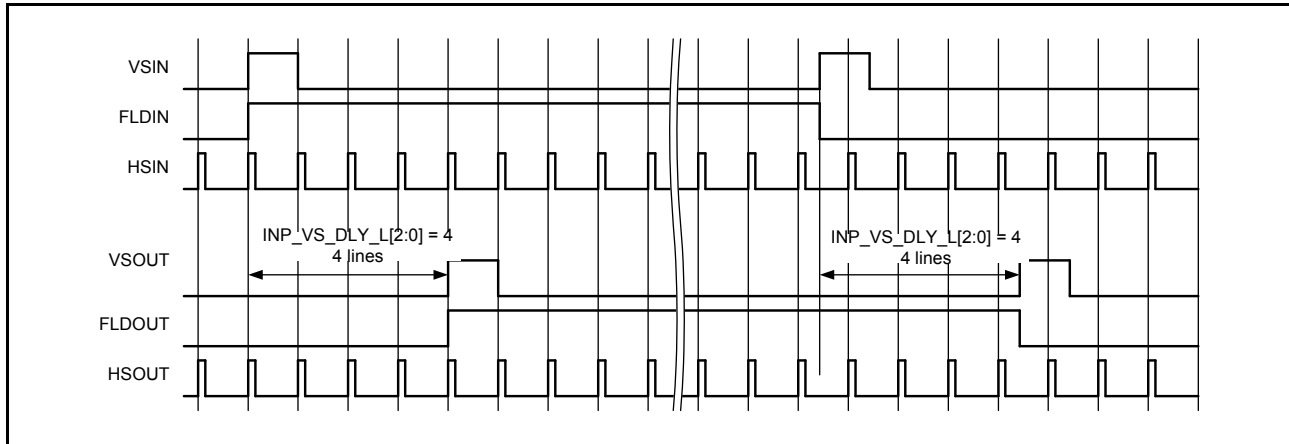

Figure 30.19 Timing of Vsync Signal Delay in Line Units

Table 30.21 Adjustment of Vsync Signal Delay in Line Units

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	0	Number of Lines for Delaying Vsync Signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)

30.1.16 Sync Signal Delay Adjustment

Delay can be adjusted independently for the Vsync signal, Hsync signal, and field differentiation signal in the units of clock.

Lacking margin of the horizontal front porch is adjusted according to the input synchronization disturbance.

Table 30.22 Sync Signal Delay Adjustment

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY[7:0]	0	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_HS_DLY[7:0]	0	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_FLD_DLY[7:0]	0	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

30.1.17 Horizontal Noise Reduction

Noise can be reduced according to horizontal pixel reference.

Noise reduction is controlled through noise component frequency band (TAP), noise level (threshold), and noise reduction intensity (gain).

(1) Frequency Band (TAP) Setting for Noise Component

The noise frequency band can be selected independently from the following four types by using the NR1D_Y_TAP[1:0], NR1D_CB_TAP[1:0], and NR1D_CR_TAP[1:0] bits.

When the number of adjacent pixels is one (noise reduction NR1D_Y/CB/CR_TAP is 0):

$$BPF_{(1)} = \frac{1}{4}(-1 \times Z_{(-1)}, 2 \times Z_{(0)}, -1 \times Z_{(+1)})$$

When the number of adjacent pixels is two (noise reduction NR1D_Y/CB/CR_TAP is 1):

$$BPF_{(2)} = \frac{1}{4}(-1 \times Z_{(-2)}, 2 \times Z_{(0)}, -1 \times Z_{(+2)})$$

When the number of adjacent pixels is three (noise reduction NR1D_Y/CB/CR_TAP is 2):

$$BPF_{(3)} = \frac{1}{4}(-1 \times Z_{(-3)}, 2 \times Z_{(0)}, -1 \times Z_{(+3)})$$

When the number of adjacent pixels is four (noise reduction NR1D_Y/CB/CR_TAP is 3):

$$BPF_{(4)} = \frac{1}{4}(-1 \times Z_{(-4)}, 2 \times Z_{(0)}, -1 \times Z_{(+4)})$$

Note: $Z_{(0)}$ indicates the target pixel for noise reduction and $Z_{(N)}$ indicates the pixel that is n pixels off from $Z_{(0)}$ in the horizontal direction.

(2) Setting Noise Level (Threshold)

The absolute value of the detected noise amount (BPF output value) is compared with the values of the NR1D_Y_TH[6:0], NR1D_CB_TH[6:0], and NR1D_CR_TH[6:0] bits. When the detected noise amount is greater than NR1D_Y/CB/CR_TH, the absolute value of the detected noise amount is considered as NR1D_Y/CB/CR_TH (fixed value).

$$\text{ABS}(BPF_{(n)}) \leq \text{absolute value of detected noise amount when } \text{ABS}(BPF_{(n)}) \leq \text{NR1D_Y/CB/CR_TH: NOISE_ABS} \\ = \text{ABS}(BPF_{(n)})$$

$$\text{ABS}(BPF_{(n)}) > \text{absolute value of detected noise amount when } \text{ABS}(BPF_{(n)}) > \text{NR1D_Y/CB/CR_TH: NOISE_ABS} \\ = \text{NR1D_Y/CB/CR_TH}$$

(3) Setting Noise Reduction Intensity (Gain)

The absolute value of the detected noise amount is multiplied by the value of gain specified by the NR1D_Y_GAIN[1:0], NR1D_CB_GAIN[1:0], and NR1D_CR_GAIN[1:0] bits, and the feedback is calculated for the original signal.

$$\text{Computation when the amount of detected noise } (BPF_{(n)}) \text{ is negative } (-): \text{DOUT} = \text{DIN} + \text{NOISE_ABS} \div \\ 2^{(\text{NR1D_Y/CB/CR_GAIN}+1)}$$

Computation when the amount of detected noise ($BPF_{(n)}$) is positive (+): $DOUT = DIN - NOISE_ABS \div 2^{(NR1D_Y/CB/CR_GAIN+1)}$

Table 30.23 Horizontal Noise Reduction

Register Name	Bit Name	Initial Value	Description
IMGCNT_NR_CNT0	NR1D_MD	1	Horizontal Noise Reduction Operating Mode 0: R/G/B mode 1: Y/Cb/Cr mode
IMGCNT_NR_CNT0	NR1D_ON	0	Noise Reduction On/Off Control 0: Noise Reduction Off 1: Noise Reduction On
IMGCNT_NR_CNT0	NR1D_Y_TAP[1:0]	0	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT0	NR1D_Y_TH[6:0]	8	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value \leq NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT0	NR1D_Y_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
IMGCNT_NR_CNT1	NR1D_CB_TAP[1:0]	0	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT1	NR1D_CB_TH[6:0]	8	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value \leq NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CB_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
IMGCNT_NR_CNT1	NR1D_CR_TAP[1:0]	0	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT1	NR1D_CR_TH[6:0]	8	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value \leq NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CR_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

30.1.18 Color Matrix

By using a color matrix, input signal offsets and nine-axis gain can be adjusted. This enables brightness adjustment, gain adjustment, and YCbCr and GBR mutual conversion.

(1) GBR to GBR Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN + IMGCNT_MTX_B - 128$$

$$CRRIN_A = CRRIN + IMGCNT_MTX_R - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256$$

(2) GBR to YCbCr Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN + IMGCNT_MTX_B - 128$$

$$CRRIN_A = CRRIN + IMGCNT_MTX_R - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256 + 128$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256 + 128$$

Table 30.24 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	0.587	IMGCNT_MTX_GG = 150	0.114	IMGCNT_MTX_GB = 29	0.299	IMGCNT_MTX_GR = 77
CBBOUT	-0.331	IMGCNT_MTX_BG = 1963	0.500	IMGCNT_MTX_BB = 128	-0.169	IMGCNT_MTX_BR = 2005
CRROUT	-0.419	IMGCNT_MTX_RG = 1941	-0.081	IMGCNT_MTX_RB = 2027	0.500	IMGCNT_MTX_RR = 128

(3) YCbCr to GBR Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256$$

Table 30.25 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	Set Value	Coefficient	Set Value	Coefficient	Set Value
YGOUT	1.000	IMGCNT_ MTX_GG = 256	-0.344	IMGCNT_MTX_GB = 1960	-0.714	IMGCNT_MTX_GR = 1865
CBBOUT	1.000	IMGCNT_ MTX_BG = 256	1.772	IMGCNT_MTX_BB = 454	0.000	IMGCNT_MTX_BR = 0
CRROUT	1.000	IMGCNT_ MTX_RG = 256	0.000	IMGCNT_MTX_RB = 0	1.402	IMGCNT_MTX_RR = 359

(4) YCbCr to YCbCr Conversion

$$YGIN_A = YGIN + IMGCNT_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (IMGCNT_MTX_GG \times YGIN_A + IMGCNT_MTX_GB \times CBBIN_A + IMGCNT_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (IMGCNT_MTX_BG \times YGIN_A + IMGCNT_MTX_BB \times CBBIN_A + IMGCNT_MTX_BR \times CRRIN_A) \div 256 + 128$$

$$CRROUT = (IMGCNT_MTX_RG \times YGIN_A + IMGCNT_MTX_RB \times CBBIN_A + IMGCNT_MTX_RR \times CRRIN_A) \div 256 + 128$$

Table 30.26 YCbCr to GBR Conversion

Register Name	Bit Name	Initial Value	Description

30.2 Register Descriptions

Table 30.27 and Table 30.28 show register Configuration.

- Symbols used in Register Description:

Initial value: Register value after a power-on reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_EXT_UPDATE	0	R/WC1	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_IMG_UPDATE	0	R/WC1	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.

30.2.2 Input Select Control Register (INP_SEL_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	INP_SEL	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	INP_FORMAT[2:0]	—	—	—	—	INP_PXD_EDGE	—	—	—	INP_VS_EDGE	—	—	—	—	INP_HS_EDGE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_SEL	0	R/W	Input Select 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on.
19 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	INP_FORMAT [2:0]	0	R/W	External Input Format Select 0: YcbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_PXD_EDGE	0	R/W	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_VS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Vsync Signals DV_VSYNC 0: Rising edge 1: Falling edge
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_HS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Hsync Signals DV_HSYNC 0: Rising edge 1: Falling edge

Note: INP_FORMAT, INP_PXD_EDGE, INP_VS_EDGE, and INP_HS_EDGE are updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1. INP_SEL is updated when set.

30.2.3 External Input Sync Signal Control Register (INP_EXT_SYNC_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INP_ENDIAN_ON	—	—	—	INP_SWAP_ON	—	—	—	INP_VS_INV	—	—	—	INP_HS_INV
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	INP_H_EDGE_SEL	—	—	—	INP_F525_625	—	—	INP_H_POS[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INP_ENDIAN_ON	0	R/W	External Input Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INP_SWAP_ON	0	R/W	External Input B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_VS_INV	0	R/W	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INP_HS_INV	0	R/W	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_H_EDGE_SEL	0	R/W	Reference Select for External Input BT656 Hsync Signal 0: EAV 1: SAV
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_F525_625	0	R/W	Number of Lines for BT656 External Input 0: 525 lines 1: 625 lines
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	INP_H_POS[1:0]	0	R/W	Y/Cb/Y/Cr Data String Start Timing to Hsync Reference for BT656/601 or YCbCr422 External Input 0: Cb/Y/Cr/Y(BT656/601), Cb/Cr (YCbCr422) 1: Y/Cr/Y/Cb(BT656/601), setting prohibited (YCbCr422) 2: Cr/Y/Cb/Y(BT656/601), setting prohibited (YCbCr422) 3: Y/Cb/Y/Cr(BT656/601), Cr/Cb (YCbCr422)

Note: This register is updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1.

30.2.4 Vsync Signal Phase Adjustment Register (INP_VSYNC_PH_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	INP_FH50[9:0]									
Initial Value:	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	INP_FH25[9:0]									
Initial Value:	0	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	INP_FH50 [9:0]	858	R/W	Vsync Signal 1/2fH Phase Timing 1/2 clock cycle of the horizontal cycle should be set.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	INP_FH25 [9:0]	429	R/W	Vsync Signal 1/4fH Phase Timing 1/4 clock cycle of the horizontal cycle should be set.

Note: The INP_FH50[9:0] bits are updated when the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE are 1. The INP_FH25[9:0] bits are updated when the INP_IMG_UPDATE bit is 1.

30.2.5 Sync Signal Delay Adjustment Register (INP_DLY_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	INP_VS_DLY_L[2:0]		INP_FLD_DLY[7:0]								
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INP_VS_DLY[7:0]							INP_HS_DLY[7:0]								
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	INP_VS_ DLY_L[2:0]	0	R/W	Number of lines for Delaying Vsync signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)
23 to 16	INP_FLD_ DLY[7:0]	0	R/W	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
15 to 8	INP_VS_ DLY[7:0]	0	R/W	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
7 to 0	INP_HS_ DLY[7:0]	0	R/W	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

Note: This register is updated when the INP_IMG_UPDATE bit in INP_UPDATE is 1.

30.2.6 Image Quality Adjustment Block Register Update Control Register (IMGCNT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_UPDATE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	IMGCNT_UPDATE	0	R/WC1	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

30.2.7 NR Control Register 0 (IMGCNT_NR_CNT0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	NR1D_MD	—	—	—	NR1D_ON
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_Y_TH[6:0]						—	—	NR1D_Y_TAP[1:0]		—	—	NR1D_Y_GAIN[1:0]		
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	NR1D_MD	1	R/W	Horizontal Noise Reduction Operating Mode 0: G/B/R mode 1: Y/Cb/Cr mode
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	NR1D_ON	0	R/W	Noise Reduction On/Off Control 0: Noise reduction Off 1: Noise reduction On
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_Y_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_Y_TAP[1:0]	0	R/W	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_Y_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.8 NR Control Register 1 (IMGCNT_NR_CNT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	NR1D_CB_TH[6:0]						—	—	NR1D_CB_TAP[1:0]	—	—	NR1D_CB_GAIN[1:0]			
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_CR_TH[6:0]						—	—	NR1D_CR_TAP[1:0]	—	—	NR1D_CR_GAIN[1:0]			
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	NR1D_CB_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CB_TH. Unsigned: 0 to 127 [LSB]
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	NR1D_CB_TAP[1:0]	0	R/W	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	NR1D_CB_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_CR_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CR_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_CR_TAP[1:0]	0	R/W	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_CR_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.9 Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	IMGCNT_MTX_GB[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GR[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_MTX_GB [10:0]	0	R/W	Cb/B Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_GR [10:0]	0	R/W	Cr/R Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.10 Image Quality Adjustment Block Matrix Mode Register (IMGCNT_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_MTX_MD[1:0]
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1 1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	IMGCNT_MTX_MD [1:0]	3	R/W	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.11 Image Quality Adjustment Block Matrix YG Adjustment Register 0 (IMGCNT_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_YG[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GG[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_MTX_YG[7:0]	128	R/W	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_GG[10:0]	256	R/W	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.12 Image Quality Adjustment Block Matrix CBB Adjustment Register 0 (IMGCNT_MTX_CBB_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_B[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_BG[10:0]										
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_MTX_B[7:0]	128	R/W	Offset (DC) Adjustment of Cb/B Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_BG[10:0]	0	R/W	Y/G Signal Gain Adjustment for Cb/B Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.13 Image Quality Adjustment Block Matrix CBB Adjustment Register 1 (IMGCNT_MTX_CBB_ADJ1)

31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_MTX_RB[10:0]	0	R/W	Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_RR[10:0]	256	R/W	Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.3 Usage Methods

30.3.1 Input Format Adjustment Method

Setting examples of each input format are shown below.

Table 30.29 External Input (BT656, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Performs the on/off control of input supplied via the external input pins.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	3
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

Table 30.30 External Input (BT601, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Performs the on/off control of input supplied via the external input pins.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	4
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

30.3.2 Usage Method of Conversion Color Matrix

Typical data conversion setting examples are shown below.

Table 30.31 Conversion Color Matrix

Register Name	Bit Name	GBR to GBR	GBR to YCbCr	YCbCr to GBR	YCbCr to YCbCr
IMGCNT_MTX_MODE	IMGCNT_MTX_MD[1:0]	0	1	2	3
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_YG[7:0]	128	128	128	128
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_GG[10:0]	256	150	256	256
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GB[10:0]	0	29	1960	0
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GR[10:0]	0	77	1865	0
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_B[7:0]	128	128	128	128
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_BG[10:0]	0	1963	256	0
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BB[10:0]	256	128	454	256
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BR[10:0]	0	2005	0	0
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_R[7:0]	128	128	128	128
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_RG[10:0]	0	1941	256	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RB[10:0]	0	2027	0	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RR[10:0]	256	128	359	256

Note: The registers require, after they are set, that the IMGCNT_VEN bit in IMGCNT_UPDATE should be set to 1.

31. Video Display Controller 5 (3): Scaler

31.1 Scaler

31.1.1 Overview of Functions

The scaler subjects the YCbCr and RGB signals output from the input controller, to sync signal generation; and reduction, enlargement, and rotation of the images.

The scaler also records video image in the frame buffer.

In scaler 0, either enlargement process or graphics 0 process can be used.

The functional block diagram of scaler 0 is shown below.

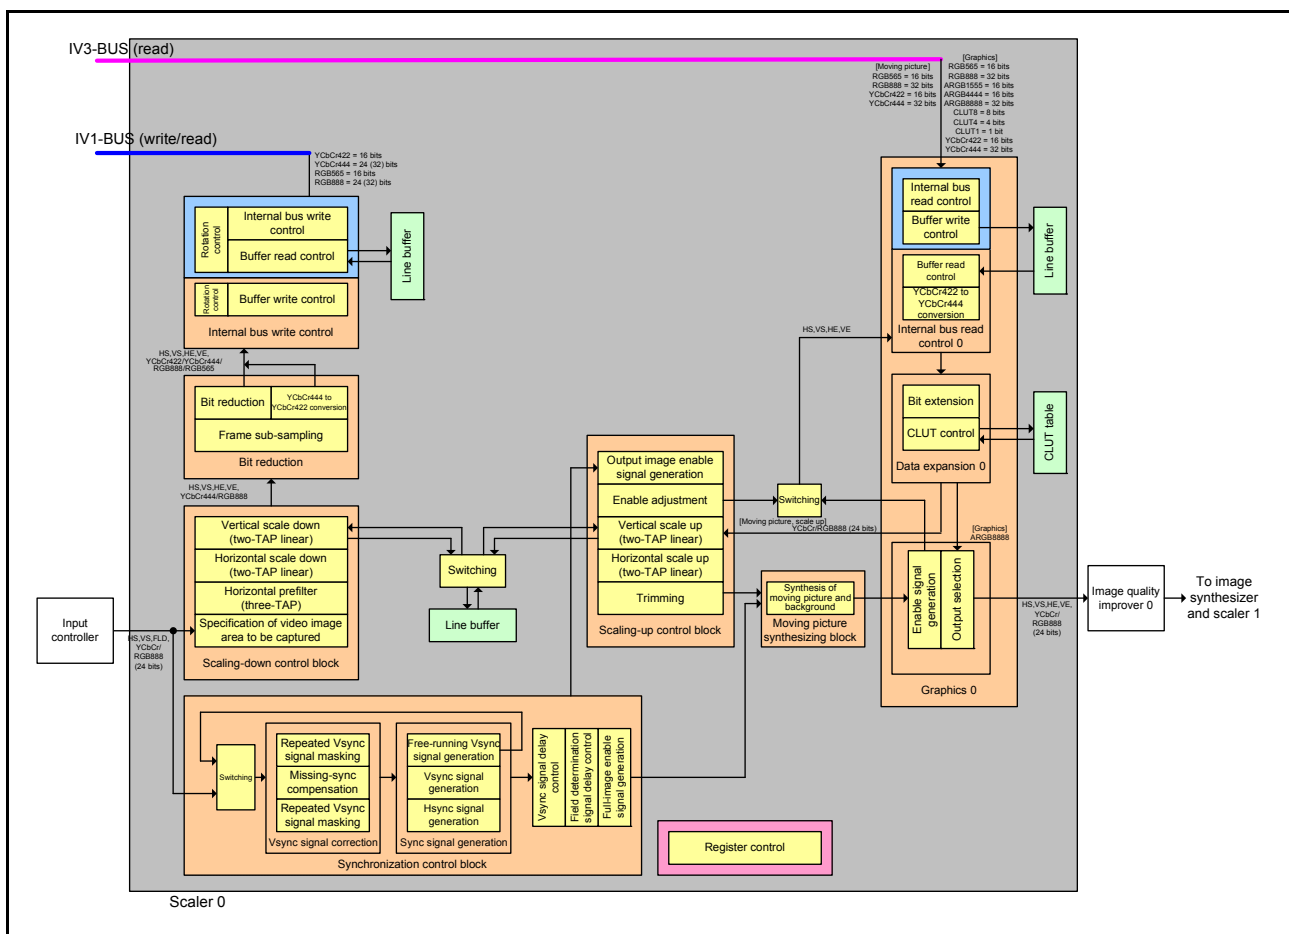

Figure 31.1 Functional Block Diagram of Scaler 0

The registers and bits in the scaler are named SC0_xxxx and those in the graphics blocks are named GR0_xxxx, but in this section, they are collectively called SC_xxxx or GR_xxxx.

31.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the scaling and graphics blocks except some registers of the sync control block and some of the other blocks.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 31.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_UPDATE	SC_SCL0_UPDATE	0	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL0_UPDATE	SC_SCL0_VEN_D	0	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_C	0	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_B	0	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_A	0	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_VEN_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_VEN_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

The registers controlled by SC_SCL0_VEN_A, SC_SCL0_VEN_C, SC_SCL1_VEN_A, and SC_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by SC_SCL0_VEN_B, SC_SCL0_VEN_D, GR_P_VEN, and GR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

31.1.3 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the scaler can be selected.

When an external input signal is to be displayed, an external input Vsync signal should be selected to be output.

When an external input signal is not provided, a free-running Vsync signal should be selected to be output.

Table 31.2 Vsync Signal Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Vsync Signal Output Select 0: External input Vsync signal 1: Internally generated free-running Vsync signal

(2) Masking Repeated Vsync Signals

It is possible to prevent receiving the Vsync signal with a period shorter than the standard period. This is achieved by setting the start timing to receive the next Vsync signal after receiving an input Vsync signal.

The Vsync signal reception masking period is set with the SC_RES_VMASK[15:0] bits.

$$\text{Masking period [usec]} = \text{SC_RES_VMASK} \times 128 \div \text{pixel clock frequency [MHz]}$$

This function is enabled or disabled by the SC_RES_VMASK_ON bit.

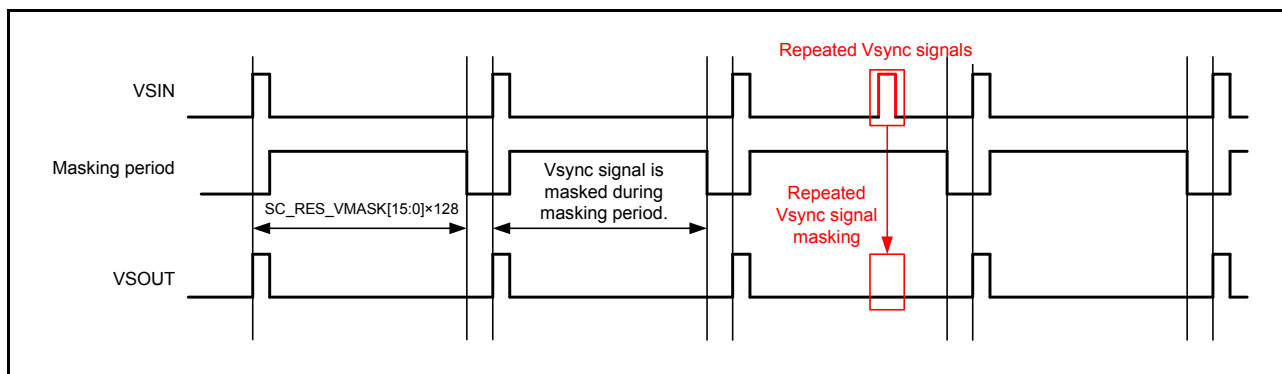

Figure 31.2 Timing for Masking Repeated Vsync Signals

Table 31.3 Repeated Vsync Signal Mask Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC1	SC_RES_VMASK_ON	1	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.
SC_SCL0_FRC1	SC_RES_VMASK[15:0]	2800	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

(3) Compensating for Missing Vsync Signals

It is possible to prevent output of the Vsync signal with a period longer than the standard period. This is achieved by setting the wait time after reception of an input Vsync signal until reception of the next Vsync signal.

If no Vsync signals are received during the wait time, an internally generated sync signal is inserted.

The wait time can be set using the SC_RES_VLACK[15:0] bits.

$$\text{Wait time [usec]} = \text{SC_RES_VLACK} \times 128 \div \text{pixel clock frequency [MHz]}$$

This function is enabled or disabled by the SC_RES_VLACK_ON bit.

If no Vsync signals are input during the Vsync signal reception time, the SC_RES_QVLACK bit is set to the high level.

If Vsync signals are continuously detected four or more times during the Vsync signal reception time, the SC_RES_QVLOCK bit is set to the high level.

The SC_RES_QVLOCK bit is valid even when both the SC_RES_VMASK_ON and SC_RES_VLACK_ON bits are set to turn off the corresponding functions.

Note that, however, the SC_RES_VMASK and SC_RES_VLACK bits must be set correctly.

Figure 31.3 Compensation of Missing Vsync Signals

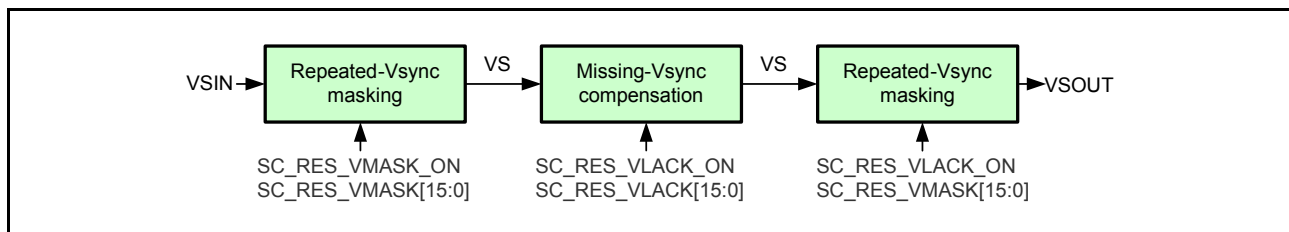

Table 31.4 Missing Vsync Compensation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC2	SC_RES_VLACK_ON	1	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.
SC_SCL0_FRC2	SC_RES_VLACK[15:0]	3600	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
SC_SCL0_FRC9	SC_RES_QVLACK	—	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.
SC_SCL0_FRC9	SC_RES_QVLOCK	—	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.

For the Vsync signal, repeated-signal masking is first carried out and then missing-signal compensation is carried out, followed by another repeated-signal masking.

Repetition masking is inserted after missing-Vsync compensation to prevent output of the Vsync signal even in cases such as the input of a Vsync signal immediately after the input of a pulse to compensate for a missing Vsync signal.

On/off control of the missing-Vsync compensation also applies to the second repeated-Vsync masking; and masking period setting of the first repeated-Vsync masking also applies to the second repeated-Vsync masking.

**Figure 31.4 Repeated-Vsync Masking and Missing-Vsync Compensation**

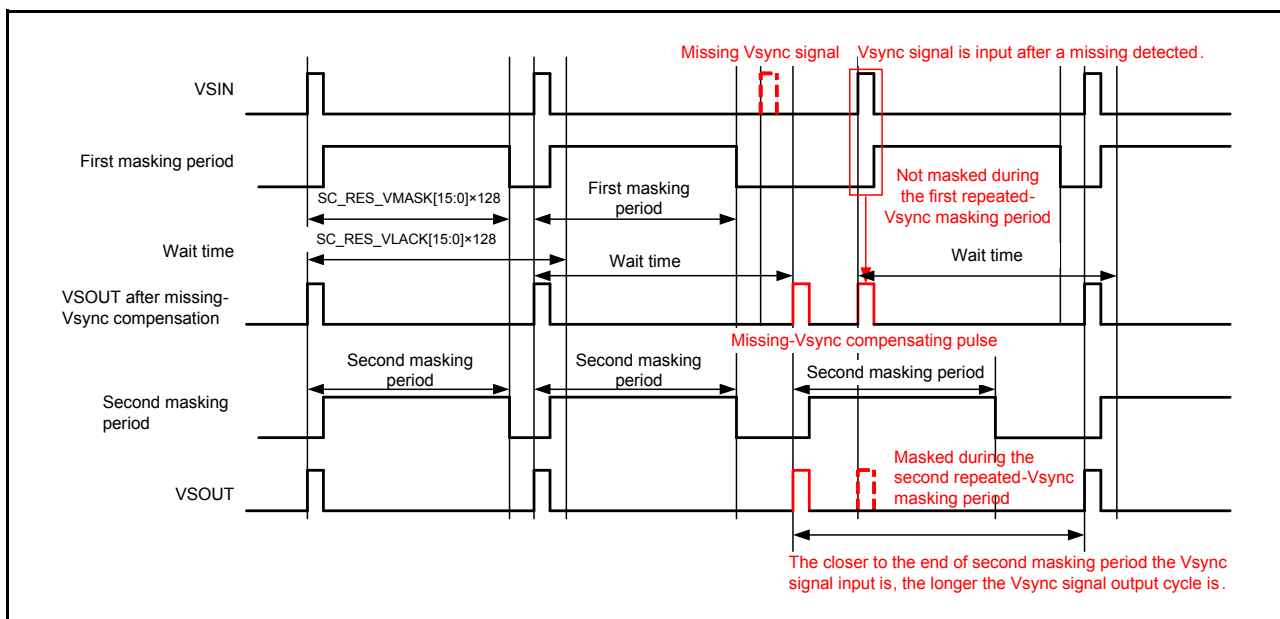

Figure 31.5 Timing for Masking Repeated Vsync Signals and Missing Vsync Signal Compensation

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

$$\text{Hsync period [usec]} = (\text{SC_RES_FH} + 1) \div \text{pixel clock frequency [MHz]}$$

$$\text{Vsync period [usec]} = \text{horizontal period [usec]} \times (\text{SC_RES_FV} + 1)$$

Table 31.5 Free-Running Period Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Free-Running Vsync Period Setting Free-running Vsync period = (SC_RES_FV + 1) × horizontal period [usec]
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Hsync Period Setting Hsync period [usec] = (SC_RES_FH + 1) ÷ pixel clock frequency [MHz]

When selecting an external input Vsync signal, set the SC_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the scaler.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the scaler can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 31.6 Vsync Output Delay Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_VSDLY[7:0]	1	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC_RES_VSDLY × output Hsync period [usec]

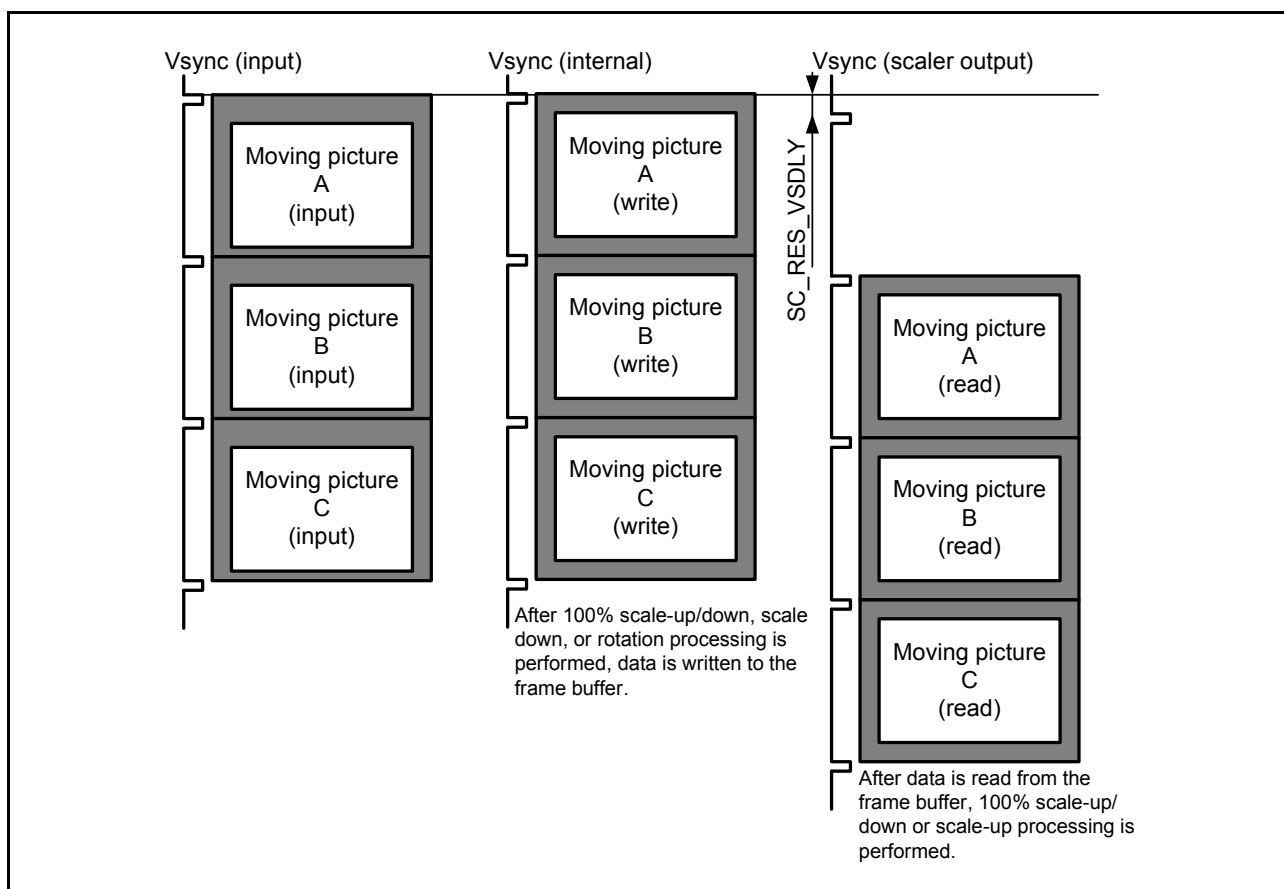

Figure 31.6 Vsync Signal Phases (Two Frame-Buffer Planes Used)

Figure 31.7 Vsync Signal Phases (One Frame-Buffer Plane Used)

31.1.4 Setting Angle of View

(1) Setting Image Area to be Captured

The image area to be captured can be set for reduction or enlargement.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 31.7 Control of Image Area to be Captured

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS2	SC_RES_VS[10:0]	18	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical Width of Video Signal to be Captured (lines) Note: SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the scaler can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 31.8 Full-Screen Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical Enable Signal Width for Full Screen (lines) Note: SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

(3) Generating an Image Output Enable Signal

The valid period of the image to be output can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 31.9 Image Output Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical Enable Signal Start Position for Output Image. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical Enable Signal Width for Output Image (lines) Note: SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal Enable Signal Start Position for Output Image. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).

Figure 31.8 Enable Settings

31.1.5 Scaling Settings

(1) Scaling Processing Block

The scaling-down control block scales down the input image from the input controller.

When rotation is required, the scaling-down control block first scales down the image and then rotates it before writing it into the frame buffer.

The scaling-up control block reads the rotated image from the frame buffer and scales it up.

Table 31.10 Rotation and Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
Normal	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
Horizontal mirroring	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale-up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
180° rotation	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
270° rotation	(Horizontal input→vertical output) scale down	(Vertical input→horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up

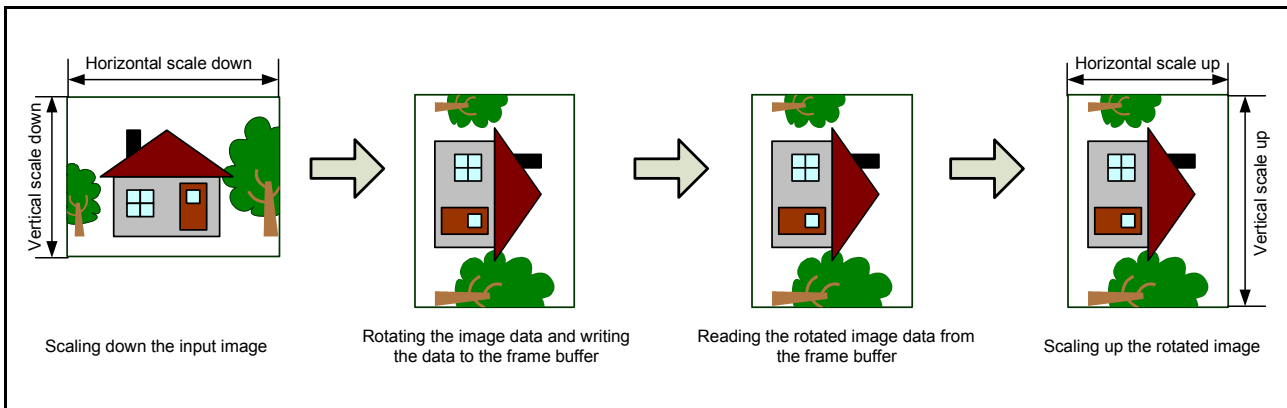

Figure 31.9 Rotation and Scaling Process

It is impossible to use vertical reduction by the scaling-down control block and vertical enlargement by the scaling-up control block simultaneously because they are mutually exclusive. Thus, the following scaling processes cannot be performed with 90° rotation or 270° rotation.

Table 31.11 Impossible Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
90° rotation 270° rotation	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale down	Horizontal 100% scale up/ vertical scale down	Horizontal 100% scale up/ vertical scale up

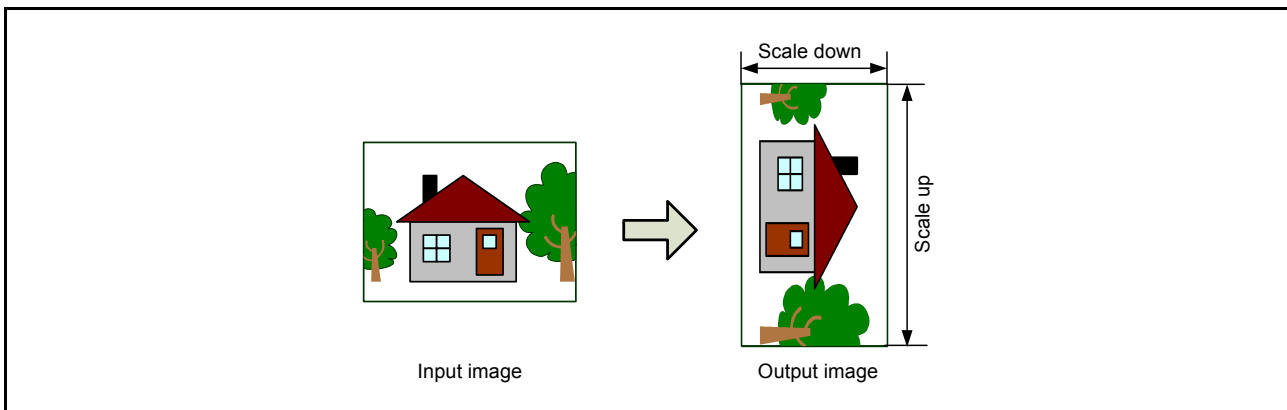

Figure 31.10 Impossible Scaling Process

31.1.6 Horizontal Prefilter

The horizontal prefilter can be turned on or off for brightness (Y) and RGB signals to suppress the frequency band of the signals during horizontal size reduction. The input format depends on the SC_RES_MD[1:0] bit setting in the writing mode register (SC_SCL1_WR1).

When the horizontal reduction ratio is high and there is too much folding frequency component to ignore, the horizontal prefilter should be turned on.

Table 31.12 Horizontal Prefilter Settings

Input Format	SC_RES_PFIL_SEL	Operation
YCbCr input	1	Turns on the horizontal prefilter for Y signal and turns off the horizontal prefilter for Cb/Cr signal.
	0	Turns off the horizontal prefilter.
RGB input	1	Turns on the horizontal prefilter for RGB signal.
	0	Turns off the horizontal prefilter.

Table 31.13 Horizontal Prefilter Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS4	SC_RES_PFIL_SEL	0	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)

31.1.7 Horizontal Scale-Down

The number of horizontally arranged pixels can be decreased at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Horizontal Scale Down Ratio

The value to be set to the horizontal scale-down ratio SC_RES_DS_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_HW and number of output pixels SC_RES_OUT_HW, where the decimals are rounded off.

$$\text{SC_RES_DS_H_RATIO} = \text{round} (\text{SC_RES_HW} \div \text{SC_RES_OUT_HW} \times 4096)$$

Note that, for 100% horizontal scale-up, the SC_RES_HW and SC_RES_OUT_HW values should be identical and the SC_RES_DS_H_RATIO bits should be set to 4096.

(4) Handling for Lack of Last-Input Pixel

Interpolation is carried out between the second-last-input and last-input pixels to produce the last-output pixel at the right end of a screen. The interpolation position of the last-output pixel may be close to the second-last-input pixel depending on the horizontal scale-down ratio; in this case, it may appear that the last-input pixel is lacking.

The undesirable influence by lack of last-input pixel can be decreased by appropriately adjusting the horizontal scale-down ratio using the following equations.

Pre-adjustment horizontal scale-down ratio $RATIO_org$ should be calculated first to find adjustment value σ , and then scale-down ratio $SC_RES_DS_H_RATIO$ should be determined.

$$RATIO_org = \text{round} (SC_RES_HW \div SC_RES_OUT_HW \times 4096)$$

$$\sigma = (RATIO_org \times (SC_RES_OUT_HW - 1) - (SC_RES_HW - 1) \times 4096) \div (SC_RES_OUT_HW - 1)$$

$$SC_RES_DS_H_RATIO = \text{roundup} (RATIO_org - \sigma)$$

Table 31.14 Horizontal Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Number of Valid Horizontal Pixels Output by Scaling-down Control Block (Video-image clock cycles)
SC_SCL0_DS4	SC_RES_DS_H_INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS4	SC_RES_DS_H_RATIO[15:0]	9224	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(SC_RES_HW \div SC_RES_OUT_HW \times 4096)$ $SC_RES_DS_H_RATIO < 4096$: Setting prohibited $SC_RES_DS_H_RATIO = 4096$: 100% scale up $SC_RES_DS_H_RATIO > 4096$: Scale down

Note: The $SC_RES_OUT_HW$ value should be aligned in 4-pixel units and equal to or smaller than the SC_RES_HW value.

31.1.8 Vertical Scale-Down

The number of lines can be decreased in the vertical direction at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Vertical Scale Down Ratio

The value to be set to the vertical scale-down ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_VW and number of output lines SC_RES_OUT_VW, where the decimals are rounded off.

$$\text{SC_RES_V_RATIO} = \text{round} (\text{SC_RES_VW} \div \text{SC_RES_OUT_VW} \times 4096)$$

Note that the SC_RES_VW and SC_RES_OUT_VW values should be identical for vertical enlargement or 100% vertical enlargement.

For 100% vertical enlargement, reduction is carried out assuming SC_RES_V_RATIO as 4096.

(4) Handling for Lack of Last-Input Line

Interpolation is carried out between the second-last-input and last-input lines to produce the last-output line at the lower end of a screen. The interpolation position of the last-output line may be close to the second-last-input line depending on the vertical scale-down ratio; in this case, it may appear that the last-input line is lacking.

The undesirable influence by the lack of last-input line can be decreased by appropriately adjusting the vertical scale-down ratio using the following equations.

Pre-adjustment vertical scale-down ratio RATIO_org should be calculated first to find adjustment value σ , and then scale-down ratio SC_RES_V_RATIO should be determined.

$$\text{RATIO_org} = \text{round} (\text{SC_RES_VW} \div \text{SC_RES_OUT_VW} \times 4096)$$

$$\sigma = (\text{RATIO_org} \times (\text{SC_RES_OUT_VW} - 1) - (\text{SC_RES_VW} - 1) \times 4096) \div (\text{SC_RES_OUT_VW} - 1)$$

$$\text{SC_RES_V_RATIO} = \text{round} (\text{RATIO_org} - \sigma)$$

Table 31.15 Vertical Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_V_ON	1	Vertical Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_VW [10:0]	240	Number of Valid Lines in Vertical Direction Output by Scaling-Down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC_SCL1_WR1.SC_RES_LOOP is 0 (frame write mode), these bits specify the number of lines for one frame. When SC_SCL1_WR1.SC_RES_LOOP is 1 (line write mode), these bits specify the number of lines for writing in a ring configuration.
SC_SCL0_DS5	SC_RES_V_INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO [15:0]	2044	Vertical Scale UP/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(\text{SC_RES_VW} + \text{SC_RES_OUT_VW} \times 4096)$ For scale up: $\text{round}(\text{SC_RES_IN_VW} + \text{SC_RES_P_VW} \times 4096)$ SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.

It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

The SC_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC_RES_VW value.

31.1.9 Horizontal Scale Up

The number of horizontally arranged pixels can be increased at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Horizontal Scale Up Ratio

The value to be set to the horizontal scale-up ratio SC_RES_US_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_IN_HW and number of output pixels SC_RES_P_HW, where the decimals are rounded off.

$$\text{SC_RES_US_H_RATIO} = \text{round} (\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$$

Note that, for 100% horizontal scale-up, the SC_RES_IN_HW and SC_RES_P_HW values should be identical and the SC_RES_US_H_RATIO bits should be set to 4096.

(4) Folding Handling

Since interpolation is carried out between the last-input pixel and second-last-input folding pixel to produce the last-output pixel at the right end of a screen, folding may undesirably stand out depending on the horizontal scale up ratio.

The undesirable influence by folding pixels can be decreased by appropriately adjusting the horizontal scale-up ratio using the following equations.

Pre-adjustment horizontal scale-up ratio RATIO_org should be calculated first to find adjustment value σ , and then scale-up ratio SC_RES_US_H_RATIO should be determined.

$$\text{RATIO_org} = \text{round} (\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$$

$$\sigma = (\text{RATIO_org} \times (\text{SC_RES_P_HW} - 1) - (\text{SC_RES_IN_HW} - 1) \times 4096) \div (\text{SC_RES_P_HW} - 1)$$

$$\text{SC_RES_US_H_RATIO} = \text{round} (\text{RATIO_org} - \sigma)$$

Table 31.16 Horizontal Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_H_ON	1	Horizontal Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Number of Valid Horizontal Pixels Input to Scaling-down Control Block (Pixel-clock cycles)
SC_SCL0_US6	SC_RES_US_H_INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	9224	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(\text{SC_RES_IN_HW} \div \text{SC_RES_P_HW} \times 4096)$ SC_RES_US_H_RATIO < 4096: Scale up SC_RES_US_H_RATIO = 4096: 100% scale-up SC_RES_US_H_RATIO > 4096: Setting prohibited

31.1.10 Vertical Scale-Up

The number of lines can be increased in the vertical direction at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1} , the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - \text{phase}) + X_{n+1} \times \text{phase}) / 4096$$

(3) Calculation of Vertical Scale Up Ratio

The value to be set to the vertical scale-up ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_IN_VW and number of output lines SC_RES_P_VW, where the decimals are rounded off.

$$\text{SC_RES_V_RATIO} = \text{round}(\text{SC_RES_IN_VW} \div \text{SC_RES_P_VW} \times 4096)$$

Note that, for 100% vertical enlargement or vertical reduction, the SC_RES_IN_VW and SC_RES_P_VW values should be identical.

(4) Folding Handling

The last line to be output at the bottom of the screen is produced by interpolation between the last line and line for folding (second-last line to be input). According to the vertical scale-up rate, this may cause folding to stand out.

The undesirable influence by folding lines can be decreased by appropriately adjusting the vertical scale-up ratio using the following equations.

Pre-adjustment vertical scale-up ratio $RATIO_org$ should be calculated first to find adjustment value σ , and then scale-up ratio $SC_RES_V_RATIO$ should be determined.

$$RATIO_org = \text{round} (SC_RES_IN_VW \div SC_RES_P_VW \times 4096)$$

$$\sigma = (RATIO_org \times (SC_RES_P_VW - 1) - (SC_RES_IN_VW - 1) \times 4096) \div (SC_RES_P_VW - 1)$$

$$SC_RES_V_RATIO = \text{round} (RATIO_org - \sigma)$$

Table 31.17 Vertical Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Number of Valid Lines in Vertical Direction Input to Scaling-down Control Block (Lines)
SC_SCL0_DS5	SC_RES_V_INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(SC_RES_VW \div SC_RES_OUT_VW \times 4096)$ For scale up: $\text{round}(SC_RES_IN_VW \div SC_RES_P_VW \times 4096)$ $SC_RES_V_RATIO < 4096$: Scale up $SC_RES_V_RATIO = 4096$: 100% scale up $SC_RES_V_RATIO > 4096$: Scale down

Note: $SC_RES_V_RATIO$ and $SC_RES_V_INTERPOTYP$ are both shared by vertical reduction and vertical enlargement.

It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

31.1.11 IP Conversion

(1) Initial Phase Control

When interlaced signals are input, line flickering caused by the line offset between the top and bottom fields can be decreased before being displayed by independently adjusting the initial scaling phases of the fields.

For various operations, appropriate settings should be made referring to the relevant registers as listed in Table 31.18.

Table 31.18 Initial Scaling Phase Settings (Standard Values) for IP Conversion

Rotation	Horizontal Scaling	Vertical Scaling	Reference Bit (Setting)
Normal	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
Horizontal mirroring	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HB_INIPHASE = 2048
180° rotation	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
270° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HT_INIPHASE = 2048

Note: Set 0 to the initial phase control registers where the specific value is not shown in the table.
Set 0 to all the initial phase control registers when progressive signals are input.

Table 31.19 Initial Scaling Phase Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS5	SC_RES_BTM_INIPHASE [11:0]	0	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_DS5	SC_RES_TOP_INIPHASE [11:0]	2048	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HB_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HT_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)

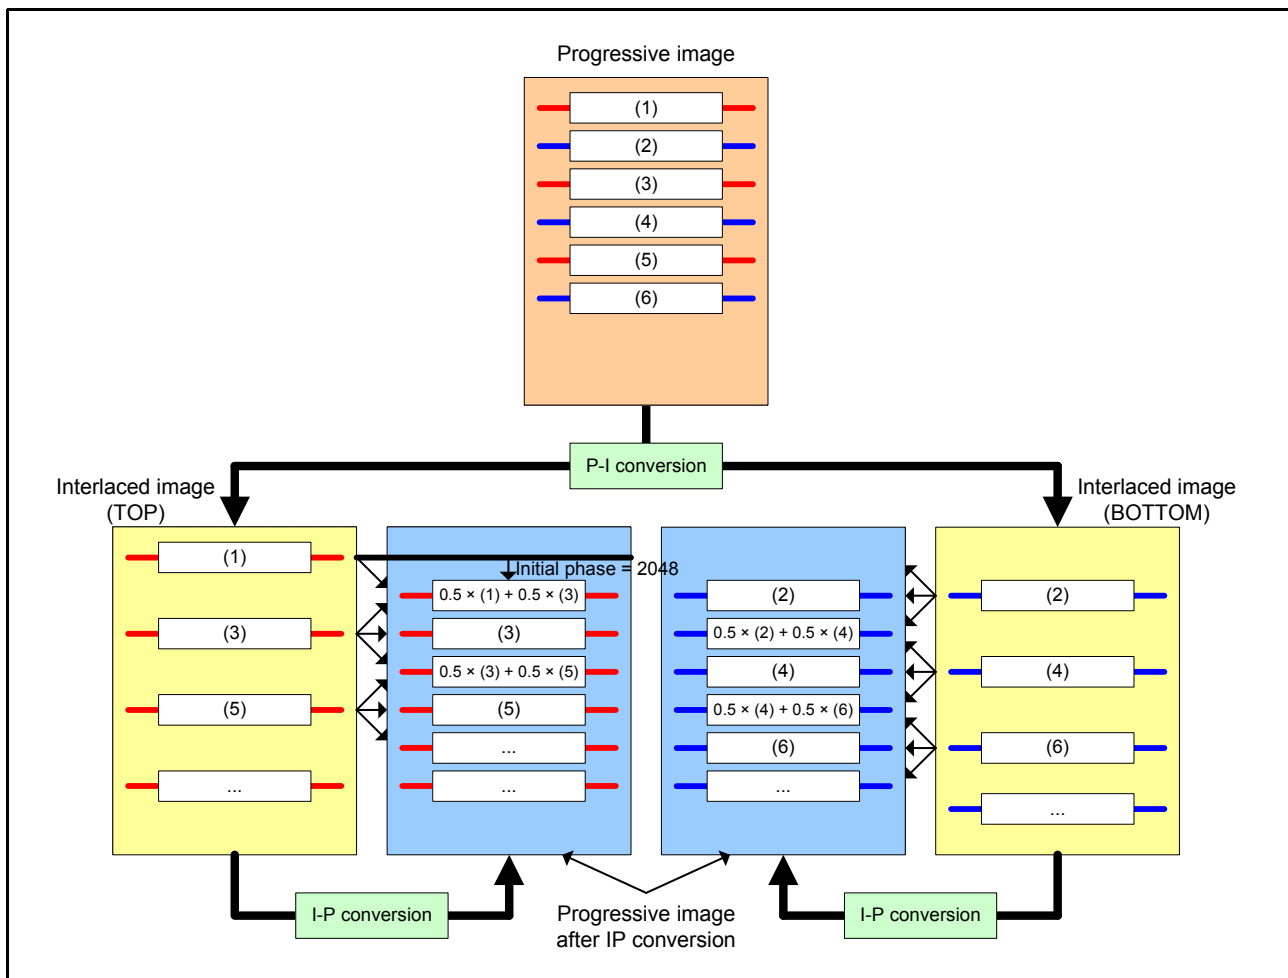

Figure 31.11 IP Conversion Processing Schematic Diagram

(2) Field Determination Signal Control

When interlaced signals are input, the field determination signal can be controlled, which is output to the scaling-up control block during vertical scaling.

When progressive signals are input or vertical scaling is carried out by the scaling-down control block, the field determination signal output to the scaling-up control block is fixed to the specific level, and thus either 0 or 1 can be set to the SC_RES_FLD_DLY_SEL bit.

Table 31.20 Settings for Field Determination Signal Control

Input Signal	Rotation	Vertical Processing	Frame Buffer	SC_RES_FLD_DLY_SEL
Progressive	—	—	—	—
Interlace	Normal	Vertical scale down	—	—
	Horizontal mirroring 180° rotation	Vertical scale up	One plane or less	0
			Two planes or more	1
	90° rotation	(Horizontal input → vertical output) scale down	—	—
270° rotation	(Horizontal input → vertical output) scale up	One plane or less	0	
		Two planes or more	1	

Table 31.21 Field Determination Signal Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle

31.1.12 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image Line before Scaling-down

When the location of the image line input to the scaling-down control block matches the SC_SCL1_LINE setting, an interrupt processing is done. In addition, the current location of the line input to the scaling-down control block can be read from a register.

Table 31.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down

Register Name	Bit Name	Initial Value	Description
SC_SCL0_INT	SC_RES_LINE[10:0]	All 0	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC_SCL0_LINE setting, an interrupt signal is output.
SC_SCL0_MON0	SC_RES_LIN_STAT[10:0]	All 0	Current Location of Image Line Input to Scaling-down Control Block

31.1.13 Trimming

The upper, lower, right, and left parts of a post-scaling image can be trimmed off as specified by the SC_RES_V CUT and SC_RES_H CUT bits before being output.

The frame lines of the post-scaling image can also be displayed by setting the SC_RES_DISP_ON bit to 1.

Figure 31.12 Area Relationship for Trimming (Frame Lines Displayed)

Table 31.23 Trimming Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US7	SC_RES_H CUT[7:0]	0	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
SC_SCL0_US7	SC_RES_V CUT[7:0]	0	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.
SC_SCL0_US8	SC_RES_DISP_ON	0	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

31.1.14 Screen Synthesis

During the valid full-screen period, the image area can be overlaid before being output. If the image area to be output is smaller than a full-screen, the background color specified by the SC_RES_BK_COL_R, SC_RES_BK_COL_G, and SC_RES_BK_COL_B bits are displayed to fill the background.

Table 31.24 Screen Synthesis Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_OVR1	SC_RES_BK_COL_R [7:0]	128	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_B [7:0]	128	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_G [7:0]	0	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

Figure 31.13 Area Relationship with Output Image Size Smaller than a Full Screen

31.1.15 Selecting Format for Writing Video Image Signals to Frame Buffer

A format can be selected for writing video image signals to the frame buffer.

Although 24-bit YCbCr signals or 24-bit RGB signals are input to the scaling control block, they are converted into 16-bit YCbCr422 signals, 16-bit RGB565 signals, 32-bit YCbCr444 signals, or 32-bit RGB888 signals before being written to the frame buffer.

As bit reduction processing of RGB565, rounding off or 2×2 pattern dither can be selected with the SC_RES_DTH_ON bit. For details on pattern dither, see in section 34, Video Display Controller 5 (7): Output Controller.

Table 31.25 Frame Buffer Writing Mode Setting

RES_BITDEC_ON	SC_RES_MD[1:0]	Writing Mode
0	3	YCbCr444 (normal, horizontal mirroring)
0	2	RGB888 (normal, horizontal mirroring)
1	1	RGB565 (normal, horizontal mirroring, rotation)
0	0	YCbCr422 (normal, horizontal mirroring, rotation)
1	0	Setting prohibited

Table 31.26 Video Signal Writing Format Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
SC_SCL1_WR6	SC_RES_BITDEC_ON	0	Bit Reduction On/Off 0: Off 1: On
SC_SCL1_WR6	SC_RES_DTH_ON	0	Dither Correction On/Off 0: Off (rounded off) 1: On (2×2 pattern dither)

31.1.16 Horizontal Mirroring and Rotation

Horizontal mirroring and rotation can be carried out for scaled-down images before being written to the frame buffer.

Table 31.27 and Table 31.28 show the relationship between various writing modes for image processing and video signals.

Table 31.27 Relationship between Writing Modes and Video Signals

RES_DS_WR_MD[2:0]	Writing Modes	YCbCr444	YCbCr422	RGB565	RGB888
0	Normal writing	Enabled	Enabled	Enabled	Enabled
1	Horizontal mirroring	Enabled	Enabled	Enabled	Enabled
2	90° rotation	Disabled	Enabled	Enabled	Disabled
3	180° rotation	Disabled	Enabled	Enabled	Disabled
4	270° rotation	Disabled	Enabled	Enabled	Disabled
5 to 7	Setting prohibited	—	—	—	—

Table 31.28 Horizontal Mirroring and Rotation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

31.1.17 Writing to Frame Buffer

(1) Frame Buffer Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video image data and graphics data are stored.

Table 31.29 Frame Buffer Transfer Mode

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_BST_MD	0	Transfer Burst Length for Frame Buffer Writing 0: 32-byte transfer (4 bursts) 1: 128-byte transfer (16 bursts)

(2) Frame Buffer Write Control

Frame buffer writing is enabled or disabled.

Table 31.30 Frame Buffer Writing Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

(3) Frame Buffer Writing Rate Selection

A frame buffer writing rate can be selected from among 1/1, 1/2, 1/4, and 1/8 the vertical frequency of the input signal.

When 1/2, 1/4, or 1/8 is selected, either the top or bottom field can be selected for writing.

Table 31.31 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_FS_RATE [1:0]	0	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
SC_SCL1_WR5	SC_RES_FLD_SEL	0	Write Field Select 0: Top field 1: Bottom field
SC_SCL1_WR5	SC_RES_INTER	1	Field Operating Mode Select 0: Progressive 1: Interlace

(4) Frame Buffer Write Addresses

Frame buffer addresses are specified using the base address, line offset address, frame offset address, data size of a line, and the number of lines in a frame. When an interlaced video image is input, the top and bottom field data can be separately stored in the frame buffer.

The SC_RES_BASE[31:0], SC_RES_LN_OFF[14:0], and SC_RES_FLM_OFF[22:0] bits should be set in 32-byte units (the lower five bits should be fixed to 0).

For 128-byte transfer, bits [6:5] in the address control registers should be fixed to 0 since addresses should be specified in 128-byte units.

For the data size of a line and the number of lines in a frame, the relevant register values set for the scaling-down control block are used.

Table 31.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_TB_ADD_MOD	0	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
SC_SCL1_WR2	SC_RES_BASE [31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR8	SC_RES_BASE_B [31:0]	0	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR3	SC_RES_LN_OFF [14:0]	2048	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Line 0: SC_RES_BASE Line 1: SC_RES_BASE + SC_RES_LN_OFF × 1 : Line n: SC_RES_BASE + SC_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR9	SC_RES_LN_OFF_B [14:0]	2048	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC_RES_TB_ADD_MOD = 1. Line 0: SC_RES_BASE_B Line 1: SC_RES_BASE_B + SC_RES_LN_OFF_B × 1 : Line n: SC_RES_BASE_B + SC_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR4	SC_RES_FLM_OFF [22:0]	524288	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Buffer 0: SC_RES_BASE Buffer 1: SC_RES_BASE + SC_RES_FLM_OFF × 1 : Buffer n: SC_RES_BASE + SC_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Table 31.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR10	SC_RES_FLM_OFF_B [22:0]	524288	<p>Frame Buffer Frame Offset Address for Bottom</p> <p>Sets the frame offset address for calculating the start address of each frame for the bottom field when SC_RES_TB_ADD_MOD = 1.</p> <p>Buffer 0: SC_RES_BASE_B Buffer 1: SC_RES_BASE_B + SC_RES_FLM_OFF_B × 1 : Buffer n: SC_RES_BASE_B + SC_RES_FLM_OFF_B × n</p> <p>For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.</p>

Figure 31.14 Data Arrangement in Frame Buffer

Figure 31.15 Data Arrangement in Frame Buffer in Various Writing Modes

(5) Frame Buffer Management

The scaling control block can handle multiple frames as the frame buffer.

Data is written to the buffer in cyclic mode according to the number of frames specified by the SC_RES_FLM_NUM bits.

For rotation, the SC_RES_FLM_NUM bits should be set to two or more frames.

To use the frame buffer as the ring buffer in line mode, the SC_RES_FLM_NUM bits should be set to 0 (1 frame) and the SC_RES_LOOP bit to 1.

Table 31.33 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR3	SC_RES_FLM_NUM[9:0]	1	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0 Number of frames defined by SC_RES_FLM_NUM + 1 are used.
SC_SCL1_WR9	SC_RES_FLM_NUM_B[9:0]	1	Number of Frames of Buffer to be Written to for Bottom Field when SC_RES_TB_ADD_MOD = 1 Number of frames defined by SC_RES_FLM_NUM_B + 1 are used.
SC_SCL1_WR1	SC_RES_LOOP	0	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
SC_SCL1_WR7	SC_RES_FLM_CNT[9:0]	—	Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC_RES_TB_ADD_MOD = 0.
SC_SCL1_WR11	SC_RES_FLM_CNT_B[9:0]	—	Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC_RES_TB_ADD_MOD = 1.

(6) Buffer Overflow Handling

If writing to the frame buffer cannot be completed due to bus-traffic related problems, an overflow interrupt can be output to the interrupt controller.

Table 31.34 Buffer Overflow Detection

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR7	SC_RES_OVERFLOW	—	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.

(7) Frame Buffer Write End Flag

When writing one frame of data to the frame buffer is completed, a frame buffer write end interrupt can be output to the interrupt controller.

31.1.18 Selecting a Scaling-up Process or Graphics 0 Process

Scaling-up process and graphics 0 process are mutually exclusive and thus frame buffer cannot be read out simultaneously for the processes.

When displaying input video image signals or displaying enlarged graphics, data is read from the frame buffer via the scaling-up control block.

However, graphics can be enlarged and displayed by the scaling-up control block only when the RGB565, RGB888, YCbCr422, or YCbCr444 format is used.

When displaying graphics without enlargement, the data is read from the frame buffer via the graphics 0 processing block.

With the SC_RES_IBUS_SYNC_SEL bit, sync signals for reading out the frame buffer and read size setting bits are selected.

Table 31.35 Selection of Scaling-Up Process and Graphics 0 Process

Type of Output Scaling Display	SC_RES_IBUS_SYNC_SEL	Sync Signals for Frame Buffer Read	Frame Buffer Read Size Setting Bits	Display Enabling Bits
Input video signal display Enlarged graphics display	0	Output from scaling-up control block	SC_RES_IN_VW SC_RES_IN_HW	SC_RES_P_VS SC_RES_P_VW SC_RES_P_HS SC_RES_P_HW
Graphics display	1	Output from graphics 0 processing block	GR_FLM_LNUM* GR_HW*	GR_GRC_VS GR_GRC_VW GR_GRC_HS GR_GRC_HW

Note: * The value set to the register + 1 is the actual read size.

Figure 31.16 Area Setting for Input Video Image Signal Display and Enlarged Graphics Display

Figure 31.17 Area Setting for Graphics Display

Table 31.36 Scaling-Up Process or Graphics 0 Process Selection

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	0	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block

The GR_DISP_SEL bits are used to select a display by the scaling-up control block (video image display or enlarged graphics display) or graphics display.

For details on the graphics processing, refer to the section 33, Video Display Controller 5 (5): Image Synthesizer.

31.1.19 Selecting Field for Frame Buffer Reading

For the next frame buffer to be read, the top or bottom field can be selected. This field selection is used in the scaling-up control block.

Table 31.37 Field Specification for Frame Buffer Reading

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLD_SEL	0	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
GR_FLM3	GR_FLD_NXT	0	Selects the top or bottom field for the next frame buffer. 0: Top 1: Bottom

31.1.20 Pointer Buffer and Frame Buffer Reading Processing

(1) Pointer Buffers

The pointer buffers can be used to control the frame buffer for the input video image. They are mainly used to prevent flicker in the output video image, which occurs when the input and output vertical sync signals are asynchronous.

Four pointer buffers are provided and each pointer buffer has a start address register that shows the start location of the frame buffer and a field information register that shows the current field is the top or bottom field. The four pointer buffers are arranged in a ring structure and a write pointer is provided to indicate the pointer buffer corresponding to the location currently being written to. The location pointed to by the write pointer is being written to, and the corresponding pointer buffer value is undetermined. The value in the pointer buffer corresponding to the location being written to and the value in the write pointer are automatically updated when frame data writing is completed.

When the frame buffer address setting signal is linked with the pointer buffer ($GR_FLM_SEL = 3$), frame buffer reading can be controlled by using the read pointer that indicates the pointer buffer corresponding to the location being read; the start address and field information of the next frame buffer to be read should be read from the pointer buffer and they should be set in the frame buffer base address and field information. The read pointer value is automatically updated at the rising edge of the vertical sync signal on the reading side.

(2) Write Pointer Control

The write pointer is incremented by one every time frame data writing is completed.

(3) Read Pointer Control

The read pointer is updated at the rising edge of the vertical sync signal on the reading side according to the difference between the read and write pointer values as follows.

(A) When $(\text{write pointer value}) - (\text{read pointer value}) \leq 1$

The read pointer value is not updated (the same frame is displayed continuously).

(B) When $(\text{write pointer value}) - (\text{read pointer value}) = 2$

The read pointer is incremented by one with the next updating timing.

(C) When $(\text{write pointer value}) - (\text{read pointer value}) \geq 3$

The read pointer is incremented by two with the next updating timing.

(One frame is skipped.)

(4) Frame Buffer Read Control

(A) When $SC_RES_WENB = 0$

Frame data is not written to the frame buffer, and the frame buffer is not read.

(B) When frame data writing is terminated with $SC_RES_WENB = 1$

As the pointer buffer value is determined, the frame buffer is read.

Table 31.38 Frame Buffer Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_PBUF0	SC_BUF0_ADD	0	Start address of the write buffer pointed to by pointer buffer 0
SC_SCL1_PBUF1	SC_BUF1_ADD	0	Start address of the write buffer pointed to by pointer buffer 1
SC_SCL1_PBUF2	SC_BUF2_ADD	0	Start address of the write buffer pointed to by pointer buffer 2
SC_SCL1_PBUF3	SC_BUF3_ADD	0	Start address of the write buffer pointed to by pointer buffer 3
SC_SCL1_PBUF_FLD	SC_FLD_INF0	0	Top or bottom field information pointed to by pointer buffer 0 0: Top 1: Bottom
SC_SCL1_PBUF_FLD	SC_FLD_INF1	0	Top or bottom field information pointed to by pointer buffer 1 0: Top 1: Bottom
SC_SCL1_PBUF_FLD	SC_FLD_INF2	0	Top or bottom field information pointed to by pointer buffer 2 0: Top 1: Bottom
SC_SCL1_PBUF_FLD	SC_FLD_INF3	0	Top or bottom field information pointed to by pointer buffer 3 0: Top 1: Bottom
SC_SCL1_PBUF_CNT	SC_PBUF_RST	0	Reset Control for the Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
SC_SCL1_MON1	SC_PBUF_NUM	0	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable 0: Writing is disabled. 1: Writing is enabled.
GR_FLM1	GR_FLM_SEL	0	Frame Buffer Address Setting Signal Selection 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC_SCL0_FRC3.) 1: Selects GR0_FLM_NUM. 2: Setting prohibited 3: Links to pointer buffer.
GR_FLM2	GR_BASE	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

For other frame buffer read operation and graphics processing, refer to section 33, Video Display Controller 5 (5): Image Synthesizer.

31.2 Register Descriptions

Table 31.39 shows the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 31.39 Register Configuration of the Scaler

Name	Abbreviation	R/W	Initial Value	Address	Access Size

Alpha blending control register 9 (graphics 0)	GR0_AB9	R/W	H'0000 0000	H'FCFF 7640	32

Table 31.39 Register Configuration of the Scaler

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Alpha blending control register 10 (graphics 0)	GR0_AB10	R/W	H'0000 0000	H'FCFF 7644	32
Alpha blending control register 11 (graphics 0)	GR0_AB11	R/W	H'0000 0000	H'FCFF 7648	32
Background color control register (graphics 0)	GR0_BASE	R/W	H'0000 8080	H'FCFF 764C	32
CLUT table control register (graphics 0)	GR0_CLUT	R/W	H'0000 0000	H'FCFF 7650	32

31.2.1 SCL0 Register Update Control Register (SC0_SCL0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SC0_SCL0_VEN_D	SC0_SCL0_VEN_C	—	—	—	SC0_SCL0_UPDATE	—	—	—	SC0_SCL0_VEN_B	—	—	—	SC0_SCL0_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SC0_SCL0_VEN_D	0	R/WC1	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
12	SC0_SCL0_VEN_C	0	R/WC1	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_SCL0_UPDATE	0	R/WC1	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL0_VEN_B	0	R/WC1	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL0_VEN_A	0	R/WC1	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.2 Mask Control Register (SC0_SCL0_FRC1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VMASK[15:0]															
Initial value:	0	0	0	0	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VMASK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_VMASK [15:0]	2800	R/W	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC0_RES_VMASK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VMASK_ON	1	R/W	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.3 Missing Vsync Compensation Control Register (SC0_SCL0_FRC2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VLACK[15:0]															
Initial value:	0	0	0	0	1	1	1	0	0	0	0	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_VLACK [15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC0_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VLACK_ON	1	R/W	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.4 Output Sync Select Register (SC0_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0-RES-VS_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VS_SEL	1	R/W	Vsync Signal Output Select 0: Externally input Vsync signal 1: Internally generated free-running Vsync signal

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.5 Free-Running Period Control Register (SC0_SCL0_FRC4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_FV[10:0]										
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_FH[10:0]										
Initial value:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_FV [10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (SC0_RES_FV + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_FH [10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (SC0_RES_FH + 1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.6 Output Delay Control Register (SC0_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_RES_FLD_DLY_SEL	SC0_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_RES_FLD_DLY_SEL	1	R/W	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle
7 to 0	SC0_RES_VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC0_RES_VSDLY × output Hsync period [usec]

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.7 Full-Screen Vertical Size Register (SC0_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.9 Vsync Detection Register (SC0_SCL0_FRC9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_QVLOCK	—	—	—	SC0_RES_QVLACK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_QVLOCK	0	R	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_QVLACK	0	R	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.

31.2.10 Status Monitor 0 Register (SC0_SCL0_MON0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LIN_STAT [10:0]	All 0	R	Current location of the image line input to the scaling-down control block.

31.2.11 Interrupt Control Register (SC0_SCL0_INT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LINE[10:0]	All 0	R/W	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC0_RES_LINE setting, an interrupt signal is output.

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.12 Scaling-Down Control Register (SC0_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DS_V_ON	—	—	—	SC0_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.13 Vertical Capture Size Register (SC0_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_VS [10:0]	18	R/W	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_VW [10:0]	240	R/W	Vertical Width of Video Signal to be Captured (Lines) Note: SC0_RES_VS + SC0_RES_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.14 Horizontal Capture Size Register (SC0_SCL0_DS3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	SC0_RES_PFIL_SEL	0	R/W	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. ($1/4 + 1/2 + 1/4$)
28	SC0_RES_DS_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_DS_H_RATIO[15:0]	9224	R/W	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) $\text{round}(\text{SC0_RES_HW} \div \text{SC0_RES_OUT_HW} \times 4096)$ SC0_RES_DS_H_RATIO < 4096: Setting prohibited SC0_RES_DS_H_RATIO = 4096: 100% scale up SC0_RES_DS_H_RATIO > 4096: Scale down

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.16 Initial Vertical Phase Register (SC0_SCL0_DS5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_V_INTERPOTYP	SC0_RES_TOP_INIPHASE[11:0]											
Initial value:	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_BTM_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_V_INTERPOTYP	1	R/W	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_TOP_INIPHASE [11:0]	2048	R/W	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_BTM_INIPHASE [11:0]	0	R/W	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.17 Vertical Scaling Register (SC0_SCL0_DS6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_V_RATIO[15:0]															
Initial value:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_V_RATIO [15:0]	2044	R/W	Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: $\text{round}(\text{SC0_RES_VW} \div \text{SC0_RES_OUT_VW} \times 4096)$ For scale up: $\text{round}(\text{SC0_RES_IN_VW} \div \text{SC0_RES_P_VW} \times 4096)$ SC0_RES_V_RATIO < 4096: Scale up SC0_RES_V_RATIO = 4096: 100% scale up SC0_RES_V_RATIO > 4096: Scale down

Note: These bits updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.18 Scaling-Down Control Block Output Size Register (SC0_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_OUT_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC0_SCL1_WR1.SC0_RES_LOOP is 0 (frame write mode), specify the number of lines for one frame. When SC0_SCL1_WR1.SC0_RES_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The SC0_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC0_RES_VW value.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_OUT_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The SC0_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC0_RES_HW value.

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_C bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.19 Scaling-Up Control Register (SC0_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_US_V_ON	—	—	—	SC0_RES_US_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_US_V_ON	1	R/W	Vertical Scale Up On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_US_H_ON	1	R/W	Horizontal Scale Up On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.20 Output Image Vertical Size Register (SC0_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.21 Output Image Horizontal Size Register (SC0_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_IN_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_IN_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_IN_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Input to Scaling-down Control Block (lines)
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_IN_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Input to Scaling-down Control Block (pixel-clock cycles)

Note: This register is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.23 Horizontal Scale Up Register (SC0_SCL0_US5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_US_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_US_H_RATIO[15:0]	9224	R/W	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC0_RES_IN_HW ÷ SC0_RES_P_HW × 4096) SC0_RES_US_H_RATIO < 4096: Scale up SC0_RES_US_H_RATIO = 4096: 100% scale up SC0_RES_US_H_RATIO > 4096: Setting prohibited

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.24 Horizontal Scale Up Initial Phase Register (SC0_SCL0_US6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_US_H_INT ERPOTYP	SC0_RES_US_HT_INIPHASE[11:0]											
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_US_HB_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_US_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_US_HT_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_US_HB_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.25 Trimming Register (SC0_SCL0_US7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_HCUT[7:0]							SC0_RES_VCUT[7:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	SC0_RES_HCUT[7:0]	0	R/W	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
7 to 0	SC0_RES_VCUT[7:0]	0	R/W	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.26 Frame Buffer Read Select Register (SC0_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_IBUS_SYNC_SEL	—	—	—	SC0_RES_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DISP_ON	0	R/W	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

Note: SC0_RES_IBUS_SYNC_SEL is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

SC0_RES_DISP_ON is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.27 Background Color Register (SC0_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SC0_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BK_COL_G[7:0]								SC0_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SC0_RES_BK_CLO_R[7:0]	128	R/W	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	SC0_RES_BK_COL_G[7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SC0_RES_BK_COL_B[7:0]	128	R/W	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.28 SCL1 Register Update Control Register (SC0_SCL1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_UPDATE_B	—	—	—	SC0_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_VEN_B	—	—	—	SC0_SCL1_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	SC0_SCL1_UPDATE_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_SCL1_UPDATE_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.29 Writing Mode Register (SC0_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_WRSWA [2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SC0_RES_TB_ADD_MOD	SC0_RES_DS_WR_MD[2:0]			SC0_RES_MD[1:0]	SC0_RES_LOOP	SC0_RES_BST_MD	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	SC0_RES_WRSWA[2:0]	All 0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units] Note: When YCbCr422 or RGB565 is selected as a frame buffer video-signal writing format, these bits should be set to 000 [Not swapped].
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	SC0_RES_TB_ADD_MOD	0	R/W	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
6 to 4	SC0_RES_DS_WR_MD[2:0]	0	R/W	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3, 2	SC0_RES_MD [1:0]	0	R/W	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
1	SC0_RES_LOOP	0	R/W	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
0	SC0_RES_BST_MD	0	R/W	Transfer Burst Length for Frame Buffer Writing 0: 32-byte transfer (4 bursts) 1: 128-byte transfer (16 bursts)

Note: SC0_RES_LOOP and SC0_RES_BST_MD are updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

SC0_RES_TB_ADD_MOD, SC0_RES_DS_WR_MD, and SC0_RES_MD are updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

SC0_RES_WRSWA is updated when the SC0_SCL1_UPDATE_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.30 Write Address Register 1T (SC0_SCL1_WR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.31 Write Address Register 2T (SC0_SCL1_WR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Line 0: SC0_RES_BASE Line 1: SC0_RES_BASE + SC0_RES_LN_OFF × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM [9:0]	1	R/W	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0 Number of frames defined by SC0_RES_FLM_NUM + 1 are used.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.32 Write Address Register 3T (SC0_SCL1_WR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Buffer 0: SC0_RES_BASE Buffer 1: SC0_RES_BASE + SC0_RES_FLM_OFF × 1 : Buffer n: SC0_RES_BASE + SC0_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SC0_RES_INTER	—	—	SC0_RES_FS_RATE[1:0]	—	—	—	SC0_RES_FLD_SEL	—	—	—	—	SC0_RES_WENB
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	SC0_RES_INTER	1	R/W	Field Operating Mode Select 0: Progressive 1: Interlace
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_RES_FS_RATE[1:0]	0	R/W	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC0_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_FLD_SEL	0	R/W	Write Field Select 0: Top field 1: Bottom field
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_WENB	0	R/W	Frame Buffer Write Enable 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

Note: SC0_RES_INTER, SC0_RES_FS_RATE[1:0], and SC0_RES_FLD_SEL are updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
SC0_RES_WENB is updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

31.2.34 Bit Reduction Register (SC0_SCL1_WR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DTH_ON	—	—	—	SC0_RES_BITDEC_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DTH_ON	0	R/W	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_BITDEC_ON	0	R/W	Bit Reduction On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.35 Write Detection Register (SC0_SCL1_WR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_OVERFLOW	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	—	SC0_RES_FLM_CNT[9:0]									—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_RES_OVERFLOW	0	R	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT [9:0]	0	R	Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0.

31.2.36 Write Address Register 1B (SC0_SCL1_WR8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE_B[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_BASE_B[31:0]	0	R/W	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.37 Write Address Register 2B (SC0_SCL1_WR9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF_B[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF_B [14:0]	2048	R/W	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Line 0: SC0_RES_BASE_B Line 1: SC0_RES_BASE_B + SC0_RES_LN_OFF_B × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM_B [9:0]	1	R/W	Number of Frames of Buffer to be Written to for Bottom Field Number of frames defined by SC0_RES_FLM_NUM_B + 1 are used when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.38 Write Address Register 3B (SC0_SCL1_WR10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF_B[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF_B[22:0]	524288	R/W	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Buffer 0: SC0_RES_BASE_B Buffer 1: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × 1 : Buffer n: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.39 Write Detection Register B (SC0_SCL1_WR11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_CNT_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT_B[9:0]	0	R	Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

31.2.40 Status Monitor 1 Register (SC0_SCL1_MON1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_PBUF_NUM [1:0]	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_PBUF_NUM[1:0]	All 0	R	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

31.2.41 Pointer Buffer 0 Register (SC0_SCL1_PBUF0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF0_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF0_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF0_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 0.

31.2.42 Pointer Buffer 1 Register (SC0_SCL1_PBUF1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF1_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF1_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF1_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 1.

31.2.43 Pointer Buffer 2 Register (SC0_SCL1_PBUF2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF2_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF2_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF2_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 2.

31.2.44 Pointer Buffer 3 Register (SC0_SCL1_PBUF3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF3_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF3_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF3_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 3.

31.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SC0_FLD_INF3	—	—	—	—	—	—	—	SC0_FLD_INF2
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_FLD_INF1	—	—	—	—	—	—	—	SC0_FLD_INF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	SC0_FLD_INF3	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 3. 0: Top 1: Bottom
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_FLD_INF2	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 2. 0: Top 1: Bottom
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_FLD_INF1	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 1. 0: Top 1: Bottom
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	SC0_FLD_INF0	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 0. 0: Top 1: Bottom

31.2.46 Pointer Buffer Control Register (SC0_SCL1_PBUF_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_PBUF_RST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_PBUF_RST	0	R/W	Reset Control for Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the SC0_SCL1_UPDATE_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.47 Graphics 0 Register Update Control Register (GR0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR0_UPDATE	—	—	—	GR0_P_VEN	—	—	—	GR0_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR0_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.48 Frame Buffer Read Control Register (Graphics 0) (GR0_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_SEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_SEL[1:0]	—	—	—	—	—	—	—	—	GR0_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_SEL	0	R/W	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR0_FLM_SEL [1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC0_SCL0_FRC3.) 1: Selects GR0_FLM_NUM. 2: Setting prohibited 3: Links to pointer buffer.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR0_FLD_SEL is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_LN_OFF_DIR and GR0_IMR_FLM_INV are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_FLM_SEL is updated when the GR0_P_VEN and GR0_IBUS_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

GR0_BST_MD is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.50 Frame Buffer Control Register 2 (Graphics 0) (GR0_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR0_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR0_BASE[4:3] and GR0_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

Note: This register is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_NXT	GR0_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—						GR0_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_NXT	0	R/W	Top or Bottom Field Selection for Next Frame Buffer 0: Top 1: Bottom
30 to 16	GR0_LN_OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR0_BASE Line 1: GR0_BASE + GR0_LN_OFF × 1 : Line n: GR0_BASE + GR0_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR0_FLM_NUM[9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR0_FLM_SEL = 1.

Note: GR0_FLD_NXT is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_LN_OFF[14:0] and GR0_FLM_NUM[9:0] are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.52 Frame Buffer Control Register 4 (Graphics 0) (GR0_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR0_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR0_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR0_BASE Buffer 1: GR0_BASE + GR0_FLM_OFF × 1 : Buffer n: GR0_BASE + GR0_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.53 Frame Buffer Control Register 5 (Graphics 0) (GR0_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR0_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR0_FLM_LOOP + 1) lines are read.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.54 Frame Buffer Control Register 6 (Graphics 0) (GR0_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FORMAT[3:0]				—	GR0_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_YCC_SWAP[2:0]			GR0_RDSWA[2:0]			—	GR0_CbW444_MD	—	—	GR0_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR0_FORMAT[3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: α RGB1555 3: α RGB4444 4: α RGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGB α 5551 11: RGB α 8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR0_HW[10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR0_HW + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	GR0_YCC_SWAP[2:0]	0	R/W	Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR0_RDSWA [2:0]	0	R/W	<p>8-Bit, 16-Bit, or 32-Bit Swap Setting</p> <p>These bits control swapping in frame buffer reading as follows.</p> <p>Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units.</p> <p>Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units.</p> <p>Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units.</p> <p>According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data.</p> <p>000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped]</p> <p>001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units]</p> <p>010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units]</p> <p>011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units]</p> <p>100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units]</p> <p>101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units]</p> <p>110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units]</p> <p>111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]</p>
9	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
8	GR0_CNV444_MD	0	R/W	<p>Sets the interpolation mode for YCbCr422 to YCbCr444 conversion.</p> <p>0: Hold interpolation 1: Average interpolation</p>
7, 6	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
5 to 0	GR0_STA_POS[5:0]	0	R/W	<p>Sets the amount of data to be skipped through.</p> <p>Specifically data amount equal to the amount indicated by GR0_STA_POS is skipped from the start of the line.</p>

Note: GR0_YCC_SWAP, GR0_CNV444, and GR0_STA_POS are updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_RDSWA is updated when the GR0_UPDATE bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

GR0_FORMAT and GR0_HW are updated when GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.55 Alpha Blending Control Register 1 (Graphics 0) (GR0_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GR0_GRC_DISP_ON	—	—	GR0_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR0_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR0_BASE) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: * Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: This register is updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.56 Alpha Blending Control Register 2 (Graphics 0) (GR0_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. Note: The set value should be four or more (lines). GR0_GRC_VS + GR0_GRC_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.57 Alpha Blending Control Register 3 (Graphics 0) (GR0_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR0_GRC_HS + GR0_GRC_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR0_HW to 2 and GR0_GRC_HW to 1 (1 pixel) or 2 (2 pixels).

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.58 Alpha Blending Control Register 7 (Graphics 0) (GR0_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0 CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_CK_ON	0	R/W	CLUT-Index/RGB-Index Chroma-Key Processing On/Off 0: Off 1: On

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.59 Alpha Blending Control Register 8 (Graphics 0) (GR0_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_CK_KCLUT[7:0]								GR0_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_CK_KB[7:0]								GR0_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR0_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.60 Alpha Blending Control Register 9 (Graphics 0) (GR0_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_CK_A[7:0]								GR0_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_CK_B[7:0]								GR0_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_CK_A[7:0]	0	R/W	Replaced Alpha Signal after RGB-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB]) Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_CK_G[7:0]	0	R/W	Replaced G Signal after RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR0_CK_B[7:0]	0	R/W	Replaced B Signal after RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR0_CK_R[7:0]	0	R/W	Replaced R Signal after RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.61 Alpha Blending Control Register 10 (Graphics 0) (GR0_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_A0[7:0]								GR0_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_B0[7:0]								GR0_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR0_A0 [7:0]	0	R/W	CLUT1 α 0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555/RGB α 5551 format and α = 0. Note: These bits should always be set to 255 to display the current graphics only.
23 to 16	GR0_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR0_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR0_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.62 Alpha Blending Control Register 11 (Graphics 0) (GR0_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_A1[7:0]								GR0_G1[7:0]

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. Referring to the CLUT table 0 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 1. 1: Selects CLUT table 1. Referring to the CLUT table 1 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.3 Usage Method

31.3.1 Scaling Setting Example for Displaying Input Video Image

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.40.

Here, the over-scan rate is assumed to be 100%.

Table 31.40 Input and Output Angles for Displaying Input Video Image

Input Signal	Output Signal	Signal Format	Rotation	Buffer Planes	Scaling Filter
1440 × 240	240 × 320	YCbCr	Normal	Two planes	2-tap linear

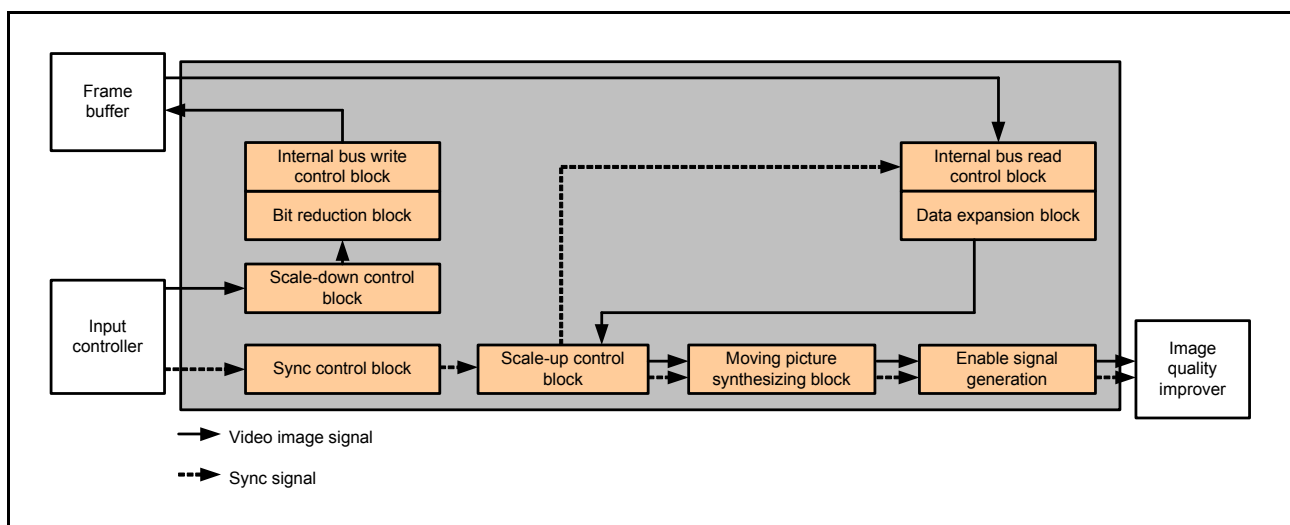

Figure 31.18 Signal Paths for Displaying Input Video Image

(2) Horizontal Scaling (Horizontal Scale Down, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round} (1440 \div 120 \times 4096) = 49152$$

$$\sigma = (49152 \times (120 - 1) - (1440 - 1) \times 4096) \div (120 - 1) = -378.62$$

$$\text{Horizontal scaling ratio} = \text{round} (49152 - (-378.62)) = 49531$$

(3) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round} (120 \div 240 \times 4096) = 2048$$

$$\sigma = (2048 \times (240 - 1) - (120 - 1) \times 4096) \div (240 - 1) = 8.56$$

$$\text{Horizontal scaling ratio} = \text{round} (2048 - (8.56)) = 2039$$

(4) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round}(240 \div 320 \times 4096) = 3072$$

$$\sigma = (3072 \times (320 - 1) - (240 - 1) \times 4096) \div (320 - 1) = 3.21$$

$$\text{Vertical scaling ratio} = \text{round}(3072 - (3.21)) = 3069$$

(5) Setting Frame Buffer Access Area

Since video data is written to the frame buffer after scaled down, the write size is 640×240 pixels.

The frame buffer area required is 640 pixels or more for line offset and line offset \times 240 pixels or more for frame offset.

Here, the frame buffer work area is assumed to be 1024×256 pixels.

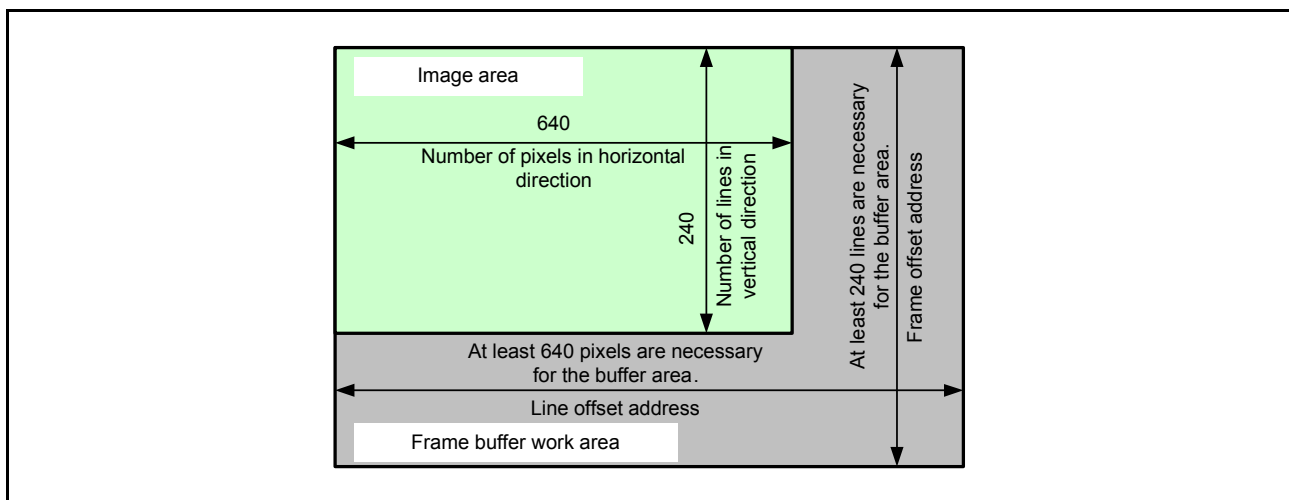

Figure 31.19 Frame Buffer Access Area Setting

Since the frame buffer is accessed in 64-bit units, YCbCr422 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

$$\text{SC_RES_LN_OFF}[14:0] = 1024 \times 2 = 2048$$

$$\text{GR_LN_OFF}[14:0] = 1024 \times 2 = 2048$$

The frame offset address values to be set are:

$$\text{SC_RES_FLM_OFF}[22:0] = \text{SC_RES_LN_OFF}[14:0] \times 256 = 524288$$

$$\text{GR_FLM_OFF}[22:0] = \text{GR_LN_OFF}[14:0] \times 256 = 524288$$

(6) Register Setting Example

Table 31.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	0	External Vsync selected
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_DS2	SC_RES_VS[10:0]	15	Vertical capture start position of input signal
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical capture width of input signal
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal capture start position of input signal
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal capture width of input signal
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical valid start position of output image
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical valid width of output image
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal valid start position of output image
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal valid width of output image
Scaling Setting			
SC_SCL0_DS4	SC_RES_DS_H_RATIO [15:0]	9224	Horizontal scaling-down because SC_RES_DS_H_RATIO is equal to or larger than 4096
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal scaling-down on
SC_SCL0_US1	SC_RES_US_H_ON	0	Horizontal scaling-up off
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	4096	Horizontal scaling-up off because SC_RES_US_H_RATIO is equal to or larger than 4096
SC_SCL0_DS1	SC_RES_DS_V_ON	0	Vertical scaling-down off
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical scaling-up on
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical scaling-up because SC_RES_V_RATIO is smaller than 4096
SC_SCL0_DS7	SC_RES_OUT_VW[10:0]	240	Vertical valid input width because the vertical scaling-down function is off
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Horizontal image size after horizontal scaling-down
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Vertical width of frame buffer read
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Horizontal width of frame buffer read
IP Conversion Setting			
SC_SCL0_DS5	SC_RES_TOP_INIPHASE[11:0]	2048	Top field adjusted by 0.5-line phase
SC_SCL0_DS5	SC_RES_BTM_INIPHASE[11:0]	0	No phase adjustment for bottom field
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	IP conversion with two planes of frame buffer used for vertical scaling-up
Frame Buffer Write Setting			
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Normal write mode for rotation control
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame buffer write format YCbCr422 (16 bits)
SC_SCL1_WR2	SC_RES_BASE[31:0]	0	Frame buffer write start address (0 in setting example)
SC_SCL1_WR3	SC_RES_LN_OFF[14:0]	2048	Frame buffer write line offset

Table 31.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
SC_SCL1_WR3	SC_RES_FLM_NUM[9:0]	1	Two planes of frame buffer used
SC_SCL1_WR4	SC_RES_FLN_OFF[22:0]	524288	Frame buffer write frame offset

GR_AB1	GR_DISP_SEL[1:0]	1	Scaling display selected

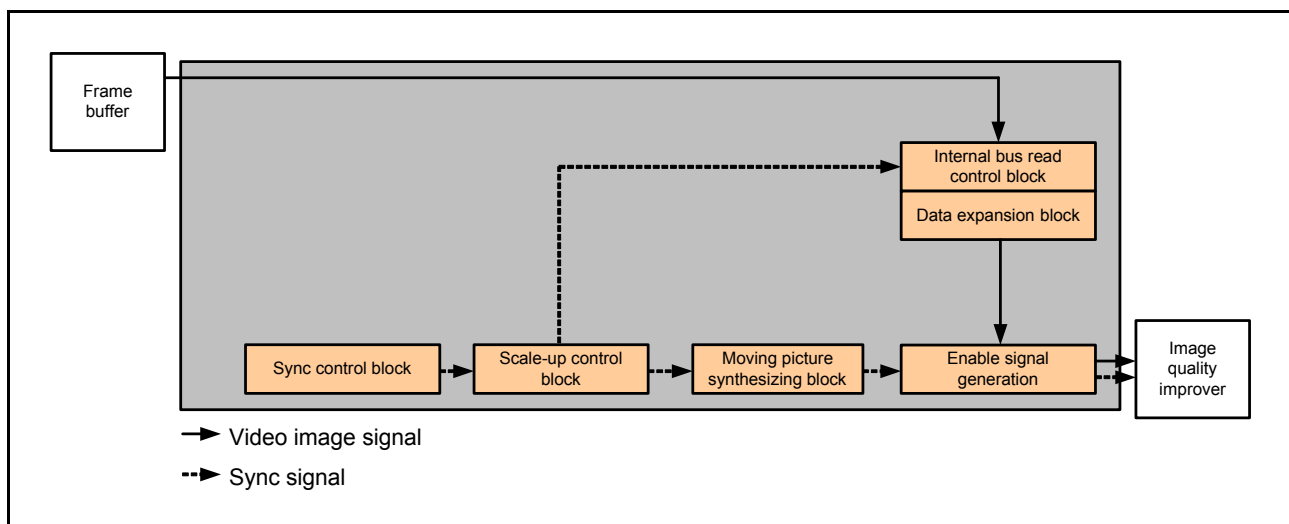

31.3.2 Scaling Setting Example for Graphics Display

(1) Angle of View for Graphics Display

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.42.

Table 31.42 Input and Output Angles of View for Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	640 × 480	RGB888

**Figure 31.20 Signal Paths for Graphics Display**

(2) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640×480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640×480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB888 (32 bits) is accessed in 2-pixel units.

The line offset address values to be set are:

$$\text{GR_LN_OFF}[14:0] = 640 \times 4 = 2560$$

The frame offset address values to be set are:

$$\text{GR_FLM_OFF}[22:0] = \text{GR_LN_OFF}[14:0] \times 480 = 1228800$$

(3) Register Setting Example

Table 31.43 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
GR_AB2	GR_GRC_VS[10:0]	35	Vertical valid start position of graphics output
GR_AB2	GR_GRC_VW[10:0]	480	Vertical valid width of graphics output
GR_AB3	GR_GRC_HS[10:0]	144	Horizontal valid start position of graphics output
GR_AB3	GR_GRC_HW[10:0]	640	Horizontal valid width of graphics output
Frame Buffer Read Setting			
GR_FLM1	GR_FLM_SEL[1:0]	1	Frame number setting with register
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame number of frame buffer (0 in setting example)
GR_FLM5	GR_FLM_LNUM[9:0]	479	Number of graphics lines (number of lines = set value + 1)
GR_FLM6	GR_HW[9:0]	639	Horizontal valid width of graphics (valid width = set value + 1)
GR_FLM2	GR_BASE[31:0]	0	Conforming to graphics expansion setting (0 in setting example)
GR_FLM3	GR_LN_OFF[14:0]	2560	Conforming to graphics expansion setting
Frame Buffer Read Setting			
GR_FLM4	GR_FLM_OFF[22:0]	1228800	Conforming to graphics expansion setting
GR_FLM6	GR_FORMAT[3:0]	1	Frame buffer read format RGB888
GR_FLM_RD	GR_R_ENB	1	Frame buffer read enabled

Table 31.43 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
Scaling-up Selection			
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	1	Graphics output displayed
GR_AB1	GR_DISP_SEL[1:0]	2	Graphics display selected

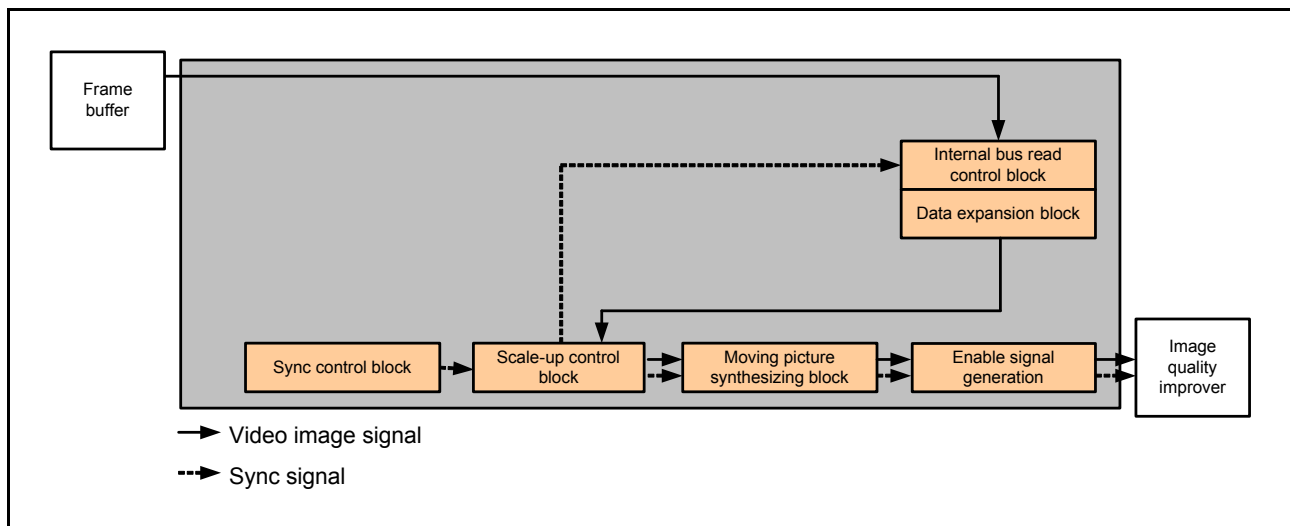

31.3.3 Scaling Setting Example for Scaled-up Graphics Display

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.44.

Table 31.44 Input and Output Angles of View for Scaled-up Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	800 × 600	RGB565

**Figure 31.21 Signal Paths for Scaled-up Graphics Display**

(2) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round} (640 \div 800 \times 4096) = 3277$$

$$\sigma = (3277 \times (800 - 1) - (640 - 1) \times 4096) \div (800 - 1) = 1.23$$

$$\text{Horizontal scaling ratio} = \text{round} (3277 - (1.23)) = 3276$$

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

$$\text{RATIO_org} = \text{round}(480 \div 600 \times 4096) = 3277$$

$$\sigma = (3277 \times (600 - 1) - (480 - 1) \times 4096) \div (600 - 1) = 1.57$$

$$\text{Vertical scaling ratio} = \text{round}(3277 - (1.57)) = 3275$$

(4) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640×480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640×480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB565 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

$$\text{GR_LN_OFF}[14:0] = 640 \times 2 = 1280$$

The frame offset address values to be set are:

$$\text{GR_FLM_OFF}[22:0] = \text{GR_LN_OFF}[14:0] \times 480 = 614400$$

(5) Register Setting Example

Table 31.45 Register Setting Example for Scaled-up Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	668	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	1040	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	27	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	600	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	216	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	800	Horizontal valid width of full screen
SC_SCL0_US2	SC_RES_P_VS[10:0]	27	Vertical valid start position of image output
SC_SCL0_US2	SC_RES_P_VW[10:0]	600	Vertical valid width of image output

32. Video Display Controller 5 (4): Image Quality Improver

32.1 Image Quality Improver

32.1.1 Overview of Functions

The image quality improver subjects scaled YCbCr signals to black stretching, LTI/sharpness processing, and GBR conversion by using a color matrix.

The image quality improver does not act on RGB signals.

Figure 32.1 is a functional block diagram of the image quality improver. Image quality improver 0 is connected to scaler 0.

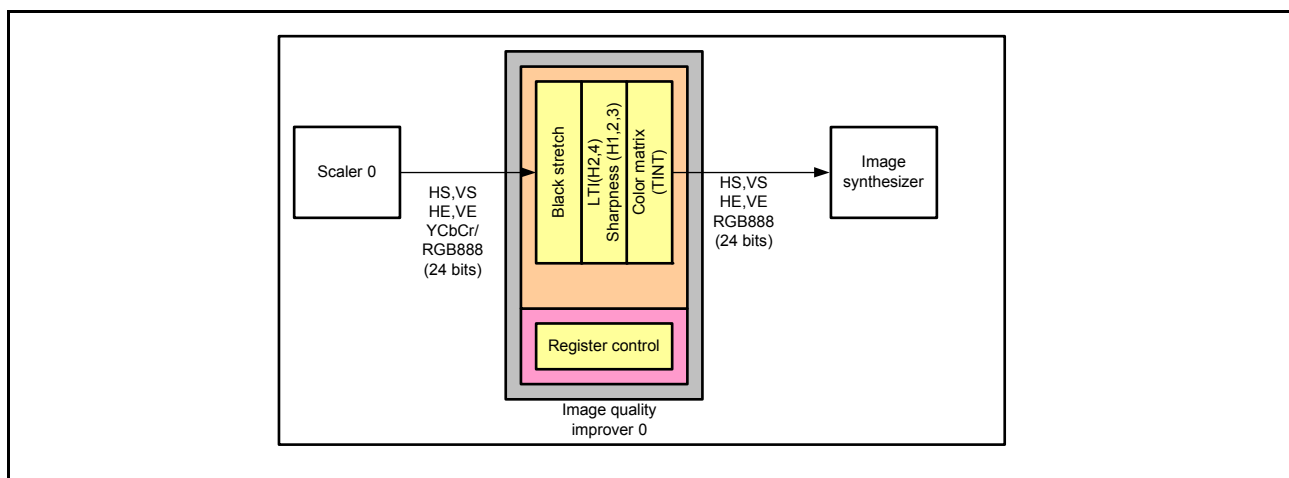

Figure 32.1 Functional Block Diagram of Image Quality Improver

32.1.2 Register Update Control

The control register for image quality improver controls the update timing entirely by vertical synchronous signals.

The vertical synchronous signal launched after the update control register is set to 1 is reflected in various registers, following which the update control register is automatically cleared to 0.

Note that registers for the improver can be identified by the number in the register name like ADJ0_xxxx. In the sections except for Register Description, however, the number is omitted like ADJ_xxxx for convenience sake.

Table 32.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
ADJ_UPDATE	ADJ_VEN	0	Image Quality Improver Register Update 0: Register is not updated. 1: Register is updated by launch of vertical synchronous signal.

32.1.3 Black Stretch

Black stretch refers to the black stretch correction of the Y signal of the input video signal of YCbCr format.

Correction of the Y signal is done by adjusting the time constant, depth (gain), and start point.

Figure 32.2 is a drawing illustrating black stretch correction.

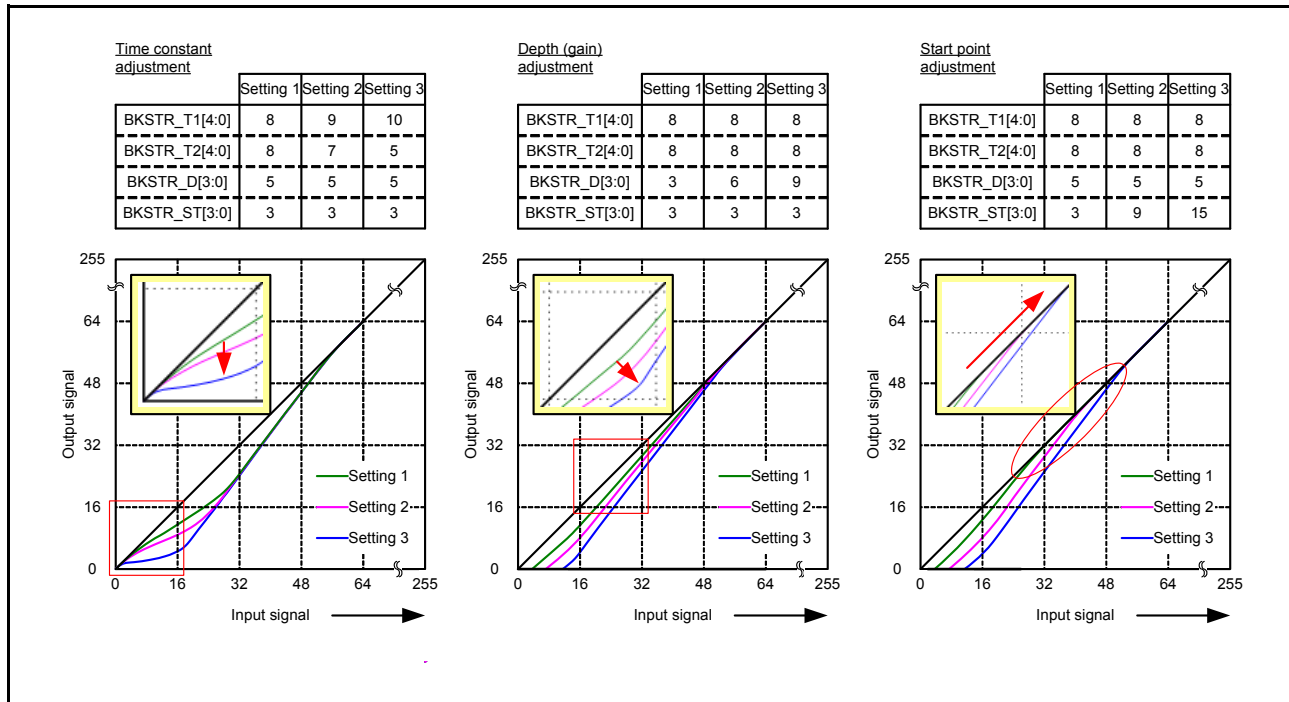

Figure 32.2 Black Stretch Correction (With Sample Settings)

Table 32.2 Black Stretch Control

Register Name	Bit Name	Initial Value	Description
ADJ_BKSTR_SET	BKSTR_ON	0	Black Stretch On/Off Control 0: Black Stretch Off 1: Black Stretch On
ADJ_BKSTR_SET	BKSTR_ST[3:0]	0	Black Stretch Start Point 0 (low) to 15 (high)
ADJ_BKSTR_SET	BKSTR_T1[4:0]	0	Black Stretch Time Constant (T1) 0 (small) to 31 (large)
ADJ_BKSTR_SET	BKSTR_T2[4:0]	0	Black Stretch Time Constant (T2) 0 (small) to 30 (large), 31: Setting prohibited
ADJ_BKSTR_SET	BKSTR_D[3:0]	0	Black Stretch Depth 0 (shallow) to 15 (deep)

32.1.4 Enhancer

The enhancer subjects the scaled Y signal input to transient improvement (LTI) and sharpness processing in the horizontal direction.

(1) Enhancer Area Specification

The operating area of the enhancer is specified with reference to the rising edges of the Hsync signal and Vsync signal. ENH_HS should be set to four or greater clocks, and ENH_VS should be set to two or greater lines. Figure 32.3 shows enhancer area setting.

Figure 32.3 Period when Enhancer is Enabled

Setting ENH_DISP_ON to 1 displays the enhancer-enabled area with frame lines.

Table 32.3 Enhancer Area Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_TIM1	ENH_MD	1	Operating Mode 0: RGB mode 1: YCbCr mode
ADJ_ENH_TIM2	ENH_VS[10:0]	0	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
ADJ_ENH_TIM2	ENH_VW[10:0]	0	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Table 32.3 Enhancer Area Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_TIM3	ENH_HS[10:0]	0	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
ADJ_ENH_TIM3	ENH_HW[10:0]	0	Width of Horizontal Valid Image Area in Enhancer-Enabled Area
ADJ_ENH_TIM1	ENH_DISP_ON	0	Frame Line Display in Enhancer-Enabled Area 0: Off 1: On

(2) LTI (Luminance Transient Improvement)

The enhancer subjects the Y signal input to transient improvement in the horizontal direction.

Transient improvement of the blanking signal is turned off.

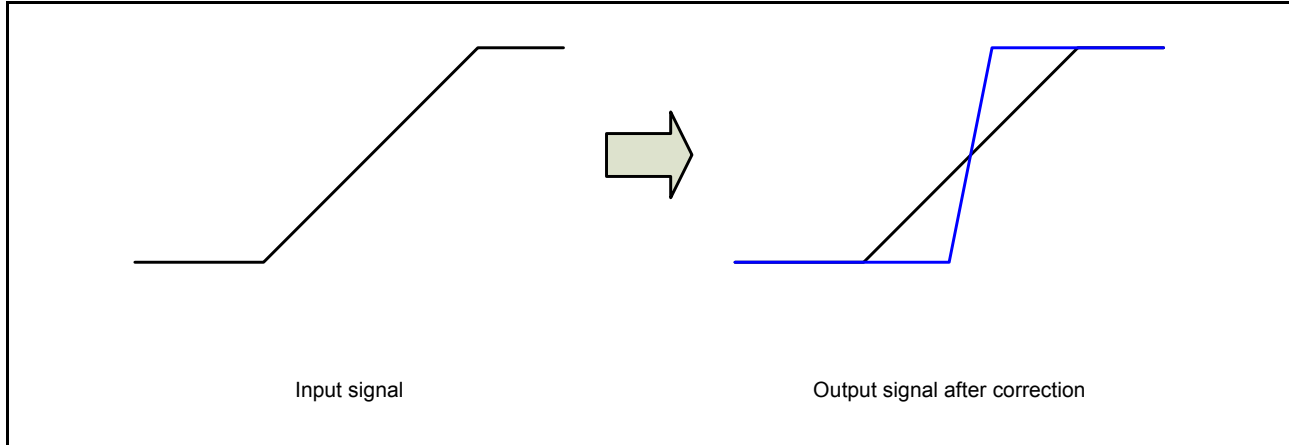

Figure 32.4 LTI Correction

After edge detection of the image, the LTI can be independently controlled in the two horizontal bands.

In LTI, the median filter is inserted after edge detection of the image.

In LTI (H4), the reference pixels of the median filter can be selected.

However, under normal operations, half the tap data (second adjacent pixel) at edge detection is used as reference.

Table 32.4 Reference Pixel Table for LTI

LTI Band	Reference Pixel for Edge Detection	LPF Application	Median Filter Reference Pixels
Horizontal LTI (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)	Adjacent pixel used as reference
Horizontal LTI (H4)	Fourth adjacent pixel used as reference	LPF (1,2,1)	Adjacent pixel or second adjacent pixel used as reference

In LTI, the detection result can be subjected to a coring process.

The core value set in the register is subtracted from the edge detection result, and LTI correction is performed on the coring output after subtraction.

Figure 32.5 LTI Coring

Table 32.5 LTI Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_LTI1	LTI_H_ON	0	LTI On/Off Control 0: LTI off 1: LTI on
ADJ_ENH_LTI1	LTI_H2_INC_ZERO [7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: $ \text{right TAP value} - \text{center TAP value} < \text{LTI1_H2_INC_ZERO}$ or $ \text{left TAP value} - \text{center TAP value} < \text{LTI1_H2_INC_ZERO}$.
ADJ_ENH_LTI1	LTI_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_LTI1	LTI_H2_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI1	LTI_H2_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude smaller than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)
ADJ_ENH_LTI2	LTI_H4_INC_ZERO[7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: $ \text{right TAP value} - \text{center TAP value} < \text{LTI1_H4_INC_ZERO}$ or $ \text{left TAP value} - \text{center TAP value} < \text{LTI1_H4_INC_ZERO}$.
ADJ_ENH_LTI2	LTI_H4_MEDIAN_TAP_SEL	0	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
ADJ_ENH_LTI2	LTI_H4_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI2	LTI_H4_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)

(3) Sharpness Process

The enhancer performs edge enhancement on the Y signal input by adding overshoot and undershoot to the original signal. Edge enhancement of the blanking signal is turned off.

Figure 32.6 Sharpness Correction

After edge detection of the image, the sharpness can be independently controlled in the three horizontal bands.

In horizontal sharpness, a 3-tap low-pass filter (LPF) is inserted before edge detection to prevent folding. The LPF can be turned on or off by register setting.

Table 32.6 Reference Pixel Table for Sharpness

Sharpness Band	Reference Pixel for Edge Detection	LPF Application
Horizontal sharpness (H1)	Adjacent pixel used as reference	LPF not applied
Horizontal sharpness (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)
Horizontal sharpness (H3)	Third adjacent pixel used as reference	LPF (1,2,1)

The edge amplitude of the edge to be enhanced is adjusted according to the value of SHP_CORE.

Edge enhancement is accomplished when the edge detection result of the image is greater than the value of SHP_CORE.

In edge enhancement, a correction value is output by multiplying (edge amplitude value - SHP_CORE) by sharpness gain.

Sharpness is turned off when the edge detection result of the image is smaller than the value of SHP_CORE.

Figure 32.7 Sharpness Characteristics

Table 32.7 Sharpness Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_SHP1	SHP_H_ON	0	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
ADJ_ENH_SHP3	SHP_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_SHP2	SHP_H1_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
ADJ_ENH_SHP2	SHP_H1_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
ADJ_ENH_SHP2	SHP_H1_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP2	SHP_H1_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP1	SHP_H1_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP4	SHP_H2_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
ADJ_ENH_SHP4	SHP_H2_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
ADJ_ENH_SHP4	SHP_H2_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP4	SHP_H2_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP3	SHP_H2_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP6	SHP_H3_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
ADJ_ENH_SHP6	SHP_H3_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
ADJ_ENH_SHP6	SHP_H3_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP6	SHP_H3_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP5	SHP_H3_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

32.1.5 Color Matrix

Color matrix is performed by adjusting the offset of each input signal and nine-axis gain. This allows YCbCr to GBR conversion.

(1) GBR to GBR Conversion

$$YGIN_A = YGIN + ADJ_MTX_YG - 128$$

$$CBBIN_A = CBBIN + ADJ_MTX_B - 128$$

$$CRRIN_A = CRRIN + ADJ_MTX_R - 128$$

$$YGOUT = (ADJ_MTX_GG \times YGIN_A + ADJ_MTX_GB \times CBBIN_A + ADJ_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (ADJ_MTX_BG \times YGIN_A + ADJ_MTX_BB \times CBBIN_A + ADJ_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (ADJ_MTX_RG \times YGIN_A + ADJ_MTX_RB \times CBBIN_A + ADJ_MTX_RR \times CRRIN_A) \div 256$$

(2) YCbCr to GBR Conversion

$$YGIN_A = YGIN + ADJ_MTX_YG - 128$$

$$CBBIN_A = CBBIN - 128$$

$$CRRIN_A = CRRIN - 128$$

$$YGOUT = (ADJ_MTX_GG \times YGIN_A + ADJ_MTX_GB \times CBBIN_A + ADJ_MTX_GR \times CRRIN_A) \div 256$$

$$CBBOUT = (ADJ_MTX_BG \times YGIN_A + ADJ_MTX_BB \times CBBIN_A + ADJ_MTX_BR \times CRRIN_A) \div 256$$

$$CRROUT = (ADJ_MTX_RG \times YGIN_A + ADJ_MTX_RB \times CBBIN_A + ADJ_MTX_RR \times CRRIN_A) \div 256$$

Table 32.8 Matrix Coefficients (Standard Values) of SMPTE 293M

32.2 Register Description

Table 32.10 shows the register configuration.

[Symbols used in Register Description]

Initial value	: Register value after a reset
—	: Undefined value
R/W	: Readable/writable. The written value can be read.
R/WC0	: Read and write. Bit is initialized if 0 is written, and ignored if 1 is written.
R/WC1	: Read and write. Bit is initialized if 1 is written, and ignored if 0 is written.
R	: Read-only. The write value should always be 0.
—/W	: Write-only. Read value is undefined.

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_VS[10:0]	35	R/W	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_VW[10:0]	480	R/W	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.5 Enhancer Timing Adjustment Register 3 (ADJ0_ENH_TIM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_HS[10:0]	145	R/W	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_HW[10:0]	640	R/W	Width of Horizontal Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.6 Enhancer Sharpness Register 1 (ADJ0_ENH_SHP1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H1_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H_ON	0	R/W	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H1_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value \geq SHP_H1_CORE: Sharpness processing on Edge amplitude value $<$ SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.7 Enhancer Sharpness Register 2 (ADJ0_ENH_SHP2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H1_CLIP_O[7:0]								SHP_H1_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H1_GAIN_O[7:0]								SHP_H1_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H1_CLIP_O [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
23 to 16	SHP_H1_CLIP_U [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
15 to 8	SHP_H1_GAIN_O [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
7 to 0	SHP_H1_GAIN_U [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (Edge amplitude value – SHP_H1_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.8 Enhancer Sharpness Register 3 (ADJ0_ENH_SHP3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H2_LPF_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H2_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H2_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value \geq SHP_H2_CORE: Sharpness processing on Edge amplitude value $<$ SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.9 Enhancer Sharpness Register 4 (ADJ0_ENH_SHP4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H2_CLIP_O[7:0]								SHP_H2_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H2_GAIN_O[7:0]								SHP_H2_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H2_CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
23 to 16	SHP_H2_CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
15 to 8	SHP_H2_GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
7 to 0	SHP_H2_GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.10 Enhancer Sharpness Register 5 (ADJ0_ENH_SHP5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H3_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H3_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.11 Enhancer Sharpness Register 6 (ADJ0_ENH_SHP6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H3_CLIP_O[7:0]								SHP_H3_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H3_GAIN_O[7:0]								SHP_H3_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H3_CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
23 to 16	SHP_H3_CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
15 to 8	SHP_H3_GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (Edge amplitude value – SHP_H3_CORE)
7 to 0	SHP_H3_GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (Edge amplitude value – SHP_H3_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.12 Enhancer LTI Register 1 (ADJ0_ENH_LTI1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LTI_H_ON	—	—	—	—	—	—	LTI_H2_LPF_SEL	LTI_H2_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H2_GAIN[7:0]								LTI_H2_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LTI_H_ON	0	R/W	LTI On/Off Control 0: LTI off 1: LTI on
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
23 to 16	LTI_H2_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when $ \text{right TAP value} - \text{center TAP value} < \text{LTI_H2_INC_ZERO}$ or $ \text{left TAP value} - \text{center TAP value} < \text{LTI_H2_INC_ZERO}$
15 to 8	LTI_H2_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H2_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.13 Enhancer LTI Register 2 (ADJ0_ENH_LTI2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	LTI_H4_MEDIAN_TAP_SEL	LTI_H4_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H4_GAIN[7:0]								LTI_H4_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H4_MEDIAN_TAP_SEL	0	R/W	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
23 to 16	LTI_H4_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when right TAP value – center TAP value < LTI_H4_INC_ZERO or left TAP value – center TAP value < LTI_H4_INC_ZERO
15 to 8	LTI_H4_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H4_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.14 Matrix Mode Register in Image Quality Improver (ADJ0_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ0_MTX_MD[1:0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ADJ0_MTX_MD[1:0]	2	R/W	Operating Mode 0: GBR → GBR 1: Setting prohibited 2: YCbCr → GBR 3: Setting prohibited

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.15 Matrix YG Control Register 0 in Image Quality Improver (ADJ0_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ0_MTX_YG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_GG[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ0_MTX_YG[7:0]	128	R/W	Y/G Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_GG[10:0]	256	R/W	Gain Adjustment of Y/G Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.16 Matrix YG Control Register 1 in Image Quality Improver (ADJ0_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ADJ0_MTX_GB[10:0]										
Initial value:	0	0	0	0	0	1	1	1	1	0	1	0	1	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_GR[10:0]										
Initial value:	0	0	0	0	0	1	1	1	0	1	0	0	1	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_GB [10:0]	1960	R/W	Gain Adjustment of Cb/B Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_GR [10:0]	1865	R/W	Gain Adjustment of Cr/R Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.17 Matrix CBB Control Register 0 in Image Quality Improver (ADJ0_MTX_CBB_ADJ0)

31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_RB [10:0]	0	R/W	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RR [10:0]	359	R/W	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.3 Usage Method

32.3.1 Black Stretch Usage Method

The degree of black stretch can be adjusted by setting the depth (BKSTR_D[3:0]) and the start point (BKSTR_ST[3:0]) of the black stretch. The variation in the black stretch time axis can be adjusted by setting the time constant (BKSTR_T1[4:0] and BKSTR_T2[4:0]). By setting the time constant, changes that occur abruptly due to swapping of the scene can be controlled.

Table 32.11 Black Stretch Setting Register

Register Name	Bit Name	Set Value
ADJ_BKSTR_SET	BKSTR_ON	When black stretch is on: 1
ADJ_BKSTR_SET	BKSTR_D[3:0]	Set the depth of black stretch. The depth increases as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_ST[3:0]	Set the start point of black stretch. The stretching area becomes larger as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T1[4:0]	Set the time constant of black stretch in the positive direction. The changes are more delayed as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T2[4:0]	Set the time constant of black stretch in the negative direction. The changes are more delayed as the value becomes larger.

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

32.3.2 LTI Processing of Enhancer

Figure 32.8 shows an example of LTI adjustment.

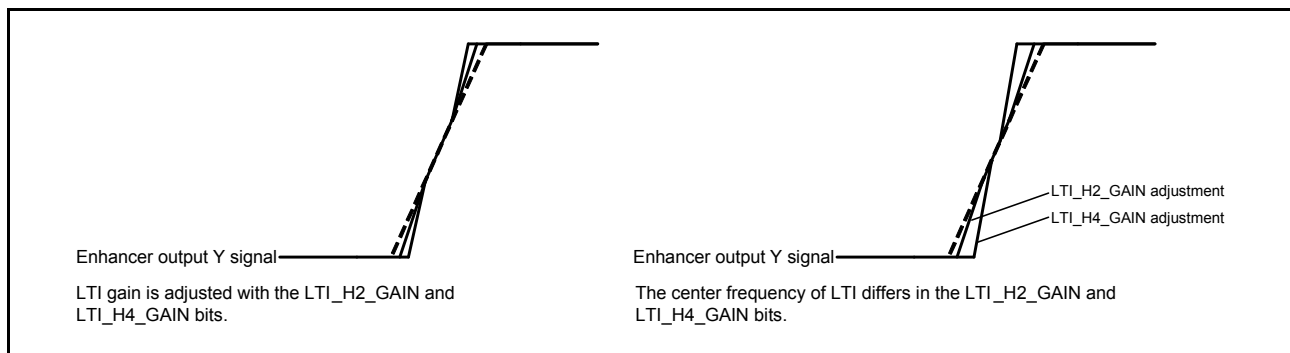

Figure 32.8 Example of LTI Adjustment

32.3.3 Sharpness Processing of Enhancer

Figure 32.9 shows an example of sharpness adjustment.

Figure 32.9 Example of Sharpness Adjustment

32.3.4 Setting Method for Color Matrix Data Conversion

GBR signals are assumed to be input to the circuit subsequent to the image quality improver; therefore, the output from the color matrix circuit should be in the GBR format.

Table 32.12 shows an example of GBR conversion setting.

Table 32.12 Recommended Setting Values for Matrix Conversion

Register Name	Bit Name	GBR to GBR Conversion	YCBCR to GBR Conversion
		Recommended Values	Recommended Values
ADJ_MTX_MODE	ADJ_MTX_MD[1:0]	0	2
ADJ_MTX_YG_ADJ0	ADJ_MTX_YG[7:0]	128	128
ADJ_MTX_CBB_ADJ0	ADJ_MTX_B[7:0]	128	128
ADJ_MTX_CRR_ADJ0	ADJ_MTX_R[7:0]	128	128
ADJ_MTX_YG_ADJ0	ADJ_MTX_GG[10:0]	256	256
ADJ_MTX_YG_ADJ1	ADJ_MTX_GB[10:0]	0	1960
ADJ_MTX_YG_ADJ1	ADJ_MTX_GR[10:0]	0	1865
ADJ_MTX_CBB_ADJ0	ADJ_MTX_BG[10:0]	0	256
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BB[10:0]	256	454
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BR[10:0]	0	0
ADJ_MTX_CRR_ADJ0	ADJ_MTX_RG[10:0]	0	256

ADJ_MTX_CRR_ADJ1	ADJ_MTX_RR[10:0]	256	359

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

33. Video Display Controller 5 (5): Image Synthesizer

33.1 Image Synthesizer

33.1.1 Overview of Functions

The image synthesizer reads graphics data from the frame buffer and displays the synthesized image on the screen.

One video plane + two graphics planes, or three graphics planes can be selected for synthesis.

RGB565, RGB888, α RGB1555, α RGB4444, α RGB8888, RGB α 5551, RGB α 8888, CLUT8, CLUT4, CLUT1, YCbCr422 (for the graphics 0 process), and YCbCr444 (for the graphics 0 process) formats can be used for graphics data, and RGB565, RGB888, YCbCr422, and YCbCr444 formats for video data.

On each of the graphics planes, background color, lower-layer graphics, current graphics, or blended image (for the graphics 2 and 3 processes) of lower-layer graphics and current graphics can be displayed.

It is recommend that the frame buffer is placed in the on-chip large-capacity RAM. Both the on-chip large-capacity RAM and an external SDRAM can be used for the frame buffer, but the bus bandwidth might become short and display might not be possible if an external SDRAM is used for the frame buffer.

The functional block diagram of the image synthesizer is shown below.

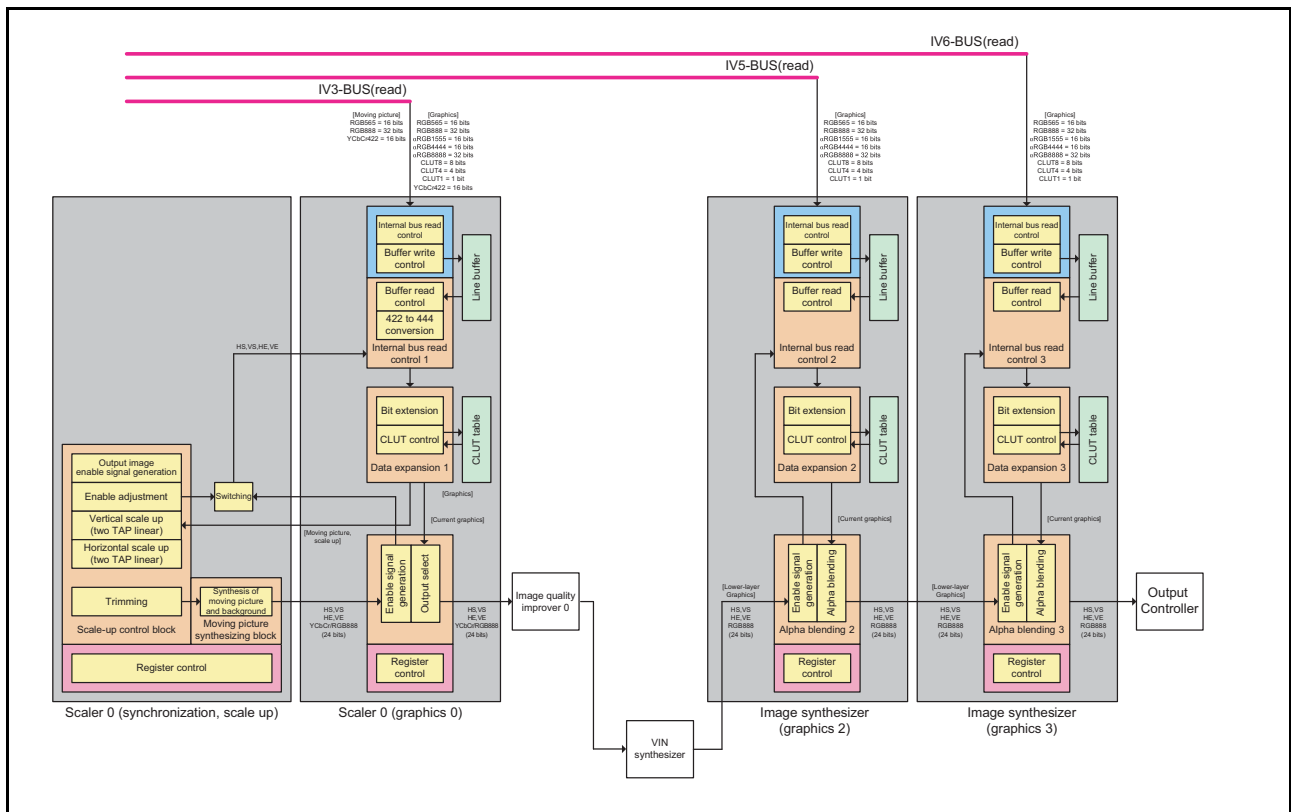

Figure 33.1 Functional Block Diagram of Image Synthesizer

33.1.2 Graphics Data Read Control

Graphics data read can be controlled for the three processes: the graphics 0 process in the scaler 0, and the graphics 2 and 3 processes in the image synthesizer.

The register bits of each process can be identified by the number in the register name like GR0_xxxx, GR2_xxxx, and GR3_xxxx, respectively. In the sections except for Register Descriptions, however, the number is omitted like GR_xxxx for convenience sake.

In the VIN synthesizer, graphics data read is not controlled. In this manual, the name is omitted like GR_xxxx for convenience sake. The synthesizer does not have the read control register (GR_FLM).

(1) Updating Registers

The Vsync signal is used to control the update timing of the registers for graphics display and frame buffer read control, except for some of the registers.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 33.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Register Update* 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

Note: * This bit is not supported for the VIN synthesizer.

(2) Frame Buffer Burst Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video data and graphics data are stored.

Table 33.2 Frame Buffer Burst Transfer Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_BST_MD	0	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

(3) Frame Buffer Control Mode

More than one frame of data is read from the frame buffer.

For graphics data, set the GR_FLM_SEL[1:0] bits to 1, and set the specific display frame number with the GR_FLM_NUM[9:0] bits. For video data, select a mode with the GR_FLM_SEL[1:0] bits depending on the writing process used; the quantity of the frames used for video data is set in the writing process block.

Table 33.3 Frame Buffer Control Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLM_SEL[1:0]	0	Frame Buffer Address Setting Signal Select 0: Control linked to scaling-down process, or frame 0 selected.*1 1: Register GR_FLM_NUM selected. 2: Frame 0 selected. 3: Control linked to pointer buffer, or setting prohibited.*2
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame Number of Frame Buffer Manually set the frame number when GR_FLM_SEL = 1.

Notes: 1. For the graphics 0 process, frame buffer control links to the scaling-down process. For the graphics 2 and 3 processes, frame 0 is selected.
2. For the graphics 0 process, frame buffer control links to the pointer buffer. For the graphics 2 and 3 processes, setting is prohibited.

(4) Frame Buffer Read Control

The following bit enables or disables read access to the frame buffer.

Table 33.4 Frame Buffer Read Control

Register Name	Bit Name	Initial Value	Description
GR_FLM_RD	GR_R_ENB	0	Frame Buffer Read Enable 0: Disables read access to the frame buffer. 1: Enables read access to the frame buffer.

(5) Frame Buffer Size

The following bits set the size of the frame buffer to be read.

The numbers of horizontal pixels and of lines in the vertical direction are set with the GR_HW[10:0] and GR_FLM_LNUM[10:0] bits, respectively.

Table 33.5 Frame Buffer Size

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_HW[10:0]	0	Sets the width of the horizontal valid period. The width is (GR_HW + 1) pixels. Note: Set to 2 or greater.
GR_FLM5	GR_FLM_LNUM[10:0]	0	Sets the number of lines in a frame The number of lines is (GR_FLM_LNUM + 1).

(6) Calculating Addresses in Frame Buffer

The data area in the frame buffer is defined using the addresses specified by GR_BASE[31:0], GR_LN_OFF[14:0], and GR_FLM_OFF[22:0] bits and the display frame number.

The GR_LN_OFF[14:0] and GR_FLM_OFF[22:0] bits should be set in units of 32/128 bytes (the lower 5/7 bits should be fixed to 0).

The GR_BASE[31:0] bits should be set in units of 64 bits to set the display data start position (the lower three bits should be fixed).

Figure 33.2 Data Arrangement in Frame Buffer

Table 33.6 Calculation of Addresses in Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM2	GR_BASE[31:0]	0	<p>Frame Buffer Base Address</p> <p>Sets the start address of the frame buffer where frame data is to be stored.</p> <p>GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data.</p> <p>The lower 3 bits should be set to 000.</p>
GR_FLM3	GR_LN_OFF[14:0]	0	<p>Frame Buffer Line Offset Address</p> <p>Sets the line offset address for calculating the start address of each line.</p> <p>Line 0: GR_BASE</p> <p>Line 1: GR_BASE + GR_LN_OFF × 1</p> <p>:</p> <p>Line n: GR_BASE + GR_LN_OFF × n</p> <p>For 32-byte transfer, the lower 5 bits should be fixed to 0_0000.</p> <p>For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.</p>
GR_FLM4	GR_FLM_OFF[22:0]	0	<p>Frame Buffer Frame Offset Address (lower)</p> <p>Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used.</p> <p>Buffer 0: GR_BASE</p> <p>Buffer 1: GR_BASE + GR_FLM_OFF × 1</p> <p>:</p> <p>Buffer n: GR_BASE + GR_FLM_OFF × n</p> <p>For 32-byte transfer, the lower 5 bits should be fixed to 0_0000.</p> <p>For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.</p>

(7) Setting Frame Buffer Size Smaller than One Frame

Frame buffer size can be set in one-line units.

When the number of lines set with the GR_FLM_LOOP[10:0] bits is smaller than the value of the GR_FLM_LNUM[10:0] bits, data is again read from the start address of the frame buffer after the number of lines set with the (GR_FLM_LOOP[10:0] + 1) bits have been read.

Table 33.7 Setting of Frame Buffer Size Smaller than One Frame

Register Name	Bit Name	Initial Value	Description
GR_FLM5	GR_FLM_LOOP[10:0]	1023	<p>Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address.</p> <p>The number of lines is (GR_FLM_LOOP + 1).</p>

(8) Line Offset Control for Frame Buffer

The following bit sets the line offset address direction of the frame buffer.

Table 33.8 Line Offset Address Direction Control for Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_LN_OFF_DIR	0	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.

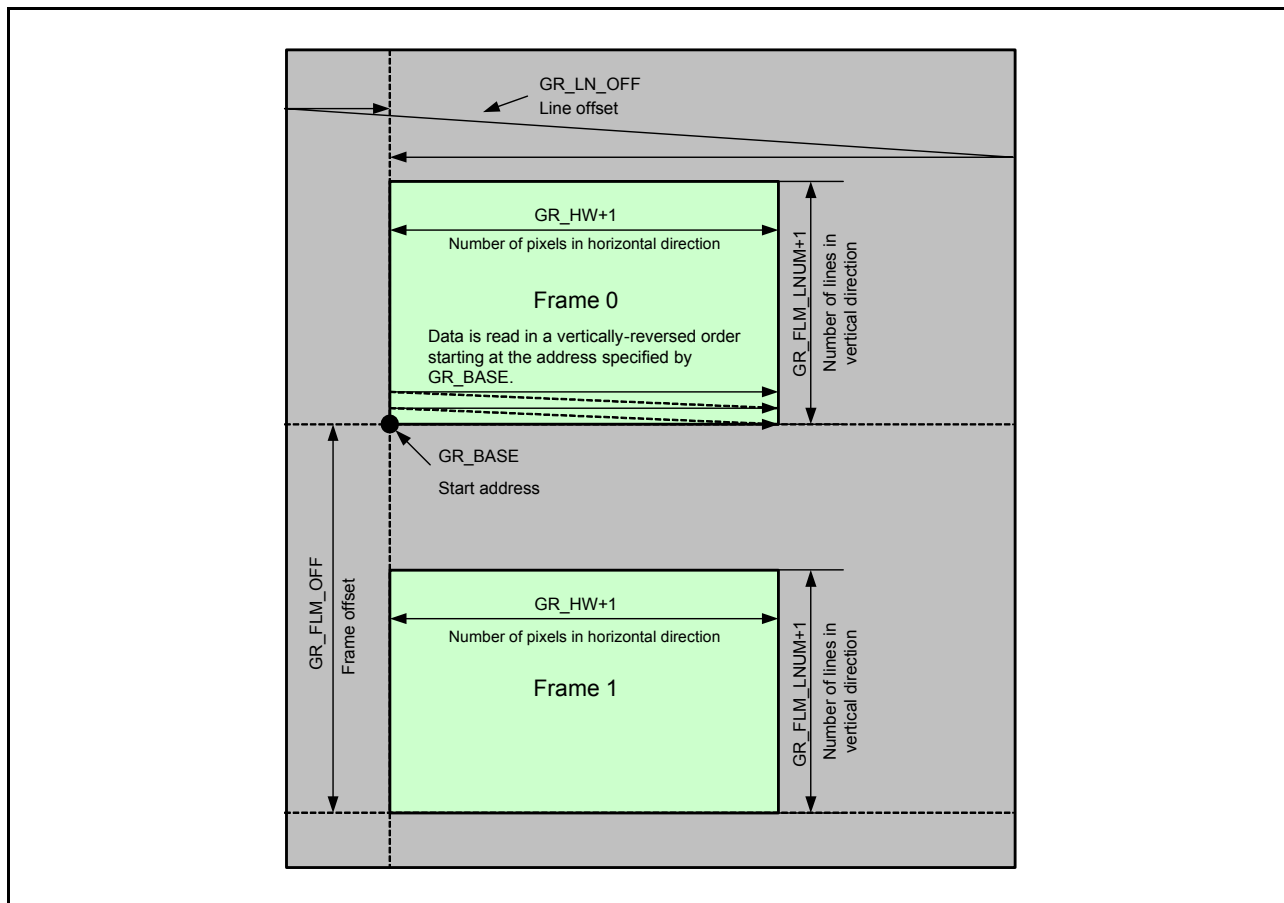

Figure 33.3 Data Arrangement with Line Offset and Decrement Control

(9) Selecting Format of Frame Buffer Read Signal

Signal formats RGB565, RGB888, α RGB1555, α RGB4444, α RGB8888, RGB α 5551, RGB α 8888, CLUT8, CLUT4 and CLUT1 are supported for the graphics 0, 2, and 3 processes. The YCbCr422 and YCbCr444 formats are also supported for the graphics 0 process.

The GR_FORMAT[3:0] bits select a signal format.

Table 33.9 Format Selection for Frame Buffer Read Signal

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_FORMAT[3:0]	0	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: α RGB1555 3: α RGB4444 4: α RGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 or setting prohibited * 9: YCbCr444 or setting prohibited * 10: RGB α 5551 11: RGB α 8888 12 to 15: Setting prohibited

Note: * Setting this value selects YCbCr422 and YCbCr444 for the graphics 0 process, and is prohibited for the graphics 2 and 3 processes.

(10) Endian Control

In the frame buffer, data is handled in 64-bit units, and endian of the data to be read can be controlled by setting the GR_RDSWA[2:0] bits. Bit 0 of these bits indicates whether 8-bit data is swapped. Bit 1 indicates whether 16-bit data is swapped. Bit 2 indicates whether 32-bit data is swapped. In the YCbCr422 format, data can be arranged with the GR_YCC_SWAP[2:0] bits.

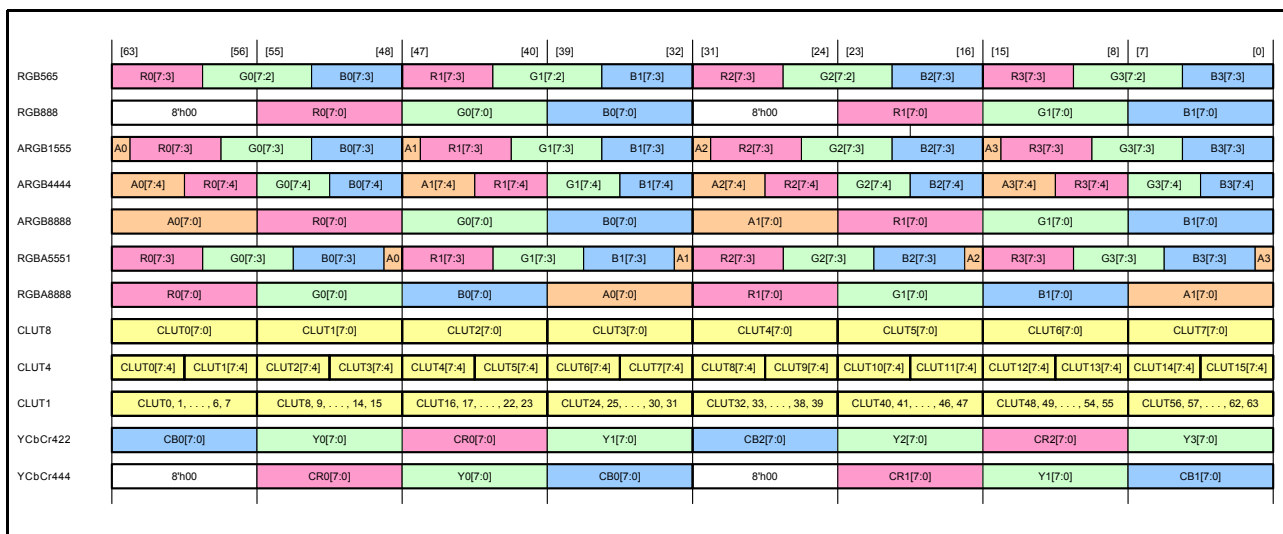

Figure 33.4 Data Arrangement with Endian Control Disabled (GR_RDSWA = 000)

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_RDSWA[2:0]	0	<p>Sets 8-, 16-, and 32-bit swap.</p> <p>These three bits specify the method for swapping the bits of frame buffer read data as follows.</p> <p>Bit 0</p> <p>0: 8 bits are not swapped.</p> <p>1: 8 bits are swapped.</p> <p>Bit 1</p> <p>0: 16 bits are not swapped.</p> <p>1: 16 bits are swapped.</p> <p>Bit 2</p> <p>0: 32 bits are not swapped.</p> <p>1: 32 bits are swapped.</p> <p>When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data.</p> <p>000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap]</p> <p>001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap]</p> <p>010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap]</p> <p>011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap]</p> <p>100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap]</p> <p>101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap]</p> <p>110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap]</p> <p>111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]</p>

Table 33.10 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_YCC_SWAP [2:0]	0	Controls swapping of data read from buffer in the YCbCr422 format. * 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Note: * These bits are supported for the graphics 0 process only.

(11) Display Start Pixel Setting for Read Data

When a horizontal offset is applied to display the image data in the frame buffer, the display start pixel is set with the GR_BASE[31:0] and GR_STA_POS[5:0] bits. Calculation of the values for the GR_BASE[31:0] and GR_STA_POS[5:0] bits depends on the signal format. The display start pixel can be calculated with the formulas in the table below, where H_OFF is a horizontal offset from the display start pixel.

Table 33.11 Calculation of Display Start Position for Various Signal Formats

Signal Format of Video/Graphics	Number of Bits per Pixel	Calculation Formula *1
RGB888 αRGB8888, RGBα8888 YCbCr422*2 YCbCr444*3	32	GR_BASE[31:3] = t (H_OFF ÷ 2) GR_STA_POS[5:0] = mod (H_OFF ÷ 2)
RGB565 αRGB1555, RGBα5551 αRGB4444	16	GR_BASE[31:3] = int (H_OFF ÷ 4) GR_STA_POS[5:0] = mod (H_OFF ÷ 4)
CLUT8	8	GR_BASE[31:3] = int (H_OFF ÷ 8) GR_STA_POS[5:0] = mod (H_OFF ÷ 8)
CLUT4	4	GR_BASE[31:3] = int (H_OFF ÷ 16) GR_STA_POS[5:0] = mod (H_OFF ÷ 16)
CLUT1	1	GR_BASE[31:3] = int (H_OFF ÷ 64) GR_STA_POS[5:0] = mod (H_OFF ÷ 64)

- Notes:
1. The functions int() and mod() output a quotient and a remainder, respectively.
 2. The YCbCr422 format is not supported for the graphics 2 and 3 processes.
In the YCbCr422 format, 32 bits are used for two pixels (Cb, Y0, Cr, and Y1 components). Therefore, the start position is controlled in units of 32 bits.
 3. The YCbCr444 format is not supported for the graphics 2 and 3 processes.

Table 33.12 Setting of Display Start Pixel of Read Data

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_STA_POS[5:0]	0	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR_STA_POS is skipped from the start of the line.
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

(12) YCbCr422 to YCbCr444 Conversion

Data format for the graphics 0 process is converted from YCbCr422 to YCbCr444.

This function is not supported for the graphics 2 and 3 processes.

Table 33.13 YCbCr422 to YCbCr444 Conversion

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_CNV444_MD	0	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. * 0: Hold interpolation 1: Average interpolation

Note: * This bit is not provided for the graphics 2 and 3 processes, for which the YCbCr422 format is not supported.

(13) Bit Extension

When the value of the GR_FORMAT[3:0] bits is 0 to 3, the RGB565, RGB888, α RGB1555, and α RGB4444 formats are converted to the α RGB8888 format. When the value of the GR_FORMAT[3:0] bits is 10, the RGB α 5551 format is converted to the RGB α 8888 format. The RGB α 5551 to RGB α 8888 format conversion is omitted because it differs from the α RGB5551 to α RGB8888 format conversion only in the position of α .

- RGB565 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is fixed to 255.

After conversion, $R[7:0] = R[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#R[4:0] \times 255 \div 31$

After conversion $G[7:0] = G[5:0] \times 259 \div 64$ (round off to an integer), approximation of $\#G[5:0] \times 255 \div 63$

After conversion, $B[7:0] = B[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#B[4:0] \times 255 \div 31$

- RGB888 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is fixed to 255.

- α RGB1555 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0]$ is GR_A1 when α input is 1, and GR_A0 when 0.

After conversion, $R[7:0] = R[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#R[4:0] \times 255 \div 31$

After conversion, $G[7:0] = G[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#G[4:0] \times 255 \div 31$

After conversion, $B[7:0] = B[4:0] \times 263 \div 32$ (round off to an integer), approximation of $\#B[4:0] \times 255 \div 31$

- α RGB4444 to α RGB8888 Format Conversion

After conversion, $\alpha[7:0] = \alpha[3:0] \times 17$

After conversion, $R[7:0] = R[3:0] \times 17$

After conversion, $G[7:0] = G[3:0] \times 17$

After conversion, $B[7:0] = B[3:0] \times 17$

(14) Buffer Underflow Processing

When data read from the frame buffer cannot be completed due to bus-traffic related problems, an underflow interrupt signal is output.

33.1.3 Setting Graphics Display Area

The graphics display area is set with the GR_GRC_HS[10:0], GR_GRC_HW[10:0], GR_GRC_VS[10:0], and GR_GRC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals.

Figure 33.7 shows the graphics display area.

Figure 33.7 Graphics Display Area

The frame line of the graphics area can be displayed by setting the GR_GRC_DISP_ON bit to 1.

Table 33.14 Graphics Image Area Setting

Register Name	Bit Name	Initial Value	Description
GR_AB3	GR_GRC_HS[10:0]	0	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR_GRC_HS + GR_GRC_HW should be smaller than or equal to 2015 clocks.
GR_AB3	GR_GRC_HW[10:0]	0	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_HW to 2 and GR_GRC_HW to 1 (1-pixel) or 2 (2-pixel).
GR_AB2	GR_GRC_VS[10:0]	0	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR_GRC_VS + GR_GRC_VW should be smaller than or equal to 2039 lines.
GR_AB2	GR_GRC_VW[10:0]	0	Sets the vertical width of the graphics image area.
GR_AB1	GR_GRC_DISP_ON	0	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on

33.1.4 Interrupt Generation at Specified Line

An interrupt signal can be generated at the line specified with the GR_LINE[10:0] bits.

Table 33.15 Interrupt Generation at Specified Line

Register Name	Bit Name	Initial Value	Description
GR_CLUT_INT	GR_LINE[10:0]	0	Line Interrupt Set * When the number of lines matches the value of the GR_LINE bits, an interrupt signal is output. This function is supported for the graphics 3 process only. This function supported for the graphics 3 process is enabled even when the graphics 3 process is not used.

Note: * This function is supported for the graphics 3 process only; these bits are not supported for the graphics 0 and 2 processes.

33.1.5 Formats of Frame Buffer Read Signals and Corresponding Alpha Blending Types

Setting the GR_FORMAT[3:0] bits selects the format of the signal read from the frame buffer.

Table 33.16 shows the signal formats and the corresponding alpha blending types. The priority of the alpha value is: alpha blending in rectangular area > chroma-key processing > alpha blending in pixel units.

Table 33.16 Formats of Frame Buffer Read Signal and Corresponding Alpha Blending Types

GR_FORMAT[3:0]	Signal Format	Alpha Blending in Rectangular Area	RGB-Index Chroma-Key Processing	CLUT-Index Chroma-Key Processing	Alpha Blending in Pixel Units
0	RGB565	Supported	Supported *1	Not supported	Not supported *2
1	RGB888	Supported	Supported	Not supported	Not supported *2
2	α RGB1555	Supported	Supported *1*3	Not supported	Supported *3
3	α RGB4444	Supported	Supported *1	Not supported	Supported
4	α RGB8888	Supported	Supported	Not supported	Supported
5	CLUT8	Supported	Not supported	Supported	Supported
6	CLUT4	Supported	Not supported	Supported	Supported
7	CLUT1	Supported *4	Not supported	Supported *4	Supported *4
8	YCbCr422	Not supported *5	Not supported *5	Not supported *5	Not supported *5
9	YCbCr444	Not supported *5	Not supported *5	Not supported *5	Not supported *5
10	RGB α 5551	Supported	Supported *1*3	Not supported	Supported *3
11	RGB α 8888	Supported	Supported	Not supported	Supported

Notes: 1. When each color component of the RGB signal read from the frame buffer is not 8 bits, it is converted to 8 bits by calculation in RGB-index chroma-key processing. (See section 33.1.2 (13) Bit Extension.)
 2. Since α value is 255, the current graphics is always displayed.
 3. α value for data read from the frame buffer is specified with one bit. This one-bit signal selects one of the two registers, each of which holds an 8-bit α value.
 4. CLUT value for the frame buffer signal is specified with one bit. This one-bit signal selects one of the two registers, each of which holds the α , G, B, and R values (8 bits for each value). The CLUT table is not referenced.
 5. YCbCr422 and YCbCr444 are supported for the graphics 0 process, but any type of blending and chroma-key processing cannot be used.

33.1.6 Display Selection

The GR_DISP_SEL[1:0] bits select the graphics to be displayed from the background color, the lower-layer graphics, the current graphics, and the blended image of the lower-layer graphics and the current graphics. For blending, alpha blending in a rectangular area, multiplication with current alpha at alpha blending in a rectangular area, RGB-index chroma-key processing, CLUT-index chroma-key processing, alpha blending in one-pixel units, or premultiplication at alpha blending in one-pixel units can be selected.

This function is not supported for the VIN synthesizer.

Table 33.17 shows the settings for various display types.

Table 33.17 Settings for Various Display Types

GR_DISP_SEL [1:0]	GR_ARC_ON	GR_CK_ON	GR_ARC_MUL	GR_ACALC_MD	Processing for Graphics Area	Processing for the Area outside the Graphics Area
0	—	—	—	—	Background color	Background color
1	—	—	—	—	Lower-layer graphics	Lower-layer graphics
2	—	—	—	—	Current graphics	Background color
3	1	—	0	0	Alpha blending in a rectangular area*1	Lower-layer graphics
3	1	—	0	1	Setting prohibited	
3	1	—	1	0	Multiplication with current alpha at alpha blending in a rectangular area*2	Lower-layer graphics
3	1	—	1	1	Multiplication with current alpha at alpha blending in a rectangular area with alpha premultiplied*2	Lower-layer graphics
3	0	1	—	—	RGB-index or CLUT-index chroma-key processing	Lower-layer graphics
3	0	0	—	0	Alpha blending in one-pixel units*2	Lower-layer graphics
3	0	0	—	1	Premultiplication at alpha blending in one-pixel units*2	Lower-layer graphics

- Notes:
1. The alpha blending in a rectangular area is not supported for the graphics 0 process in the scaler.
 2. The multiplication with current alpha at alpha blending in a rectangular area and alpha blending function in one-pixel units are supported for the graphics 2 and 3 processes only.

Figure 33.8 Graphic Display Types

Figure 33.9 shows the graphics planes displayed when the GR_DISP_SEL bits are set to 3.

For correspondence between the lower-layer graphics and the current graphics, see Figure 33.1.

Figure 33.9 Graphics Planes with GR_DISP_SEL Set to 3

Table 33.18 Alpha Blending Setting

Register Name	Bit Name	Initial Value	Description
GR_AB1	GR_DISP_SEL [1:0]	0	Selects the graphics display mode. 0:Background color display 1:Lower-layer graphics display 2:Current graphics display 3:Blended display of lower-layer graphics and current graphics*1
GR_AB1	GR_ARC_ON	0	Turns on/off alpha blending in a rectangular area.*2 0: Off 1: On
GR_AB1	GR_ARC_MUL	0	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area *3 0: Off 1: On
GR_AB1	GR_ACALC_MD	0	Turns on/off premultiplication processing at alpha blending in one-pixel units *3 0: Off 1: On
GR_AB7	GR_CK_ON	0	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

- Notes:
1. The graphics 0 process supports the chroma-key processing only. When performing chroma-key processing, set the α value for converting the pixels to be subjected to chroma-key processing, and the α value of the pixels not to be subjected to the chroma-key processing to 255 to display the current graphics only.
 2. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.
 3. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.

33.1.7 Background Color Display Processing

The color set with the GR_BASE_G[7:0], GR_BASE_B[7:0], and GR_BASE_R[7:0] bits is displayed.

G output = GR_BASE_G

B output = GR_BASE_B

R output = GR_BASE_R

Table 33.19 Background Color Setting

Register Name	Bit Name	Initial Value	Description
GR_BASE	GR_BASE_G[7:0]	0	Background color G signal G: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_B[7:0]	0	Background color B signal B: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_R[7:0]	0	Background color R signal R: 8 bits; unsigned (0 to 255 [LSB])

33.1.8 Lower-Layer Graphics Display Processing

The lower-layer graphics are displayed as follows:

G output = G input of lower-layer graphics

B output = B input of lower-layer graphics

R output = R input of lower-layer graphics

33.1.9 Current Graphics Display Processing

The current graphics are displayed as follows:

G output = G input of current graphics

B output = B input of current graphics

R output = R input of current graphics

33.1.10 Display with Alpha Blending in a Rectangular Area

The rectangular area subjected to alpha blending is set with the GR_ARC_HS[10:0], GR_ARC_HW[10:0], GR_ARC_VS[10:0], and GR_ARC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals. This function is not supported for the graphics 0 process.

Figure 33.10 shows the rectangular area setting for alpha blending.

Figure 33.10 Rectangular Area Setting for Alpha Blending

The frame line of graphics area can be displayed by setting the GR_ARC_DISP_ON bit to 1.

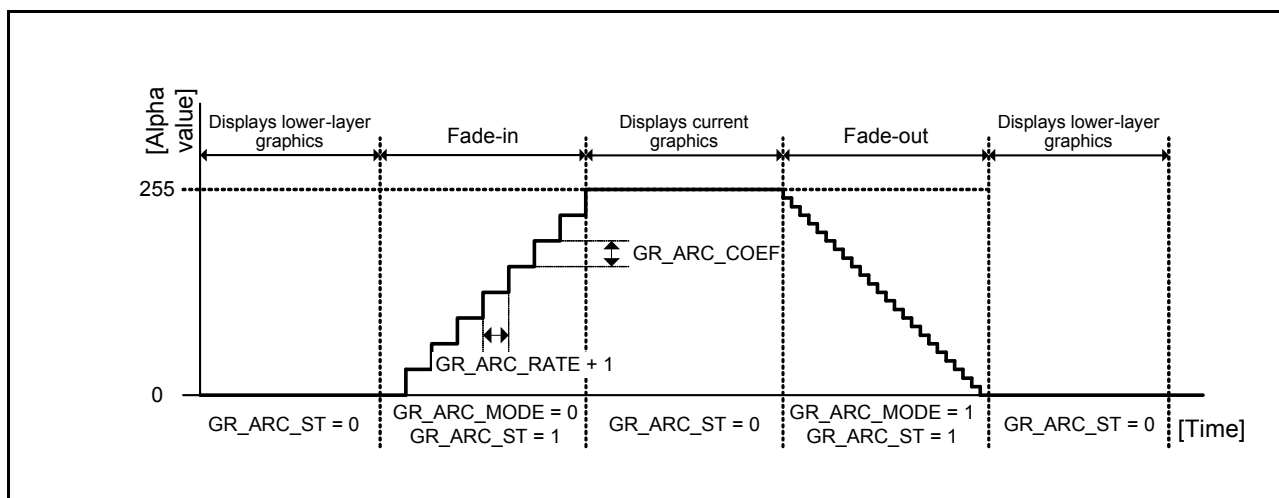

Table 33.20 Setting of Rectangular Area for Alpha Blending

Register Name	Bit Name	Initial Value	Description
GR_AB5	GR_ARC_HS[10:0]	0	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
GR_AB5	GR_ARC_HW[10:0]	0	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VS[10:0]	0	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VW[10:0]	0	Sets the vertical width of the valid image area for alpha blending in a rectangular area.
GR_AB1	GR_ARC_DISP_ON	0	Turns on/off frame-line display of the valid image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on

In alpha blending in a rectangular area, the current graphics are faded in or out by setting the fade-in or fade-out coefficients with the GR_ARC_DEF[7:0], GR_ARC_MODE, GR_ARC_COEF[7:0], and GR_ARC_RATE[7:0] bits.

First, the value of the GR_ARC_DEF[7:0] bits is assigned to the α value.

Then, each time the Vsync signal rises for the number of times set with the GR_ARC_RATE[7:0] bits + 1, the value of the GR_ARC_COEF[7:0] bit is added to or subtracted from the α value.

**Figure 33.11 Fade In and Fade Out****Table 33.21 Setting for Alpha Blending in a Rectangular Area**

Register Name	Bit Name	Initial Value	Description
GR_AB7	GR_ARC_DEF[7:0]	0	Sets the initial alpha value for alpha blending in a rectangular area.
GR_AB6	GR_ARC_MODE	0	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
GR_AB6	GR_ARC_COEF[7:0]	0	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
GR_AB6	GR_ARC_RATE[7:0]	0	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.
GR_MON	GR_ARC_ST	—	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

The values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.11 RGB-Index Chroma-Key Processing

The pixels that satisfy all the expressions below are subjected to RGB-index chroma-key processing.

G input of the current graphics = GR_CK_KG

B input of the current graphics = GR_CK_KB

R input of the current graphics = GR_CK_KR

In RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 33.22 Setting for RGB-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_KG[7:0]	0	G Signal for RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KB[7:0]	0	B Signal for RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KR[7:0]	0	R Signal for RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_A[7:0]	0	Replaced Alpha Signal after RGB-Index Chroma-Key Processing* α : 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_G[7:0]	0	Replaced G Signal after RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_B[7:0]	0	Replaced B Signal after RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_R[7:0]	0	Replaced R Signal after RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

33.1.12 CLUT-Index Chroma-Key Processing

The pixels that satisfy the expression below are subjected to CLUT-index chroma-key processing.

$$\text{CLUT input of the current graphics} = \text{GR_CK_KCLUT}$$

In CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

$$\alpha \text{ value} = \text{GR_CK_A}$$

$$\text{G value} = \text{GR_CK_G}$$

$$\text{B value} = \text{GR_CK_B}$$

$$\text{R value} = \text{GR_CK_R}$$

For the pixels that are not subjected to CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

$$\alpha \text{ value} = \alpha \text{ input of the current graphics}$$

$$\text{G value} = \text{G input of the current graphics}$$

$$\text{B value} = \text{B input of the current graphics}$$

$$\text{R value} = \text{R input of the current graphics}$$

Table 33.23 Setting for CLUT-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_ KCLUT[7:0]	0	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: 8 bits; unsigned (0 to 255 [LSB])
GR_AB10	GR_A0[7:0]	0	CLUT1 α 0 Signal* Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555 format and $\alpha = 0$.
GR_AB10	GR_G0[7:0]	0	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_B0[7:0]	0	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_R0[7:0]	0	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.
GR_AB11	GR_A1[7:0]	0	CLUT1 α 1 Signal* Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 format and $\alpha = 1$.
GR_AB11	GR_G1[7:0]	0	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_B1[7:0]	0	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_R1[7:0]	0	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

33.1.13 Display with Alpha Blending in One-Pixel Units

In the alpha blending in one-pixel units, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the graphics 0 process and the VIN synthesizer.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.14 Alpha Blending Calculation

Alpha blending of two input signals is performed using the α value as described below.

[GR_ACALC_MD = 0]

$$\text{G output} = (\text{G value} \times \alpha \text{ value} + \text{G input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 255$$

$$\text{B output} = (\text{B value} \times \alpha \text{ value} + \text{B input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 255$$

$$\text{R output} = (\text{R value} \times \alpha \text{ value} + \text{R input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 255$$

[GR_ACALC_MD = 1 (premultiplication)]

$$\text{G output} = (\text{G value} + \text{G input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 255$$

$$\text{B output} = (\text{B value} + \text{B input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 255$$

$$\text{R output} = (\text{R value} + \text{R input of the lower-layer graphics} \times (255 - \alpha \text{ value})) \div 255$$

33.1.15 CLUT Table

When the signal format is CLUT8 or CLUT4, the format is converted to α RGB8888 based on the CLUT table. When the format is CLUT1, it is converted to α RGB8888 based on the register value.

Figure 33.12 shows data arrangement in the CLUT table.

Figure 33.12 Data Arrangement in CLUT Table

The CLUT tables are arranged in the following addresses:

- Graphics 0 CLUT table: H'FCFF6000 to H'FCFF63FF
(For CLUT4, addresses H'FCFF6000 to H'FCFF603F are valid.)
- Graphics 2 CLUT table: H'FCFF6800 to H'FCFF6BFF
(For CLUT4, addresses H'FCFF6800 to H'FCFF683F are valid.)
- Graphics 3 CLUT table: H'FCFF6C00 to H'FCFF6FFF
(For CLUT4, addresses H'FCFF6C00 to H'FCFF6C3F are valid.)

Two CLUT tables (CLUT table 0, CLUT table 1) on the different planes are allocated to the same address and one of the tables is selected with the GR_CLT_SEL bit. This allows rewriting one CLUT table when this module refers to the other CLUT table.

Table 33.24 CLUT Table Selection

Register Name	Bit Name	Initial Value	Description
GR_CLUT	GR_CLT_SEL	0	<p>CLUT Table Select Signal</p> <p>0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU.</p> <p>1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.</p>

33.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area

In multiplication processing with current alpha at alpha blending in a rectangular area, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

[GR_ACALC_MD = 0]

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

[GR_ACALC_MD = 1 (premultiplication)]

α value = Fade-in/out coefficient x α input of current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.17 Selection of Lower-Layer Graphics in VIN Synthesizer

Graphics 0 is allocated to the lower-layer graphics in the VIN synthesizer.

Table 33.25 Selection of Lower-Layer Plane in Scaler

Register Name	Bit Name	Initial Value	Description
GR_VIN_AB1	GR_VIN_SCL_UND_SEL	0	<p>Specifies lower-layer plane in the scaler.</p> <p>0: Selects graphics 0 as lower-layer graphics.</p> <p>1: Setting prohibited</p>

33.2 Register Descriptions

Table 33.26 to Table 33.29 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 33.26 shows the register configuration for the graphics 2 process.

Table 33.27 shows the register configuration for the graphics 3 process.

Table 33.28 shows the CLUT table configuration.

Table 33.29 shows the register configuration for the VIN synthesizer.

The register configuration for the graphics 0 process is described in section 31, Video Display Controller 5 (3): Scaler.

Table 33.26 Register Configuration of the Image Synthesizer (Graphics 2 Process)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Graphics 2 register update control register	GR2_UPDATE	R/WC1	H'0000 0000	H'FCFF 7700	32
Frame buffer read control register (Graphics 2)	GR2_FLM_RD	R/W	H'0000 0000	H'FCFF 7704	32
Frame buffer control register 1 (Graphics 2)	GR2_FLM1	R/W	H'0000 0000	H'FCFF 7708	32
Frame buffer control register 2 (Graphics 2)	GR2_FLM2	R/W	H'0000 0000	H'FCFF 770C	32
Frame buffer control register 3 (Graphics 2)	GR2_FLM3	R/W	H'0000 0000	H'FCFF 7710	32
Frame buffer control register 4 (Graphics 2)	GR2_FLM4	R/W	H'0000 0000	H'FCFF 7714	32
Frame buffer control register 5 (Graphics 2)	GR2_FLM5	R/W	H'0000 03FF	H'FCFF 7718	32
Frame buffer control register 6 (Graphics 2)	GR2_FLM6	R/W	H'0000 0000	H'FCFF 771C	32
Alpha blending control register 1 (Graphics 2)	GR2_AB1	R/W	H'0000 0000	H'FCFF 7720	32

33.2.1 Graphics 2 Register Update Control Register (GR2_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR2_UPDATE	—	—	—	GR2_P_VEN	—	—	—	GR2_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.2 Frame Buffer Read Control Register (Graphics 2) (GR2_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.3 Frame Buffer Control Register 1 (Graphics 2) (GR2_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR2_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR2_FLM_SEL [1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR2_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR2_LN_OFF_DIR and GR2_FLM_SEL are updated when GR2_IBUS_VEN in GR2_UPDATE is 1.
GR2_BST_MD is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.4 Frame Buffer Control Register 2 (Graphics 2) (GR2_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR2_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.5 Frame Buffer Control Register 3 (Graphics 2) (GR2_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR2_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR2_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR2_BASE Line 1: GR2_BASE + GR2_LN_OFF × 1 : Line n: GR2_BASE + GR2_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR2_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR2_FLM_SEL = 1.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.6 Frame Buffer Control Register 4 (Graphics 2) (GR2_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR2_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR2_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR2_BASE Buffer 1: GR2_BASE + GR2_FLM_OFF × 1 : Buffer n: GR2_BASE + GR2_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.7 Frame Buffer Control Register 5 (Graphics 2) (GR2_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR2_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR2_FLM_LOOP + 1).

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.8 Frame Buffer Control Register 6 (Graphics 2) (GR2_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_FORMAT[3:0]				—	GR2_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR2_RDSWA[2:0]		—	—	—	—	GR2_STA_POS[5:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR2_FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR2_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR2_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR2_RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	GR2_STA_POS [5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR2_STA_POS is skipped from the start of the line.

Note: GR2_STA_POS is updated when GR2_P_VEN in GR2_UPDATE is 1. GR2_RDSWA is updated when GR2_UPDATE in GR2_UPDATE is 1. GR2_FORMAT and GR2_HW are updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.9 Alpha Blending Control Register 1 (Graphics 2) (GR2_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_ARC_MUL	GR2_ACALC_MD	—	GR2_ARC_ON	—	—	—	GR2_ARC_DISP_ON	—	—	—	GR2_GRC_DISP_ON	—	—	GR2_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR2_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR2_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR2_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	GR2_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.10 Alpha Blending Control Register 2 (Graphics 2) (GR2_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR2_GRC_VS + GR2_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.11 Alpha Blending Control Register 3 (Graphics 2) (GR2_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR2_GRC_HS + GR2_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR2_HW to 2 and GR2_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.12 Alpha Blending Control Register 4 (Graphics 2) (GR2_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.13 Alpha Blending Control Register 5 (Graphics 2) (GR2_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.14 Alpha Blending Control Register 6 (Graphics 2) (GR2_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	—	—	—	—	—	—	—	GR2_ARC_MODE	GR2_ARC_COEF[7:0]							—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
	—	—	—	—	—	—	—	—	GR2_ARC_RATE[7:0]							—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR2_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR2_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR2_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This bit is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.15 Alpha Blending Control Register 7 (Graphics 2) (GR2_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.16 Alpha Blending Control Register 8 (Graphics 2) (GR2_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_KCLUT[7:0]								GR2_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_KB[7:0]								GR2_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.17 Alpha Blending Control Register 9 (Graphics 2) (GR2_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_A[7:0]								GR2_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_B[7:0]								GR2_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.18 Alpha Blending Control Register 10 (Graphics 2) (GR2_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A0[7:0]								GR2_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B0[7:0]								GR2_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A0 [7:0]	0	R/W	CLUT1 α 0 Signal Replaced with α signal when in the CLUT1 format and CLUT1= 0. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 0.
23 to 16	GR2_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR2_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR2_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.19 Alpha Blending Control Register 11 (Graphics 2) (GR2_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A1[7:0]								GR2_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B1[7:0]								GR2_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A1 [7:0]	0	R/W	CLUT1 α 1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 1.
23 to 16	GR2_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR2_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR2_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.20 Background Color Control Register (Graphics 2) (GR2_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE_B[7:0]								GR2_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.21 CLUT Table Control Register (Graphics 2) (GR2_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to α RGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to α RGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.22 Status Monitor Register (Graphics 2) (GR2_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

33.2.23 Graphics 3 Register Update Control Register (GR3_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR3_UPDATE	—	—	—	GR3_P_VEN	—	—	—	GR3_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.24 Frame Buffer Read Control Register (Graphics 3) (GR3_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.25 Frame Buffer Control Register 1 (Graphics 3) (GR3_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR3_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR3_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR3_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR3_LN_OFF_DIR and GR3_FLM_SEL are updated when GR3_IBUS_VEN in GR3_UPDATE is 1.
GR3_BST_MD is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.26 Frame Buffer Control Register 2 (Graphics 3) (GR3_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR3_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.27 Frame Buffer Control Register 3 (Graphics 3) (GR3_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR3_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR3_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR3_BASE Line 1: GR3_BASE + GR3_LN_OFF × 1 : Line n: GR3_BASE + GR3_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR3_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR3_FLM_SEL = 1.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.28 Frame Buffer Control Register 4 (Graphics 3) (GR3_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR3_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR3_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR3_BASE Buffer 1: GR3_BASE + GR3_FLM_OFF × 1 : Buffer n: GR3_BASE + GR3_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.29 Frame Buffer Control Register 5 (Graphics 3) (GR3_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR3_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR3_FLM_LOOP + 1).

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.30 Frame Buffer Control Register 6 (Graphics 3) (GR3_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_FORMAT[3:0]				—	GR3_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR3_RDSWA[2:0]		—	—	—	—	GR3_STA_POS[5:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR3_FORMAT[3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: α RGB1555 3: α RGB4444 4: α RGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGB α 5551 11: RGB α 8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR3_HW[10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR3_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR3_RDSWA[2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	GR3_STA_POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR3_STA_POS is skipped from the start of the line.

Note: GR3_STA_POS is updated when GR3_P_VEN in GR3_UPDATE is 1. GR3_RDSWA is updated when GR3_UPDATE in GR3_UPDATE is 1. GR3_FORMAT and GR3_HW are updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.31 Alpha Blending Control Register 1 (Graphics 3) (GR3_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR3_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR3_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR3_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.32 Alpha Blending Control Register 2 (Graphics 3) (GR3_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR3_GRC_VS + GR3_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.33 Alpha Blending Control Register 3 (Graphics 3) (GR3_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR3_GRC_HS + GR3_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR3_HW to 2 and GR3_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: All the bits assigned to this address are updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.34 Alpha Blending Control Register 4 (Graphics 3) (GR3_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.35 Alpha Blending Control Register 5 (Graphics 3) (GR3_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.36 Alpha Blending Control Register 6 (Graphics 3) (GR3_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR3_ARC_MODE	GR3_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR3_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR3_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR3_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR3_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.37 Alpha Blending Control Register 7 (Graphics 3) (GR3_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.38 Alpha Blending Control Register 8 (Graphics 3) (GR3_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_KCLUT[7:0]								GR3_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_KB[7:0]								GR3_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.39 Alpha Blending Control Register 9 (Graphics 3) (GR3_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_A[7:0]								GR3_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_B[7:0]								GR3_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α : Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.40 Alpha Blending Control Register 10 (Graphics 3) (GR3_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A0[7:0]								GR3_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B0[7:0]								GR3_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A0 [7:0]	0	R/W	CLUT1 α 0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 0.
23 to 16	GR3_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR3_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR3_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.41 Alpha Blending Control Register 11 (Graphics 3) (GR3_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A1[7:0]								GR3_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B1[7:0]								GR3_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A1 [7:0]	0	R/W	CLUT1 α 1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the α RGB1555 or RGB α 5551 format and α = 1.
23 to 16	GR3_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR3_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR3_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.42 Background Color Control Register (Graphics 3) (GR3_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE_B[7:0]								GR3_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.43 CLUT Table and Interrupt Control Register (Graphics 3) (GR3_CLUT_INT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to α RGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to α RGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	GR3_LINE [10:0]	0	R/W	Line Interrupt Set When number of lines matches the value of the GR3_LINE bits, an interrupt signal is output. This function is enabled even when the graphics 3 process is not used.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.44 Status Monitor Register (Graphics 3) (GR3_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_LIN_STAT[10:0]	0	R	Line Position of Image being Currently Read
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

33.2.45 VIN Synthesizer Register Update Control Register (GR_VIN_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	GR_VIN_SCL_UND_SEL	GR_VIN_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	GR_VIN_SCL_UND_SEL	0	R/W	Selection of Lower-Layer Plane in Scaler 0: Selects graphics 0 as lower-layer graphics. 1: Setting prohibited
1, 0	GR_VIN_DISP_SEL [1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (fixed to black) 1: Lower-layer graphics display 2: Setting prohibited 3: Setting prohibited

Notes: GR_VIN_SCL_UND_SEL is updated when GR_VIN_UPDATE in GR_VIN_UPDATE is 1. The other bits of this register are updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

33.3 Usage Method

33.3.1 Mute Image

The initial values of the GR0_DISP_SEL[1:0], GR2_DISP_SEL[1:0], GR3_DISP_SEL[1:0], and GR_VIN_DISP_SEL[1:0] bits are all 0. Accordingly, in the initial setting, a background color is displayed both inside and outside the graphics area for the graphics 0, 2, and 3 processes and the VIN synthesizer. Since the default background color is black, the black mute image is displayed in the initial state. Note that the background color for the VIN synthesizer is fixed to black.

33.3.2 Alpha Blending in Rectangular Area

The alpha coefficient and the frame rate can be changed during fade in and fade out by modifying the GR_ARC_MODE, GR_ARC_COEF[7:0] and GR_ARC_RATE[7:0] bits, respectively.

34. Video Display Controller 5 (7): Output Controller

34.1 Output Controller

34.1.1 Overview of Functions

The output controller subjects RGB signals output from the image synthesizer to brightness adjustment, contrast adjustment, gamma correction of individual RGB, dither process, and output format conversion.

Figure 34.1 shows the function block diagram of the output controller.

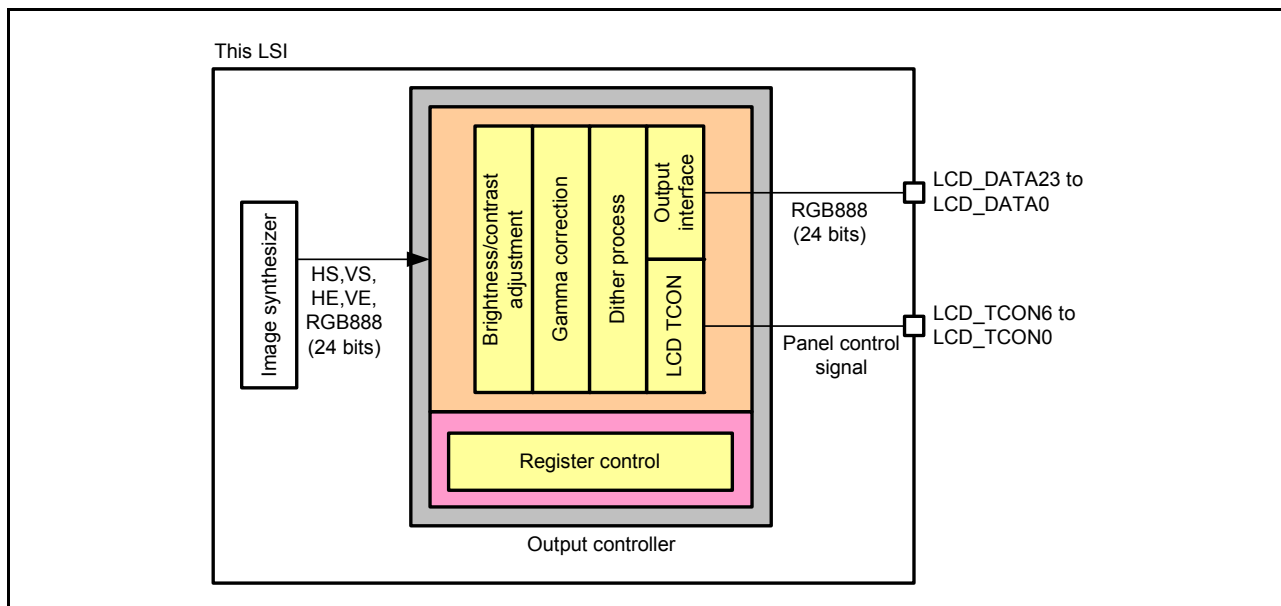

Figure 34.1 Functional Block Diagram of Output Controller

34.1.2 Register Update Control

The Vsync signal is used to control the update timing of all the registers of the output controller.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 34.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
OUT_UPDATE	OUTCNT_VEN	0	Brightness/Contrast Control, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_G_UPDATE	GAM_G_VEN	0	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_B_UPDATE	GAM_B_VEN	0	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_R_UPDATE	GAM_R_VEN	0	Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
TCON_UPDATE	TCON_VEN	0	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.1.3 Route Selection

The processing sequence of the brightness/contrast control and gamma correction control can be swapped according to the settings of the register.

Table 34.2 Route Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_ FRONT_GAM	0	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast

34.1.4 Panel Brightness Adjustment

Brightness (DC) adjustment is individually performed for RGB signals from the image synthesizer.

(BRT_R/G/BOUT after brightness adjustment has many bits to prevent overflow or underflow. The overflow or underflow process is performed at contrast calculation.)

(1) Calculation formulas for brightness (DC) adjustment

$$\text{BRT_GOUT} = \text{GIN} + \text{PBRT_G} - 512$$

$$\text{BRT_BOUT} = \text{BIN} + \text{PBRT_B} - 512$$

$$\text{BRT_ROUT} = \text{RIN} + \text{PBRT_R} - 512$$

Table 34.3 Brightness (DC) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_BRIGHT1	PBRT_G[9:0]	512	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_B[9:0]	512	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_R[9:0]	512	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

34.1.5 Contrast Adjustment

Contrast is calculated for RGB signals obtained after brightness calculation.

(If an overflow or underflow occurs, contrast is clipped to the maximum or minimum value.)

(1) Calculation formulas for contrast (gain) adjustment

$$\text{GOUT} = \text{BRT_GOUT} \times \text{CONT_G}/128$$

$$\text{BOUT} = \text{BRT_BOUT} \times \text{CONT_B}/128$$

$$\text{ROUT} = \text{BRT_ROUT} \times \text{CONT_R}/128$$

Table 34.4 Contrast (Gain) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_CONTRAST	CONT_G [7:0]	128	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_B [7:0]	128	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_R [7:0]	128	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

34.1.6 Gamma Correction

Gamma correction is carried out by dividing an input signal having 256 gradation levels into 32 and controlling the gain of each area. Gain coefficient of each area can be set as 0 to approx. 2.0 [times]

(1) Gamma correction formula for each area

$$DOUT = ((DIN - TH_{(n)}) \times GAIN_{(n)} + OFFSET_{(n)})/256$$

DIN: Input signal (8-bit)

DOUT: Output signal (10-bit)

TH(n): Threshold (8-bit)

OFFSET(n): Offset value (19-bit)

GAIN(n): Gain coefficient (11-bit)

(2) Offset calculation formulas for each area

$$OFFSET_{(n)} = OFFSET_{(n-1)} + DEF_O_{(n)} \text{ (When } n = 0, \text{ } OFFSET_{(0)} = 0.)$$

$$DEF_O_{(n)} = (TH_{(n)} - TH_{(n-1)}) \times GAIN_{(n-1)} \text{ (When } n = 0, \text{ } OFFSET_{(0)} = 0.)$$

OFFSET(n): Offset value of current area (19-bit)

OFFSET(n-1): Offset value of previous area (19-bit)

DEF_O(n): Difference in offset value of Current and previous area (19-bit)

TH(n): Threshold of current area (8-bit)

TH(n-1): Threshold of previous area (8-bit)

GAIN(n-1): Gain coefficient of previous area (11-bit)

Figure 34.2 Corresponding Chart of Offset Calculation Formulas

34.1.7 Dither Process

Dither process is carried out by adjusting brightness/contrast or reducing 10-bit RGB signals output from the gamma correction block to 8-bit, 6-bit, or 5-bit RGB signals. The operation mode of dither process can be selected from truncate mode, round-off mode, 2×2 pattern dither mode and random pattern dither mode.

Figure 34.4 Operation Specification of 2×2 Pattern Dither

The conversion equations are as follows.

[Truncate mode]

(a) 10 bits to 8 bits

$$\text{Output RGB data}[7:0] = \text{Input RGB data}[9:0] \div 4 \text{ (truncate the number below the decimal point)}$$

(b) 10 bits to 6 bits

$$\text{Output RGB data}[7:2] = \text{Input RGB data}[9:0] \div 16 \text{ (truncate the number below the decimal point)}$$

(c) 10 bits to 5 bits

$$\text{Output RGB data}[7:3] = \text{Input RGB data}[9:0] \div 32 \text{ (truncate the number below the decimal point)}$$

[Round-off mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (round off to an integer)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (round off to an integer)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (round off to an integer)

[2 × 2 pattern dither mode, random pattern dither mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

Table 34.6 Panel Dither Correction

Register Name	Bit Name	Initial Value	Description
OUT_PDTHA	PDTH_SEL[1:0]	0	Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither

OUT_PDTHA	PDTH_PC[1:0]	2	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PD[1:0]	1	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

34.1.8 Output Format Conversion

In output format conversion, the RGB signal after dither process is converted to LCD output signal having any of the following formats, namely, parallel RGB888, parallel RGB666, parallel RGB565, and serial RGB.

Further, converted data can be allocated to LCD output pins as selected.

(1) Bit Allocation of LCD Signals for RGB888 Output

Table 34.7 shows the RGB signal input allocated to the LCD signal output for RGB888 output.

R/G/BIN[7:0] are the RGB internal signals after dither process.

Table 34.7 Bit Allocation of RGB Signal Input for RGB888 Output

(4) Bit Allocation of LCD Signal for Serial RGB Output

For serial RGB output, RGB signal input shown Table 34.10 is allocated to rgb internal signals and the signals are converted from parallel to serial format and output as LCD signals. R/G/BIN[7:0] are the RGB internal signals after dither process.

The internal signals r[7:0], g[7:0], and b[7:0] are serially output to LCD_DATA7 to LCD_DATA0.

Table 34.10 Bit Allocation of RGB Signal Input for Serial RGB Output

(5) Parallel to Serial Conversion

As shown in Table 34.11, four types of parallel to serial conversions are possible by controlling clock speed mode and selecting the scan direction ('n' in the table are natural numbers).

Table 34.11 Specifications of Serial RGB Output

OUT_FRQ_SEL	1	1	2	2
OUT_DIR_SEL	0	1	0	1
Line (2n-1)	Repeated (r → g → b)	Repeated (b → g → r)	Repeated (r → g → b → X)	Repeated (X → b → g → r)
Line 2n	Repeated (g → b → r)	Repeated (r → b → g)	Repeated (r → g → b → X)	Repeated (X → b → g → r)

Figure 34.5 and Figure 34.6 show the timing of parallel to serial conversion in triple speed and quadruple speed modes, respectively.

Figure 34.5 Timing of Parallel to Serial Conversion in Triple Speed Mode

Figure 34.6 Timing of Parallel to Serial Conversion in Quadruple Speed Mode

During serial output, the phase timing with the HE signal can be adjusted by OUT_PHASE[0:1].

Figure 34.7 shows the timing of the clock phases of the serial RGB output (triple speed mode).

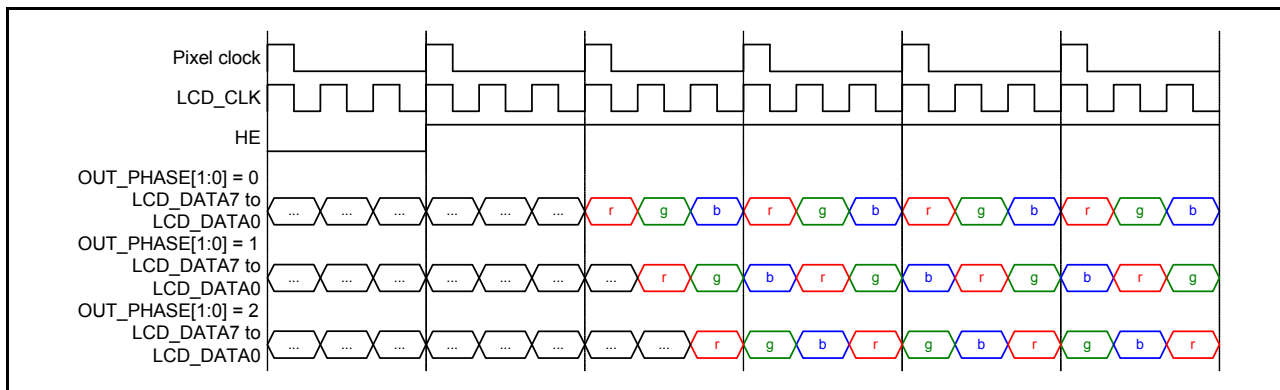

Figure 34.7 Timing of Clock Phases of Serial RGB Output (Triple Speed Mode)

Figure 34.8 shows the timing of the clock phases of the serial RGB output (quadruple speed mode).

34.1.9 LCD TCON

The LCD TCON generates various timing signals for driving the LCD panel.

Specifically, the timing include two vertical panel driver signals, five horizontal panel driver signals, and one composite signal of the vertical and horizontal panel driver signals. Table 34.13 lists the timing signals that are generated by LCD TCON

Table 34.13 Signals Generated by LCD TCON

Signal Name	Type	Description
STVA/VS	Vertical	<ul style="list-style-type: none"> Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Vsync signal The width, position, and polarity of the sync signal can be controlled.
STVB/VE	Vertical	<ul style="list-style-type: none"> Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Vertical enable signal The width, position, and polarity of the sync signal can be controlled.
STH/SP/HS	Horizontal	<ul style="list-style-type: none"> Source start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Hsync signal The width, position, and polarity of the sync signal can be controlled.
STB/LP/HE	Horizontal	<ul style="list-style-type: none"> Source strobe signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. Horizontal enable signal The width, position, and polarity of the enable signal can be controlled.
CPV/GCK	Horizontal	<ul style="list-style-type: none"> Gate clock signal The pulse width, pulse position, and pulse polarity of the signal can be controlled.
POLA	Horizontal	<ul style="list-style-type: none"> VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
POLB	Horizontal	<ul style="list-style-type: none"> VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
DE	Horizontal/Vertical	<ul style="list-style-type: none"> Data enable signal The width, position, and polarity of the enable signal can be controlled.

(1) Horizontal Reference Offset Control

The horizontal reference offset control enables generation of a reference signal with a clock delay equivalent to the value of TCON_OFFSET[10:0] from the rising edge of the Hsync signal. If a signal that spans across the Hsync signal needs to be generated, such a signal is generated with reference to the offset reference signal.

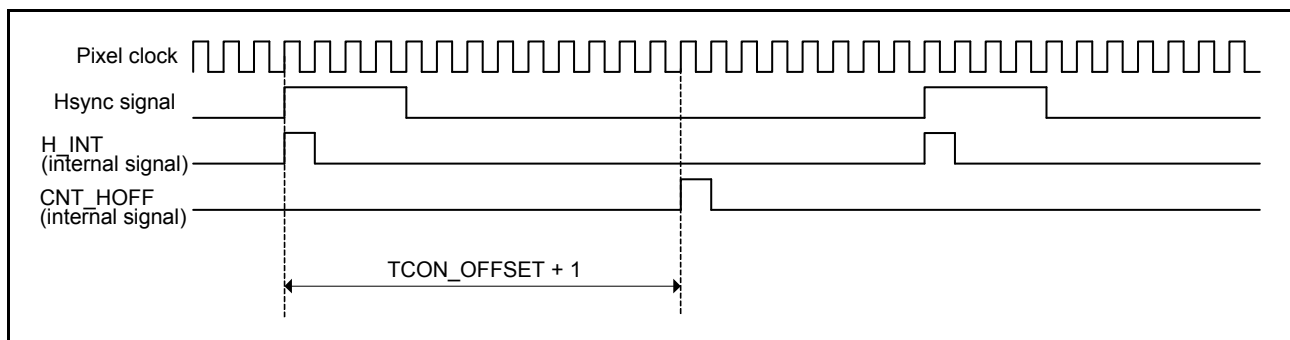

Figure 34.9 Generation of Offset Horizontal Reference (H_OFF) Signal

Table 34.14 Horizontal Reference Signal Selection

Signal Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_OFFSET[10:0]	0	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.
TCON_TIM_STH2	TCON_STH_HS_SEL	0	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_STB2	TCON_STB_HS_SEL	0	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_CPV2	TCON_CPV_HS_SEL	0	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLA2	TCON_POLA_HS_SEL	0	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLB2	TCON_POLB_HS_SEL	0	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference

Note: When generating the POLA and POLB signals in reverse mode, the bits TCON_POLA_HS_SEL and TCON_POLB_HS_SEL should be set to 0.

(2) Horizontal Panel Driver Signal Generation (A)

Horizontal synchronous panel driver signal generation (A) involves generation of a timing signal that changes twice in a horizontal period according to the values of TCON_xxxx_HS[10:0] and TCON_xxxx_HW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter performs the following operations.

1. Resets the counter value at the rising edge of the Hsync signal as the reference.
2. Increments the counter value at the rising edge of the panel clock.

A fixed output value of 0 can be obtained by setting 0 in TCON_xxxx_HW[10:0], which set the second changing timing.

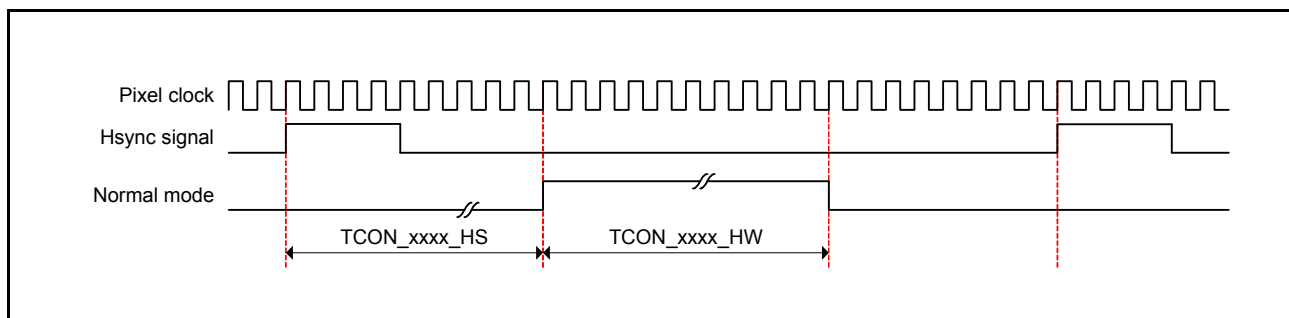

Figure 34.10 Horizontal Panel Driver Signal (in Normal Mode)

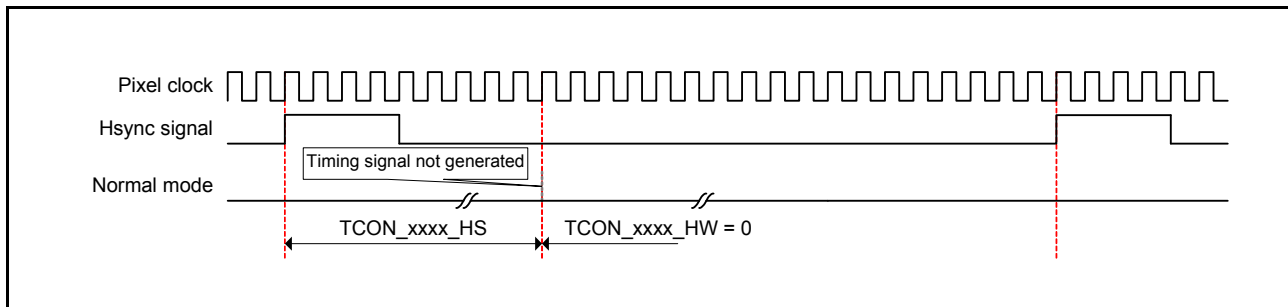

Figure 34.11 Horizontal Panel Driver Signal (in Normal Mode and When TCON_xxxx_HW_ = 0)

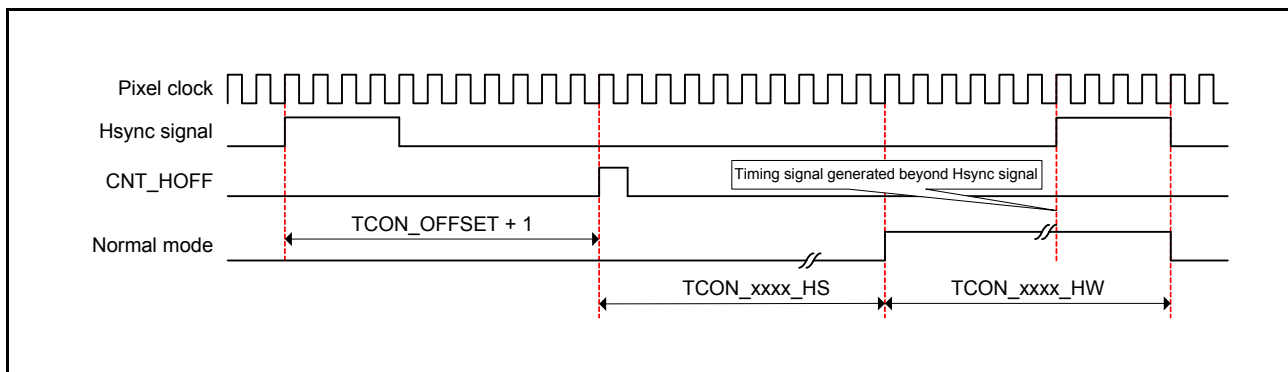

Figure 34.12 Horizontal Panel Driver Signal (in Normal Mode and When Offset Horizontal Reference is Used)

Table 34.15 Settings for Horizontal Panel Driver Signal Generation (A)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles)
TCON_TIM_STB1	TCON_STB_HS[10:0]	144	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HS[10:0]	0	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HW[10:0]	0	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles)

(3) Horizontal Panel Driver Signal Generation (B)

In addition to the normal mode operation described in (2), reverse mode operation, that is, horizontal panel driver signal generation (B) is provided. In reverse mode, operation starts at the rising edge of the Vsync signal as the reference and a signal is generated such that its polarity is inverted every horizontal period in the timing set by the TCON_xxxx_HS[10:0] bits, which set the first changing timing.

In reverse mode, regardless of whether the number of lines in the vertical direction is odd or even, the polarity of the signals generated is inverted every horizontal period. The following three reverse modes are selectable for polarity inversion operation.

Table 34.16 Horizontal Panel Driver Signal Generation Modes

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA2	TCON_POLA_MD [1:0]	1	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
TCON_TIM_POLB2	TCON_POLB_MD [1:0]	1	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.

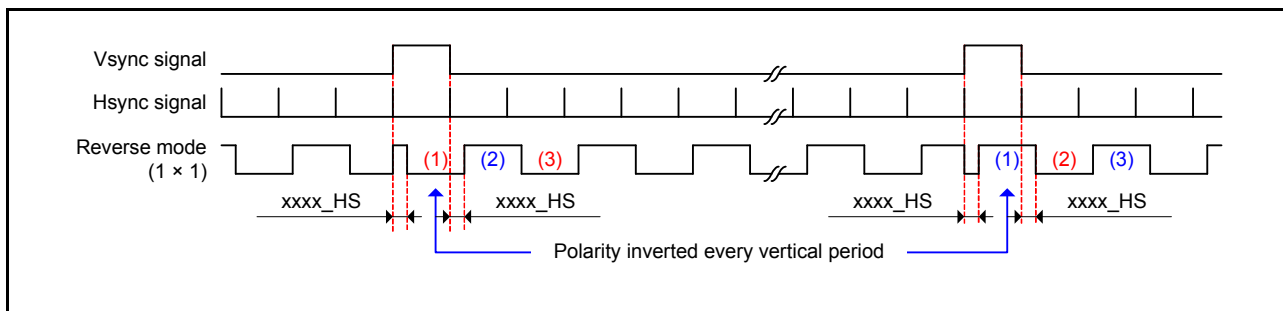

Figure 34.13 Horizontal Panel Driver Signal (in 1 × 1 Reverse Mode)

Figure 34.14 Horizontal Panel Driver Signal (in 1 × 2 Reverse Mode)

Figure 34.15 Horizontal Panel Driver Signal (in 2 × 2 Reverse Mode)

Table 34.17 Settings of Horizontal Panel Driver Signal Generation (B)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA1	TCON_POLA_HS [10:0]	0	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLA1	TCON_POLA_HW [10:0]	0	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles)
TCON_TIM_POLB1	TCON_POLB_HS [10:0]	0	POLBA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLB1	TCON_POLB_HW [10:0]	0	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles)

(4) Vertical Panel Driver Signal Generation

The vertical synchronous panel driver signal generation involves the following operations.

1. Initialization at the rising edge of the Vsync signal
2. Generation of a timing signal that changes twice in a vertical period according to the values of the internal counter, and TCON_xxxx_VS[10:0] and TCON_xxxx_VW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter increments the counter value in the following two cases.

1. At the rising edge of the Hsync signal
2. At the point reached after a clock delay specified by the value of TCON_HALF[10:0] from the rising edge of the Hsync signal (normally, 1/2fH is set).

Figure 34.16 1/2 Pulse (H_HALF) Signal Generation

Table 34.18 Settings of 1/2 Pulse (H_HALF) Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_HALF[10:0]	400	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter

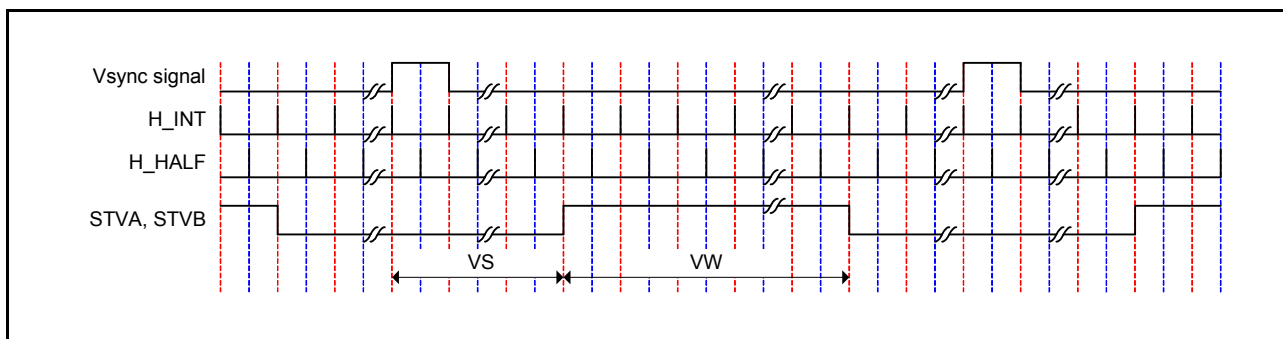

Figure 34.17 Vertical Panel Driver Signal (H_INT Reference Operation)

Figure 34.18 Vertical Panel Driver Signal (H_HALF Reference Operation)

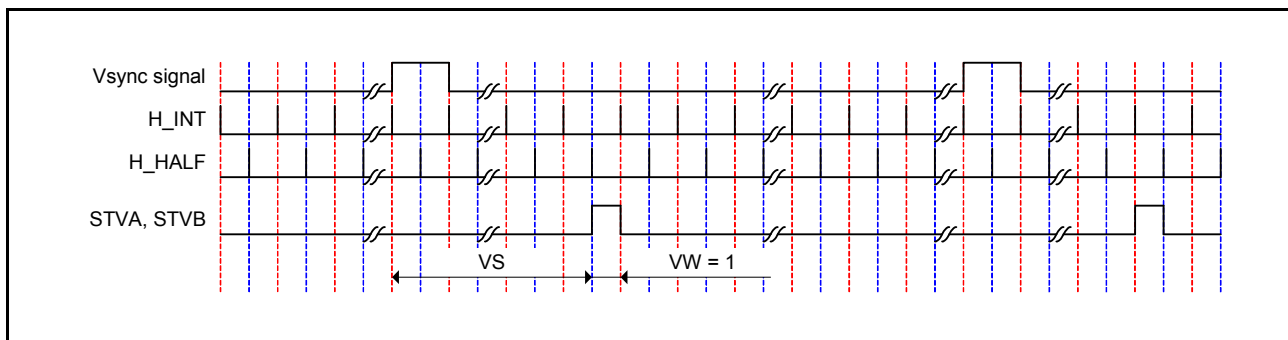

Figure 34.19 Vertical Panel Driver Signal (H_INT and H_HALF Reference Operation)

Table 34.19 Vertical Panel Driver Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_HW (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	70	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_HW (1/2fH cycles)

(5) DE Timing Signal Generation

DE timing signal generation involves generation of data enable signal (DE) that indicates the valid period of the video signal by synthesizing the horizontal panel driver (HE) signal and the vertical panel driver (VE) signal (AND).

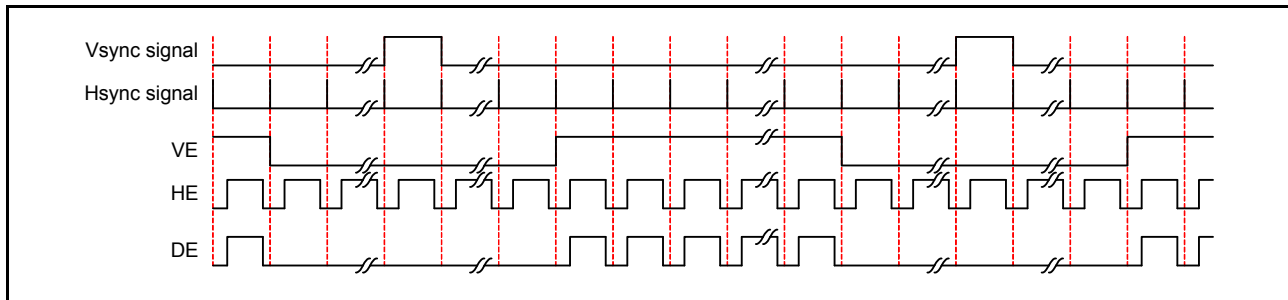

Figure 34.20 Data Enable Signal Generation

(6) Polarity Inversion

Polarity inversion enables inversion of polarity of each signal generated by the signal generating circuit.

Table 34.20 Panel Driver Signal Polarity Inversion Control

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_INV	1	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
TCON_TIM_STVB2	TCON_STVB_INV	0	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
TCON_TIM_STH2	TCON_STH_INV	1	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
TCON_TIM_STB2	TCON_STB_INV	0	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
TCON_TIM_CPV2	TCON_CPV_INV	0	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
TCON_TIM_POLA2	TCON_POLA_INV	0	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
TCON_TIM_POLB2	TCON_POLB_INV	0	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
TCON_TIM_DE	TCON_DE_INV	0	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

(7) Output Selection

An output pin is selected for every signal subjected to polarity inversion control.

Table 34.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_SEL [2:0]	0	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

(8) Output Phase Selection

The output phase can be individually selected for the video output signal and the various timing output signals based on the LCD_CLK (panel clock).

Table 34.22 Panel Output Signal Phase Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_LCD_EDGE	0	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVA_EDGE	0	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVB_EDGE	0	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STH_EDGE	0	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STB_EDGE	0	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_CPV_EDGE	0	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLA_EDGE	0	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLB_EDGE	0	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

34.2 Register Descriptions

Table 34.23 to Table 34.25 show the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 34.25 Output Controller Register Configuration (Channel 0)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Register update control register in output controller	OUT_UPDATE	R/WC1	H'0000 0000	H'FCFF 7A00	32
Output interface register	OUT_SET	R/W	H'001F 0000	H'FCFF 7A04	32
Brightness (DC) correction register 1	OUT_BRIGHT1	R/W	H'0000 0200	H'FCFF 7A08	32
Brightness (DC) correction register 2	OUT_BRIGHT2	R/W	H'0200 0200	H'FCFF 7A0C	32
Contrast (gain) correction register	OUT_CONTRAST	R/W	H'0080 8080	H'FCFF 7A10	32
Panel dither register	OUT_PDTHA	R/W	H'0000 3021	H'FCFF 7A14	32
Output phase control register	OUT_CLK_PHASE	R/W	H'0000 0000	H'FCFF 7A24	32

34.2.1 Register Update Control Register G in Gamma Correction Block (GAM_G_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_G_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_G_VEN	0	R/WC1	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.2 Function Switch Register in Gamma Correction Block (GAM_SW)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_ON	0	R/W	Gamma Correction On/Off Control 0: Off 1: On

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.3 Table Setting Register G1 to G16 in Gamma Correction Block (GAM_G_LUT1 to GAM_G_LUT16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GAM_G_GAIN_xx[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GAM_G_GAIN_yy[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	*	1024	R/W	GAM_G_LUT1: Gain Adjustment of Area 0 of G Signal GAM_G_LUT2: Gain Adjustment of Area 2 of G Signal GAM_G_LUT3: Gain Adjustment of Area 4 of G Signal GAM_G_LUT4: Gain Adjustment of Area 6 of G Signal GAM_G_LUT5: Gain Adjustment of Area 8 of G Signal GAM_G_LUT6: Gain Adjustment of Area 10 of G Signal GAM_G_LUT7: Gain Adjustment of Area 12 of G Signal GAM_G_LUT8: Gain Adjustment of Area 14 of G Signal GAM_G_LUT9: Gain Adjustment of Area 16 of G Signal GAM_G_LUT10: Gain Adjustment of Area 18 of G Signal GAM_G_LUT11: Gain Adjustment of Area 20 of G Signal GAM_G_LUT12: Gain Adjustment of Area 22 of G Signal GAM_G_LUT13: Gain Adjustment of Area 24 of G Signal GAM_G_LUT14: Gain Adjustment of Area 26 of G Signal GAM_G_LUT15: Gain Adjustment of Area 28 of G Signal GAM_G_LUT16: Gain Adjustment of Area 30 of G Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times])
26 to 16	*	1024	R/W	*: Bit Name GAM_G_LUT1: GAM_G_GAIN_00[10:0] GAM_G_LUT2: GAM_G_GAIN_02[10:0] GAM_G_LUT3: GAM_G_GAIN_04[10:0] GAM_G_LUT4: GAM_G_GAIN_06[10:0] GAM_G_LUT5: GAM_G_GAIN_08[10:0] GAM_G_LUT6: GAM_G_GAIN_10[10:0] GAM_G_LUT7: GAM_G_GAIN_12[10:0] GAM_G_LUT8: GAM_G_GAIN_14[10:0] GAM_G_LUT9: GAM_G_GAIN_16[10:0] GAM_G_LUT10: GAM_G_GAIN_18[10:0] GAM_G_LUT11: GAM_G_GAIN_20[10:0] GAM_G_LUT12: GAM_G_GAIN_22[10:0] GAM_G_LUT13: GAM_G_GAIN_24[10:0] GAM_G_LUT14: GAM_G_GAIN_26[10:0] GAM_G_LUT15: GAM_G_GAIN_28[10:0] GAM_G_LUT16: GAM_G_GAIN_30[10:0]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	*	1024	R/W	GAM_G_LUT1: Gain Adjustment of Area 1 of G Signal GAM_G_LUT2: Gain Adjustment of Area 3 of G Signal GAM_G_LUT3: Gain Adjustment of Area 5 of G Signal GAM_G_LUT4: Gain Adjustment of Area 7 of G Signal GAM_G_LUT5: Gain Adjustment of Area 9 of G Signal GAM_G_LUT6: Gain Adjustment of Area 11 of G Signal GAM_G_LUT7: Gain Adjustment of Area 13 of G Signal GAM_G_LUT8: Gain Adjustment of Area 15 of G Signal GAM_G_LUT9: Gain Adjustment of Area 17 of G Signal GAM_G_LUT10: Gain Adjustment of Area 19 of G Signal

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_08[7:0]	64	R/W	Start Threshold of Area 8 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_09[7:0]	72	R/W	Start Threshold of Area 9 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_10[7:0]	80	R/W	Start Threshold of Area 10 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_11[7:0]	88	R/W	Start Threshold of Area 11 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.27 Area Setting Register R4 in Gamma Correction Block (GAM_R_AREA4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_12[7:0]								GAM_R_TH_13[7:0]							
Initial value:	0	1	1	0	0	0	0	0	0	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_14[7:0]								GAM_R_TH_15[7:0]							
Initial value:	0	1	1	1	0	0	0	0	0	1	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_12[7:0]	96	R/W	Start Threshold of Area 12 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_13[7:0]	104	R/W	Start Threshold of Area 13 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_14[7:0]	112	R/W	Start Threshold of Area 14 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_15[7:0]	120	R/W	Start Threshold of Area 15 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.28 Area Setting Register R5 in Gamma Correction Block (GAM_R_AREA5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_16[7:0]								GAM_R_TH_17[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_18[7:0]								GAM_R_TH_19[7:0]							
Initial value:	1	0	0	1	0	0	0	0	1	0	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_16[7:0]	128	R/W	Start Threshold of Area 16 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_17[7:0]	136	R/W	Start Threshold of Area 17 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_18[7:0]	144	R/W	Start Threshold of Area 18 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_19[7:0]	152	R/W	Start Threshold of Area 19 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.29 Area Setting Register R6 in Gamma Correction Block (GAM_R_AREA6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_20[7:0]								GAM_R_TH_21[7:0]							
Initial value:	1	0	1	0	0	0	0	0	1	0	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_22[7:0]								GAM_R_TH_23[7:0]							
Initial value:	1	0	1	1	0	0	0	0	1	0	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_20[7:0]	160	R/W	Start Threshold of Area 20 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_21[7:0]	168	R/W	Start Threshold of Area 21 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_22[7:0]	176	R/W	Start Threshold of Area 22 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_23[7:0]	184	R/W	Start Threshold of Area 23 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.30 Area Setting Register R7 in Gamma Correction Block (GAM_R_AREA7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_24[7:0]								GAM_R_TH_25[7:0]							
Initial value:	1	1	0	0	0	0	0	0	1	1	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_26[7:0]								GAM_R_TH_27[7:0]							
Initial value:	1	1	0	1	0	0	0	0	1	1	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_24[7:0]	192	R/W	Start Threshold of Area 24 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_25[7:0]	200	R/W	Start Threshold of Area 25 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_26[7:0]	208	R/W	Start Threshold of Area 26 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_27[7:0]	216	R/W	Start Threshold of Area 27 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.31 Area Setting Register R8 in Gamma Correction Block (GAM_R_AREA8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_R_TH_28[7:0]								GAM_R_TH_29[7:0]							
Initial value:	1	1	1	0	0	0	0	0	1	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_R_TH_30[7:0]								GAM_R_TH_31[7:0]							
Initial value:	1	1	1	1	0	0	0	0	1	1	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_28[7:0]	224	R/W	Start Threshold of Area 28 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_29[7:0]	232	R/W	Start Threshold of Area 29 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_30[7:0]	240	R/W	Start Threshold of Area 30 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_31[7:0]	248	R/W	Start Threshold of Area 31 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area \leq Threshold of current area < Threshold of next area

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.32 TCON Register Update Control Register (TCON_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_VEN	0	R/WC1	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.33 TCON Reference Timing Setting Register (TCON_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_HALF[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_OFFSET[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_HALF[10:0]	400	R/W	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_OFFSET[10:0]	0	R/W	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.34 TCON Vertical Timing Setting Register A1 (TCON_TIM_STVA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	TCON_STVA_VS[10:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	TCON_STVA_VW[10:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVA_VS [10:0]	0	R/W	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVA_VW [10:0]	4	R/W	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVA_INV	—	TCON_STVA_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVA_INV	1	R/W	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVA_SEL [2:0]	0	R/W	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.36 TCON Vertical Timing Setting Register B1 (TCON_TIM_STVB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	—	—	—	—	—	TCON_STVB_VS[10:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	—	—	—	—	—	TCON_STVB_VW[10:0]											
Initial value:	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVB_VS [10:0]	70	R/W	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVB_VW [10:0]	960	R/W	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.37 TCON Vertical Timing Setting Register B2 (TCON_TIM_STVB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVB_INV	—	TCON_STVB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVB_INV	0	R/W	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVB_SEL [2:0]	1	R/W	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.38 TCON Horizontal Timing Setting Register STH1 (TCON_TIM_STH1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STH_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STH_HS [10:0]	0	R/W	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STH_HW [10:0]	96	R/W	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STH_HS_SEL	—	—	—	TCON_STH_INV	—	TCON_STH_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STH_HS_SEL	0	R/W	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STH_INV	1	R/W	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STH_SEL [2:0]	2	R/W	Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.40 TCON Horizontal Timing Setting Register STB1 (TCON_TIM_STB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STB_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STB_HS [10:0]	144	R/W	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STB_HW [10:0]	640	R/W	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.41 TCON Horizontal Timing Setting Register STB2 (TCON_TIM_STB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STB_HS_SEL	—	—	—	TCON_STB_INV	—	TCON_STB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STB_HS_SEL	0	R/W	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STB_INV	0	R/W	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STB_SEL [2:0]	7	R/W	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.42 TCON Horizontal Timing Setting Register CPV1 (TCON_TIM_CPV1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_CPV_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_CPV_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_CPV_HS [10:0]	0	R/W	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_CPV_HW [10:0]	0	R/W	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.43 TCON Horizontal Timing Setting Register CPV2 (TCON_TIM_CPV2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON CPV_HS_ SEL	—	—	—	TCON CPV_INV	—	TCON_CPV_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_CPV_HS_SEL	0	R/W	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_CPV_INV	0	R/W	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_CPV_SEL [2:0]	4	R/W	Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.44 TCON Horizontal Timing Setting Register POLA1 (TCON_TIM_POLA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLA_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLA_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLA_HS [10:0]	0	R/W	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLA_HW [10:0]	0	R/W	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.45 TCON Horizontal Timing Setting Register POLA2 (TCON_TIM_POLA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLA_MD[1:0]	—	—	—	TCON_POLA_HS_SEL	—	—	—	TCON_POLA_INV	—	TCON_POLA_SEL[2:0]			
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLA_MD [1:0]	1	R/W	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLA_HS_SEL	0	R/W	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLA_INV	0	R/W	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLA_SEL [2:0]	5	R/W	Output Signal Select for LCD_TCON5 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.46 TCON Horizontal Timing Setting Register POLB1 (TCON_TIM_POLB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLB_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLB_HS [10:0]	0	R/W	POLB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLB_HW [10:0]	0	R/W	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.47 TCON Horizontal Timing Setting Register POLB2 (TCON_TIM_POLB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLB_MD[1:0]	—	—	—	TCON_POLB_HS_SEL	—	—	—	TCON_POLB_INV	—	TCON_POLB_SEL[2:0]	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLB_MD [1:0]	1	R/W	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLB_HS_SEL	0	R/W	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLB_INV	0	R/W	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLB_SEL [2:0]	6	R/W	Output Signal Select for LCD_TCON6 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.48 TCON Data Enable Polarity Setting Register (TCON_TIM_DE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_DE_INV
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_DE_INV	0	R/W	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.49 Register Update Control Register in Output Controller (OUT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTCNT_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OUTCNT_VEN	0	R/WC1	Brightness/Contrast, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.50 Output Interface Register (OUT_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	OUT_ENDIAN_ON	—	—	—	OUT_SWAP_ON	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OUT_FORMAT[1:0]	—	—	OUT_FRQ_SEL[1:0]	—	—	—	OUT_DIR_SEL	—	—	OUT_PHASE[1:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	OUT_ENDIAN_ON	0	R/W	Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	OUT_SWAP_ON	0	R/W	B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	OUT_FORMAT[1:0]	0	R/W	Output Format Select 0: RGB888 1: RGB666 2: RGB565 3: Serial RGB
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	OUT_FRQ_SEL [1:0]	0	R/W	Clock Frequency Control 0: 100% speed — (parallel RGB) 1: Triple speed — (serial RGB) 2: Quadruple speed — (serial RGB) 3: Setting prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OUT_DIR_SEL	0	R/W	Scan Direction Select 0: Forward scan 1: Reverse scan
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	OUT_PHASE[1:0]	0	R/W	Clock Phase Adjustment During Serial RGB Output Triple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: Setting prohibited Quadruple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: 3 (clk)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.2.51 Brightness (DC) Correction Register 1 (OUT_BRIGHT1)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	OUTCNT_	—	—	—	OUTCNT_	—	OUTCNT_	OUTCNT_	OUTCNT_	OUTCNT_	OUTCNT_	OUTCNT_	OUTCNT_
				FRONT_				LCD_		STVA_	STVB_	STH_	STB_	CPV_	POLA_	POLB_
				GAM				EDGE		EDGE	EDGE	EDGE	EDGE	EDGE	EDGE	EDGE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	OUTCNT_	0	R/W	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	OUTCNT_	0	R/W	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	OUTCNT_	0	R/W	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
5	OUTCNT_	0	R/W	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
4	OUTCNT_	0	R/W	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
3	OUTCNT_	0	R/W	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
2	OUTCNT_	0	R/W	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
1	OUTCNT_	0	R/W	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
0	OUTCNT_	0	R/W	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.3 Usage Methods

34.3.1 Gamma Correction Adjustment Method

The characteristics of G, B, R of each panel to be connected should be measured and gamma correction should be made to suit the panel.

Since the gamma correction adjustment depends on to the characteristics of the panel, there are no recommended setting values.

34.3.2 Dither Usage Method

Dither is used when pseudo contour is appeared on the display screen.

Table 34.26 Dither Settings

Bit Name	Setting Value
PDTH_FORMAT[1:0]	Selects the format. For RGB888: 0 For RGB666: 1 For RGB565: 2
PDTH_SEL[1:0]	When 2 × 2 pattern dither is to be used: 2
PDTH_PA[1:0]	Normally 3 (initial value)
PDTH_PB[1:0]	Normally 0 (initial value)
PDTH_PC[1:0]	Normally 2 (initial value)
PDTH_PD[1:0]	Normally 1 (initial value)

34.3.3 Output Format Adjustment Method

The setting example of the typical output format is shown in Table 34.27 and Table 34.28.

It is necessary to carry out the setting of synchronization system signals of each output format similarly as the setting of output after scaling.

Table 34.27 Setting Example of Synchronizing Signal

Register Name	Bit Name	VGA	SVGA	Description
TCON_TIM	TCON_HALF[10:0]	400	528	Sets the half value of 1H time period in clock units.
Vsync signal				
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	8	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVA2	TCON_STVA_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVA2	TCON_STVA_SEL[2:0]	0	0	For STVA output selection: 0
Vertical enable signal				
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	68	44	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	1200	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVB2	TCON_STVB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVB2	TCON_STVB_SEL[2:0]	1	1	For STVB output selection: 1
Hsync signal				
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	128	Sets the changing point from the above pulse generation start position.
TCON_TIM_STH2	TCON_STH_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STH2	TCON_STH_SEL[2:0]	2	2	For STH output selection: 2
Horizontal enable signal				
TCON_TIM_STB1	TCON_STB_HS[10:0]	128	192	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	800	Sets the changing point from the above pulse generation start position.
TCON_TIM_STB2	TCON_STB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STB2	TCON_STB_SEL[2:0]	3	3	For STB output selection: 3

Table 34.28 Setting Example of Data System

Register Name	Bit Name	RGB888	Serial RGB (Triple Speed)	Description
OUT_SET	OUT_ENDIAN_ON	0	0	When bit endian is changed: 1
OUT_SET	OUT_SWAP_ON	0	0	When B/R is to be swapped: 1
OUT_SET	OUT_PIXEL_INV_ON	0	0	When the function of reducing number of simultaneous changes is to be used: 1
OUT_SET	OUT_SUM_MOVE[4:0]	31	31	When OUT_PIXEL_INV_ON = 1, this register becomes valid. Sets the simultaneous changing threshold.
OUT_SET	OUT_FORMAT[1:0]	0	3	Sets the output format. For RGB888: 0 For RGB666: 1 For RGB565: 2 For serial RGB: 3
OUT_SET	OUT_FRQ_SEL[1:0]	0	1	Sets the output clock. For RGB888, RGB666, RGB565: 0 For triple speed serial RGB output: 1 For quadruple serial RGB output: 2
OUT_SET	OUT_DIR_SEL	0	0	When data arrangement of the serial RGB output is to be reversed: 1
OUT_SET	OUT_PHASE[1:0]	0	0	Sets when output phase of the serial RGB is shifted. Not delayed Delayed by one clock cycle: 1 Delayed by two clock cycles: 2 Delayed by three clock cycles: 3 (applicable only for quadruple speed mode)

35. Video Display Controller 5 (8):System Controller

35.1 System Controller

35.1.1 Overview of Functions

The system controller provides interrupt control, panel clock control, CLUT table read select signal status flag output functions.

35.1.2 Interrupt Control

Ten interrupt signals are output from the scaler and image synthesizer. The system controller controls whether to output these interrupt signals.

One is written to the corresponding INT_STA* bit when an interrupt signal is to be accepted. After 1 has been written to the bit, however, its value is still read out as 0 until the interrupt signal is accepted. Once the interrupt signal has been accepted, the INT_STA* bit is read out as 1.

The bit for an accepted interrupt signal is cleared by writing 0 to the INT_STA* bit. If further interrupt signals are to be accepted after the INT_STA* bit has been cleared, 1 is again written to the bit.

Table 35.1 Interrupt Signals

Request Source Name	Bit Name	Function
S0_VI_VSYNC	INT_STA 0	Vsync signal input to scaler 0
S0_LO_VSYNC	INT_STA 1	Vsync signal output from scaler 0
S0_VSYNCERR	INT_STA 2	Missing Vsync signal for scaler 0
GR3_VLINE	INT_STA 3	Specified line signal for panel output in graphics 3
S0_VFIELD	INT_STA 4	Field end signal for recording function in scaler 0
IV1_VBUFERR	INT_STA 5	Frame buffer write overflow signal for scaler 0
IV3_VBUFERR	INT_STA 6	Frame buffer read underflow signal for graphics 0
IV5_VBUFERR	INT_STA 7	Frame buffer read underflow signal for graphics 2
IV6_VBUFERR	INT_STA 8	Frame buffer read underflow signal for graphics 3
S0_WLINE	INT_STA 9	Write specification line signal input to scaling-down control block in scaler 0

Table 35.2 Interrupt Clear/Hold Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT1	INT_STA0	0	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA1	0	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA2	0	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA3	0	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA4	0	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA5	0	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA6	0	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA7	0	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA8	0	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA9	0	S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Table 35.3 Interrupt Output On/Off Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT4	INT_OUT0_ON	0	S0_VI_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT1_ON	0	S0_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT2_ON	0	S0_VSYNCERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT3_ON	0	GR3_VLINE Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT4_ON	0	S0_VFIELD Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT5_ON	0	IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT6_ON	0	IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT7_ON	0	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT8_ON	0	IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT9_ON	0	S0_WLINE Interrupt Output On/Off 0: Off 1: On

35.1.3 Panel Clock Control

The video image clock, external clock, or peripheral clock 1 is selectable as the source of the panel clock for supply to this module. The module is also equipped with a divider for scaling the frequency by factors from 1/1 to 1/32. The bits listed in Table 35.4 control the panel clock.

Table 35.4 Panel Clock Control

Register Name	Bit Name	Initial Value	Description
SYSCNT_PANEL_CLK	PANEL_ICKSEL [1:0]	0	Divided Clock Source Select 0: Video image clock (this is DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: Setting prohibited 3: Peripheral clock 1 (P1φ)
SYSCNT_PANEL_CLK	PANEL_ICKEN	0	Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL or PANEL_DCDR bits.
SYSCNT_PANEL_CLK	PANEL_DCDR [5:0]	1	Clock Frequency Division Ratio Refer to Table 35.5 for details on the settings. Note: Settings other than those in Table 35.5 are prohibited.

Table 35.5 I/O Clock Frequency and Divisors

DCDR[5:0]	Clock Ratio	I/O Clock Frequency (MHz)		
		27.00	54.00	66.67
000001	1/1	27.00	54.00	66.67
000010	1/2	13.50	27.00	33.33
000011	1/3	9.00	18.00	22.22
000100	1/4	6.75	13.50	16.67
000101	1/5	5.40	10.80	13.33
000110	1/6	4.50	9.00	11.11
000111	1/7	3.86	7.71	9.52
001000	1/8	3.38	6.75	8.33
001001	1/9	3.00	6.00	7.41
001100	1/12	2.25	4.50	5.56
010000	1/16	1.69	3.38	4.17
011000	1/24	1.13	2.25	2.78
100000	1/32	0.84	1.69	2.08

35.1.4 CLUT Table Read Select Signal Status Flag

The CLUT read select signal status can be read using the flags shown in Table 35.6.

Table 35.6 CLUT Table Read Select Signal Status Flags

Register Name	Bit Name	Initial Value	Description
SYSCNT_CLUT	GR0_CLT_SEL_ST	—	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR2_CLT_SEL_ST	—	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR3_CLT_SEL_ST	—	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

35.2 Register Descriptions

The following register sets are allocated in the SH register map area.

- Symbols used in Register Descriptions

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Table 35.7 Register Configuration of System Controller (CH0)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt control register 1	SYSCNT_INT1	R/W	H'0000 0000	H'FCFF 7A80	32
Interrupt control register 2	SYSCNT_INT2	R/W	H'0000 0000	H'FCFF 7A84	32
Interrupt control register 4	SYSCNT_INT4	R/W	H'0000 0000	H'FCFF 7A8C	32
Interrupt control register 5	SYSCNT_INT5	R/W	H'0000 0000	H'FCFF 7A90	32
Panel clock control register	SYSCNT_PANEL_CLK	R/W	H'0001	H'FCFF 7A98	16
CLUT table read select signal status register	SYSCNT_CLUT	R	H'0000	H'FCFF 7A9A	16

R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	PANEL_ICKSEL [1:0]	All 0	R/W	Divided Clock Source Select 0: Video image clock (this is DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: Setting prohibited 3: Peripheral clock 1 (P1φ)
11 to 9	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	PANEL_ICKEN	0	R/W	Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL or PANEL_DCDR bits.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	PANEL_DCDR[5:0]	1	R/W	Clock Frequency Division Ratio Refer to Table 35.5 for details on the settings. Note: Settings other than those in Table 35.5 are prohibited.

35.2.6 CLUT Table Read Select Signal Status Register (SYSCNT_CLUT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR3_CLT_SEL_ST	—	—	—	GR2_CLT_SEL_ST	—	—	—	—	—	—	—	GR0_CLT_SEL_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_CLT_SEL_ST	—	R	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_CLT_SEL_ST	—	R	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_CLT_SEL_ST	—	R	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

36. Capture Engine Unit

The capture engine unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. The CEU is connected to the system bus via bus bridge modules.

36.1 Features of CEU

Lists the features of CEU as follows.

(1) Image data fetch

- Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data.
- Fetches image data other than YCbCr data, e.g. JPEG data, RGB565, from an externally connected module, such as a camera, and sequentially writes the image data to the memory.
- Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.

(2) Filter processing

- Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.

(3) Format conversion

- Converts image data input in the YCbCr 422 format into the YCbCr 420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

36.2 Functional Overview of CEU

The functional overview of the CEU is shown in Table 36.1, and the main functions and their details are shown in Table 36.1.

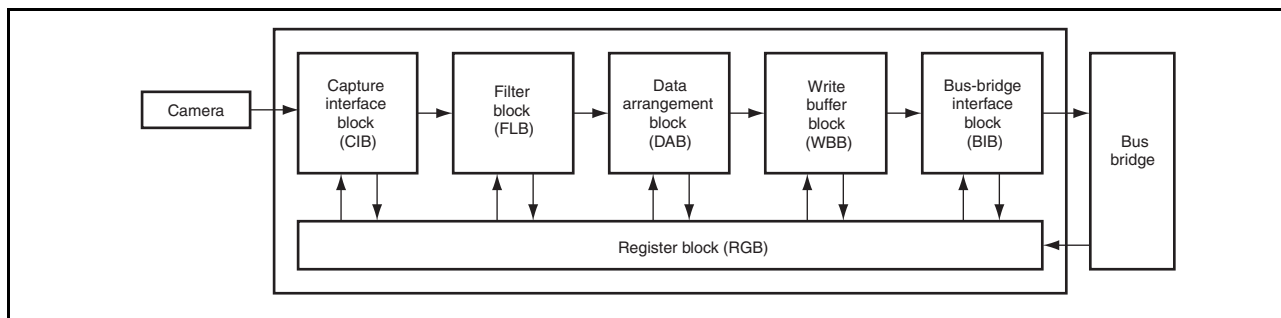

Table 36.1 Functional Overview of CEU

Classification	Item	Function	Description	Note
Connectable camera	Size	WXGA	1,280 pixels × 768 lines	Horizontal: 4-pixel units Vertical: 4-line units The range of the image size that can be input is as follows. Horizontal: 1,280 pixels to 128 pixels Vertical: 768 lines to 96 lines [Note] This depends on the AC characteristics of the device to be connected.
		XGA	1,024 pixels × 768 lines	
		SVGA	800 pixels × 600 lines	
		WVGA	800 pixels × 480 lines	
		VGA	640 pixels × 480 lines	
		CIF	352 pixels × 288 lines	
		WQVGA	480 pixels × 240 lines	
		QVGA	320 pixels × 240 lines, 240 pixels × 320 lines	
		QCIF	176 pixels × 144 lines	
		QQVGA	160 pixels × 120 lines	
		Sub-QCIF	128 pixels × 96 lines	
	Input format	YCbCr 422 8 bits	Cb ₀ , Y ₀ , Cr ₀ , Y ₁ ... Cr ₀ , Y ₀ , Cb ₀ , Y ₁ ... Y ₀ , Cb ₀ , Y ₁ , Cr ₀ ... Y ₀ , Cr ₀ , Y ₁ , Cb ₀ ...	Supports clock ratio of 1:1
		Binary data	Specified amount to be fetched on edges of the sync signal Data is fetched with the horizontal sync signal as an enable signal.	Written sequentially
	Horizontal and vertical sync signal polarities	Arbitrary	High-active and low-active	
	Capture start location	Arbitrary	Can be specified in camera input clock units	Horizontal: 1-cycle units Vertical: 1-HD (horizontal sync signal) units
	Number of captured pixels	Arbitrary	Can be specified in 4-pixel units horizontally and in 4-line units vertically	
	Interlace	Both-field capture	Stored as a field image Stored as a frame image	Capture: 2-VD (vertical sync signal) units
		One-field capture	Top field or bottom field can be specified	Capture: 1-VD units
Memory write	Output format	YCbCr 422 YCbCr 420	YCbCr 420 is realized by simple skipping	
Filter function	No scaling or scale-down	Scale-down of captured display	Desired scaling factor from 1/16 to 1 (scaled-down display must not exceed VGA)	
	Low-pass filter		Removal of high-frequency components	Only in the horizontal direction

Table 36.2 Main Functions of CEU and Their Details

Main Function	Detailed Description
Image data fetch	<ul style="list-style-type: none"> • Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data. • Fetches image data other than YCbCr data, e.g. JPEG data, from an externally connected module, such as a camera, and sequentially writes the image data to the memory. • Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.
Filter processing	Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.
Format conversion	Converts image data input in the YCbCr 422 format into the YCbCr 420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

Figure 36.1 shows a block diagram of the CEU.

**Figure 36.1 Block Diagram of CEU**

36.3 Pin Configuration of CEU

The pin configuration of the CEU is shown in Table 36.3.

Table 36.3 Pin Configuration of CEU

Pin Name	Function	I/O	Description
VIO_D7 to VIO_D0*	CEU data bus	Input	Camera image data input to the CEU
VIO_CLK	CEU clock	Input	Camera clock input to the CEU
VIO_VD	CEU vertical sync	Input	Camera vertical sync signal input to the CEU
VIO_HD	CEU horizontal sync	Input	Camera horizontal sync signal input to the CEU
VIO_FLD	Field signal	Input	Field identification signal to the CEU

Note: * When the distinction according to the bus width for the data bus is not needed, VIO_D is used in this manual. Otherwise, VIO_D7 to VIO_D0 are used.

36.4 Register Descriptions of CEU

The register configuration of the CEU is shown in Table 36.4.

Most CEU registers have a 2-plane configuration (plane A and plane B). The CEU switches the planes when using these 2-plane registers. A mirror address, which is an address that can always access the register on the unused plane, is provided for each 2-plane register. Figure 36.2 shows the timing to switch the register planes. The CEU switches the register planes at the same time a VD interrupt is asserted.

In the following register descriptions, "during operation" indicates the period that begins when the CEU is activated by the CE bit in the capture start register (CAPSR) and ends when a capture end interrupt (CPE) of the capture event flag clear register (CETCR) occurs. In the read-only bits in each register, the write value should always be 0. If a value other than 0 is written to any of these bits, correct operation cannot be guaranteed.

Table 36.4 Register Configuration of CEU

Register Name	Abbr.	R/W	Addresses			Access Size
			Address (Plane A)	Address (Plane B)	Mirror Address	
CEU Capture start register	CAPSR	R/W	H'E821 0000	—	—	32

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPKIL	0	R/W	Write 1 to this bit to perform a software reset of capturing. At a software reset, capturing ends immediately without completing capture operation until the end of a frame. Clear the CE bit to 0 when writing 1 to this bit. Processing of the capture software reset is indicated by this bit being set to 1. When this bit is 1, do not start capturing since reset processing is in progress. When restarting capture operations, after referring to the CPTON bit in CSTSR to ensure that the CEU is halted (in the idle state), wait until this bit is cleared to 0. The timing of restarting capture operations is shown in Figure 36.6. When a software reset is generated by this bit, a capture end interrupt (CPE bit in CETCR) may be output immediately after the software reset. However, such kind of interrupt should be ignored. Also, even if the capture end interrupt is not output, the interrupt source (CPE bit) must be cleared before capturing of the next frame. 0: Normal state 1: Software reset of capturing
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	CE	0	R/W	<ul style="list-style-type: none"> • Single-capture <p>This bit reserves capturing of the next frame. When 1 is written to this bit, the capture of one frame starts from the next VD input, and stops when the one-frame capture end interrupt (CPE bit in CETCR) is asserted (Figure 36.7). To perform capture again, write 1 to this bit. After the VD or HD polarity is changed, do not write 1 to this bit until the next VD interrupt is asserted.</p> <p>As this bit indicates the capture reserve state, this bit is read as 1 after it is set to 1 and until VD is input. When VD is input, this bit returns to 0 and so is read as 0.</p> <p>The capture end is determined by the one-frame capture end interrupt (CPE bit). This is similar in data fetch mode.</p> <p>Registers should be set before the VD interrupt of the frame where capture starts next. The new register settings take effect at the next VD input. When registers are modified during capturing, the register settings take effect from the capture operations of the next VD input. If a setting register to which writing during capturing is prohibited is modified during capturing, an interrupt source (IGRW bit in CETCR) is generated. For details on the interrupt source, see the description on CETCR.</p> • Continuous capture <p>When this bit is set to 1 while the CTNCP bit in CAPCR is set to 1, continuous capture starts from the next frame (Figure 36.8). Note that this bit is not cleared to 0 but remains as 1. To stop capturing, clear this bit to 0; capturing stops after the current frame is completed.</p> <p>Continuous capture operations are possible in only image capture mode. The start address of the memory to which the captured data is written to must be set for each frame.</p> <p>0: Stops capturing 1: Starts capturing</p>

When both the VD (vertical sync signal) and HD (horizontal sync signal) polarities are high-active, one frame is defined as a period from a VD rising edge to the next VD rising edge, and one line as a period from an HD rising edge to the next HD rising edge. Figure 36.3 shows the timing of one frame (when both the VD and HD polarities are high-active).

Figure 36.3 Frame Timing

When both the VD and HD polarities are high-active, similar to one frame, one field is defined as follows:

- Period from a VD rising edge to the next VD rising edge
- One line is a period from an HD rising edge to the next HD rising edge

The field identification signal FLD should be fixed for at least 1-HD period from a VD input. Figure 36.4 shows the timing of one field (when both the VD and HD polarities are high-active).

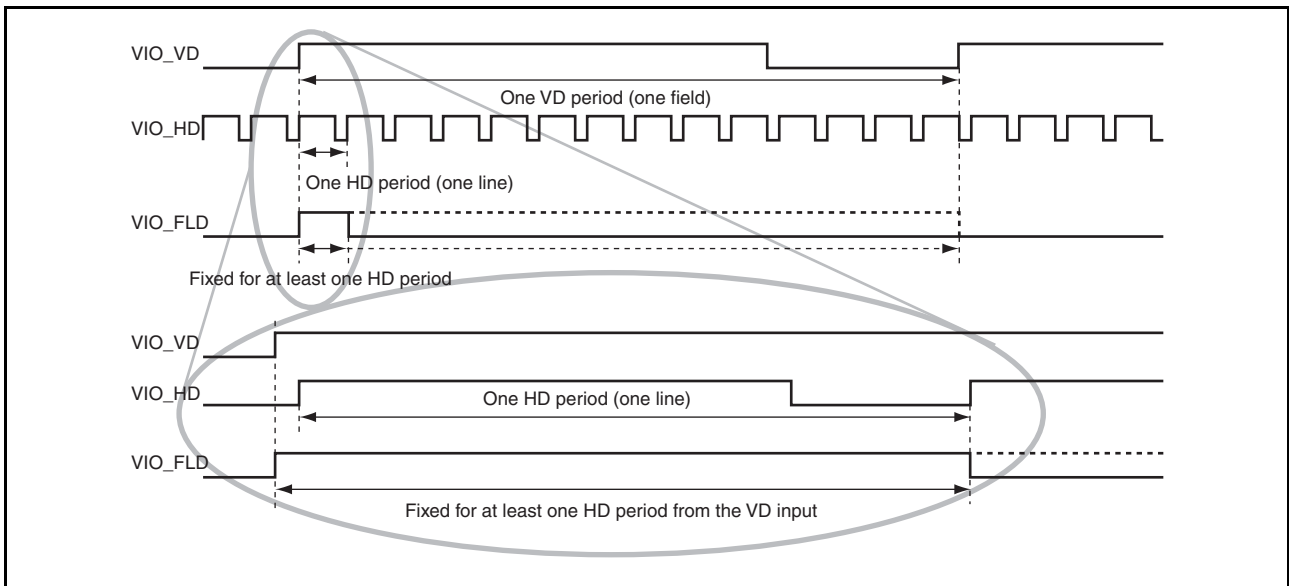

Figure 36.4 One Field Timing

In data enable fetch, one frame is defined as a period from a VD rising edge to the VD falling edge. With the HD as an enable signal (positive polarity), data of a cycle in which the HD is asserted is fetched while the VD is high. Figure 36.5 shows the timing of one frame for data enable fetch.

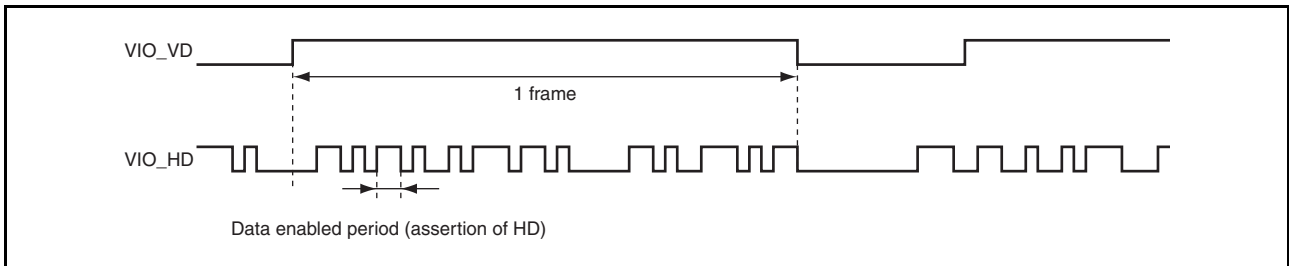

Figure 36.5 Frame Timing (Data Enable Fetch)

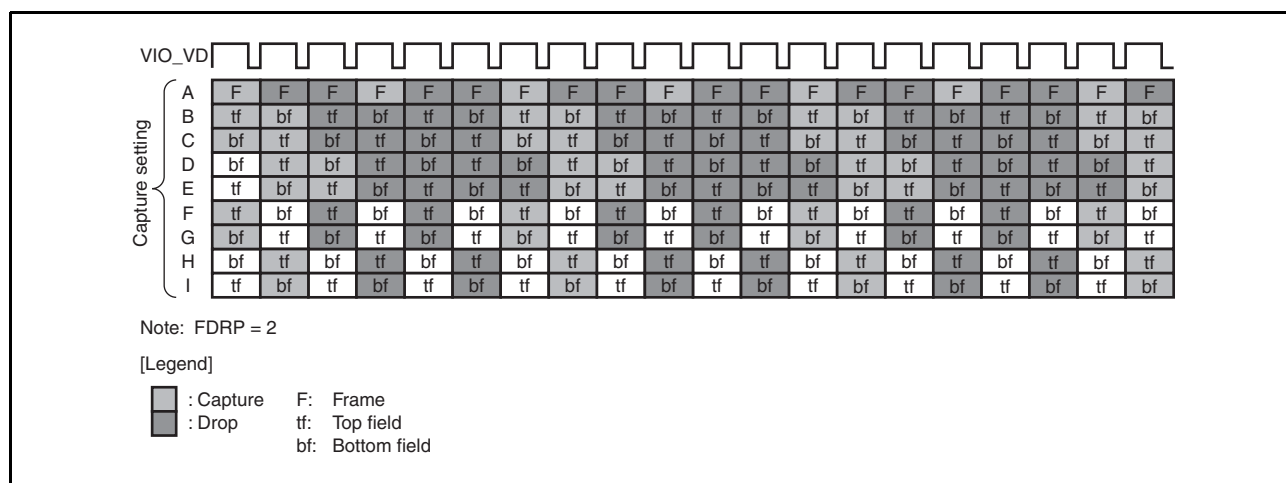

Figure 36.10 Image of Frame Drop Timing for Capture Settings (FDRP Bits = 2)

36.4.3 Capture Interface Control Register (CAMCR)

CAMCR sets the capture interface.

The following items are set by CAMCR.

- Selection between image capture operation or data fetch operation
- Polarities of the vertical and horizontal sync signals
- Input order of image data components (Y, Cb, and Cr) (only for image capture mode)
- Selection of digital image input pins (8 bits only)
- Polarity of the field identification signal

CAMCR must be set according to the module connected. In data fetch mode, set the DTARY bits to B'0. Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	FLDPOL	0	R/W	Sets the polarity of the field identification signal (FLD) from an external module. 0: When the FLD signal is high-active, the field is detected as the top field and when low-active, the field is detected as the bottom field. 1: When the FLD signal is low-active, the field is detected as the top field and when high-active, the field is detected as the bottom field.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DTIF	0	R/W	Sets the digital image input pins from which data is to be captured. The write value should always be 0.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	DTARY[1:0]	00	R/W	These bits set the input order of the luminance component and chrominance component. The order in which the luminance component (Y) and chrominance component (Cb and Cr) are input from an external module differs among modules. The CEU supports the input orders shown in Figure 36.12. Set the corresponding value in these bits. In data fetch mode, set these bits to 00. 00: Image input data is fetched in the order of Cb ₀ , Y ₀ , Cr ₀ , and Y ₁ 01: Image input data is fetched in the order of Cr ₀ , Y ₀ , Cb ₀ , and Y ₁ 10: Image input data is fetched in the order of Y ₀ , Cb ₀ , Y ₁ , and Cr ₀ 11: Image input data is fetched in the order of Y ₀ , Cr ₀ , Y ₁ , and Cb ₀

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	JPG[1:0]	00	R/W	These bits select the fetched data type. 00: Image capture mode (input data are separated into Y data and CbCr data for output to the memory) 01: Data synchronous fetch mode (specified size of input data are output to the specified memory addresses in order of input and in synchronization with the sync signal) 01: Data enable fetch mode (input data are fetched with HD as an enable signal and output to the specified addresses in memory in order of input)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	VDPOL	0	R/W	Sets the polarity for detection of the vertical sync signal input from an external module. Figure 36.14 shows the relationship between the VD and VD interrupt when high-active is selected. Since a VD interrupt may occur when this bit value is modified, the VD bit in CETCR must always be cleared to 0 when this bit value is changed. 0: Vertical sync signal (VD) from an external module is detected as high-active 1: Vertical sync signal (VD) from an external module is detected as low-active
0	HDPOL	0	R/W	Sets the polarity for detection of the horizontal sync signal input from an external module. Figure 36.15 shows the relationship between the HD and HD interrupt when high-active is selected. Since an HD interrupt may occur when this bit value is modified, the HD bit in CETCR must always be cleared to 0 when this bit value is changed. 0: Horizontal sync signal (HD) from an external module is detected as high-active 1: Horizontal sync signal (HD) from an external module is detected as low-active

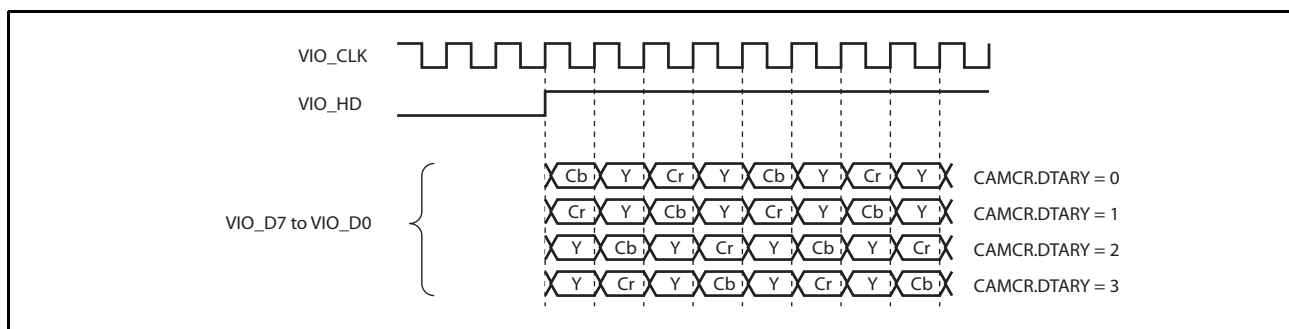

Figure 36.11 Input Order of Image Data

The JPG bit in CAMCR selects whether digital image data is fetched or data such as JPEG is fetched. In addition, when data such as JPEG is fetched, select whether the specified amount of data is continuously fetched in synchronization with the sync signal or data is fetched while the horizontal sync signal is enabled.

In data enable fetch mode, one frame is defined as a period from the rising edge to the falling edge of the vertical sync signal (VD) for data fetching. The horizontal sync signal (HD) is enabled only when the VD is high and treated as an enable signal. Data input in the cycle in which the HD is asserted (high) is fetched and output to the memory continuously.

Figure 36.12 and Figure 36.13 show the interface timing in data enable fetch mode.

Figure 36.12 Data Enable Fetch Timing (HD Asserted (High) While VD is High)

Figure 36.13 Data Enable Fetch Timing (HD Asserted (High) When VD is Not High)

This module starts fetching data at the rising edge of the VD and stops fetching data at the falling edge of the VD in data enable fetch mode. Thus, if the VD remains high and does not go low, end processing does not start. In addition, if the VD remains high and the HD also remains asserted, data continues to be fetched.

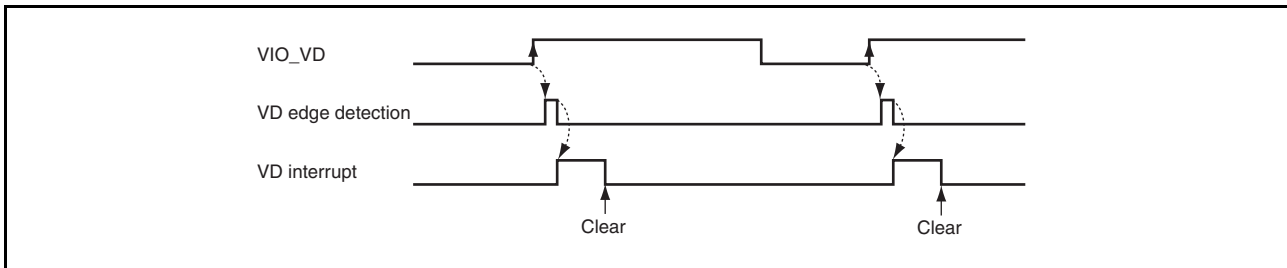

Figure 36.14 Relationship between VIO_VD and VD Interrupt when VD is High-Active

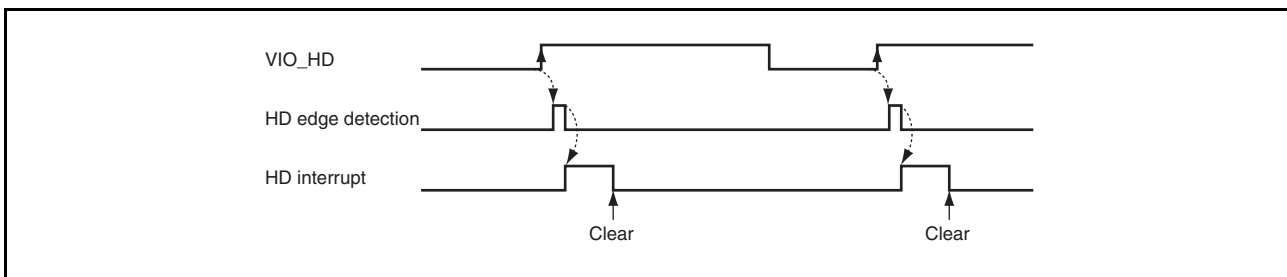

Figure 36.15 Relationship between VIO_HD and HD Interrupt when HD is High-Active

36.4.4 Capture Interface Cycle Register (CMCYR)

CMCYR is used to detect an illegal VD and an illegal HD. For HD, the number of cycles from a rising edge of HD to the next rising edge is set (falling edges when low-active is selected for HD). For VD, the number of HD inputs from a rising edge of VD to the next rising edge is set (falling edges when low-active is selected for VD).

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Set 0 in all bits of this register, during data enable fetch mode.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	VCYL[13:0]	H'0000	R/W	Vertical HD Count of External Module These bits set the number of VD cycles of an external module with the number of HD inputs. The interrupt source bit IGVS in CETCR is set to 1 when the actual number of VD cycles input from the external module differs from this setting. Set these bits for detecting an illegal VD. When these bits are all cleared to 0, the interrupt source bit IGVS in CETCR is not set to 1. Though the interrupt source bit IGVS in CETCR may be set to 1 after the VDPOL bit (VD polarity) in CAMCR is changed, this interrupt should be ignored.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	HCYL[13:0]	H'0000	R/W	Horizontal Cycle Count of External Module These bits set the number of HD cycles of an external module. The interrupt source bit IGHS in CETCR is set to 1 when the actual number of HD cycles input from the external module differs from this setting. Set these bits for detecting an illegal HD. When these bits are all cleared to 0, the interrupt source bit IGHS in CETCR is not set to 1. Though the interrupt source bit IGHS in CETCR may be set to 1 after the HDPOL bit (HD polarity) in CAMCR is changed, this interrupt should be ignored.

36.4.5 Capture Interface Offset Register (CAMOR)

CAMOR sets the location to start capturing when capturing images.

Since the number of HD (horizontal sync signal) inputs from a VD (vertical sync signal) input to the start of a valid image period, and the number of clock cycles from an HD input to the start of a valid image period differ among external modules, these must be set in CAMOR. By setting a value greater than the valid image area, part of the image can be clipped for capture. When fetching data, the setting of this register becomes the number of cycles (HD count) up to the start of a valid data period.

This register is not used, during data enable fetch mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	VOFST[11:0]	H'000	R/W	These bits specify the capture start location in terms of the HD count from a vertical sync signal (1-HD units). The blanking period from a vertical sync signal differs among external modules. Therefore, the vertical capture start location must be specified by these bits in terms of the HD count from a vertical sync signal so that an image can be captured from the valid image area (see Figure 36.16). Some external modules output a vertical sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 36.17).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	HOFST[12:0]	H'0000	R/W	These bits specify the capture start location in terms of the number of clock cycles from a horizontal sync signal (1-cycle units). The blanking period from a horizontal sync signal differs among external modules. Therefore, the horizontal capture start location must be specified by these bits in terms of external input clock cycles from a horizontal sync signal so that an image can be captured from the valid image area. This is similar in data synchronous fetch mode (see Figure 36.18). Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 36.19). Note: The first HD (horizontal sync signal) being input simultaneously or after the first VD (vertical sync signal) is the operating condition of the CEU. These inputs are affected by the polarities (set by the VDPOL and HDPOL bits in CAMCR).

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18	VWDTH[11:2]	H'000	R/W	These bits specify the vertical capture period (4-HD units). These bits specify the number of lines (HD count) to be captured from the location specified by the VOFST bits in CAMOR. Figure 36.20 shows the timing when the vertical blanking period is 0. The CEU captures only the number of lines (HD count) specified by these bits in the vertical direction. Make a setting in the same way to obtain data synchronization. The maximum value to be set is 768 HD (WVGA, VGA).
17, 16	VWDTH[1:0]		R	
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 1	HWDTH[12:1]	H'0000	R/W	These bits specify the horizontal capture period. These bits specify the number of cycles to be captured from the location specified by the HOFST bits. Figure 36.21 shows the timing when the horizontal blanking period is 0. The CEU captures for only the number of cycles specified by these bits in the horizontal direction. Make a similar setting for data synchronous fetch. The maximum value to be set is as follows: Image capture (8-cycle units) : 2,560 cycles (1,280 pixels) Data synchronous fetch (4-cycle units) : 2,560 cycles (2,560 bytes) Note: In data synchronous fetch mode, set CFSZR and CDWDR according to the values set in this register. For details, see the descriptions on CFSZR and CDWDR.

36.4.7 Capture Interface Input Format Register (CAIFR)

CAIFR sets the input mode (progressive or interlace) for capturing images, the images to be captured (frame, both-field, or one-field), and the image from which capturing starts (top field, bottom field, etc.). CAIFR is not used in data fetch mode.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

The items set by CAIFR are listed in Table 36.7.

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	IFS	0	R/W	Sets the input mode for capturing images. 0: Progressive 1: Interlace
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CIM	0	R/W	Sets the images to be captured. Clear this bit to 0 when the input mode for image capture is progressive (frame image) or when the input mode for image capture is interlace for continuous capture of both the top and bottom fields. Set this bit to 1 when the input mode for image capture is interlace for capture of only a one-field image. 0: Capture of frame image (1 VD) or both-field image (2 VD) 1: Capture of one-field image (1 VD)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	FCI[1:0]	00	R/W	These bits set the timing to start capturing. The timing to start capturing is set by specifying the image to be captured first. Set these bits to 00 when the input mode is progressive. 00: Capture starts from the VD input immediately after the CEU activation regardless of it being a top or bottom field 01: After the CEU activation, input of a top-field image is waited, and then capture starts from the top field 10: After the CEU activation, input of a bottom-field image is waited, and then capture starts from the bottom field 11: Setting prohibited

Table 36.7 CAIFR Setting Items

Input Mode	IFS Bit	Captured Image	CIM Bit	Image to Start Capture	FCI Bits
Progressive	0	Frame	0	Frame immediately after activation	00
Interlace	1	Both-field (2-VD capture)	0	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11
		One-field (1-VD capture)	1	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11

In frame image capture and one-field image capture, a one-frame capture end interrupt occurs when capture for 1 VD finishes. In both-field image capture, a one-field capture end interrupt occurs when capture for 1 VD finishes and a one-frame capture end interrupt occurs when capture for 2 VD finishes. At this time, a one-field capture end interrupt occurs simultaneously with a one-frame capture end interrupt. Figure 36.23 shows the timing of a one-frame capture end interrupt and one-field capture end interrupt in both-field image capture.

Figure 36.22 One-Frame Capture End Interrupt and One-Field Capture End Interrupt in Both-Field Image Capture

A captured frame image or captured one-field image is stored in the memory from the addresses set in CDAYR and CDACR (Figure 36.23). Captured both-field images are stored in different memory areas depending on whether it is a top-field or bottom-field image. A top-field image is stored in the memory from the addresses set in CDAYR and CDACR whereas a bottom-field image is stored in the memory from the addresses set in CDBYR and CDBCRCR (Figure 36.24).

Figure 36.23 Image of Storing Captured Frame Image or Captured One-Field Image in Memory

Figure 36.24 Image of Storing Captured Both-Field Images in Memory

If the FCI bits are set to B'00 for continuous capture in interlace input mode, images are continuously captured for 2 VD with the first captured field as the reference in both-field image capture (Figure 36.25). In one-field image capture, only the first captured field is continuously captured for 1 VD (Figure 36.26).

Figure 36.25 Continuous Both-Field Capture in Interlace Mode (Image Immediately after Activation is Top Field (FCI Bits = B'00))

Figure 36.26 Continuous One-Field Capture in Interlace Mode (Image Immediately after Activation is Top Field (FCI Bits = B'00))

(1) Storage of Interlace Input as Frame Image

The CEU can store an interlace source image in the memory as a frame image. To store an interlace source image as a frame image, make the following register settings:

Input mode: Interlace (IFS bit = B'1)

Capture image: Both-field (CIM bit = B'0)

Image to start capture: Any setting other than the prohibited setting (FCI bits = as desired)

Figure 36.27 shows a memory image of capturing both fields of an interlace input and storing it as a frame image in the memory. Set the start addresses of the memory destination for the captured top-field image in CDAYR and CDACR, and the start addresses of the memory destination for the captured bottom-field image in CDBYR and CDBCR. When storing an interlace image as a frame image in the memory, set the horizontal image size of the memory area in CDWDR with the top-field image and bottom-field image placed next to each other as shown in Figure 36.27. In addition, set the number of captured lines of the field image in the VWDTH bits in CAPWR.

A memory image of folding the horizontal image size of the memory area in Figure 36.27 at CDWDR/2 is shown in Figure 36.28. Setting the registers to form the image in Figure 36.27 enables an interlace image to be stored as a frame image in the memory as shown in Figure 36.28.

Figure 36.27 Image of Storing Captured Both-Fields of Interlace Input in Memory

Figure 36.28 Image of Storing Interlace Input as Frame Image in Memory

36.4.8 CEU Register Control Register (CRCNTR)

CRCNTR controls switching of the planes of registers with a 2-plane configuration.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	RVS	0	R/W	Sets the timing to switch the register plane in both-field capture. The setting of this bit is valid only when the RC bit is 1 in both-field capture. 0: Switches the register plane every 2 VD 1: Switches the register plane every 1 VD
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	RS	0	R/W	Specifies which register plane is used by the CEU in synchronization with VD. The setting of this bit is valid only when the RC bit is 0. 0: Uses plane A of the register 1: Uses plane B of the register
0	RC	0	R/W	Specifies switching of the register plane used by the CEU in synchronization with VD. If the register plane is not switched, the register plane specified by the RS bit is used. 0: Uses the specified register plane in synchronization with VD 1: Switches the register plane in synchronization with VD

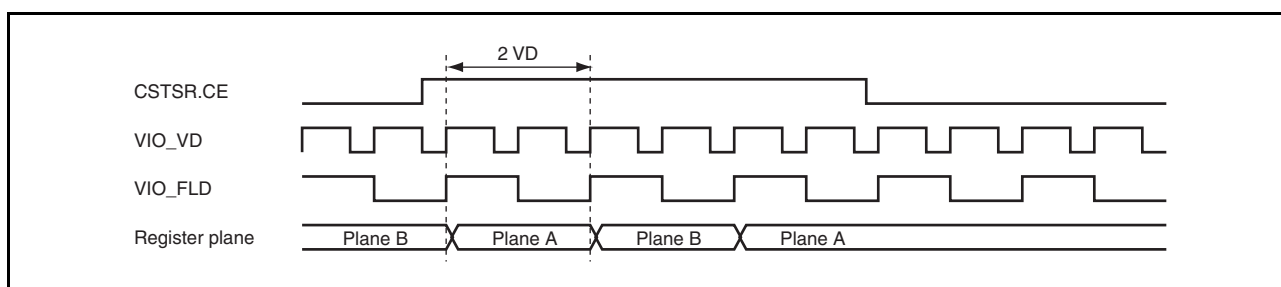

Figure 36.29 Timing for Register Plane Switching when RVS Bit is B'0

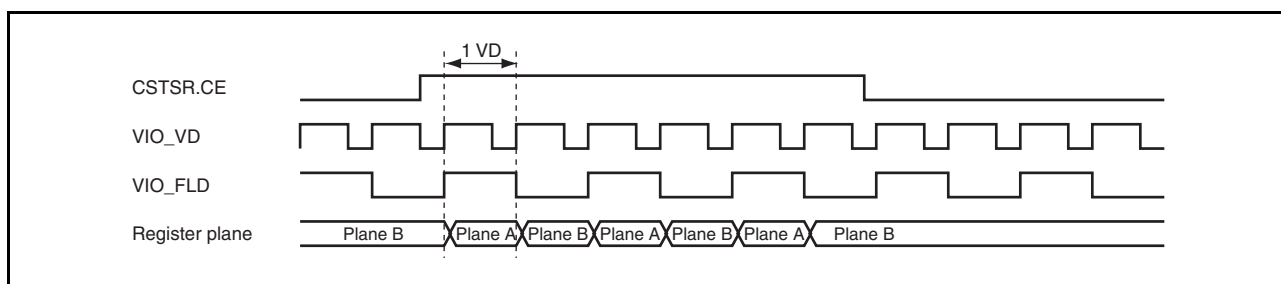

Figure 36.30 Timing for Register Plane Switching when RVS Bit is B'1

36.4.9 CEU Register Forcible Control Register (CRCMPR)

CRCMPR forcibly controls switching of the planes of registers with a 2-plane configuration. Setting this register enables direct control of register plane switching.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RA	0	R/W	Indicates the register plane currently specified. This register value automatically changes in synchronization with VD for starting capture. To start capture with plane A of the register when a setting to switch the register plane in synchronization with VD has been made (RC bit in CRCNTR is 1), specify plane B of the register using this bit. 0: Specifies plane A of the register 1: Specifies plane B of the register

36.4.10 Capture Filter Control Register (CFLCR)

CFLCR sets the scale-down factor for the filter to scale images down.

The CEU has an image scale-down filter which can be used to scale down the captured images before storing them in the memory. Set CFLCR to 0 when not performing scale-down (same size output). If a value other than 0 is set in CFLCR, scale-down is performed. In data fetch mode, set CFLCR to 0.

When handling an interlace source image as a frame image, set CFLCR to 0 not to use the filter.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VMANT[3:0]				VFRAC[11:0]

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	VMANT[3:0]	H'0	R/W	Mantissa Part of Vertical Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the VMANT bits and H'000 is set for the VFRAC bits, the scale-down filter is not used.
27 to 19 18 to 16	VFRAC[11:3] VFRAC[2:0]	H'000	R/W R	Fraction Part of Vertical Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the VMANT bits must be set with these bits.
15 to 12	HMANT[3:0]	H'0	R/W	Mantissa Part of Horizontal Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the HMANT bits and H'000 is set for the HFRAC bits, the scale-down filter is not used.
11 to 3 2 to 0	HFRAC[11:3] HFRAC[2:0]	H'000	R/W R	Fraction Part of Horizontal Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the HMANT bits must be specified with these bits.

An image scale-down filter is installed in the CEU, and the captured images can be scaled down and stored in the memory.

Figure 36.31 Scale-Down of Captured Image

The formulas for obtaining the MANT (VMANT or HMANT) and FRAC (VFRAC or HFRAC) values from the input pixel count and output pixel count of the filter are shown below. Set the MANT and FRAC bits in order to obtain the desired output pixel count from the number of pixels input to the CEU.

First, calculate preliminary MANT and FRAC values. The parameters needed for calculation are defined as follows:

$$\alpha = MANT \times 4096 + FRAC \quad \dots \text{Formula 1}$$

$$SCL \text{ (scaling factor)} = \frac{4096}{\alpha} \quad \dots \text{Formula 2}$$

Assuming an operator $\lfloor x \rfloor$ which discards fractions of an integer x , the MANT and FRAC values can be temporarily set as follows, according to formula 1 and formula 2.

$$MANT = \left\lfloor \frac{1}{SCL} \right\rfloor, \quad FRAC = \left\lfloor 512 \times \left(\frac{1}{SCL} - MANT \right) \right\rfloor \times 8$$

Here, the scaled-down filter output size ($SIZE_D$) can be calculated using the input image size S_{in} (half of the CAPWR setting) in the following formula.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \dots \text{Formula 3}$$

$$\left[\begin{array}{l} MANT_{pre} = 1 \rightarrow (0 \leq MANT < 2) \\ MANT_{pre} = 2 \rightarrow (2 \leq MANT < 4) \\ MANT_{pre} = 4 \rightarrow (4 \leq MANT < 8) \\ MANT_{pre} = 8 \rightarrow (8 \leq MANT) \end{array} \right]$$

The number of output pixels can be obtained by substituting the temporarily calculated MANT, FRAC, and input image size into these formulas. If the calculated number of output pixels is smaller than the number of output pixels used to obtain the preliminary MANT and FRAC values, recalculate with a smaller FRAC (α) value, and set the MANT and FRAC values in this register so that a pixel value greater than the desired number of output pixels can be obtained.

Example: Scale down 640 pixels to 480 pixels

$SCL = 480/640 = 3/4$, and the preliminary settings of $MANT = 1$, $MANT_{pre} = 1$, and $FRAC = H'550$ are made. Substituting these in the following formula results in an output pixel count of 479.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \dots \text{Formula 3}$$

Since this output pixel count is smaller than the desired output pixel count of 480, the formula is recalculated with a FRAC value of H'548, a value eight less than the previous time. The obtained result of output pixel count = 480 is equal to the desired output pixel count of 480, so this register is set as $MANT = 1$ and $FRAC = H'548$.

Table 36.8 Setting Examples for Each Scale-Down Filter Factor

Scale-Down Factor	FRAC		MANT	Input Pixel Count	Output Pixel Count	Clipping Size (CFSZR)
	Decimal	Hexadecimal				
7/8	576	H'240	1	640	560	560
3/4	1352	H'548	1	640	480	480
5/8	2448	H'990	1	640	400	400
1/2	0	H'0	2	640	320	320
3/8	2728	H'AA8	2	640	240	240
1/3	0.0	H'0	3	640	213	212
1/4	0.0	H'0	4	640	160	160
1/5	0.0	H'0	5	640	128	128
1/6	0.0	H'0	6	640	107	104
1/7	0.0	H'0	7	640	91	88
1/8	0.0	H'0	8	640	80	80
1/16	4088	H'FF8	15	640	40	40

Note: This scale-down filter uses a VGA-size line memory for scale-down. Therefore, when an image larger than the VGA size is input for scale-down, settings must be made so that the output image size is equal to or larger than the SubQCIF size and equal to or smaller than the VGA size. When an image is not scaled down (same size output), this restriction does not apply.

36.4.11 Capture Filter Size Clip Register (CFSZR)

CFSZR sets the clipping size for fine adjustment of the image size output from the filter, and must be set in combination with CFLCR. When clipping the output size of the filter, set the clipping size as a number of pixels, and the setting unit should be four pixels. CFSZR must be set even when scale-down is not performed (same size output).

In data synchronous fetch mode, set CFSZR according to the setting of CAPWR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	VFCLP[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HFCLP[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18 17, 16	VFCLP[11:2] VFCLP[1:0]	H'000	R/W R	These bits set the vertical clipping value of the filter output size (4-pixel units).
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 2 1, 0	HFCLP[11:2] HFCLP[1:0]	H'000	R/W R	These bits specify the horizontal clipping value of the filter output size (4-pixel units).

The scale-down filter in the CEU may output an odd number of pixels or lines depending on the settings. To adjust the output size of the filter, the CEU clips the destination image by using the number of pixels specified in CFSZR, as shown in Figure 36.32. The clipping size must be specified vertically and horizontally in 4-pixel units.

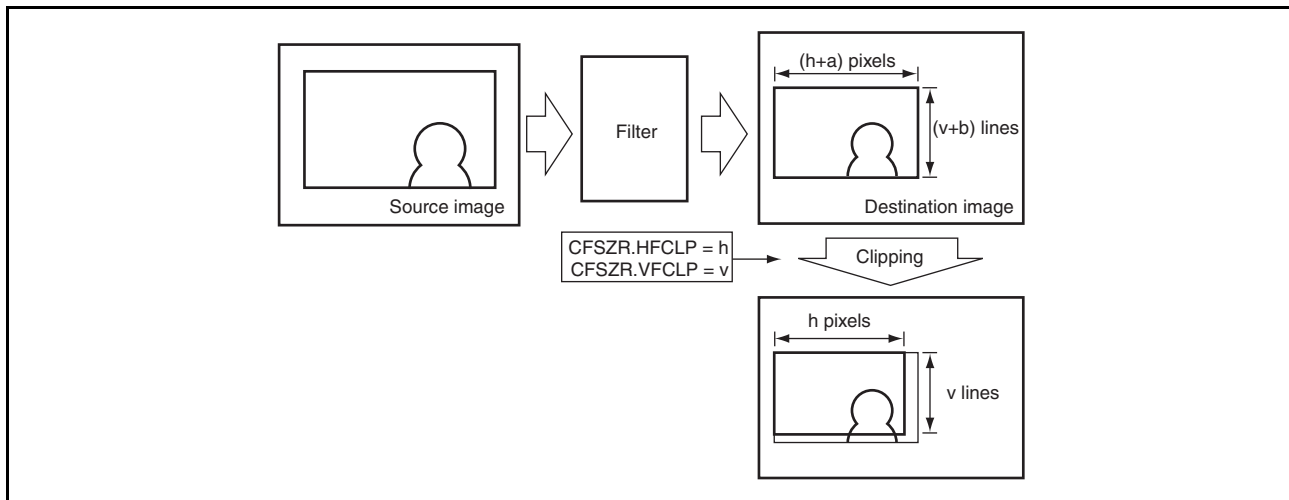

Figure 36.32 Clipping of Image Output from Filter

The pixels to be clipped are counted from the top-left corner of a display. The pixels located to the right of the specified number of pixels or below the specified number of lines are discarded by the clipping function. If the number of pixels specified in CFSZR is larger than that output from the filter, correct operation cannot be guaranteed. To avoid this, the clipping size specified in CFSZR must be equal to or smaller than the number of pixels output from the filter.

Note: In data synchronous fetch mode, the following settings are required. Data cannot be fetched correctly unless the following settings are made.

VFCLP = CAPWR.VWDTH

HFCLP = CAPWR.HWDTH/2

36.4.12 Capture Destination Width Register (CDWDR)

CDWDR sets the horizontal image size in the memory area where the captured image is to be output in 4-byte units (4-pixel units).

In data synchronous fetch mode, set CDWDR according to the setting of CAPWR.

This register is not used, during data enable fetch mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 2 1, 0	CHDW[12:2] CHDW[1:0]	H'0000	R/W R	These bits specify the horizontal image size in the memory area where the captured image is to be stored (4-byte units). The image data captured by the CEU is stored in the memory. If the right end of the captured image does not match the horizontal image size in the memory area as shown in Figure 36.33, some addresses must be skipped at the right end of the image when storing the captured image. Therefore, the horizontal image size in the memory area where the captured image is to be stored must be set in these bits. The maximum value to be set is 8188 bytes (8188 pixels). In data synchronous fetch mode, set as follows: CHDW = CAPWR.HWDTH

Figure 36.33 Captured Image and Memory Area Image

36.4.13 Capture Data Address Y Register (CDAYR)

CDAYR specifies the address where the luminance (Y) component of the captured data is to be stored in frame image capture or one-field image capture, the address where the luminance (Y) component of the captured top field is to be stored in both-field image capture, and the address where the fetched data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y (luminance) component of the captured data is to be stored by CDAYR. In both-field image capture, set the start address of the memory area where the Y (luminance) component of the captured top-field image is to be stored by CDAYR. In data fetch, set the start address of the memory area where data is to be stored by CDAYR.

Because the address must be specified in 32 bits, the address set by CDAYR must be in longword units. As the setting is in 4-pixel units for image capture and 4-byte units for data fetch, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2 1, 0	CAYR[31:2] CAYR[1:0]	H'0000 0000	R/W R	<ul style="list-style-type: none"> • Frame image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y (luminance) component data of the captured top-field data (4-pixel units). • Data fetch: These bits set the address for storing data (4-byte units). • Data enable fetch bundle write: These bits set the address for storing data (32-byte units).

Set the address of the starting point of the memory area where the fetched data is to be stored in this register, as shown in Figure 36.34.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.
- Data fetch: Set the address of the starting point of the memory area where the fetched data is to be stored. In data fetch mode, the data is simply stuffed in order from the start address so the end address becomes as follows:

End address = CDAYR + number of fetched bytes

- Data enable fetch bundle write: Set the address in 32-byte units.

Figure 36.34 Relationship between Captured Image and Y Component Memory Area

36.4.14 Capture Data Address C Register (CDACR)

CDACR specifies the address where the chrominance (C) component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the chrominance (C) component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C (chrominance) component of the captured data is to be stored by CDACR. In both-field image capture, set the start address of the memory area where the C (chrominance) component of the captured top-field image is to be stored by CDACR. CDACR is not used in data fetch.

Because the address must be specified in 32 bits, the address set by CDACR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CACR[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units).
1, 0	CACR[1:0]		R	• One-field image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C (chrominance) component data of the captured top-field data (4-pixel units).

Set the address of the starting point of the memory area where the C component of the captured image is to be stored in this register, as shown in Figure 36.35. The C component has an output data format like that in Figure 36.36, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

Figure 36.35 Relationship between Captured Image and C Component Memory Area

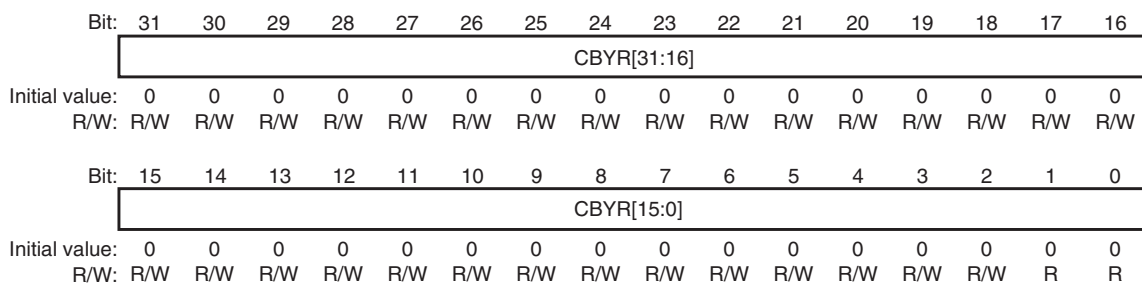

Figure 36.36 Image of Storing C Components in Memory

36.4.15 Capture Data Bottom-Field Address Y Register (CDBYR)

CDBYR specifies the address where the luminance (Y) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y (luminance) component of the captured bottom-field image is to be stored by CDBYR. CDBYR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBYR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CDBYR[31:2]	H'0000 0000	R/W	These bits set the address for storing the Y (luminance) component data of the captured bottom-field data (4-pixel units).
1, 0	CDBYR[1:0]		R	

Set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in this register, as shown in Figure 36.37.

Figure 36.37 Relationship between Captured Bottom-Field Image and Y Component Memory Area

36.4.16 Capture Data Bottom-Field Address C Register (CDBCR)

CDBCR specifies the address where the chrominance (C) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C (chrominance) component of the captured bottom-field image is to be stored by CDBCR. CDBCR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBCR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBCR[31:2]	H'0000 0000	R/W	These bits set the address for storing the C (chrominance) component data of the captured bottom-field data (4-pixel units).
1, 0	CBCR[1:0]		R	

Set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in this register, as shown in Figure 36.38. The C component has an output data format like that in Figure 36.39, and is saved in the memory in this format.

Figure 36.38 Relationship between Captured Bottom-Field Image and C Component Memory Area

Figure 36.39 Image of Storing C Components in Memory

36.4.17 Capture Bundle Destination Size Register (CBDSR)

CBDSR sets the size of output to memory in a bundle write. The number of output lines should be specified for image capture or data synchronous fetch. The number of bytes should be specified for data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CBVS[22:16]

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CBVS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	CBVS[22:3] CBVS[2:0]	H'000	R/W R	These bits select the number of lines or number of bytes for output to the memory in a bundle write. Image capture and data synchronous fetch: Number of lines for output to the memory in a bundle write. Unit: 8 lines, min.: 8 lines, max.: 768 lines (H'300) Data enable fetch: Number of bytes for output to the memory in a bundle write. Unit: 32 bytes, min.: 512 bytes, max.: 6291456 lines (H'600000)

(a) Image capture and data synchronous fetch

Set the number of lines of captured data to be written to the memory by a bundle write as a multiple of eight. This register is valid only when the CBE bit in CDOCR is 1. When the CBE bit in CDOCR is 1 and this register cleared to H'0, this module operates with the number of lines of captured data to be written to the memory as eight. The maximum number of lines that can be set is 768 (H'300). Only bits CBVS[11:3] are valid.

Figure 36.40 Image of Storing Captured Image in Memory by Bundle Write

(b) Data enable fetch

Set the number of bytes of captured data to be written to the memory by a bundle write as a multiple of 32. This register is valid only when the CBE bit in CDOCR is 1. The minimum settable size is 512 bytes. When a number smaller than 512 bytes is specified, operation is not guaranteed.

36.4.18 Capture Low-Pass Filter Control Register (CLFCR)

CLFCR specifies whether or not to operate the low-pass filter. In data fetch mode, clear the LPF bit to B'0.

The characteristic of the low-pass filter installed in the CEU causes the phase location of the image processed by the low-pass filter to be shifted right by one pixel compared to the raw image.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LPF	0	R/W	Enables or disables operation of the low-pass filter. The low-pass filter removes high-frequency components from the destination image in the horizontal direction. Clear this bit to 0 in data fetch mode. 0: Low-pass filter not used 1: Low-pass filter used (only in the horizontal direction)

36.4.19 Firewall Operation Control Register (CFWCR)

CFWCR specifies the upper limit of the write addresses in data enable fetch. When the VD input from an external module does not go low and end notification is not given, this register can prevent writing to memory from being out of control.

This register is enabled only in data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FWV[26:11]

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	FWV[26:0]	H'0000008	R/W	These bits specify the upper limit of a write address. Specify the upper 27 bits of the 32-bit address. The upper limit of an address is $FWV[26:0] \ll 5 + H'1F$.
4 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FWE	0	R/W	With the setting of FWE = 1, when an address exceeds the value set with FWV, the address is retained and an interrupt source FWF is set. After this, the address is not incremented and data is overwritten on the upper limit address. 0: Firewall is not activated. 1: Firewall is activated.

36.4.20 Capture Data Output Control Register (CDOCR)

CDOCR sets the format for outputting captured data to the memory. In data fetch mode, set the CDS bit to B'1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	CBE	0	R/W	<p>Controls the number of lines of captured data to be written to the memory.</p> <ul style="list-style-type: none"> • Image capture This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDACR, and CDAYR2 and CDACR2 (CDBYR and CDBCR, and CDBYR2 and CDBCR2 for the bottom field in both-field capture) alternately (Figure 36.41). When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame (one-field) capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data synchronous fetch This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data enable fetch This bit controls the number of bytes of captured data to be written to the memory. When bundle write is set by this register, captured data is written in byte units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of bytes set by CBDSR, a write end interrupt corresponding to each address setting register occurs. Also, only in data enable fetch, a bundle write end interrupt occurs when bundle write has finished after write for one-frame capture ends. Table 36.9 shows the correspondence between address setting registers and write end interrupt sources. Figure 36.42 shows the timing of write end interrupts in image capture and data synchronous fetch. Figure 36.43 shows the timing of write end interrupts in data enable fetch. <p>0: Normal write 1: Bundle write</p>
15 to 5	—	All 0	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>
4	CDS	0	R/W	<p>Sets the image format when outputting the image data captured in the YCbCr 422 format to the memory. When 0 is written to this bit, only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines. With an interlace source image, similarly only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines of the field. In data fetch mode, set this bit to 1. 0: Converts the YCbCr 422 format to the YCbCr 420 format before outputting data to the memory 1: Outputs data in the YCbCr 422 format to the memory without conversion</p>
3	—	0	R	<p>Reserved This bit is always read as 0. The write value should always be 0.</p>
2	COLS	0	R/W	<p>Controls swapping in 32-bit units for data output from the CEU. 0: Data is not swapped in 32-bit units 1: Data is swapped in 32-bit units</p>
1	COWS	0	R/W	<p>Controls swapping in 16-bit units for data output from the CEU. 0: Data is not swapped in 16-bit units 1: Data is swapped in 16-bit units</p>
0	COBS	0	R/W	<p>Controls swapping in 8-bit units for data output from the CEU. 0: Data is not swapped in 8-bit units 1: Data is swapped in 8-bit units</p>

CDBYR2, CDBCR2	CPBE4 bit in CETCR

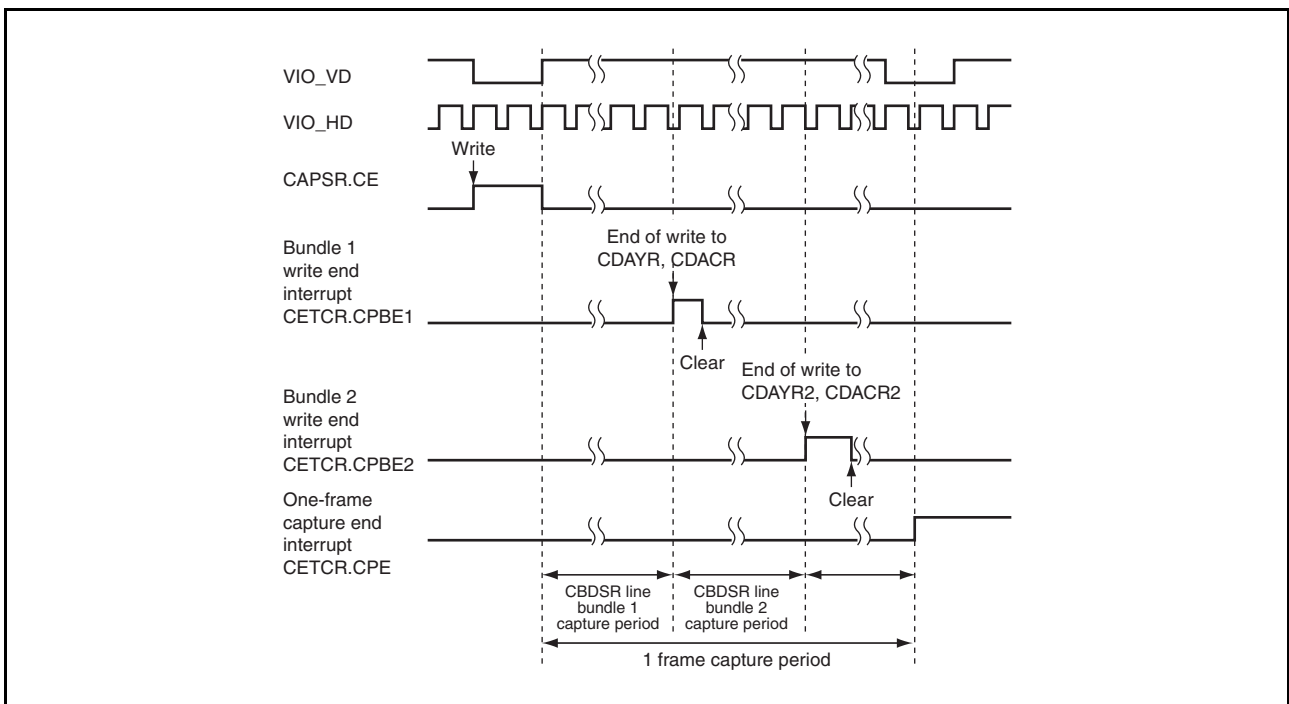

Figure 36.42 Timing of Write End Interrupts (Image Capture, Data Synchronous Fetch)

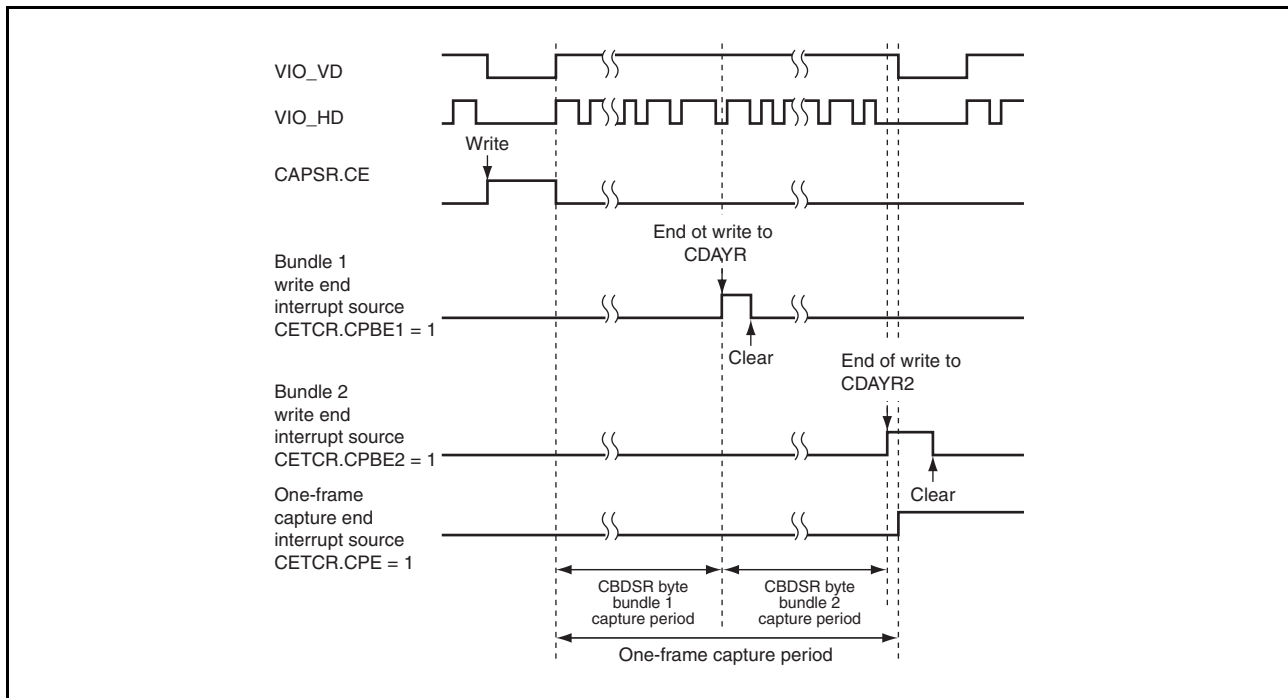

Figure 36.43 Timing of Write End Interrupts (Data Enable Fetch)

For data output from the CEU, the COLS, COWS, and COBS bits control swapping in 32-bit, 16-bit, and 8-bit units, respectively. Set these bits when data is misaligned because of a difference in endian. The data swapping bits are shown below. These bits can be set similarly in data fetch mode.

Data can be swapped in 8-bit, 16-bit, 32-bit units, or in 32 bits, 16 bits and 8 bits, as shown in Figure 36.44. To enable data swapping, set the corresponding control bit to B'1.

Figure 36.44 Data Swapping by Data Aligner

36.4.21 Capture Event Interrupt Enable Register (CEIER)

CEIER enables or disables interrupts of the event flag register that generates CEU interrupts.

0	CPEIE	0	R/W	One-Frame Capture End Interrupt Enable 0: Disables a one-frame capture end interrupt 1: Enables a one-frame capture end interrupt

36.4.22 Capture Event Flag Clear Register (CETCR)

CETCR notifies the CPU of the source of an interrupt that is generated in the CEU. The flags of CETCR can be used as interrupt signals. When the corresponding interrupt is enabled, an interrupt is generated. To clear the interrupt, clear the bit corresponding to the interrupt source to 0. After several cycles have passed after modifying the bit, the interrupt is cleared.

To clear the bit corresponding to the interrupt source to be cleared to 0 and retain that state, write 1 to that bit. For example, to clear only the CPE bit to 0, write H'FFFF FFFE to CETCR.

In CETCR, only bits to which 0 is written are cleared. Bits to which 1 is written retain their current values. To clear an interrupt source, write 0 only to the bit corresponding to the interrupt source to be cleared, and 1 to the other bits.

Note: Since the CETCR value becomes undefined in the following cases, clear all bits in CETCR to 0.

- VD and HD bits immediately after power-on reset or the deep-standby mode is entered
- All bits after the software standby or module standby mode is entered
- VD and HD bits after the polarities of the capture interface sync signals are changed

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

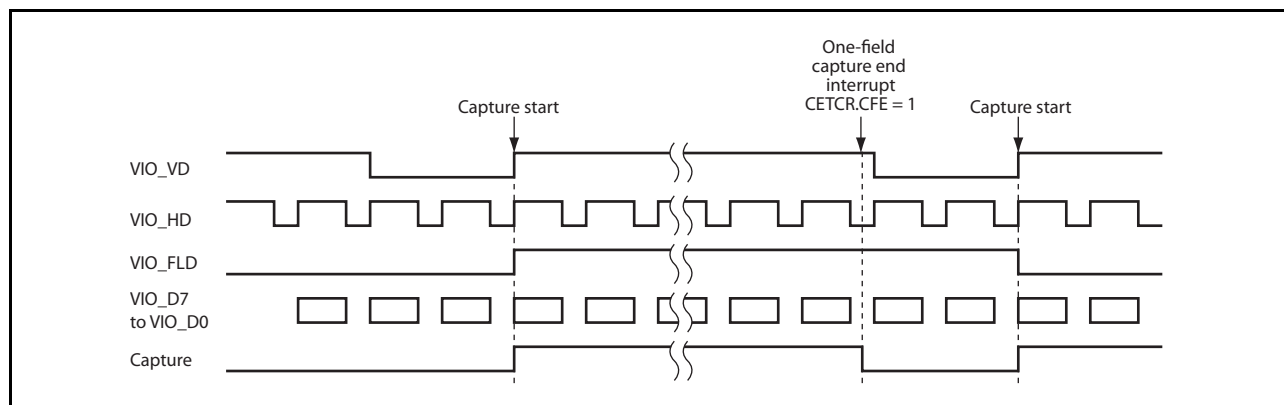

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	NVD	0	R/W	This bit is used for an interrupt indicating that no VD was input. A non-VD interrupt occurs when the 14-bit internal counter becomes full. Accordingly, this bit is set to 1 when no VD has been input for at least 16,383 lines since the last VD was input.
24	NHD	0	R/W	This bit is used for an interrupt indicating that no HD was input. A non-HD interrupt occurs when the 11-bit internal counter that is incremented every eight cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,376 cycles since the last HD was input. When connecting a camera whose HD is fixed low when VD is low, this bit may be set to 1. Ignore this interrupt during data enable fetch.

Bit	Bit Name	Initial Value	R/W	Description
23	FWF	0	R/W	The interrupt is generated when data is written to the address that exceeds the value specified with CFWCR.FMV. This bit is set to 1 when data is written to the address that exceeds the value specified with CFWCR.FMV while CFWCR.FWE = 1.
22, 21	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	VBP	0	R/W	This bit is used for an interrupt indicating that VD has been input while the CEU holds data (insufficient vertical-sync front porch). The conditions for a VBP interrupt to occur are as follows: <ul style="list-style-type: none"> • Condition 1 VD is input when there is captured data within the CEU • Condition 2 The last transfer data cannot be internally detected due to a write buffer overflow or an illegal HD so that the end timing is unclear until the next VD (By generating a VBP interrupt at the VD input timing, capture fail can be announced.) When a VBP interrupt occurs, a capture end interrupt (CPE bit in CETCR) does not occur and the image of that frame is not captured correctly. Though a capture end interrupt (CPE bit) will occur on rare occasions, it should be ignored in this case. Capturing cannot be performed until the next VD (even if the CE bit (capture reservation signal) in CAPSR is 1, capturing does not start). In the case of condition 2, instead of waiting for a VBP interrupt to occur, execute a software reset (CPKIL bit in CAPSR) to stop capturing and then restart capturing. In this case, since capture operation is terminated without waiting for the next VD, a VBP interrupt does not occur and capturing can be performed from the next VD.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	IGVS	0	R/W	This bit is used for an interrupt generated when the number of VD cycles set in CMCYR differ from the number of VD cycles input from an external module. This bit is set to 1 when there is an illegal VD input from an external module. This bit is set to 1 when the number of HD cycles for the VD input to the CEU differs from the value set in the VCYL bits in CMCYR. Note however that when the VCYL bits are cleared to 0, this interrupt does not occur.
17	IGHS	0	R/W	This bit is used for an interrupt generated when the number of HD cycles set in CMCYR differ from the number of HD cycles input from an external module. This bit is set to 1 when there is an illegal HD input from an external module. This bit is set to 1 when the number of clock cycles for the HD input to the CEU differs from the value set in the HCYL bits in CMCYR. Note however that when the HCYL bits are cleared to 0, this interrupt does not occur.
16	CDTOF	0	R/W	This bit is used for an interrupt indicating that data overflowed in the CRAM of the write buffer. Since data is input at realtime from an external module in capture operations, the frame image is overwritten unless the captured data is transferred from the CEU internal buffer to the memory at a certain or higher transfer rate. This bit is set to 1 when writing the data in the CRAM of the CEU internal write buffer to the bus is not performed within time and data has overflowed.
15	CPBE4	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR2 and CDBCR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
14	CPBE3	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR and CDBCR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).

Bit	Bit Name	Initial Value	R/W	Description

36.4.23 Capture Status Register (CSTSR)

CSTSR indicates the internal status of the CEU. CSTSR differs from CETCR in that no interrupt is generated for the events indicated in CSTSR.

The CEU operating/halt state can be confirmed using CSTSR. To confirm the halt state of the CEU, make sure that the status bit (bit 0) indicating that the CEU is operating is cleared to 0 for sure.

31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	CRST	0	R	Indicates which register plane is currently used. 0: Plane A of the register is being used 1: Plane B of the register is being used
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPFLD	0	R	Indicates which field is being captured. 0: Bottom field is being captured 1: Top field is being captured
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CPTON	0	R	Indicates that the CEU is operating. This bit retains 1 during the period that starts from the internal VD at capture start and ends when a one-frame capture end interrupt occurs. Figure 36.47 shows the CEU operating period.

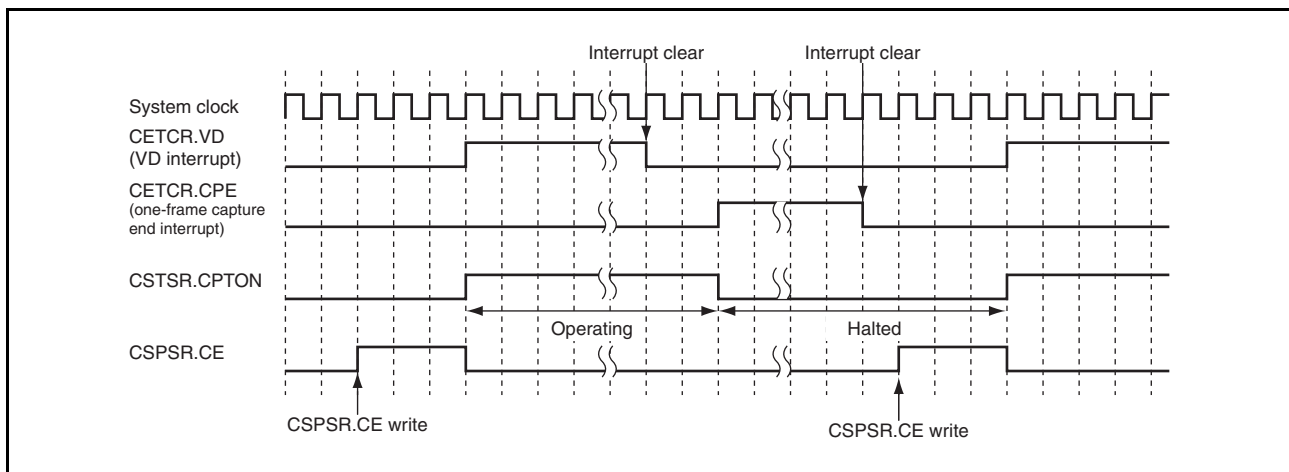

Figure 36.47 Operating Status during Capturing

36.4.24 Capture Data Size Register (CDSSR)

CDSSR indicates the size of data written to the memory in data enable fetch. As this register indicates a correct value at the end of capture, confirm this register when capture is completed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDSS[31:0]	H'0000 0000	R	<p>Indicate the size of data written to the memory in data enable fetch. In a bundle write, size of data written to the selected address at the end of one-frame capture is indicated. In a bundle write, as soon as the number of bytes specified by CBDSR is transferred to the bus, address to which data is written is switched.</p> <p>Therefore, if one-frame capture is completed at the same time as a bundle write is completed, this register indicates H'0000 0000. Figure 36.48 and Figure 36.49 show the overall timing of the CDSSR operation in a bundle write.</p>

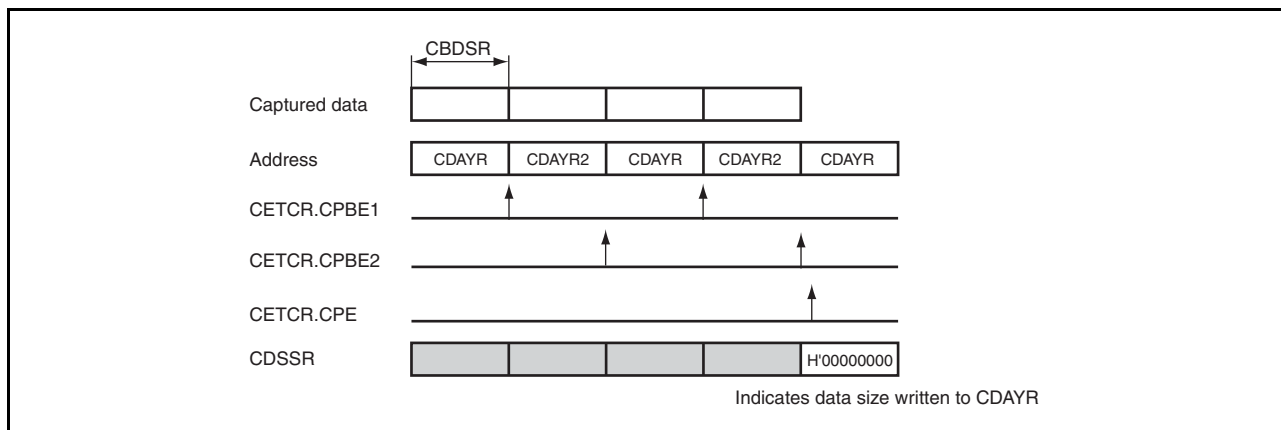

Figure 36.48 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Coincide)

Figure 36.49 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Do Not Coincide)

36.4.25 Capture Data Address Y Register 2 (CDAYR2)

CDAYR2 specifies the address for the luminance (Y) component used in a bundle write and the address for data storage in a bundle write in data fetch. CDAYR2 is used only in a bundle write.

CDAYR2 specifies the address where the Y component of the captured data is to be stored in frame image capture or one-field image capture, the address where the Y component of the captured top field is to be stored in both-field image capture, and the address where data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y component of the captured data is to be stored by CDAYR2. In both-field image capture, set the start address of the memory area where the Y component of the captured top-field image is to be stored by CDAYR2. In data fetch, set the start address of the memory area to be used for data storage.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CAYR2[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CAYR2[31:2]	H'0000 0000	R/W	<ul style="list-style-type: none"> • Frame image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y component data of the captured top-field data (4-pixel units). • Data synchronous fetch: These bits set the address for storing data (4-byte units). • Dana enable fetch: These bits set the address for storing data (32-byte units).
1, 0	CAYR2[1:0]		R	

Set the address of the starting point of the memory area where the Y component of the captured image is to be stored in this register, as shown in Figure 36.50.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.

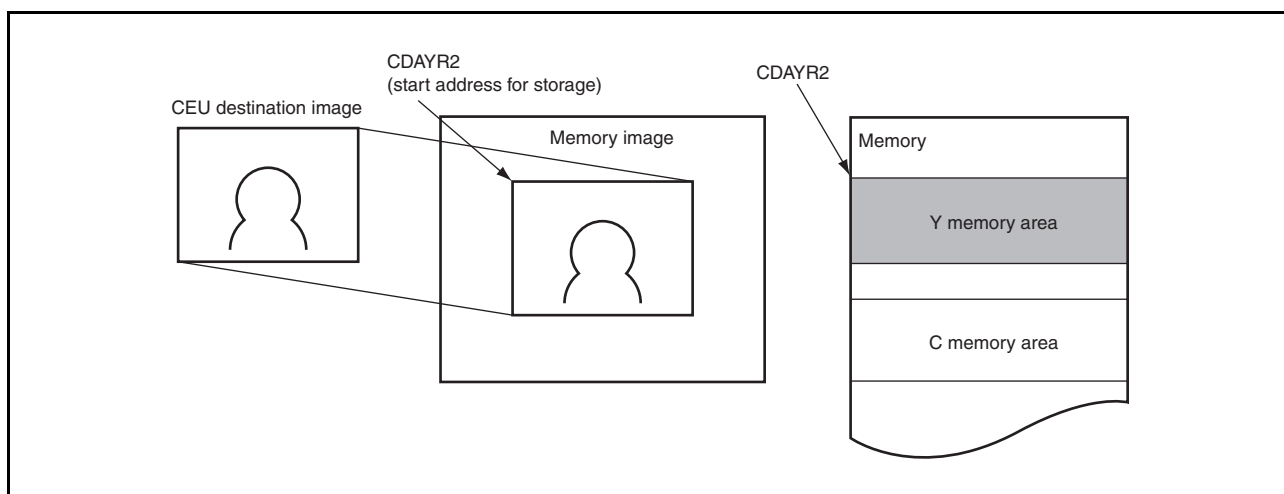

Figure 36.50 Relationship between Captured Image and Y Component Memory Area

36.4.26 Capture Data Address C Register 2 (CDACR2)

CDACR2 specifies the address for the chrominance (C) component used in a bundle write. CDACR2 is used only in a bundle write.

CDACR2 specifies the address where the C component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the C component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C component of the captured data is to be stored by CDACR2. In both-field image capture, set the start address of the memory area where the C component of the captured top-field image is to be stored by CDACR2. CDACR2 is not used in data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CACR2[31:16]

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CACR2[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CACR2[31:2]	H'0000 0000	R/W	<ul style="list-style-type: none"> • Frame image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C component data of the captured top-field data (4-pixel units).
1, 0	CACR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the captured data is to be stored in a bundle write, as shown in Figure 36.51. The C component has an output data format as shown in Figure 36.52, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

The C component has an output data format as shown in Figure 36.51, and is saved in the memory in this format.

Figure 36.51 Relationship between Captured Image and C Component Memory Area

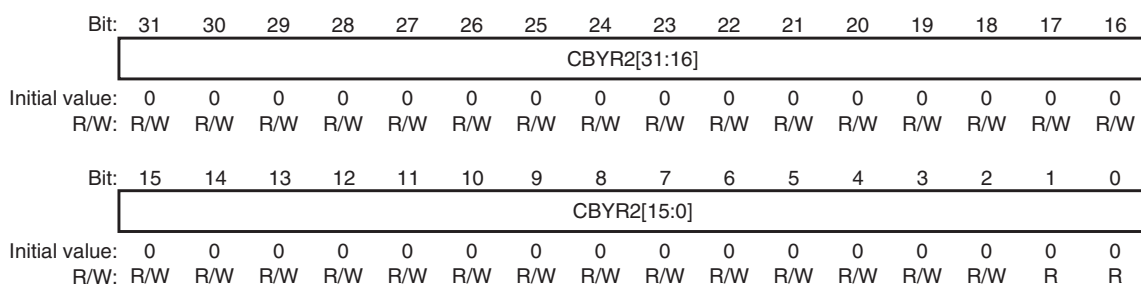

Figure 36.52 Image of Storing C Components in Memory

36.4.27 Capture Data Bottom-Field Address Y Register 2 (CDBYR2)

CDBYR2 specifies the address for the luminance (Y) component of the bottom field used in a bundle write. CDBYR2 is used only in a bundle write.

CDBYR2 specifies the address where the Y component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y component of the bottom-field image captured in both-field image capture is to be stored by CDBYR2. CDBYR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBYR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the Y component data of the captured bottom-field data (4-pixel units).
1, 0	CBYR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 36.53.

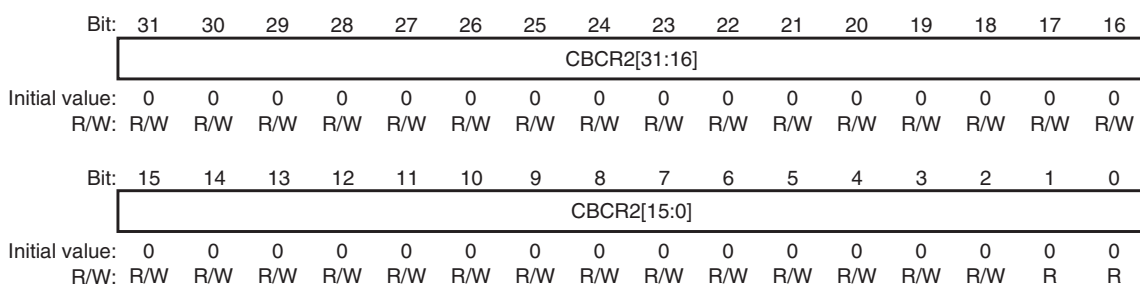

Figure 36.53 Relationship between Captured Bottom-Field Image and Y Component Memory Area

36.4.28 Capture Data Bottom-Field Address C Register 2 (CDBCR2)

CDBCR2 specifies the address for the chrominance (C) component of the bottom field used in a bundle write. CDBCR2 is used only in a bundle write.

CDBCR2 specifies the address where the C component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C component of the bottom-field image captured in both-field image capture is to be stored by CDBCR2. CDBCR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBCR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the C component data of the captured bottom-field data (4-pixel units).
1, 0	CBCR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 36.54. The C component has an output data format as shown in Figure 36.55, and is saved in the memory in this format.

Figure 36.54 Relationship between Captured Bottom-Field Image and C Component Memory Area

Figure 36.55 Image of Storing C Components in Memory

36.5 Usage Notes for CEU

36.5.1 Conditions for Connection to an External Module

(1) Clock Frequency

The external input clock should have a frequency at least the same as the CEU operating clock frequency ($B\phi$), with jitter on both sides included.

$$\text{CEU operating clock frequency (B}\phi\text{)} \geq \text{External input clock frequency}$$

(2) Blanking Period

The period from the last valid pixel in each line to the next horizontal sync signal HD must be at least 20 cycles.

(3) Fixed Period of Field Identification Signal

The field identification signal FLD should be fixed for at least 1-HD period since a VD input.

36.5.2 Restrictions on Input/Output Functions

Table 36.11 lists the restrictions regarding the CEU input/output functions.

Table 36.11 Restrictions on CEU Input/Output Functions

Item	Restrictions
External module interface	The operating clock of the external module (VIO_CLK) should always have a frequency at most the same as that of the CEU operating clock (Bφ), with jitter on both sides included.
	Selecting the interface, or modifying the frequency of the external module operating clock or HD/VD polarity must be done when capture operations are halted for sure.
	Specify the capture horizontal size in image capture in 8-cycle units.
	Specify the capture horizontal size in data fetch in 4-cycle units.
	The capture vertical size must be specified in 4-line units.
	The maximum number of cycles in the horizontal sync signal period should be 16,375 cycles of external input clock.
	The maximum number of lines (HD count) in the vertical sync signal should be 16,382 lines.
	The minimum number of captured pixels should be sub-QCIF (128 × 96).
	The maximum number of captured pixels should be WVGA (1,280 × 768) pixels.
	Captured size in data enable fetch Maximum: 6 Mbytes (2,048 × 1,536 × 2) Minimum: 16 bytes (must be specified in 4-byte units)
Memory output	The output address must be specified in 32-bit units.
	The horizontal size of the destination image (memory) must be specified in 4-pixel units.
	The number of horizontal output pixels (= horizontal clipping size) must be specified in 4-pixel units.
	The number of vertical output lines (HD) (= vertical clipping size) must be specified in 4-line (HD) units.
	In data enable fetch bundle write, the output address must be specified in 32-byte units.
Internal processing	The filter clipping size must be specified as a value equal to or lower than the actual output size of the filter.

36.5.3 Cooperation with Video Display Controller 5

Since the input data are written to the memory separately as Y data and CbCr data in image capture mode, the captured data cannot be displayed in the video display controller 5.

37. SCUX

The SCUX consists of sampling converters, digital volume units, and a mixer. It is connected to the SSIF module to have an interface with external modules.

37.1 Features

(1) [SRC] Sampling Rate Conversion

- Asynchronous or synchronous sampling rate conversion is possible*¹
- Sampling rate (synchronous mode)*²
Input [KHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable
Output [KHz]: 8, 16, 24, 32, 44.1, 48, or 96 is selectable
- Sampling rate (asynchronous mode)*²
Input/output [KHz]: 1 to 96
- Supported bit sizes are 16 bits and 24 bits
- Sound quality: -132 dB or less*³
- 1, 2, 4, 6, or 8 channels are supported*⁴
- DMA transfer with on-chip memory or external memory and direct transfer with the SSIF module are possible

Note 1. The synchronous mode can be selected only when the SCUX is connected to the FFD and FFU modules. For details, refer to section 37.4.5.

Note 2. The selectable sampling rates depend on the number of used channels and rate ratio. For details, refer to section 37.3.22 and section 37.4.7.

Note 3. The data format is a 24-bit value.

Note 4. The number of selectable channels depends on the sampling rate and route. For details, refer to section 37.4.7.

(2) [DVU] Digital Volume and Mute Functions

- Digital volume, volume ramp, and zero cross mute are provided as functions to adjust the volume
- The digital volume is set as a 24-bit fixed-point value within the range from a multiple of 0 to 8 (mute, -120 to 18 dB)
- Volume ramp can be used to perform soft mute, fade in, fade out, and volume change as desired
- The ramp time of volume ramp can be changed and set within the sampling range of 2^0 to 2^{23}
- Zero cross mute turns the sound mute at the zero cross point of audio data
- Direct transfer with the SSIF module and transfer with the mixer are possible

(3) [MIX] Mixer

- Data of two to four source systems can be mixed (added together) into one system
- The ratio to add the sources can be set
- The ratio can be changed dynamically
- Volume ramp enables mixing to be performed (ramp time is variable)
- Only direct transfer with the SSIF module is possible

Figure 37.1 shows a block diagram of the SCUX.

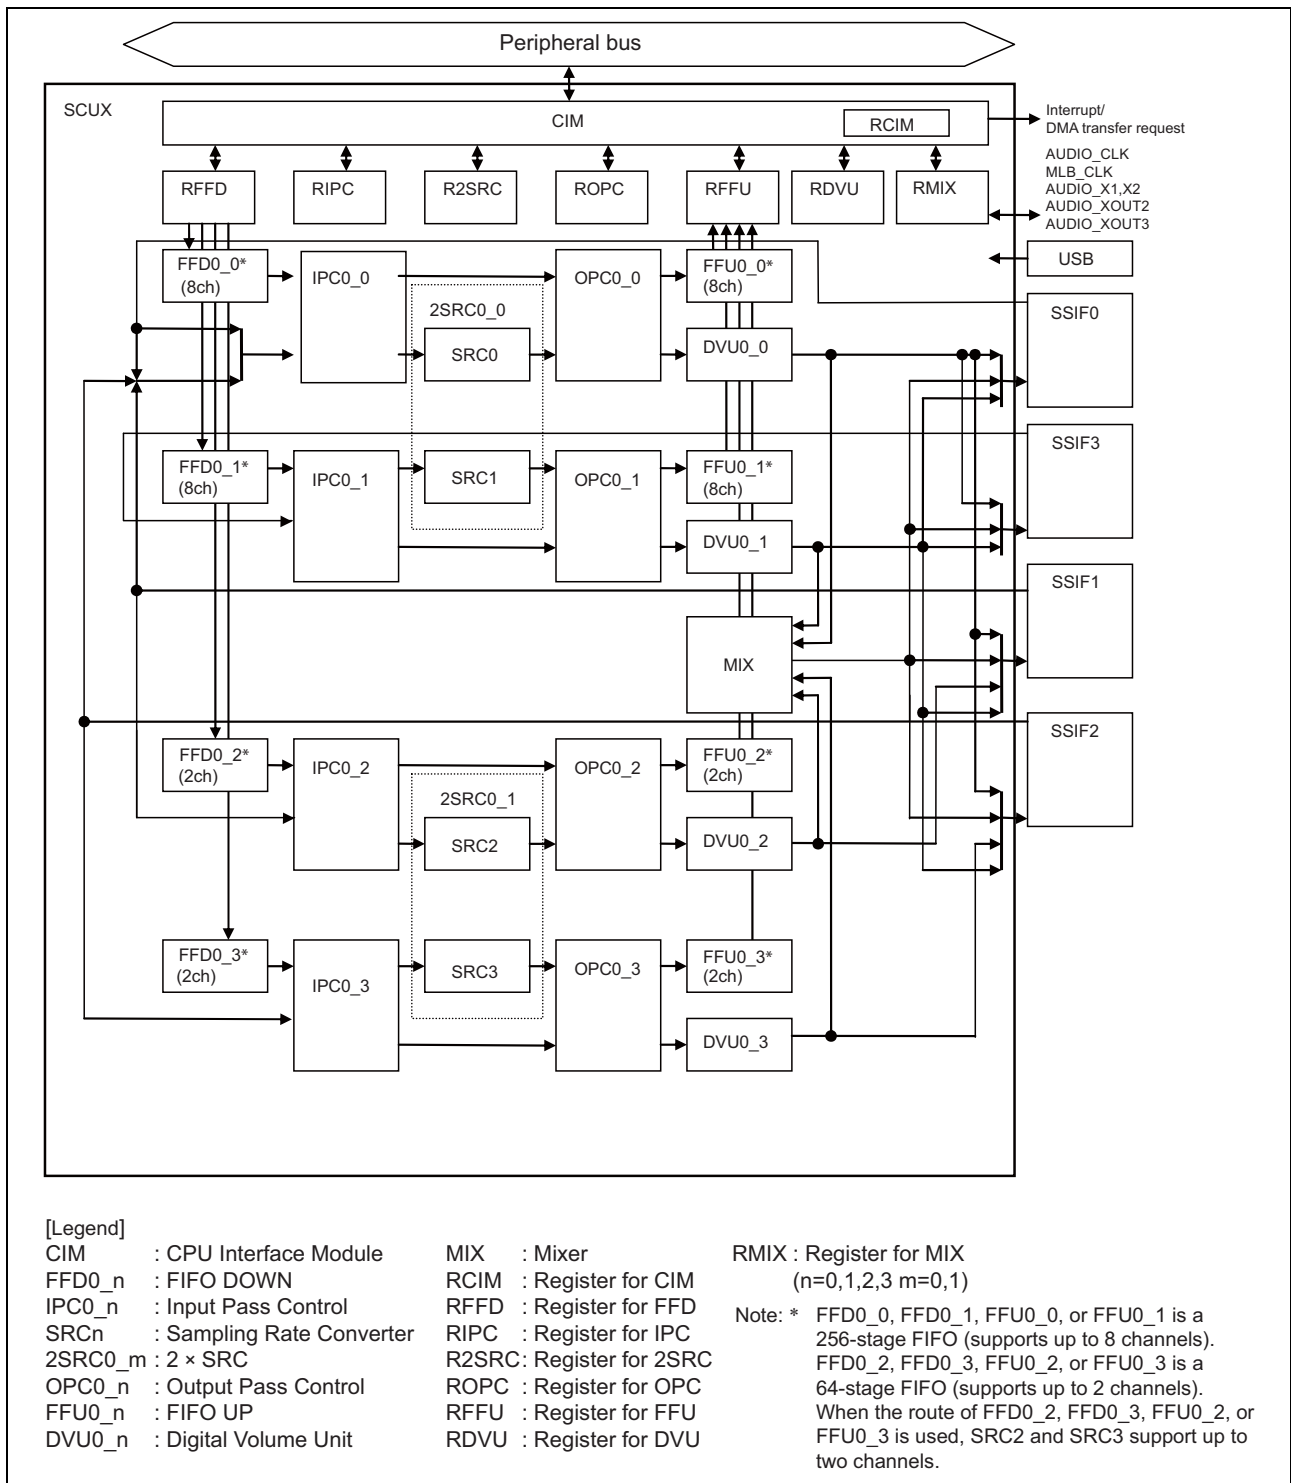

Figure 37.1 Block Diagram of SCUX

37.2 Input/Output Pins

Table 37.1 Pin Configuration

Name	I/O	Function
AUDIO_CLK	Input	External clock for audio Can be used in generating the sampling timing.
MLB_CLK	Input	External clock for MLB Can be used in generating the sampling timing.
AUDIO_X1	Input	Crystal resonator/external clock for audio Can be used in generating the sampling timing.
AUDIO_X2	Output	
AUDIO_XOUT2	Output	Output clock of AUDIO_X1 divided into two
AUDIO_XOUT3	Output	Output clock of AUDIO_X1 divided into three

37.3 Register Descriptions

Table 37.2 shows the register configuration.

Table 37.2 Register Configuration

	MIX route select register	MIXRSEL_CIM	R/W	H'76543210	H'E8209774	32

Note 1. Only 0 can be written to clear the flag. Writing 0 is ignored.

Note 2. Address H'E8209708 can be accessed in only 16-bit or 32-bit units.

Note 3. Address H'E820970C can be accessed in only 16-bit or 32-bit units.

Note 4. Address H'E8209710 can be accessed in only 16-bit or 32-bit units.

Note 5. Address H'E8209714 can be accessed in only 16-bit or 32-bit units.

Note 6. Address H'E8209718 can be accessed in only 16-bit or 32-bit units.

Note 7. Address H'E820971C can be accessed in only 16-bit or 32-bit units.

Note 8. Address H'E8209720 can be accessed in only 16-bit or 32-bit units.

Note 9. Address H'E8209724 can be accessed in only 16-bit or 32-bit units.

37.3.1 IPC0_n Initialization Register (IPCIR_IPC0_n) (n = 0, 1, 2, 3)

IPCIR_IPC0_n is a 32-bit readable/writable register that initializes the IPC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the IPC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.2 IPC0_n Pass Select Register (IPSLR_IPC0_n) (n = 0, 1, 2, 3)

IPSLR_IPC0_n is a 32-bit readable/writable register that selects the input source and output destination of the input timing signal and audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	IPC_PASS_SEL	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	IPC_PASS_SEL	0	R/W	IPC Pass Select These bits select the pass. 000: No operation 001: Input Timing Signal/Input Audio Data : EXTERNAL(SSIF) → IPC → SRC (Async mode) 010: Reserved 011: Input Timing Signal : EXTERNAL → IPC → FFD/SRC Input Audio Data : FFD → IPC → SRC (Async mode) 100: Input Timing Signal/Input Audio Data : FFD → IPC → SRC (Sync mode) 101 to 111: No operation

37.3.3 OPC0_n Initialization Register (OPCIR_OPC0_n) (n = 0, 1, 2, 3)

OPCIR_OPC0_n is a 32-bit readable/writable register that initializes the OPC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the OPC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.4 OPC0_n Pass Select Register (OPSLR_OPC0_n) (n = 0, 1, 2, 3)

OPSLR_OPC0_n is a 32-bit readable/writable register that selects the input source and output destination of the output timing signal and audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	OPC_PASS_SEL	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	OPC_PASS_SEL	0	R/W	OPC Pass Select These bits select the pass. 000: No operation 001: Output Timing Signal : EXTERNAL → OPC → SRC/DVU Output Audio Data : SRC(Async mode) → OPC → DVU 010: Reserved 011: Output Timing Signal : EXTERNAL → OPC → FFU/SRC Output Audio Data : SRC(Async mode) → OPC → FFU 100: Output Timing Signal : FFU → OPC → SRC Output Audio Data : SRC(Sync mode) → OPC → FFU 101 to 111: No operation

37.3.5 FFD0_n FIFO Download Initialization Register (FFDIR_FFD0_n) (n = 0, 1, 2, 3)

FFDIR_FFD0_n is a 32-bit readable/writable register that initializes the FFD internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the FFD internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.6 FFD0_n FIFO Download Audio Information Register (FDAIR_FFD0_n) (n = 0, 1, 2, 3)

FDAIR_FFD0_n is a 32-bit readable/writable register that sets the number of FFD data channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels* 0011: Reserved 0100: 4 channels* 0101: Reserved 0110: 6 channels* 0111: Reserved 1000: 8 channels* 1001 to 1111: Reserved Note: * These bits are only settable for FFD0_0 and FFD0_1. Setting these bits in the registers for FFD0_2 and FFD0_3 is prohibited.

37.3.7 FFD0_n FIFO Download Request Size Register (DRQSR_FFD0_n) (n = 0, 1, 2, 3)

DRQSR_FFD0_n is a 32-bit readable/writable register that sets the request size of data transfer requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SIZE			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SIZE	All 0	R/W	Request Size These bits set the PCM data size per request. The size must be less than the FIFO size. 0000: 256 data. (FFD0_0,FFD0_1), 64 data. (FFD0_2,FFD0_3) *1 0001: 128 data. (FFD0_0,FFD0_1), 32 data. (FFD0_2,FFD0_3) 0010: 64 data. (FFD0_0,FFD0_1), 16 data. (FFD0_2,FFD0_3) 0011: 32 data. (FFD0_0,FFD0_1), 8 data. (FFD0_2,FFD0_3) 0100: 16 data. (FFD0_0,FFD0_1), 4 data. (FFD0_2,FFD0_3) 0101: 8 data. (FFD0_0,FFD0_1), 2 data. (FFD0_2,FFD0_3) 0110: 4 data. (FFD0_0,FFD0_1), 1 data. (FFD0_2,FFD0_3) 0111: 2 data. (FFD0_0,FFD0_1)*2 1000: 1 data. (FFD0_0,FFD0_1)*2 1001 to 1111: Reserved. Notes: 1. If the request size equals the FIFO size, the request size must be a multiple of the number of channels so that the operation is correct. For example, the request size and FIFO size are 256, the number of channels can be set to 1, 2, 4, or 8. If the number of channels is not set to any of the numbers, FIFO overflow may occur. 2. These bits are only settable for FFD0_0 and FFD0_1. Setting these bits in the registers for FFD0_2 and FFD0_3 is prohibited.

37.3.8 FFD0_n FIFO Download Pass Register (FFDPR_FFD0_n) (n = 0, 1, 2, 3)

FFDPR_FFD0_n is a 32-bit readable/writable register that sets the input/output route of audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PASS	All 0	R/W	Data Pass Select These bits set the data pass of audio data. 00: No pass selected 01: CIM → FFD → IPC (Async Mode) *1 10: CIM → FFD → IPC (Sync Mode) *2 11: Reserved Notes: 1.- Async mode: The FFD use external timing. 2.- Sync mode: The FFD use the request which is generated by SRC module. Set Sync mode in SRC.

37.3.9 FFD0_n FIFO Download Boot Register (FFDBR_FFD0_n) (n = 0, 1, 2, 3)

FFDBR_FFD0_n is a 32-bit readable/writable register that controls the starting and stopping of data requests sent to RFFD.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BOOT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BOOT	0	R/W	Data Request Start/Stop This bit controls the start/stop of data request. This bit can be set when the PASS bits in the FFDPR register are set to B'01 or B'10. This bit should be set after all the registers are set. 0: Stops the data request. 1: Starts the data request.

37.3.10 FFD0_n FIFO Download Event Mask Register (DEVMR_FFD0_n) (n = 0, 1, 2, 3)

DEVMR_FFD0_n is a 32-bit readable/writable register that controls SCUFDIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEV MUF	DEV MOF	DEV MOL	DEV MIUF	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEV MRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DEVMUF	0	R/W	FFD Underflow Mask This bit sets whether to mask the interrupt request from the DEVCUF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
30	DEVMOF	0	R/W	FFD Overflow Mask This bit sets whether to mask the interrupt request from the DEVCOF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
29	DEVMOL	0	R/W	FFD Overlap Mask This bit sets whether to mask the interrupt request from the DEVCOL bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
28	DEVMUIF	0	R/W	FFD Initialization Underflow Mask This bit sets whether to mask the interrupt request from the DEVCIUF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
27 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	DEVMRQ	0	R/W	FFD Request Packet Mask This bit sets whether to mask the interrupt request from the DEVCRQ bit in the DEVCRQ register. 0: Disables interrupts. 1: Enables interrupts.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

37.3.11 FFD0_n FIFO Download Event Clear Register (DEVCR_FFD0_n) (n = 0, 1, 2, 3)

DEVCR_FFD0_n is a 32-bit readable/writable register that clears SCUFDIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEV CUF	DEV COF	DEV COL	DEV CIUF	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEV CRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DEVCUF	0	R/(W)*1	FFD Underflow Clear This is an interrupt flag to indicate whether DPRAM underflow occurs. When it occurs and the first packet has already been written to DPRAM, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	DEVCOF	0	R/(W)*1	FFD Overflow Clear This is an interrupt flag to indicate whether DPRAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	DEVCOL	0	R/(W)*1	FFD Overlap Clear This is an interrupt flag to indicate whether FFD overlap occurs. When the next read request occurs while FFD reads data from DPRAM upon the previous read request, the overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Waiting.
28	DEVCIUF	0	R/(W)*1	FFD Initialization Underflow Clear This is an interrupt flag to indicate whether DPRAM initialization underflow occurs. When it occurs and the first packet has not been written to DPRAM, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
27 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	DEVCRQ	0	R/(W)*1	FFD Request Packet Clear This is an interrupt flag to send a request to write one packet in FFD, to the CPU. When the request occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.12 FFU0_n FIFO Upload Initialization Register (FFUIR_FFU0_n) (n = 0, 1, 2, 3)

FFUIR_FFU0_n is a 32-bit readable/writable register that initializes the FFU internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the FFU internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.13 FFU0_n FIFO Upload Audio Information Register (FUAIR_FFU0_n) (n = 0, 1, 2, 3)

FUAIR_FFU0_n is a 32-bit readable/writable register that sets the number of FFU data channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. For details, see below. 0000: Zero (None) 0001: 1 channel 0010: 2 channels* 0011: Reserved 0100: 4 channels* 0101: Reserved 0110: 6 channels* 0111: Reserved 1000: 8 channels* 1001 to 1111: Reserved Note: *These bits are only settable for FFU0_0 and FFU0_1. Setting these bits in the registers for FFU0_2 and FFU0_3 is prohibited.

37.3.14 FFU0_n FIFO Upload Request Size Register (URQSR_FFU0_n) (n = 0, 1, 2, 3)

URQSR_FFU0_n is a 32-bit readable/writable register that sets the request size of data transfer requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	SIZE				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SIZE	All 0	R/W	Request Size These bits set the PCM data size per request. The size must be less than the FIFO size. 0000: 256 data. (FFU0_0,FFU0_1), 64 data. (FFU0_2,FFU0_3) *1 0001: 128 data. (FFU0_0,FFU0_1), 32 data. (FFU0_2,FFU0_3) 0010: 64 data. (FFU0_0,FFU0_1), 16 data. (FFU0_2,FFU0_3) 0011: 32 data. (FFU0_0,FFU0_1), 8 data. (FFU0_2,FFU0_3) 0100: 16 data. (FFU0_0,FFU0_1), 4 data. (FFU0_2,FFU0_3) 0101: 8 data. (FFU0_0,FFU0_1), 2 data. (FFU0_2,FFU0_3) 0110: 4 data. (FFU0_0,FFU0_1), 1 data. (FFU0_2,FFU0_3) 0111: 2 data. (FFU0_0,FFU0_1)*2 1000: 1 data. (FFU0_0,FFU0_1)*2 1001 to 1111: Reserved. Note 1. If the request size equals the FIFO size, the request size must be a multiple of the number of channels so that the operation is correct. For example, the request size and FIFO size are 256, the number of channels can be set to 1, 2, 4, or 8. If the number of channels is not set to any of the numbers, FIFO overflow may occur. Note 2. These bits are only settable for FFU0_0 and FFU0_1. Setting these bits in the registers for FFU0_2 and FFU0_3 is prohibited.

37.3.15 FFU0_n FIFO Upload Pass Register (FFUPR_FFU0_n) (n = 0, 1, 2, 3)

FFUPR_FFU0_n is a 32-bit readable/writable register that sets the input/output route of audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PASS	All 0	R/W	Data Pass Select These bits set the data pass of audio data. 00: No pass selected 01: CIM ← FFU ← OPC (Async Mode) *1 10: CIM ← FFU ← OPC (Sync Mode) *2 11: Reserved Notes: 1. Async mode: The FFU use external timing. 2. Sync mode: The FFU use the request which is generated by SRC module. Set Sync mode in SRC.

37.3.16 FFU0_n FIFO Upload Event Mask Register (UEVMR_FFU0_n) (n = 0, 1, 2, 3)

UEVMR_FFU0_n is a 32-bit readable/writable register that controls SCUFUIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UEV MUF	UEV MOF	UEV MOL	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UEV MRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	UEVMUF	0	R/W	FFU Underflow Mask This bit sets whether to mask the interrupt request from the UEVCUF bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
30	UEVMOF	0	R/W	FFU Overflow Mask This bit sets whether to mask the interrupt request from the UEVCOF bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
29	UEVMOL	0	R/W	FFU Overlap Mask This bit sets whether to mask the interrupt request from the UEVCOL bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
28 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	UEVMRQ	0	R/W	FFU Request Packet Mask This bit sets whether to mask the interrupt request from the UEVCRQ bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

37.3.17 FFU0_n FIFO Upload Event Clear Register (UEVCR_FFU0_n) (n = 0, 1, 2, 3)

UEVCR_FFU0_n is a 32-bit readable/writable register that clears SCUFUIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UEV CUF	UEV COF	UEV COL	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UEV CRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	UEVCUF	0	R/(W)*1	FFU Underflow Clear This is a flag to indicate whether DPRAM underflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 0: Retains the flag.
30	UEVCOF	0	R/(W)*1	FFU Overflow Clear This is a flag to indicate whether DPRAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 0: Retains the flag.
29	UEVCOL	0	R/(W)*1	FFU Overlap Clear This is a flag to indicate whether DPRAM overlap occurs. When the next write request occurs while FFU writes data upon the previous write request, the overlap occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 0: Retains the flag.
28 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	UEVCRQ	0	R/(W)*1	FFU Request Packet Clear This is an interrupt flag to send a request to read one packet from FFU, to the CPU. When the request occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.18 2SRC0_m Initialization Register p (SRCIRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCIRp_2SRC0_m is a 32-bit readable/writable register that initializes the SRC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the SRC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.19 2SRC0_m Audio Information Register p (SADIRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SADIRp_2SRC0_m is a 32-bit readable/writable register that sets the bit length of data and the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	OTBL				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL	All 0	R/W	Bit Length of Output Audio Data 00000: 24 bits 00001 to 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.20 2SRC0_m Bypass Register p (SRCBRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCBRp_2SRC0_m is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of SRC. The bypass function is only used in asynchronous SRC mode. Therefore, this bit must be set to 0 when synchronous SRC mode is used (bit SRCMD0 in SRCCRp_2SRC0_m register is 1). 0: SRC function is used. Input data is processed by SRC and then the result data is connected to output data. 1: SRC function is not used. Input data is directly connected to output data.

37.3.21 2SRC0_m IFS Control Register p (IFSCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

IFSCRp_2SRC0_m is a 32-bit readable/writable register that enables or disables usage of the initial value set by INTIFS.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INT IFSEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INTIFSEN	0	R/W	INTIFS Value Enable This bit is enabled only in asynchronous SRC mode (bit SRCMD in SRCCRp_2SRC0_m register is 0). 0: Disables initial value setting in IFSVR register. 1: Enables initial value setting in IFSVR register.

37.3.22 2SRC0_m IFS Value Setting Register p (IFSVRp_2SRC0_m) (m = 0, 1; p = 0, 1)

IFSVRp_2SRC0_m is a 32-bit readable/writable register that sets the INTIFS value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	INTIFS											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTIFS															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	INTIFS	All 0	R/W	Initial Value of FSI These bits set initial value of FSI. Set the input sampling rate and output sampling rate within the restricted range determined by the number of channels. Example: Fin = 32 kHz Fout = 44.1 kHz FSI = $2^{22} * 32000/44100 = 3043485 = 0x02E709D$

When using the SRC in asynchronous mode, INTIFS is given as the initial value of FSI, which is the sampling conversion function. Therefore, after setting the INTIFSEN bit in IFSCRp_2SRC0_m to 1, set the INTIFS bits to the desired value. The SRC automatically detects the input sampling frequency and output sampling frequency. Based on this, the FSI value is calculated so that the following equation is satisfied.

$$\frac{F_{in}}{F_{out}} \approx \frac{FSI}{FSO}$$

[Legend]

Fin: Input sampling frequency

Fout: Output sampling frequency

FSI: Input sampling rate

FSO: Output sampling rate (fixed value: $2^{22} = 0x0400000$)

When using the SRC in synchronous mode, the value set in INTIFS is used as the FSI value from beginning to end. The value set in INITFS is shown in Table 37.3 to Table 37.8.

Table 37.3 INITFS Setting (Delay Mode: Normal, Number of Channels: 1 or 2)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	MINFS	All 0	R/W	Minimum Value of FS Ratio These bits set the FS ratio to start fading out the output data to mute under the situation that the input timing stops during SRC processing. This setting value should be less than the value of IFSVRp_2SRC0_m register. Example: Fin = 32kHz Fout = 44.1kHz FSI = $2^{22} * 32000/44100 = 3043485 = 0x02E709D$ MINFS = FSI * 98% = 2982615 = 0x02D82D7 Set the ratio which is out of the range of the jitter. (The recommended value is from 90 to 98 percent.)

37.3.25 2SRC0_m Buffer Size Setting Register p (BFSSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

BFSSRp_2SRC0_m is a 32-bit readable/writable register that sets the buffer size. This register setting is valid only when SRCCRp_2SRC0_m.BUFMD = 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	BUFDATA

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	BUFDATA	All 0	R/W	Set the buffer size of 1 channel in DATA RAM. Sets 0x80 for low delay mode 1. Sets 0x40 for low delay mode 2.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	BUFIN	All 0	R/W	Set the buffer size of 1 channel in INDATA RAM. Sets 0x5 for low delay mode.

37.3.26 2SRC0_m SCU2 Status Register p (SC2SRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SC2SRp_2SRC0_m is a 32-bit read-only register that indicates the status of the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SRCWSTS	0	R	Status of Wait Time Operation of SRC 0: Wait for count up to wait time 1: Reached to wait time
30	SC2MUTE	0	R	SRC Mute Status This bit is only used for debug. 0: SRC output data is not fixed and it should be muted. This happens when SRC cannot synchronize the input sampling rate and output sampling rate. 1: SRC output data is fixed.
29, 28	SC2STS	All 0	R	Status of SRC 00: SRC is reset. 01: SRC is initialized. 10: SRC is processing. 11: Reserved
27 to 0	SC2FSI	All 0	R	Latest value of FSI which is calculated by SRC

37.3.27 2SRC0_m Wait Time Setting Register p (WATSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

WATSRp_2SRC0_m is a 32-bit readable/writable register that sets the wait time for data input to the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	WTIME							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WTIME															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	WTIME	All 0	R/W	These bits set the wait time when WATMD bit of SRCCRp_2SRC0_m register is 1. After the INIT bit of SRCIRp_2SRC0_m register is set to 0, 0 data is stored into the SRC until the number of input data reaches to the setting value of these bits. The data input before the INIT bit is set to 0 is discarded. After the number of input data reaches to the setting value, input data is stored into the SRC.

37.3.28 2SRC0_m Event Mask Register p (SEVMRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SEVMRp_2SRC0_m is a 32-bit readable/writable register that enables or disables SCUAI_m interrupt requests. The name of the interrupt source corresponding to the interrupt request from SEVMRp_2SRC0_0 is SCUAI0 and that corresponding to the interrupt request from SEVMRp_2SRC0_1 is SCUAI1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EVMUF	0	R/W	SRC Underflow Mask This bit sets whether to mask the interrupt request from the EVCUF bit in the SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
30	EVMOF	0	R/W	SRC Overflow Mask This bit sets whether to mask the EVCOF bit in the SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
29 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	EVMWAIT	0	R/W	SRC Wait Time Mask This bit sets whether to mask the interrupt request from the EVCWAIT bit of SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

37.3.29 2SRC0_m Event Clear Register p (SEVCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SEVCRp_2SRC0_m is a 32-bit readable/writable register that clears SCUAI_m interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EVCUF	EVCOF	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W:	R/(W)* ¹	R/(W)* ¹	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	EVCWAIT	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/(W)* ¹	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EVCUF	0	R/(W)* ¹	SRC Underflow Clear This is an interrupt flag to indicate whether INDATA RAM underflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	EVCOF	0	R/(W)* ¹	SRC Overflow Clear This is an interrupt flag to indicate whether INDATA RAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	EVCWAIT	0	R/(W)* ¹	SRC Wait Time Clear This is an interrupt flag to indicate whether SRC has started processing after the wait time. 0: Clears the flag. 1: Retains the flag.
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.30 2SRC0_m Initialization Register RIF (SRCIRR_2SRC0_m) (m = 0, 1)

SRCIRR_2SRC0_m is a 32-bit readable/writable register that initializes COEF-ROMIF which is mounted on 2SRC0_m.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the COEF-ROMIF internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.31 DVU0_n Initialization Register (DVUIR_DVU0_n) (n = 0, 1, 2, 3)

DVUIR_DVU0_n is a 32-bit readable/writable register that initializes the DVU internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the DVU internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.32 DVU0_n Audio Information Register (VADIR_DVU0_n) (n = 0, 1, 2, 3)

VADIR_DVU0_n is a 32-bit readable/writable register that sets the bit length of data and the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	OTBL

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL	All 0	R/W	Bit Length of Output Audio Data. 00000: 24 bits 00001 to 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.33 DVU0_n Bypass Register (DVUBR_DVU0_n) (n = 0, 1, 2, 3)

DVUBR_DVU0_n is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of DVU. 0: DVU function is used. Input data is processed by DVU and then the result data is connected to output data. 1: DVU function is not used. Input data is directly connected to output data.

37.3.34 DVU0_n Control Register (DVUCR_DVU0_n) (n = 0, 1, 2, 3)

DVUCR_DVU0_n is a 32-bit readable/writable register that selects the DVU mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	VVMD	0	R/W	Digital Volume Mode Select This bit selects the digital volume function. 0: Disables the digital volume function. 1: Enables the digital volume function.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRMD	0	R/W	Volume Ramp Mode Select This bit selects the volume ramp function. 0: Disables the volume ramp function. 1: Enables the volume ramp function.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ZCMD	0	R/W	Zero Cross Mute Mode Select This bit selects the zero cross mute function. 0: Disables the zero cross mute function. 1: Enables the zero cross mute function.

37.3.35 DVU0_n Zero Cross Mute Control Register (ZCMCR_DVU0_n) (n = 0, 1, 2, 3)

ZCMCR_DVU0_n is a 32-bit readable/writable register that controls operation of the zero cross mute function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ZCEN7	ZCEN6	ZCEN5	ZCEN4	ZCEN3	ZCEN2	ZCEN1	ZCEN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ZCEN7	0	R/W	Zero Cross Mute Enable for Channel 7 This bit controls the operation of the zero cross mute function for channel 7. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
6	ZCEN6	0	R/W	Zero Cross Mute Enable for Channel 6 This bit controls the operation of the zero cross mute function for channel 6. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
5	ZCEN5	0	R/W	Zero Cross Mute Enable for Channel 5 This bit controls the operation of the zero cross mute function for channel 5. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
4	ZCEN4	0	R/W	Zero Cross Mute Enable for Channel 4 This bit controls the operation of the zero cross mute function for channel 4. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
3	ZCEN3	0	R/W	Zero Cross Mute Enable for Channel 3 This bit controls the operation of the zero cross mute function for channel 3. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
2	ZCEN2	0	R/W	Zero Cross Mute Enable for Channel 2 This bit controls the operation of the zero cross mute function for channel 2. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
1	ZCEN1	0	R/W	Zero Cross Mute Enable for Channel 1 This bit controls the operation of the zero cross mute function for channel 1. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
0	ZCEN0	0	R/W	Zero Cross Mute Enable for Channel 0 This bit controls the operation of the zero cross mute function for channel 0. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.

37.3.36 DVU0_n Volume Ramp Control Register (VRCTR_DVU0_n) (n = 0, 1, 2, 3)

VRCTR_DVU0_n is a 32-bit readable/writable register that controls operation of the volume ramp function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	VREN7	VREN6	VREN5	VREN4	VREN3	VREN2	VREN1	VREN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	VREN7	0	R/W	Volume Ramp Enable for Channel 7 This bit controls the operation of the volume ramp function for channel 7. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
6	VREN6	0	R/W	Volume Ramp Enable for Channel 6 This bit controls the operation of the volume ramp function for channel 6. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
5	VREN5	0	R/W	Volume Ramp Enable for Channel 5 This bit controls the operation of the volume ramp function for channel 5. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
4	VREN4	0	R/W	Volume Ramp Enable for Channel 4 This bit controls the operation of the volume ramp function for channel 4. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
3	VREN3	0	R/W	Volume Ramp Enable for Channel 3 This bit controls the operation of the volume ramp function for channel 3. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
2	VREN2	0	R/W	Volume Ramp Enable for Channel 2 This bit controls the operation of the volume ramp function for channel 2. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
1	VREN1	0	R/W	Volume Ramp Enable for Channel 1 This bit controls the operation of the volume ramp function for channel 1. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
0	VREN0	0	R/W	Volume Ramp Enable for Channel 0 This bit controls the operation of the volume ramp function for channel 0. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.

37.3.37 DVU0_n Volume Ramp Period Register (VRPDR_DVU0_n) (n = 0, 1, 2, 3)

VRPDR_DVU0_n is a 32-bit readable/writable register that sets the ramp time of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

37.3.38 DVU0_n Volume Ramp Decibel Register (VRDBR_DVU0_n) (n = 0, 1, 2, 3)

VRDBR_DVU0_n is a 32-bit readable/writable register that sets the gain level (decibel units) of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	VRDB									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VRDB	All 0	R/W	Decibel of Volume Ramp These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of 0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x000	1	0
.....	0x091	0.125	-18.125
0x031	0.5	-6.125
.....	0x3FE	4.1x10 ⁻⁷	-127.75
0x061	0.25	-12.125	0x3FF	0 (Mute)	-∞

37.3.39 DVU0_n Volume Ramp Wait Time Register (VRWTR_DVU0_n) (n = 0, 1, 2, 3)

VRWTR_DVU0_n is a 32-bit readable/writable register that sets the wait time before executing the volume ramp function.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VRWT	All 0	R/W	Volume Ramp Wait Time These bits set the wait time before starting the volume ramp function when the setting of VRDBR register is changed. If the internal counter of the DVU logic reached to the value of these bits, the volume ramp function starts operating to change the volume to the value changed in the VRDBR register as a target.

37.3.40 DVU0_n Volume Value Setting 0 Register (VOL0R_DVU0_n) (n = 0, 1, 2, 3)

VOL0R_DVU0_n is a 32-bit readable/writable register that sets the digital volume value of channel 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL0	All 0	R/W	Digital Volume Value for Channel 0 These bits set the digital volume of channel 0. The maximum value is octupled gain (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL0[23] : Sign bit VOLVAL0[22:20] : Integer bits VOLVAL0[19:0] : Decimal bits

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]

37.3.47 DVU0_n Volume Value Setting 7 Register (VOL7R_DVU0_n) (n = 0, 1, 2, 3)

VOL7R_DVU0_n is a 32-bit readable/writable register that sets the digital volume value of channel 7.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL7	All 0	R/W	Digital Volume Value for Channel7 These bits set the digital volume of channel 7. The maximum value is octupled gain (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL7[23] : Sign bit VOLVAL7[22:20] : Integer bits VOLVAL7[19:0] : Decimal bits

37.3.48 DVU0_n Enable Register (DVUER_DVU0_n) (n = 0, 1, 2, 3)

DVUER_DVU0_n is a 32-bit readable/writable register that enables or disables the DVU register settings.

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DVUEN	0	R/W	DVU Register Setting Enable This bit controls the setting of DVU registers (ZCMCR, VRCTR, VRPDR, VRDBR, VOL0R, VOL1R, VOL2R, VOL3R, VOL4R, VOL5R, VOL6R, and VOL7R). 0: Disables the setting of DVU registers. 1: Enables the setting of DVU registers.

37.3.49 DVU0_n Status Register (DVUSR_DVU0_n) (n = 0, 1, 2, 3)

DVUSR_DVU0_n is a 32-bit read-only register that indicates the status of zero cross mute and volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	ZSTS7	0	R	Zero Cross Mute Status of Channel 7 This bit indicates the zero cross mute status of channel 7. 0: Not in mute status 1: Mute status
22	ZSTS6	0	R	Zero Cross Mute Status of Channel 6 This bit indicates the zero cross mute status of channel 6. 0: Not in mute status 1: Mute status
21	ZSTS5	0	R	Zero Cross Mute Status of Channel 5 This bit indicates the zero cross mute status of channel 5. 0: Not in mute status 1: Mute status
20	ZSTS4	0	R	Zero Cross Mute Status of Channel 4 This bit indicates the zero cross mute status of channel 4. 0: Not in mute status 1: Mute status
19	ZSTS3	0	R	Zero Cross Mute Status of Channel 3 This bit indicates the zero cross mute status of channel 3. 0: Not in mute status 1: Mute status
18	ZSTS2	0	R	Zero Cross Mute Status of Channel 2 This bit indicates the zero cross mute status of channel 2. 0: Not in mute status 1: Mute status
17	ZSTS1	0	R	Zero Cross Mute Status of Channel 1 This bit indicates the zero cross mute status of channel 1. 0: Not in mute status 1: Mute status
16	ZSTS0	0	R	Zero Cross Mute Status of Channel 0 This bit indicates the zero cross mute status of channel 0. 0: Not in mute status 1: Mute status
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	VRSTS	All 0	R	Volume Ramp Status These bits indicate the volume ramp status. 000: Mute status 001: Volume ramp down 010: Volume ramp up 011: Level of volume ramp is in the state of the value of VRDBR register 100: Volume of input data is maintained (Volume is not multiplied). 101 to 111: Reserved

37.3.50 DVU0_n Event Mask Register (VEVMR_DVU0_n) (n = 0, 1, 2, 3)

VEVMR_DVU0_n is a 32-bit readable/writable register that enables or disables SCUDVIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VEVM ZCM7	VEVM ZCM6	VEVM ZCM5	VEVM ZCM4	VEVM ZCM3	VEVM ZCM2	VEVM ZCM1	VEVM ZCM0	-	-	-	-	-	-	-	-

R/W:	R/(W) ¹	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VEVMZCM7	0	R/W	Zero Cross Mute Status Change Mask of Channel 7 This bit sets whether to mask the interrupt request from the VEVCZCM7 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
30	VEVMZCM6	0	R/W	Zero Cross Mute Status Change Mask of Channel 6 This bit sets whether to mask the interrupt request from the VEVCZCM6 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
29	VEVMZCM5	0	R/W	Zero Cross Mute Status Change Mask of Channel 5 This bit sets whether to mask the interrupt request from the VEVCZCM5 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
28	VEVMZCM4	0	R/W	Zero Cross Mute Status Change Mask of Channel 4 This bit sets whether to mask the interrupt request from the VEVCZCM4 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
27	VEVMZCM3	0	R/W	Zero Cross Mute Status Change Mask of Channel 3 This bit sets whether to mask the interrupt request from the VEVCZCM3 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
26	VEVMZCM2	0	R/W	Zero Cross Mute Status Change Mask of Channel 2 This bit sets whether to mask the interrupt request from the VEVCZCM2 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
25	VEVMZCM1	0	R/W	Zero Cross Mute Status Change Mask of Channel 1 This bit sets whether to mask the interrupt request from the VEVCZCM1 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
24	VEVMZCM0	0	R/W	Zero Cross Mute Status Change Mask of Channel 0 This bit sets whether to mask the interrupt request from the VEVCZCM0 bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	VEVMVR	0	R/W	Volume Ramp Status Change This bit sets whether to mask the interrupt request from the VEVCVCR bit in the VEVCVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.

Bit	Bit Name	Initial Value	R/W	Description
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

37.3.51 DVU0_n Event Clear Register (VEVCR_DVU0_n) (n = 0, 1, 2, 3)

VEVCR_DVU0_n is a 32-bit readable/writable register that clears SCUDVIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VEVC ZCM7	VEVC ZCM6	VEVC ZCM5	VEVC ZCM4	VEVC ZCM3	VEVC ZCM2	VEVC ZCM1	VEVC ZCM0	-	-	-	-	-	-	-	-

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VEV CVR	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W) ^{*1}	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VEVCZCM7	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 7 This is an interrupt flag to indicate whether the zero cross mute status change of channel 7 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	VEVCZCM6	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 6 This is an interrupt flag to indicate whether the zero cross mute status change of channel 6 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	VEVCZCM5	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 5 This is an interrupt flag to indicate whether the zero cross mute status change of channel 5 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
28	VEVCZCM4	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 4 This is an interrupt flag to indicate whether the zero cross mute status change of channel 4 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
27	VEVCZCM3	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 3 This is an interrupt flag to indicate whether the zero cross mute status change of channel 3 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
26	VEVCZCM2	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 2 This is an interrupt flag to indicate whether the zero cross mute status change of channel 2 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
25	VEVCZCM1	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 1 This is an interrupt flag to indicate whether the zero cross mute status change of channel 1 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
24	VEVCZCM0	0	R/(W) ^{*1}	Zero Cross Mute Status Change Clear of Channel 0 This is an interrupt flag to indicate whether the zero cross mute status change of channel 0 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15	VEVCVR	0	R/(W)*1	Volume Ramp Status Change Clear This is an interrupt flag to judge volume ramp mute occurs or not. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.52 MIX0_0 Initialization Register (MIXIR_MIX0_0)

MIXIR_MIX0_0 is a 32-bit readable/writable register that initializes the MIX internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the MIX internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.53 MIX0_0 Audio Information Register (MADIR_MIX0_0)

MADIR_MIX0_0 is a 32-bit readable/writable register that sets the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.54 MIX0_0 Bypass Register (MIXBR_MIX0_0)

MIXBR_MIX0_0 is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BPSYS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	BPSYS	All 0	R/W	Bypass System Select This bit selects the input data output from the MIX module when the BYPASS bit is set to 1. 00: Input data of system A 01: Input data of system B 10: Input data of system C 11: Input data of system D
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of MIX function. 0: MIX function is used. Input data is processed by MIX and then the result data is connected to output data. 1: SRC function is not used. Input data is connected to output data according to the BPSYS bits.

37.3.55 MIX0_0 Mode Register (MIXMR_MIX0_0)

MIXMR_MIX0_0 is a 32-bit readable/writable register that selects the MIX mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIX MODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXMODE	0	R/W	MIX mode This bit sets the mix mode. 0: Selects volume step mixer. 1: Selects volume ramp mixer.

37.3.56 MIX0_0 Volume Period Register (MVPDR_MIX0_0)

MVPDR_MIX0_0 is a 32-bit readable/writable register that sets the ramp time of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MXPDPUP				-	-	-	-	MXPDDW			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	MXPDPUP	0	R/W	Volume Up Period These bits set the decibel which changes per sample during volume up. This setting is used when the MIXMODE bit in the MIXMR register is set to 1. 0000: 128 dB/1 sample 0001: 64 dB/1 sample 0010: 32 dB/1 sample 0011: 16 dB/1 sample 0100: 8 dB/1 sample 0101: 4 dB/1 sample 0110: 2 dB/1 sample 0111: 1 dB/1 sample 1000: 0.5 dB/1 sample 1001: 0.25 dB/1 sample 1010: 0.125 dB/1 sample 1011 to 1111: Reserved
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	MXPDDW	0	R/W	Volume Down Period These bits set the decibel which changes per sample during volume down. This setting is used when the MIXMODE bit in the MIXMR register is set to 1. 0000: -128 dB/1 sample 0001: -64 dB/1 sample 0010: -32 dB/1 sample 0011: -16 dB/1 sample 0100: -8 dB/1 sample 0101: -4 dB/1 sample 0110: -2 dB/1 sample 0111: -1 dB/1 sample 1000: -0.5 dB/1 sample 1001: -0.25 dB/1 sample 1010: -0.125 dB/1 sample 1011 to 1111: Reserved

37.3.57 MIX0_0 Decibel A Register (MDBAR_MIX0_0)

MDBAR_MIX0_0 is a 32-bit readable/writable register that sets the gain level (decibel units) of system A.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXDBEN	0	R/W	MIX Decibel Enable This bit controls the decibel dB set in MDBAR, MDBBR, MDBCR and MDBDR registers. 0: Disables the setting of decibel. 1: Enables the setting of decibel.

37.3.62 MIX0_0 Status Register (MIXSR_MIX0_0)

MIXSR_MIX0_0 is a 32-bit read-only register that indicates the status of the MIX.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIXSTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MIXSTS	All 0	R	MIX Status This bit specifies the status of ramp process. 00: Ramp process is unchanged. 01: Ramp down 10: Ramp up

37.3.63 Software Reset Register (SWRSR_CIM)

SWRSR_CIM is a 32-bit readable/writable register that initializes the SCUX internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SWRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SWRST	1	R/W	While this bit is set to 0, the SCUX internal circuit is reset. Registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: The SCUX is reset. 1: The SCUX is operating.

37.3.64 DMA Control Register (DMACR_CIM)

DMACR_CIM is a 32-bit readable/writable register that controls DMA execution.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	DMAM DFFU3	DMAM DFFU2	DMAM DFFU1	DMAM DFFU0	DMAM DFFD3	DMAM DFFD2	DMAM DFFD1	DMAM DFFD0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	—	All 0	R/W	Reserved The write value should always be 0.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	DMAMDFFU3	0	R/W	FFU0_3 DMA Mode 0: Disables DMA transfer to DMATD3_CIM. 1: Enables DMA transfer to DMATD3_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_3.UEVMRQ bit to 0.)
6	DMAMDFFU2	0	R/W	FFU0_2 DMA Mode 0: Disables DMA transfer to DMATD2_CIM. 1: Enables DMA transfer to DMATD2_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_2.UEVMRQ bit to 0.)
5	DMAMDFFU1	0	R/W	FFU0_1 DMA Mode 0: Disables DMA transfer to DMATD1_CIM. 1: Enables DMA transfer to DMATD1_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_1.UEVMRQ bit to 0.)
4	DMAMDFFU0	0	R/W	FFU0_0 DMA Mode 0: Disables DMA transfer to DMATD0_CIM. 1: Enables DMA transfer to DMATD0_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_0.UEVMRQ bit to 0.)
3	DMAMDFFD3	0	R/W	FFD0_3 DMA Mode 0: Disables DMA transfer to DMATD3_CIM. 1: Enables DMA transfer to DMATD3_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_3.DEVMRQ bit to 0.)
2	DMAMDFFD2	0	R/W	FFD0_2 DMA Mode 0: Disables DMA transfer to DMATD2_CIM. 1: Enables DMA transfer to DMATD2_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_2.DEVMRQ bit to 0.)
1	DMAMDFFD1	0	R/W	FFD0_1 DMA Mode 0: Disables DMA transfer to DMATD1_CIM. 1: Enables DMA transfer to DMATD1_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_1.DEVMRQ bit to 0.)
0	DMAMDFFD0	0	R/W	FFD0_0 DMA Mode 0: Disables DMA transfer to DMATD0_CIM. 1: Enables DMA transfer to DMATD0_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_0.DEVMRQ bit to 0.)

37.3.65 DMA Transfer Register for FFD0_n (DMATDn_CIM) (n = 0, 1, 2, 3)

DMATDn_CIM is a 32-bit register that stores the data to be transmitted to FFD0_n. The data written to DMATDn_CIM is automatically stored in FFD0_n. When the number of data bytes in FFD0_n becomes equal to or smaller than the value set in DRQSR_FFD0_0.SIZE, a data transfer request is issued. When the DMA controller is used (DMACR_CIM.DMAMDFFDn = 1), a transfer request for the number of counts set in DRQSR_FFD0_0.SIZE is sent to the DMA controller. When the interrupt controller is used (DEVMR_FFD0_n.DEVMRQ = 1), data is written in this register for the number of counts set in DRQSR_FFD0_0.SIZE.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

In the SCUX internal block, audio data is handled in the 24-bit big endian format. When this register is accessed in 32-bit units, the lower eight bits are not used and only the upper 24 bits are used, as shown in Figure 37.2. When the SCUX is used in 16-bit mode, the valid data needs to be located at the MSB of audio data. Therefore, when this register is accessed in 16-bit units, the written data is located in the upper 16 bits of audio data and the lower eight bits are fixed to 0 in the CIM block. When the SCUX is used in 16-bit mode and this register is accessed in 32-bit units, since bits [15:8] of the data to be written is passed to the FFD block without change, 0 should be written to bits [15:8].

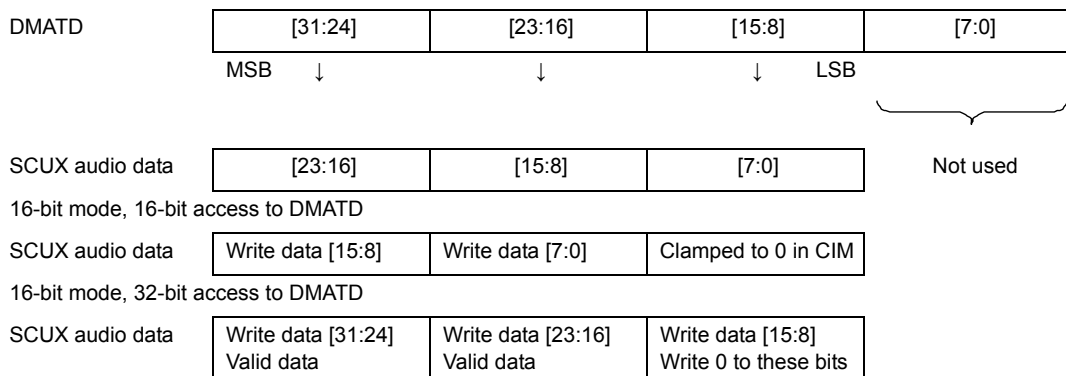

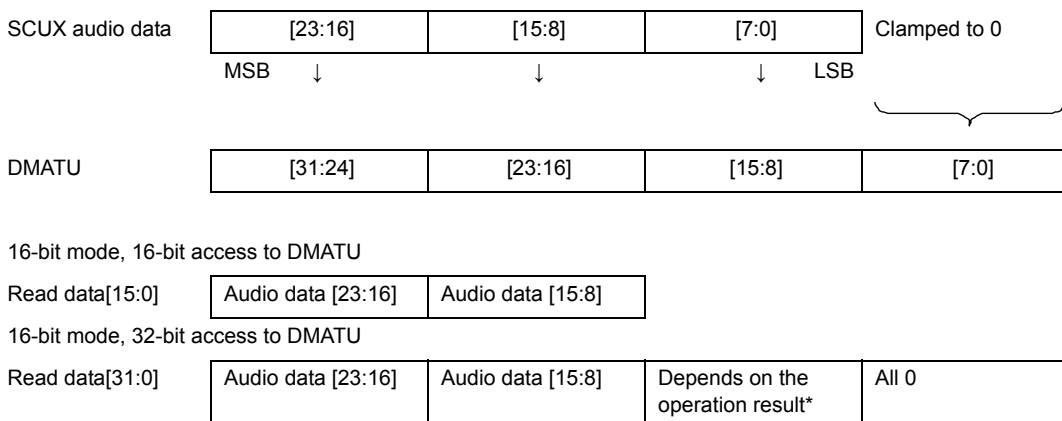

Figure 37.2 Data Alignment of DMATDn_CIM

37.3.66 DMA Transfer Register for FFU0_n (DMATUn_CIM) (n = 0, 1, 2, 3)

DMATUn_CIM is a 32-bit register that stores the data received from FFU0_n. When data is read from DMATUn_CIM, the next data is automatically transferred from FFU0_n. When the number of data bytes in FFU0_n becomes equal to or greater than the value set in URQSR_FFU0_n.SIZE, a data transfer request is issued. When the DMA controller is used (DMACR_CIM.DMAMDFFU_n = 1), a transfer request for the number of counts set in URQSR_FFU0_n.SIZE is sent to the DMA controller. When the interrupt controller is used (UEVMR_FFU0_n.UEVMRQ = 1), data is read from this register for the number of counts set in DRQSR_FFD0_0.SIZE.

When this register is accessed in 32-bit units, audio data is located in the upper 24 bits and the lower eight bits are always read as 0, as shown in Figure 37.3. When this register is accessed in 16-bit units, the upper 16 bits of audio data are read as valid data. When the SCUX is used in 16-bit mode and this register is accessed in 32-bit units, the lower eight bits are always read as 0 and bits [15:8] of the read data are read as a value dependent on the internal operation result in the SRC.

Note: * All 1 when the internal operation result of the SRC is 0x7FFFFFFF; otherwise, all 0.
Even when used in 16-bit mode, operation is performed in 24-bit units.

Figure 37.3 Data Alignment of DMATUn_CIM

37.3.67 SSI Route Select Register (SSIRSEL_CIM)

SSIRSEL_CIM is a 32-bit readable/writable register that selects the SSIF channel to be connected to each SRC during direct transfer with the SSIF module. This register setting has no meaning when a route between the FFD or FFU module is selected. The IPSLR_IPC0_n and OPSLR_OPC0_n registers are used to select connection between the SSIF or FFD/FFU module. The DVUBR_DVU0_n register is used to specify whether the DVU is used or not.

37.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3)

FDTSELn_CIM is a 32-bit readable/writable register that selects the input timing signal to be used in SRCn (n = 0, 1, 2, 3) when asynchronous mode is selected. This register setting is used only when the route with the FFD module is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SCKDIV	All 0	R/W	Division Ratio These bits specify the ratio for dividing the input clock specified in the SCKSEL bits to generate the timing signal. Note: Always write 0 to bit 16. (Writing 1 to bit 16 is ignored.) When all of these bits are set to 0, the division ratio is 1. Only the input clock selected by SCKSEL[3] = 0 will be divided. The WS signal selected by SCKSEL[3] = 1 will not be divided. The DIVEN bit must be set to 0 before changing these bits.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DIVEN	0	R/W	Division Enable Frequency division starts the moment 1 is written to this bit. 1: Starts frequency division. 0: Outputs 0.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	—	0	R/W	Reserved The write value should always be 0.
3 to 0	SCKSEL	All 0	R/W	Clock Select These bits select the clock that is used in generating the timing signal. 0000: Uses AUDIO_CLK. 0001: Uses the AUDIO_X1 input. 0010: Uses MLB_CLK. 0011: Uses USB_X1. 0100: Uses the peripheral clock (clkp1 ϕ) divided into 2. 0101 to 0111: Setting prohibited 1000: Uses the WS signal of SSIF0. 1001: Uses the WS signal of SSIF1. 1010: Uses the WS signal of SSIF2. 1011: Uses the WS signal of SSIF3. 1100 to 1111: Setting prohibited Note: The DIVEN bit must be set to 0 before changing these bits.

The input timing signal selector has the configuration shown in Figure 37.4.

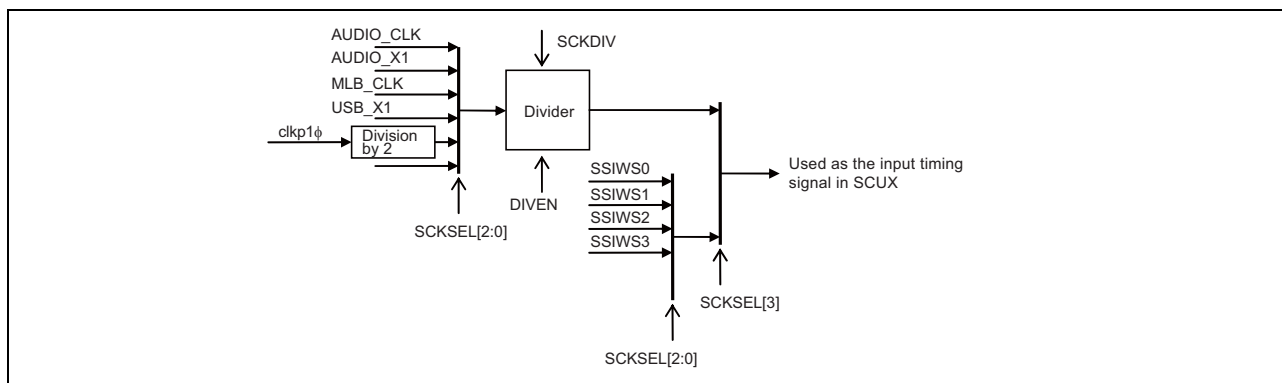

Figure 37.4 Configuration Diagram of Input Timing Signal Selector

37.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3)

FDTSELn_CIM is a 32-bit writable register that selects the output timing signal to be used in SRCn (n = 0, 1, 2, 3) when asynchronous mode is selected. This register setting is used when the route with the FFU module is selected or when output to the MIX is selected.

R/W:	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	—	All 0	R/W	Reserved The write value should always be 0.
19	SSI3CKS	0	R/W	SSIF3 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF3 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF3 module, SSICR3.CKS = 1 must also be set in the SSIF3 module.
18	SSI2CKS	0	R/W	SSIF2 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF2 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF2 module, SSICR2.CKS = 1 must also be set in the SSIF2 module.
17	SSI1CKS	0	R/W	SSIF1 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF1 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF1 module, SSICR1.CKS = 1 must also be set in the SSIF1 module.
16	SSIOCKS	0	R/W	SSIF0 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF0 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF0 module, SSICR0.CKS = 1 must also be set in the SSIF0 module.
15, 14	SSI3PMD	00	R/W	SSIF3 Pin Mode These bits select connection of the SSISCK3 and SSIWS3 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF3 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF3 is the slave. 11: Setting prohibited
13	—	All 0	R/W	Reserved This bits is always read as 0. The write value should always be 0.
12 to 8	—	All 0	R/W	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SSI012EN	0	R/W	SSIF012 Enable This bit selects whether the three modules SSIF0, SSIF1, and SSIF2 are used to provide six channels at transmission. 0: Not handled as six channels. 1: Handled as six channels. Note: This bit can be set to 1 only when the SSI1PMD and SSI2PMD bits of this register are both set to 01 or 10. Usage of six channels at reception can be specified by SSIRSEL_CIM.SISEL0.
3, 2	SSI2PMD	00	R/W	SSIF2 Pin Mode These bits select connection of the SSISCK2 and SSIWS2 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF2 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF2 is the slave. 11: Setting prohibited
1, 0	SSI1PMD	00	R/W	SSIF1 Pin Mode These bits select connection of the SSISCK1 and SSIWS1 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF1 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF1 is the slave. 11: Setting prohibited

37.3.71 SSI Control Register (SSICTRL_CIM)

SSIPCTRL_CIM is a 32-bit readable/writable register that controls connection with the SSIF module and starting and stopping of the module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8	SSI2RX	0	W	SSIF2 Direct Reception 0: Disables direct reception from SSIF2. 1: Enables direct reception from SSIF2.
7 to 2	—	All 0	—	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	SSI012TEN	0	W	<p>SSIF012 Transmission Enable</p> <p>This bit specifies transmission in three modules SSIF0, SSIF1, and SSIF2 to be started or stopped simultaneously.</p> <p>0: Stops transmission in SSIF0, SSIF1, and SSIF2.</p> <p>1: Starts transmission in SSIF0, SSIF1, and SSIF2.</p> <p>Note: This function can be used only when SSIPMD_CIM.SSI012EN = 1.</p> <p>When SSIPMD_CIM.SSI012EN = 0, SSIF modules should be controlled using SSICRn.TEN.</p> <p>This bit must be set to 0 when performing direct transmission to SSIF0, SSIF1, or SSIF2.</p>
0	SSI012REN	0	W	<p>SSIF012 Reception Enable</p> <p>This bit specifies reception in three modules SSIF0, SSIF1, and SSIF2 to be started or stopped simultaneously.</p> <p>0: Stops reception in SSIF0, SSIF1, and SSIF2.</p> <p>1: Starts reception in SSIF0, SSIF1, and SSIF2.</p> <p>Note: This function can be used only when SSIRSEL_CIM.SISEL0 = 01.</p> <p>When SSIRSEL_CIM.SISEL0 = 00, SSIF modules should be controlled using SSICRn.REN.</p> <p>This bit must be set to 0 when performing direct reception from SSIF0, SSIF1, or SSIF2.</p>

37.3.72 SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3)

SRCRSEL_CIM is a 32-bit readable/writable register that sets the route for the data that is input to the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16				
	-	PLACE7				-	PLACE6				-	PLACE5				-	PLACE4			
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0				
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W				
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
	-	PLACE3				-	PLACE2				-	PLACE1				-	PLACE0			
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0				
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W				

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	PLACE7	111	R/W	Place 7 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 7 on the output side. 000: Data at place 0 on the input side is output to place 7 on the output side. 001: Data at place 1 on the input side is output to place 7 on the output side. 010: Data at place 2 on the input side is output to place 7 on the output side. 011: Data at place 3 on the input side is output to place 7 on the output side. 100: Data at place 4 on the input side is output to place 7 on the output side. 101: Data at place 5 on the input side is output to place 7 on the output side. 110: Data at place 6 on the input side is output to place 7 on the output side. 111: Data at place 7 on the input side is output to place 7 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	PLACE6	110	R/W	Place 6 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 6 on the output side. 000: Data at place 0 on the input side is output to place 6 on the output side. 001: Data at place 1 on the input side is output to place 6 on the output side. 010: Data at place 2 on the input side is output to place 6 on the output side. 011: Data at place 3 on the input side is output to place 6 on the output side. 100: Data at place 4 on the input side is output to place 6 on the output side. 101: Data at place 5 on the input side is output to place 6 on the output side. 110: Data at place 6 on the input side is output to place 6 on the output side. 111: Data at place 7 on the input side is output to place 6 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	PLACE5	101	R/W	Place 5 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 5 on the output side. 000: Data at place 0 on the input side is output to place 5 on the output side. 001: Data at place 1 on the input side is output to place 5 on the output side. 010: Data at place 2 on the input side is output to place 5 on the output side. 011: Data at place 3 on the input side is output to place 5 on the output side. 100: Data at place 4 on the input side is output to place 5 on the output side. 101: Data at place 5 on the input side is output to place 5 on the output side. 110: Data at place 6 on the input side is output to place 5 on the output side. 111: Data at place 7 on the input side is output to place 5 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	PLACE4	100	R/W	Place 4 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 4 on the output side. 000: Data at place 0 on the input side is output to place 4 on the output side. 001: Data at place 1 on the input side is output to place 4 on the output side. 010: Data at place 2 on the input side is output to place 4 on the output side. 011: Data at place 3 on the input side is output to place 4 on the output side. 100: Data at place 4 on the input side is output to place 4 on the output side. 101: Data at place 5 on the input side is output to place 4 on the output side. 110: Data at place 6 on the input side is output to place 4 on the output side. 111: Data at place 7 on the input side is output to place 4 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PLACE3	011	R/W	<p>Place 3</p> <p>Stream data is rearranged before it is input to the SRC.</p> <p>These bits select data on the input side to be output to place 3 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 3 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 3 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 3 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 3 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 3 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 3 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 3 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 3 on the output side.</p> <p>Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.</p>
11	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

37.3.73 MIX Route Select Register (MIXRSEL_CIM)

MIXRSEL_CIM is a 32-bit readable/writable register that sets the route for the data that is output from the MIX.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	PLACE7			-	PLACE6			-	PLACE5			-	PLACE4

R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	PLACE7	111	R/W	Place 7 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 7 on the output side. 000: Data at place 0 on the input side is output to place 7 on the output side. 001: Data at place 1 on the input side is output to place 7 on the output side. 010: Data at place 2 on the input side is output to place 7 on the output side. 011: Data at place 3 on the input side is output to place 7 on the output side. 100: Data at place 4 on the input side is output to place 7 on the output side. 101: Data at place 5 on the input side is output to place 7 on the output side. 110: Data at place 6 on the input side is output to place 7 on the output side. 111: Data at place 7 on the input side is output to place 7 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	PLACE6	110	R/W	Place 6 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 6 on the output side. 000: Data at place 0 on the input side is output to place 6 on the output side. 001: Data at place 1 on the input side is output to place 6 on the output side. 010: Data at place 2 on the input side is output to place 6 on the output side. 011: Data at place 3 on the input side is output to place 6 on the output side. 100: Data at place 4 on the input side is output to place 6 on the output side. 101: Data at place 5 on the input side is output to place 6 on the output side. 110: Data at place 6 on the input side is output to place 6 on the output side. 111: Data at place 7 on the input side is output to place 6 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	PLACE5	101	R/W	Place 5 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 5 on the output side. 000: Data at place 0 on the input side is output to place 5 on the output side. 001: Data at place 1 on the input side is output to place 5 on the output side. 010: Data at place 2 on the input side is output to place 5 on the output side. 011: Data at place 3 on the input side is output to place 5 on the output side. 100: Data at place 4 on the input side is output to place 5 on the output side. 101: Data at place 5 on the input side is output to place 5 on the output side. 110: Data at place 6 on the input side is output to place 5 on the output side. 111: Data at place 7 on the input side is output to place 5 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	PLACE4	100	R/W	Place 4 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 4 on the output side. 000: Data at place 0 on the input side is output to place 4 on the output side. 001: Data at place 1 on the input side is output to place 4 on the output side. 010: Data at place 2 on the input side is output to place 4 on the output side. 011: Data at place 3 on the input side is output to place 4 on the output side. 100: Data at place 4 on the input side is output to place 4 on the output side. 101: Data at place 5 on the input side is output to place 4 on the output side. 110: Data at place 6 on the input side is output to place 4 on the output side. 111: Data at place 7 on the input side is output to place 4 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PLACE3	011	R/W	<p>Place 3</p> <p>Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 3 on the output side.</p> <p>000: Data at place 0 on the input side is output to place 3 on the output side.</p> <p>001: Data at place 1 on the input side is output to place 3 on the output side.</p> <p>010: Data at place 2 on the input side is output to place 3 on the output side.</p> <p>011: Data at place 3 on the input side is output to place 3 on the output side.</p> <p>100: Data at place 4 on the input side is output to place 3 on the output side.</p> <p>101: Data at place 5 on the input side is output to place 3 on the output side.</p> <p>110: Data at place 6 on the input side is output to place 3 on the output side.</p> <p>111: Data at place 7 on the input side is output to place 3 on the output side.</p> <p>Note: This bit setting is used when four or more channels are set. 37.4.3 Data Rearrangement for Each Channel

Data can be rearranged independently for each channel in the SCUX. Data rearrangement can be performed immediately before input to the SRC and immediately after output from the MIX. Table 37.9 to Table 37.11 show definition of data places. Data rearrangement immediately before the SRC is performed as described in section 37.3.72, SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3). Data rearrangement immediately after the MIX is performed as described in section 37.3.73, MIX Route Select Register (MIXRSEL_CIM).

37.4.4 Pin Connection Specifications of SSIF

SSIF0 to SSIF3 can be operated in synchronization with the same SSISCK and SSIWS signals. The AUDIO_CLK input to the SSIF can be selected between external pins AUDIO_CLK and MLB_CLK. These settings are made as described in section 37.3.70, SSI Pin Mode Register (SSIPMD_CIM). Figure 37.12 shows the pin connection specifications of each SSIF module.

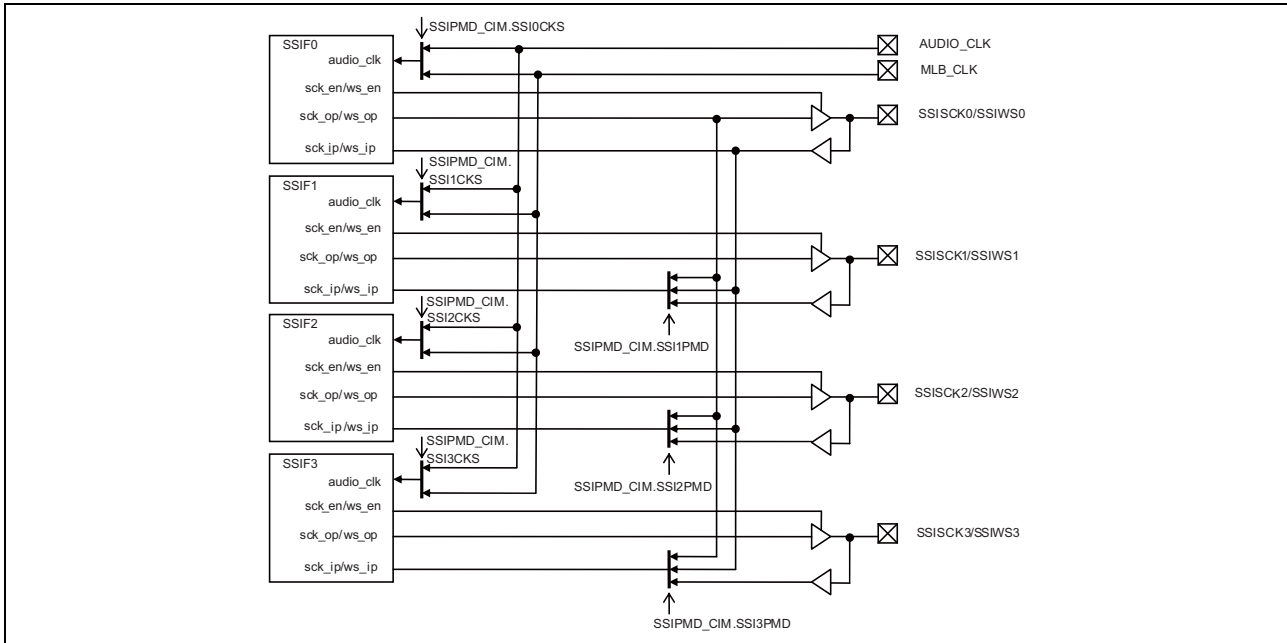

Figure 37.12 Pin Connection Specifications of SSIF

37.4.5 Data Transfer Route

Table 37.12 to Table 37.14 list the data transfer routes that can be selected by the SCUX.

Table 37.15 to Table 37.17 show the necessary register settings for selecting each transfer route.

The DVU0_n bypass register should be set appropriately to bypass the DVU.

37.4.6 Input Timing Signal and Output Timing Signal

The input timing signal and output timing signal need to be set when using the SRC or MIX. Table 37.18 to Table 37.20 show the input/output timing setting necessary for each transfer route in Table 37.12 to Table 37.14. When direct connection between the SRC and SSIF is selected, the WS signal of the relevant SSIF is automatically selected regardless of the setting of the FFD0_n/FFU0_n timing select register. When direct connection between the MIX and SSIF is selected, set the prescribed value in the FFU0_n timing select register. When connection between the FFD and SRC or connection between the SRC and FFU is selected, a desired value can be set in the FFD0_n/FFU0_n timing select register and timing signals corresponding to the setting are used.

Table 37.18 Input/Output Timing Setting (1)

37.4.7 2SRC (SRC) Block

The 2SRC block consists of two SRCs (Sampling Rate Converters) which implement the sampling rate conversion function. Each SRC has two modes allowing either synchronous or asynchronous sampling rate conversion to be performed.

- Asynchronous or synchronous sampling rate conversion is possible*¹
- Sampling rate (synchronous mode)*²
Input [KHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable
Output [KHz]: 8, 16, 24, 32, 44.1, 48, or 96 is selectable
- Sampling rate (asynchronous mode)*²
Input/output [KHz]: 1 to 96
- The supported number of bits is 16 bits and 24 bits
- Sound quality: -132 dB or less*³
- Supports 1, 2, 4, 6, or 8 channels*⁴
- DMA transfer with on-chip memory or external memory and direct transfer with the SSIF module are possible

Note 1. The synchronous mode can be selected only when the SCUX is connected to the FFD and FFU modules.

Note 2. The selectable sampling rates depend on the number of used channels and rate ratio.

Note 3. The data format is a 24-bit value.

Note 4. The number of selectable channels depends on the sampling rate and route.

Figure 37.13 shows a block diagram of the 2SRC (SRC) block. Input audio data indicates the data before executing the SRC function and output audio data indicates the data after executing the SRC function.

In synchronous SRC mode, the 2SRC (SRC) block outputs the input request signal to the FFD block and outputs the output request signal to the FFU block. In asynchronous SRC mode, the 2SRC (SRC) block receives the input timing signal and output timing signal from an external module and automatically detects the input sampling rate and output sampling rate from these timing signals.

Each SRC in the 2SRC (SRC) block can simultaneously process audio data for a maximum of eight channels. However, the maximum sampling rate that can be handled depends on the number of channels used. When SRC2 or SRC3 is used by the route from the FFD or the route to the FFU, the maximum number of processable channels is two. The number of channels is set by `SADIRp_2SRC0_m.CHNUM`. When not in bypass mode (`SRCBRp_2SRC0_m.BYPASS = 0`), unused channels always output 0 after initialization (`SRCIRp_2SRC0_m.INIT = 1`) unless the `CHNUM` setting is changed. In bypass mode, the input audio data is output one cycle later in all channels regardless of the `CHNUM` setting.

The bit width of output audio data can be set to 16 bits or 24 bits by `SADIRp_2SRC0_m.OTBL`. For input audio data, audio data with the same bit width as the `OTBL` bit setting in Table 37.21 should be input.

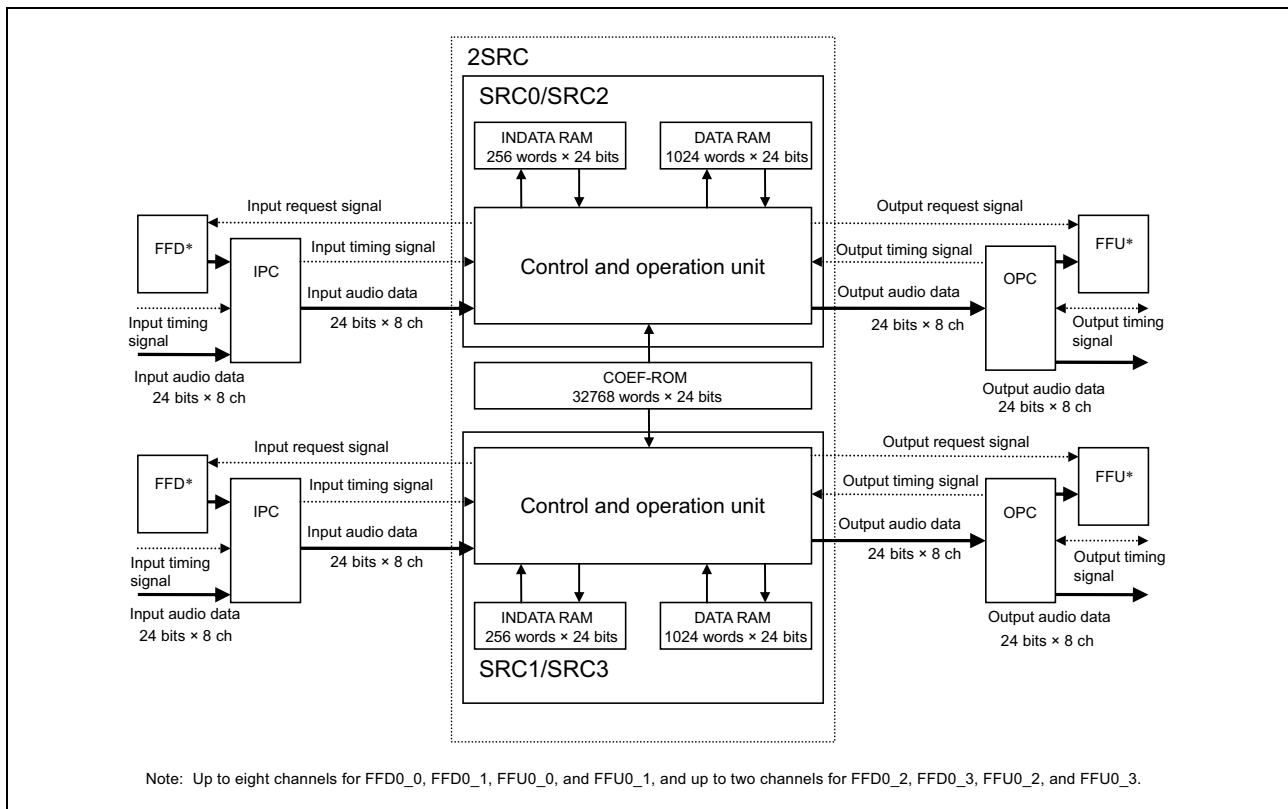

Figure 37.13 Block Diagram of 2SRC Block

Table 37.21 Combinations of Bit Width of Input/Output Audio Data

SADIRp_2SRC0_m.OTBL	Bit Width of Input Audio Data	Bit Width of Output Audio Data
00000 = 24 bits	24 bits	24 bits
01000 = 16 bits	16 bits	16 bits

Table 37.22 shows the functions of the 2SRC (SRC) block.

Table 37.22 2SRC (SRC) Block Functions

Item	Performance					
Type of SRC	Asynchronous SRC/synchronous SRC					
Operation frequency	66 MHz					
Delay mode	Normal				Low delay 1	Low delay 2
Channel number	1 or 2	4	6	8	1 or 2	1 or 2
Sampling rate of input source	8k to 96k [Hz]	8k to 96k [Hz]	8k to 66k [Hz]	8k to 49k [Hz]	8k to 96k [Hz]	8k to 96k [Hz]
Sampling rate of output source	8k to 96k [Hz]	8k to 96k [Hz]	8k to 66k [Hz]	8k to 49k [Hz]	8k to 96k [Hz]	8k to 96k [Hz]
Ratio of input and output sampling rate (FSO/FSI)	16 to 0.125 [time]	16 to 0.25 [time]	16 to 0.375 [time]	16 to 0.5 [time]	16 to 0.5 [time]	16 to 1 [time]
Sound quality	-132 dB					

Table 37.23 shows the latency of the 2SRC (SRC) block.

Table 37.23 2SRC (SRC) Block Latency

Item	Bypass	Normal					Low Delay 1		Low Delay 2	
		1	2	4	6	8	1	2	1	2
Channel number	Any	1	2	4	6	8	1	2	1	2
Processing delay	0	641	321	161	102	81	81	81	49	49
Logic delay	1	3	3	3	3	3	3	3	3	3
Output delay	Output delay [sample] = (Processing delay) * (FSO/FSI ratio) + (Logic delay)									

37.4.8 DVU Block

The DVU block is used to control volume and mute. This block can simultaneously process data for a maximum of eight channels.

- Digital volume, volume ramp, and zero cross mute are provided as functions to adjust the volume
- The digital volume is set as a 24-bit fixed-point value within the range from a multiple of 0 to 8 (mute, -120 to 18 dB)
- Volume ramp can be used to perform soft mute, fade in, fade out, and volume change as desired
- The ramp time of volume ramp can be changed and set within the sampling range of 2^0 to 2^{23}
- Zero cross mute turns the sound mute at the zero cross point of audio data
- Direct transfer with the SSIF module and transfer with the mixer are possible

The number of channels is set by VADIR_DVU0_n.CHNUM. For unused channels, the input data that is input to the corresponding channels is output one cycle later. In bypass mode, the input data is output one cycle later in all channels regardless of the CHNUM setting.

Figure 37.14 shows the processing image of the DVU block.

Figure 37.14 Processing Image of DVU Block

Table 37.24 shows the functions of the DVU block.

Table 37.24 DVU Block Functions

Item	Performance
Digital volume	Range: -120 dB to 18 dB (9.5×10^{-7} -time to 8-time)
Volume ramp	Volume ramp use for many kinds of operation (soft mute, fade in, fade out, volume change by ramp) Ramp time: $2^0/fso$ to $2^{23}/fso$ Example: (1/fso: -128 dB/1 step) (2/fso: -64 dB/1 step) (4/fso: -32 dB/1 step) (128/fso: -1 dB/1 step) (256/fso: -0.5 dB/1 step) (512/fso: -0.25 dB/1 step) (1024/fso: -0.125 dB/1 step) (2048/fso: -0.125 dB/2 steps) (4096/fso: -0.125 dB/4 steps) (8388608/fso: -0.125 dB/8192 steps)
Zero cross mute	Mute the signal at zero cross point

Figure 37.15 shows the image of digital volume operation.

DVUBR_DVU0_n.BYPASS = 0
DVUCR_DVU0_n.VVMD = 1 (digital volume mode)
VOL0R_DVU0_n.VOLVALm (m = arbitrary value from 0 to 7): 24'H10_0000 (0 dB) → 24'H05_0F45 (-10 dB)

Figure 37.15 Digital Volume Operation

Operation

- (1) In the initialized state ($DVUIR_DVU0_n.INIT = 1$), set the $VVMD$ bit in $DVUCR_DVU0_n$ to 1 (digital volume mode) and the $VOLVALm$ bit in $VOL0R_DVU0_n$ to $24'H10_0000$ (0 dB). Until the initialized state is cleared, the DVU does not start operation and its output data is 0.
- (2) When the initialized state is cleared ($DVUIR_DVU0_n.INIT = 0$), the DVU starts operation. Since the $VOLVALm$ bit is set to 0 dB, the output data is the same size as the input data.
- (3) Set the $DVUEN$ bit in $DVUER_DVU0_n$ to 0 and the $VOLVAL0$ bit in $VOL0R_DVU0_n$ to $24'H05_0F45$ (-10 dB).
- (4) The setting to the $VOLVAL0$ bit in (3) is enabled by setting the $DVUEN$ bit in $DVUER_DVU0_n$ to 1. The output data is the value obtained by attenuating the input data by -10 dB.

Figure 37.16 shows the image of volume ramp operation.

Figure 37.16 Volume Ramp Operation

Operation

- (1) In the initialized state ($DVUIR_DVU0_n.INIT = 1$), set the VRMD bit in $DVUCR_DVU0_n$ to 1 (volume ramp mode) and the VRENm (m: arbitrary value from 0 to 7) bit in $VRCTR_DVU0_n$ to 1. Until the initialized state is cleared, the DVU does not start operation and its output data is 0.
- (2) When the initialized state is cleared ($DVUIR_DVU0_n.INIT = 0$), the DVU starts operation.
- (3) Set the DVUEN bit in $DVUER_DVU0_n$ to 0, the VRPDDW bit in $VRPDR_DVU0_n$ to 5'H0F (0.125 dB/32 steps), the VRDB bit in $VRDBR_DVU0_n$ to 10'H064 (-12.5 dB), and the VRWT bit in $VRWTR_DVU0_n$ to 24'H00_113A (4410 samples).
- (4) The setting in (3) is enabled by setting the DVUEN bit in $DVUER_DVU0_n$ to 1.
- (5) The VDU waits to start the volume ramp operation for $4410/44100 = 0.1$ second because the sampling rate is set to 44.1 kHz with $VRWTR_DVU0_n.VRWT = 24'H00_113A$ (4410 samples).
- (6) The VDU starts volume ramp operation after the wait time in (5).
The output data is the value obtained by attenuating the input data by -12.5 dB after $12.5 \times 32/0.125 = 3200$ steps because the VRPDDW bit in $VRPDR_DVU0_n$ is set to 5'H0F (0.125 dB/32 steps) according to 0 dB to -12.5 dB ramp down.
- (7) Set the DVUEN bit in $DVUER_DVU0_n$ to 0, the VRPDUP bit in $VRPDR_DVU0_n$ to 5'H0C (0.125 dB/4 steps), the VRDB bit in $VRDBR_DVU0_n$ to 10'H000 (0 dB), and the VRWT bit in $VRWTR_DVU0_n$ to 24'H00_0000 (0 sample).
- (8) The setting in (7) is enabled by setting the DVUEN bit in $DVUER_DVU0_n$ to 1.
- (9) The VDU starts volume ramp operation without delay because the VRWT bit in $VRWTR_DVU0_n$ is set to 24'H00_0000 (0 sample).
The output data is the same size as the input data after $12.5 \times 4/0.125 = 400$ steps because the VRPDUP bit in $VRPDR_DVU0_n$ is set to 5'H0C (0.125 dB/4 steps) according to -12.5 dB to 0 dB ramp up.

Table 37.25 shows the latency of the DVU block.

Table 37.25 DVU Block Latency

Item	Bypass	DVU Operation
Output delay	1	2

37.4.9 MIX Block

The MIX block is used to mix (add together) the input audio data from a maximum of four systems into one system. Each system can simultaneously process data for a maximum of eight channels.

- Data of two to four source systems can be mixed (added together) into one system
- The ratio to add the sources can be set
- The ratio can be changed dynamically
- Volume ramp enables mixing to be performed (ramp time is variable)
- Only direct transfer with the SSIF module is possible

The number of channels is set by MADIR_MIX0_0.CHNUM. When not in bypass mode (MIXBR_MIX0_0.BYPASS = 0), unused channels always output 0 after initialization (MIXIR_MIX0_0.INIT = 1) unless the CHNUM setting is changed. In bypass mode, the input data is output one cycle later in all channels regardless of the CHNUM setting. Figure 37.17 shows a block diagram of the MIX block.

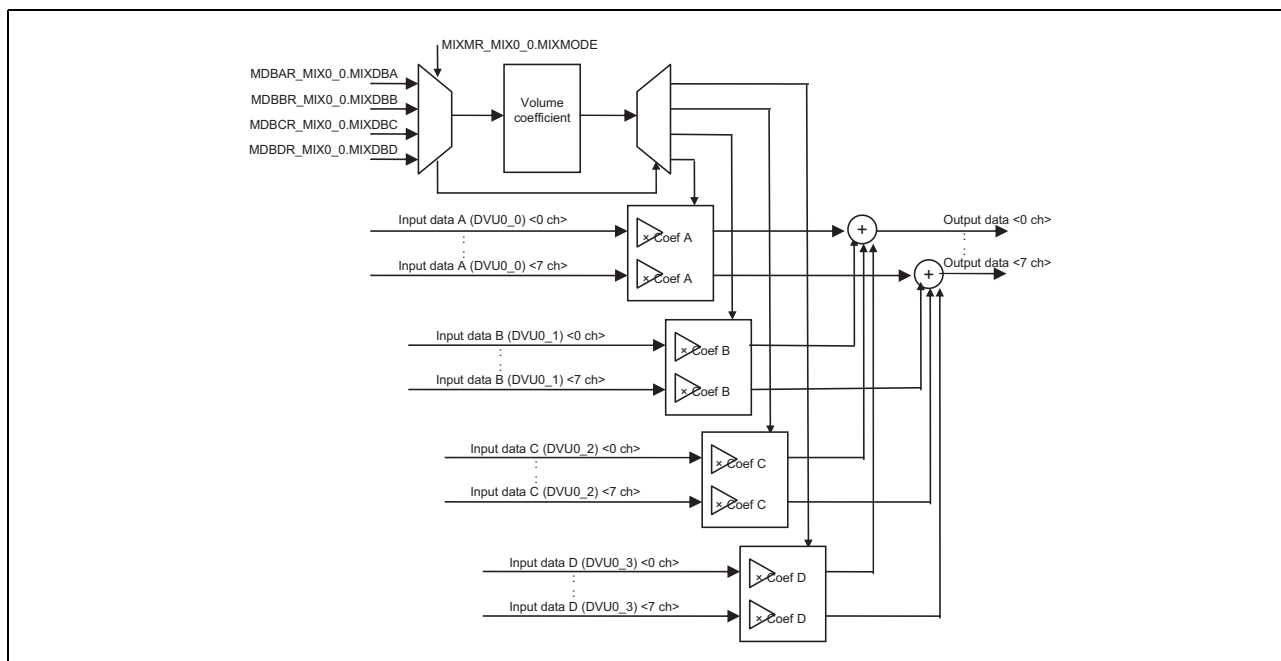

Figure 37.17 Block Diagram of MIX Block

Table 37.26 shows the functions of the MIX block.

Table 37.26 MIX Block Functions

Item	Performance
Volume step mixer	Mix the data of four systems into one system. The volume of each system can be adjusted by step change.
Volume ramp mixer	Mix the data of four systems into one system. The volume of each system can be adjusted by ramp.

Figure 37.18 shows the image of volume step operation for 1-system data. This figure explains about the operation when the volume is changed from 0 dB to $-\infty$ dB. The volume can change the target dB for one step each. In the case of the volume step mixer, the volume of four systems can be adjusted at each step change (one sample).

Figure 37.19 shows the image of volume ramp operation for 1-system data. This figure explains about the operation when the volume is changed from 0 dB to $-\infty$ dB. The volume can be changed by 0.125-dB/step each and it takes 1024 samples to reach $-\infty$ dB in the maximum case for each system. In the case of the volume ramp mixer, the volume of four

systems can be adjusted at each ramp. In addition, the volume ramp mixer has a mechanism to reduce the noise. If the direction of volume is different among the four systems, it operates from the volume-down systems and after that operates on the volume-up systems automatically. In the case of the same direction, it changes the volume at the same timing.

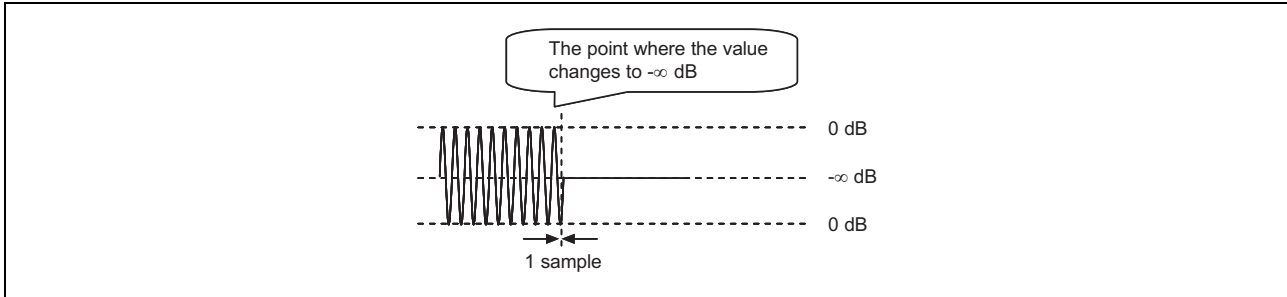

Figure 37.18 Volume Step Operation

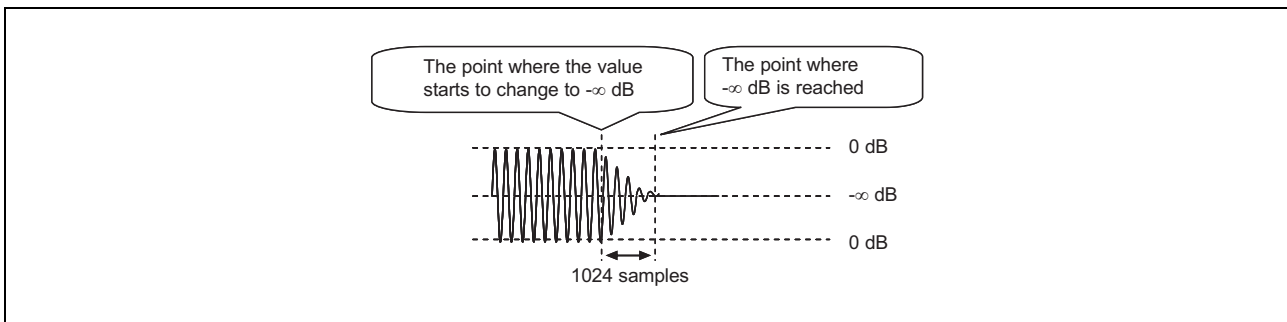

Figure 37.19 Volume Ramp Operation

Figure 37.20 shows the image of volume ramp operation for 4-system data.

Figure 37.20 Volume Ramp Operation for 4-System Data

Operation

- (1) In the initialized state (MIXIR_MIX0_0.INIT = 1), set the MIXMODE bit in MIXMR_MIX0_0 to 1 (volume ramp mode) and the MXPDDW bit in MVPDR_MIX0_0 to 4'HA (0.125 dB/1 sample).
Until the initialized state is cleared, the MIX does not start operation and its output data is 0.
- (2) When the initialized state is cleared (MIXIR_MIX0_0.INIT = 0), the MIX starts operation.
- (3) Set as follows:
 MDBER_MIX0_0.MIXDBEN = 0
 MDBAR_MIX0_0.MIXDBA = 10'H0C8 (-25 dB)
 MDBBR_MIX0_0.MIXDBB = 10'H0C8 (-25 dB)
 MDBCR_MIX0_0.MIXDBC = 10'H0C8 (-25 dB)
 MDBDR_MIX0_0.MIXDBD = 10'H0C8 (-25 dB)
- (4) The setting in (3) is enabled by setting the MIXDBEN bit in MDBER_MIX0_0 to 1.
- (5) The output data is the value obtained by attenuating and mixing the input data of each system by -25 dB after $25/0.125 = 200$ steps because the MXPDDW bit in MVPDR_MIX0_0 is set to 4'HA (0.125 dB/1 sample) according to 0 dB to -25 dB ramp down for each system.
- (6) Set as follows:
 MDBER_MIX0_0.MIXDBEN = 0
 MDBAR_MIX0_0.MIXDBA = 10'H000 (0 dB)
 MDBBR_MIX0_0.MIXDBB = 10'H000 (0 dB)
 MDBCR_MIX0_0.MIXDBC = 10'H000 (0 dB)
 MDBDR_MIX0_0.MIXDBD = 10'H000 (0 dB)
- (7) The setting in (6) is enabled by setting the MIXDBEN bit in MDBER_MIX0_0 to 1.
- (8) The output data is the value obtained by boosting and mixing the input data of each system by 25 dB after $25/0.125 = 200$ steps because the MXPDPUP bit in MVPDR_MIX0_0 is set to 4'HA (0.125 dB/1 sample) according to -25 dB to 0 dB ramp up for each system.

Table 37.27 shows the latency of the MIX block.

Table 37.27 MIX Block Latency

Item	Bypass	MIX Operation
Output delay	1	2

38. SD Host Interface

The contents of this section are available upon non-disclosure agreement.

For details, contact your local sales representatives.

For the features of the SD host interface, consult [section 1, Overview](#).

39. MMC Host Interface

The MMC host interface is a host controller conforming to the JEDEC Standard JESD84-A441 that allows connection with devices with the MMC interface.

39.1 Features

- Supports 1/4/8-bit MMC bus
- Supports the Single Data Rate only
- MMC clock frequency = $P1\phi$ frequency/ 2^n ($n = 1$ to 10)
- Supports High Priority Interrupt (HPI)*
- Supports background operation
- Data buffer: 512 bytes \times 2
- Three types of interrupt requests: normal operation, error/timeout, card detection
- DMA transfer requests: buffer write and buffer read
- Card detection function

Note: * Supports HPI in the sequences of CMD6, CMD24, CMD25 (pre-defined), and CMD38.

Figure 39.1 shows a block diagram of this module.

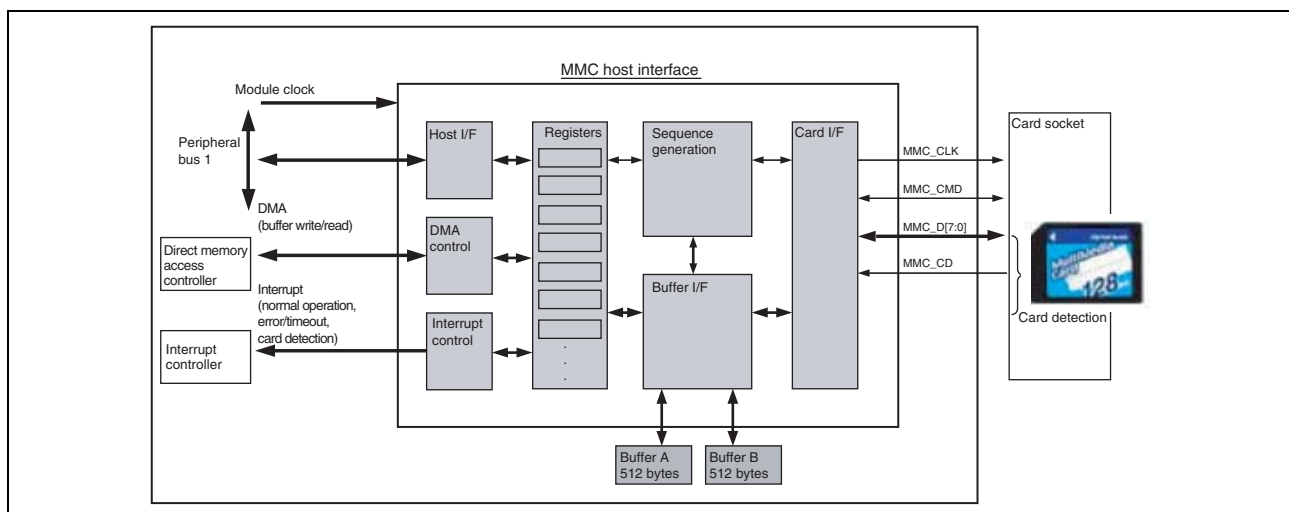

Figure 39.1 Block Diagram of MMC Host Interface

39.2 Input/Output Pins

Table 39.1 shows the pin configuration of this module.

Table 39.1 Pin Configuration

Pin Name	I/O	Function
MMC_CLK	Output	MMC clock
MMC_CMD	Input/output	Command/response
MMC_D[7:0]	Input/output	Transmit/receive data
MMC_CD	Input	Card detection*1

Note 1. Check the specifications of the card socket to be used before connection.

39.3 Register Descriptions

Table 39.2 shows the register configuration of this module.

Table 39.2 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
Command setting register	CE_CMD_SET	R/W	H'E804C800	16
			H'E804C802	16

Note: • Do not access registers other than those shown above.

39.3.1 Command Setting Register (CE_CMD_SET)

CE_CMD_SET sets a command sequence.

The command sequence starts when the settings have been made in bits 31 to 16. Note that writing to CE_CMD_SET is disabled while a command sequence is proceeding (i.e., the value of CMDSEQ in CE_HOST_STS1 is 1).

CE_CMD_SET should be set according to the description in section 39.7.12, Setting Values of CE_CMD_SET. This register should be accessed in 16 bits. (The address of bits 31 to 16 is H'E804C800 and that of bits 15 to 0 is H'E804C802.)

R/W:	R/W	R/W	R/W	R/W	R	R/W	R	R/W	R/W	R/W	R	R	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 24	CMD[5:0]	All 0	R/W	Command Index These bits set a command index ([45:40]). Note: Setting a command index in these bits initiates the command sequence.
23, 22	RTYP[1:0]	00	R/W	Response Type 00: No response 01: 6-byte response (R1, R1b, R3, R4, R5) 10: 17-byte response (R2) 11: Setting prohibited
21	RBSY	0	R/W	Response Busy Select Selects whether "busy" is involved in response reception. 0: No response busy 1: Response busy involved (R1b)
20	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
19	WDAT	0	R/W	Presence/Absence of Data 0: No data 1: With data
18	DWEN	0	R/W	Read/Write (valid when "with data" is selected) 0: Read from the card 1: Write to the card
17	CMLTE	0	R/W	Single/Multi Block Transfer Select (valid when "with data" is selected) 0: Single-block transfer 1: Multi-block transfer
16	CMD12EN	0	R/W	Automatic CMD12 Issuance (valid when multi-block transfer is selected)* 0: Does not issue CMD12 automatically. 1: Issues CMD12 automatically (= automatic CMD12) For details of automatic CMD12 issuance, see section 39.6.4, Automatic CMD12 Issuance. Note: Set the transfer block size to 512 bytes. Set RBSY to 0.

Bit	Bit Name	Initial Value	R/W	Description
15, 14	RIDXCI[1:0]	00	R/W	Response Index Check Specify the items to be checked for [45:40] of a 6-byte response or [133:128] of a 17-byte response. 00: Checks the response index (ensure that the response index matches the command index.) 01: Checks the check bits (ensure that the bits are all 1.) 10: No checking 11: Setting prohibited
13, 12	RCRC7C [1:0]	00	R/W	Response CRC7 Check Specify the items to be checked for [7:1] of a 6-byte response or a 17-byte response. 00: Checks CRC7 (set the response type to 01) 01: Checks the check bits (set the response type to 01) 10: Checks internal CRC7 (R2 only) (set the response type to 10) 11: No checking
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	CRC16C	0	R/W	CRC16 Check in Reception (valid when "with data" and "read" are selected) 0: Checks CRC16 1: Does not check CRC16 (use when CMD14)
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	CRCSTE	0	R/W	CRC Status Reception (valid when "with data" and "write" are selected) 0: Receives CRC status 1: Does not receive CRC status (use when CMD19)
7	TBIT	0	R/W	Transmission Bit Setting 0: Sets the transmission bit ([46]) to 1. 1: Sets the transmission bit ([46]) to 0.
6	OPDM	0	R/W	Open-Drain Output Mode 0: Normal output 1: Open-drain output Note: This setting is only applied to the MMC_CMD line.
5, 4	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SBIT	0	R/W	Read Data Start Bit Detection (valid when "with data" and "read" are selected) 0: Detects the start bit when the MMC_D signals set by DATW are all 0. 1: Detects the start bit when MMC_D[0] is 0.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	DATW[1:0]	00	R/W	Data Bus Width Setting (valid when "with data" is selected) 00: 1 bit 01: 4 bits 10: 8 bits 11: Setting prohibited

Note: * When HPI is executed, use multi-block transfer (pre-defined) without setting this bit to 1.

39.3.2 Argument Register (CE_ARG)

CE_ARG sets the argument for the command to be transmitted. Set CE_ARG before starting the command sequence.

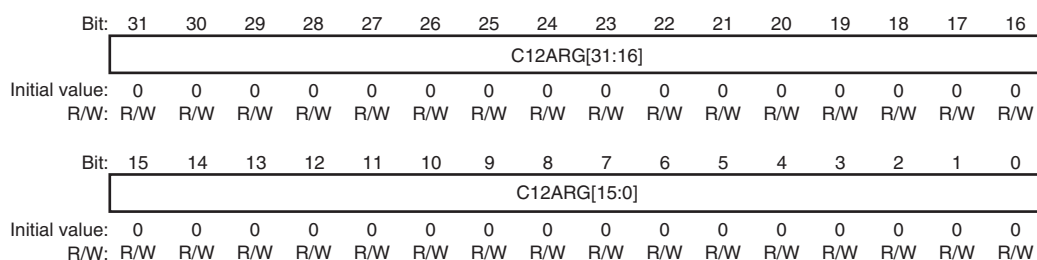

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ARG[31:0]	H'00000000	R/W	These bits set [39:8] of a command. Note: Set the argument of automatically-issued CMD12 by CE_ARG_CMD12.

39.3.3 Argument Register for Automatically-Issued CMD12 (CE_ARG_CMD12)

CE_ARG_CMD12 is used to set the argument for the automatically-issued CMD12 in multi-block transfer.

For the automatically-issued CMD12, see section 39.6.4, Automatic CMD12 Issuance. Set CE_ARG_CMD12 before starting the command sequence.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	C12ARG[31:0]	H'00000000	R/W	These bits set [39:8] of the automatically-issued CMD12.

39.3.4 Command Control Register (CE_CMD_CTRL)

CE_CMD_CTRL is used to terminate a command sequence forcibly.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BREAK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BREAK	0	R/W	Forcible Termination of Command Sequence To discontinue the current command sequence, write 1 to this bit while the bit is 0 and then write 0. After the above procedure, check if the value of the CMDSEQ bit in CE_HOST_STS1 has become 0 and then perform a software reset. Note: Since a software reset returns the register value to the initial value, the register needs be set again.

39.3.5 Transfer Block Setting Register (CE_BLOCK_SET)

CE_BLOCK_SET specifies the size of the block and the number of blocks for the data to be transferred. Set CE_BLOCK_SET before starting the command sequence.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BLKCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BLKSIZ[15:0]															
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	BLKCNT [15:0]	H'0000	R/W	Number of Blocks for Transfer Note: This setting is valid for multi-block transfer.
15 to 0	BLKSIZ [15:0]	H'0200	R/W	Transfer Block Size Note: Transfer block size should be set as follows. <ul style="list-style-type: none"> • Single-block transfer: 1 to 512 bytes • Multi-block transfer: 512 bytes

39.3.6 Clock Control Register (CE_CLK_CTRL)

CE_CLK_CTRL controls the MMC clock and sets timeout values. Do not change the setting of this register while a command sequence is in progress.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CLKEN	—	—	—	—	CLKDIV[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SRSPTO[1:0]		SRBSYTO[3:0]			SRWDTO[3:0]			—	—	—	—		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	CLKEN	0	R/W	MMC Clock Output Control 0: Does not output the MMC clock (tied to low level) 1: Outputs the MMC clock
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	CLKDIV[3:0]	0000	R/W	MMC Clock Frequency Setting 0000: $P1\phi/2$ 0001: $P1\phi/2^2$ 0111: $P1\phi/2^8$ 1000: $P1\phi/2^9$ 1001: $P1\phi/2^{10}$ 1010 to 1111: Setting prohibited
15, 14	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	SRSPTO [1:0]	00	R/W	Response Timeout Setting Specifies the timeout period for the RSPTO bit of CE_INT. 00: 64 MMC clock cycles 01: 128 MMC clock cycles 10: 256 MMC clock cycles 11: Setting prohibited
11 to 8	SRBSYTO [3:0]	0000	R/W	Response Busy Timeout Setting Specifies the timeout period for the RBSYTO bit of CE_INT. 0000: 2^{14} MMC clock cycles 0001: 2^{15} MMC clock cycles : 1110: 2^{28} MMC clock cycles 1111: 2^{29} MMC clock cycles
7 to 4	SRWDTO [3:0]	0000	R/W	Write Data/Read Data Timeout Setting Specifies the timeout period for the WDATTO and RDATTO bits of CE_INT. 0000: 2^{14} MMC clock cycles 0001: 2^{15} MMC clock cycles : 1110: 2^{28} MMC clock cycles 1111: 2^{29} MMC clock cycles
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.7 Buffer Access Configuration Register (CE_BUF_ACC)

CE_BUF_ACC configures the method of accessing data registers and mode of DMA transfer. Do not change the setting of this register while a command sequence is in progress. For explanation of the buffers, see section 39.6.3, Buffer Structure and Buffer Accesses.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DMAW EN	DMAR EN	—	—	—	—	—	—	—	ATYP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	DMAWEN	0	R/W	Buffer Write DMA Transfer Request Enable 0: Disables DMA transfer request for buffer writing 1: Enables DMA transfer request for buffer writing
24	DMAREN	0	R/W	Buffer Read DMA Transfer Request Enable 0: Disables DMA transfer request for buffer reading 1: Enables DMA transfer request for buffer reading
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	ATYP	0	R/W	Buffer Access Select 0: When not swapped byte-wise. 1: When swapped byte-wise. Note: For explanation of buffer access, see section 39.6.3, Buffer Structure and Buffer Accesses.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.8 Response Registers 3 to 0 (CE_RESP3 to CE_RESP0)

CE_RESP3 to CE_RESP0 are the registers for storing the response that has been received. For the formats of response values, see section 39.6.1, Command/Response Formats.

- CE_RESP3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[127:112]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[111:96]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[127:96]	H'00000000	R	[127:96] of a 17-byte response are stored.

- CE_RESP2

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[95:80]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[79:64]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[95:64]	H'00000000	R	[95:64] of a 17-byte response are stored.

- CE_RESP1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[63:48]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[47:32]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[63:32]	H'00000000	R	[63:32] of a 17-byte response are stored.

- CE_RESP0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[31:0]	H'00000000	R	[39:8] of a 6-byte response or [31:0] of a 17-byte response are stored. Note: The response to the automatically-issued CMD12 is stored in CE_RESP_CMD12.

39.3.9 Response Register for Automatically-Issued CMD12 (CE_RESP_CMD12)

CE_RESP_CMD12 is the register for storing the response to the automatically-issued CMD12.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP12[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP12[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP12[31:0]	H'00000000	R	[39:8] of a response to the automatically-issued CMD12 are stored.

39.3.10 Data Register (CE_DATA)

CE_DATA is used to access the buffers of this module.

For the write/read data formats, see section 39.6.2, Data Block Format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DATA[31:0]	H'00000000	R/W	Buffer write/read data [31:0]

39.3.11 Interrupt Flag Register (CE_INT)

CE_INT indicates various status during execution of a command sequence. Each bit is set to 1 when its setting condition has been met. To clear flag(s), write 0 only to the bit(s) to be cleared and write 1 to the other bits.

For the operation in the case of an error or timeout, see section 39.6.7, Operation in the Case of Error/Timeout.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	CMD12 DRE	CMD12 RBE	CMD12 CRE	DTRAN E	BUFR E	BUFW EN	BUFR EN	—	—	RBSY E	CRSP E

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.
26	CMD12DRE	0	R/W*1	Automatic CMD12 Issuance & Buffer Read Complete [Setting condition] Response busy for automatically-issued CMD12 and buffer reading have been completed. [Clearing condition] Writing a 0 to this bit Note: When CMD12DRE has been set, CMD12RBE, CMD12CRE, and BUFRE have also been set. So, these bits should be cleared as well.
25	CMD12RBE	0	R/W*1	Automatic CMD12 Issuance Response Busy Complete [Setting condition] Reception of the response and response busy for an automatically-issued CMD12 have been completed. [Clearing condition] Writing a 0 to this bit Note: When CMD12RBE is set, CMD12CRE is also set. So, clear the bit as well. When CMD12RBE is set during a multi-block write, DTRANE is also set. So clear the bit as well.
24	CMD12CRE	0	R/W*1	Automatic CMD12 Response Complete [Setting condition] The response to an automatically-issued CMD12 has been received. [Clearing condition] Writing a 0 to this bit
23	DTRANE	0	R/W*1	Data Transmission Complete [Setting conditions] Transmission of all blocks of data has been completed. <ul style="list-style-type: none"> When configured to receive CRC status: Completion of busy (data busy) after reception of CRC status When configured not to receive CRC status: Completion of data transmission [Clearing condition] Writing a 0 to this bit
22	BUFRE	0	R/W*1	Buffer Read Complete [Setting condition] All blocks of data have been received and the data have been read from the buffer [Clearing condition] Writing a 0 to this bit

Bit	Bit Name	Initial Value	R/W	Description
21	BUFWEN	0	R/W*1	<p>Buffer Write Ready [Setting condition] The buffer has become empty and ready for writing. [Clearing condition] Writing a 0 to this bit Note: When data is written to CE_DATA by the CPU, clear this bit first, and then write the amount of data equivalent to the block size set in the CE_BLOCK_SET register. Note that this bit is not set when DMA transfer request for buffer writing is enabled.</p>
20	BUFREN	0	R/W*1	<p>Buffer Read Ready [Setting condition] Transfer block size of data have been stored in the buffer and it has become ready for reading [Clearing condition] Writing a 0 to this bit Note: When data is read from CE_DATA by the CPU, clear this bit first, and then read the amount of data equivalent to the block size set in the CE_BLOCK_SET register. Note that this bit is not set when DMA transfer request for buffer reading is enabled.</p>
19, 18	—	00	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>
17	RBSYE	0	R/W*1	<p>Response Busy Complete [Setting condition] Reception of a response and response busy have been completed [Clearing condition] Writing a 0 to this bit Note: When RBSYE has been set, CRSPE has also been set. So, this bit should be cleared as well. Completion of reception of the response and response busy for automatically-issued CMD12 is reflected in CMD12RBE.</p>
16	CRSPE	0	R/W*1	<p>Command/Response Complete [Setting conditions] A command has been transmitted or a response has been received <ul style="list-style-type: none"> When configured not to receive response: A command has been transmitted When configured to receive 6- or 17-byte response: A response has been received [Clearing condition] Writing a 0 to this bit Note: Completion of reception of the response to automatically-issued CMD12 is reflected in CMD12CRE.</p>
15	CMDVIO	0	R/W*1	<p>Command Issuance Error [Setting conditions] Illegal setting has been made in CE_CMD_SET or CE_BLOCK_SET <ul style="list-style-type: none"> During execution of a command sequence: Writing to CMD[5:0] in CE_CMD_SET (The command sequence is not stopped automatically.) At the start of command sequence: Writing to CMD[5:0] in CE_CMD_SET when the registers have been set for one of the following combinations of selection <ul style="list-style-type: none"> No response + response busy No response + with data No data + automatic CMD12 issuance With data + single-block transfer + automatic CMD12 issuance With data + response busy + automatic CMD12 issuance With data + transfer block size = 0 With data + transfer block size \geq 513 With data + multi-block transfer + number of blocks for transfer = 0 [Clearing condition] Writing a 0 to this bit</p>

Bit	Bit Name	Initial Value	R/W	Description
14	BUFVIO	0	R/W*1	<p>Buffer Access Error [Setting conditions] Illegal buffer access has been attempted.</p> <ul style="list-style-type: none"> CE_DATA has been accessed exceeding the block size set in BLKSIZ[15:0] in CE_BLOCK_SET While data is being read from the card: CE_DATA has been accessed with BUFREN not set (when DMA is used, with no DMA transfer request asserted for buffer reading) While data is being written to the card: CE_DATA has been accessed with BUFWEN not set (when DMA is used, with no DMA transfer request asserted for buffer writing) <p>[Clearing condition] Writing a 0 to this bit Note: When BUFVIO is set, the command sequence is not stopped automatically. When an error occurs, this bit may be set.</p>
13, 12	—	00	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>
11	WDATERR	0	R/W*1	<p>Write Data Error [Setting conditions] Error is found in the data that has been written.</p> <ul style="list-style-type: none"> Error is in the status of the CRC status Error is in the end bit of the CRC status <p>[Clearing condition] Writing a 0 to this bit Note: When WDATERR is set, the command sequence is stopped automatically.</p>

7 to 5	—	All 0	R	<p>Reserved These bits are always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	CRCSTO	0	R/W*1	CRC Status Timeout [Setting condition] CRC status could not be received [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if CRCSTO is set.
3	WDATTO	0	R/W*1	Write Data Timeout [Setting condition] The busy status remains unchanged after the period set by SRWDTO in CE_CLK_CTRL after the CRC status was received. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if WDATTO is set.
2	RDATTO	0	R/W*1	Read Data Timeout [Setting conditions] <ul style="list-style-type: none"> Read data could not be received within the period set by SRWDTO in CE_CLK_CTRL after the read command was transmitted Read data could not be received within the period set by SRWDTO in CE_CLK_CTRL after the read data was received. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RDATTO is set.
1	RBSYTO	0	R/W*1	Response Busy Timeout [Setting condition] The busy status remains unchanged after the period set by SRBSYTO in CE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RBSYTO is set.
0	RSPTO	0	R/W*1	Response Timeout [Setting condition] Response could not be received within the period set by SRSPTO in CE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RSPTO is set.

Note 1. A 0 is the only value that can be written to the bit. Writing a 1 is ignored.

39.3.12 Interrupt Enable Register (CE_INT_EN)

CE_INT_EN controls output of the CE_INT-related interrupt signals. If a flag in CE_INT is set to 1 while its corresponding bit in CE_INT_EN is set to 1, an interrupt request is output. For details on interrupt requests, see section 39.4, Interrupt Requests.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CRCSTE	0	R	CRC Status Error This bit is set to 1 when an error is found in the CRC status value.
30	CRC16E	0	R	Read Data CRC16 Error This bit is set to 1 when an error is found in CRC16 in the read data.
29	AC12CRCE	0	R	Automatic CMD12 Response CRC7 Error This bit is set to 1 when an error is found in [7:1] of the response to the automatically-issued CMD12. Note: The items to be checked are set by RCRC7C in CE_CMD_SET.
28	RSPCRC7E	0	R	Command Response CRC7 Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in [7:1] of a 6-byte response or a 17-byte response. Note: The items to be checked are set by RCRC7C in CE_CMD_SET.
27	CRCSTEBE	0	R	CRC Status End Bit Error This bit is set to 1 when an error is found in the end bit in CRC status.
26	RDATEBE	0	R	Read Data End Bit Error This bit is set to 1 when an error is found in the end bit in the read data.
25	AC12REBE	0	R	Automatic CMD12 Response End Bit Error This bit is set to 1 when an error is found in the end bit of the response to the automatically-issued CMD12.
24	RSPEBE	0	R	Command Response End Bit Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in the end bit of the response.
23	AC12IDXE	0	R	Automatic CMD12 Response Index Error This bit is set to 1 when an error is found in [45:40] of the response to the automatically-issued CMD12. Note: The items to be checked are set by RIDXC in CE_CMD_SET.
22	RSPIDXE	0	R	Command Response Index Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in [45:40] of a 6-byte response or [133:128] of a 17-byte response. Note: The items to be checked are set by RIDXC in CE_CMD_SET.
21 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	CRCST [2:0]	000	R	CRC Status Indicate the value of the CRC status that has been received.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	STRDATTO	0	R	Read Data Timeout <ul style="list-style-type: none"> This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in CE_CLK_CTRL after a read command was transmitted. This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in CE_CLK_CTRL after a read data was received.

Bit	Bit Name	Initial Value	R/W	Description
13	DATBSYTO	0	R	Data Busy Timeout This bit is set to 1 if busy status remains unchanged after the period set by the SRWDTO bits in CE_CLK_CTRL after the CRC status was received.
12	CRCSTTO	0	R	CRC Status Timeout This bit is set to 1 if CRC status could not be received.
11	AC12BSYTO	0	R	Automatic CMD12 Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in CE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
10	RSPBSYTO	0	R	Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in CE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
9	AC12RSPTO	0	R	Automatic CMD12 Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in CE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
8	STRSPTO	0	R	Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in CE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.15 DMA Mode Setting Register (CE_DMA_MODE)

CE_DMA_MODE sets the transfer unit for DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DMASEL	0	R/W	DMA Transfer Size Select Selects the transfer unit for CE_DATA read/write DMA transfer. Set this bit in combination with the transfer size set in the DMA channel configuration register. 0: 2-byte (word) or 4-byte (longword) unit 1: 64-byte (longword × 16) unit Note: For DMA transfer in 64-byte units, set address H'E804C800 as the destination or source of DMA transfer instead of the data register (CE_DATA). Moreover, when a transfer error or timeout occurs during DMA transfer in 64-byte units, leading to the forced termination of transfer, write 0 to this bit and then set it to 1 again. Also do this whenever a software reset is used.

39.3.16 Card Detection/Port Control Register (CE_DETECT)

CE_DETECT controls card detection. For details on interrupt requests by card detection, see section 39.4, Interrupt Requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	CD SIG	CD RISE	CD FALL	—	—	—	—	—	—	MCD RISE	MCD FALL	—	—	—	—
Initial value:	0	—	0	0	0	—	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W*	R/W*	R	R	R	R	R	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	CDSIG	Undefined	R	MMC_CD Pin Status Indication Indicates the MMC_CD pin status.
13	CDRISE	0	R/W*1	MMC_CD Pin Rise Detection Flag [Setting condition] The MMC_CD pin level changes from low to high. [Clearing condition] Writing a 0 to this bit
12	CDFALL	0	R/W*1	MMC_CD Pin Fall Detection Flag [Setting condition] The MMC_CD pin level changes from high to low. [Clearing condition] Writing a 0 to this bit
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	—	Undefined	R	Reserved The write value should always be 0.
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	MCDRISE	0	R/W	CDRISE Interrupt Enable 0: Disables interrupt output by the CDRISE flag. 1: Enables interrupt output by the CDRISE flag.
4	MCDFALL	0	R/W	CDFALL Interrupt Enable 0: Disables interrupt output by the CDFALL flag. 1: Enables interrupt output by the CDFALL flag.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. A 0 is the only value that can be written to the bit. Writing a 1 is ignored.

39.3.17 Special Mode Setting Register (CE_ADD_MODE)

CE_ADD_MODE controls the internal clock.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLK MAIN	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	CLKMAIN	0	R/W	Internal Clock Control 0: Normal mode 1: Low power consumption mode (only card detection is enabled)
18 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.18 Version Register (CE_VERSION)

CE_VERSION indicates the version number and controls software reset of this module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SW RST	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VERSION[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SWRST	0	R/W	Software Reset 0: Software reset cleared (normal operation) 1: Executes software reset. When SWRST is set to 1, all the register values are reset to the initial values. (SWRST is not reset to the initial value)
30 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	VERSION [15:0]	H'0003	R	Version Information Indicates the version number of this module.

39.4 Interrupt Requests

Table 39.3 shows the interrupt request specifications of this module.

This module generates three types of interrupt requests: normal operation, error/timeout, and card detection. When an interrupt flag is set to 1 and also the corresponding interrupt is enabled, an interrupt request is asserted.

Table 39.3 Specifications of Interrupt Requests

Flag Register	Bit	Mask Register	Bit	Interrupt Request
CE_INT	CMD12DRE	CE_INT_EN	MCMD12DRE	Normal operation interrupt (MMC2)
	CMD12RBE		MCMD12RBE	
	CMD12CRE		MCMD12CRE	
	DTRANE		MDTRANE	
	BUFRE		MBUFRE	
	BUFWEN		MBUFWEN	
	BUFREN		MBUFREN	
	RBSYE		MRBSYE	
	CRSPE		MCRSPE	
	CMDVIO		MCMDVIO	
	BUFVIO		MBUFVIO	
	WDATERR		MWDATERR	
	RDATERR		MRDATERR	
	RIDXERR		MRIDXERR	
	RSPERR		MRSPELL	
	CRCSTO		MCRCSO	
	WDATTO		MWDATTO	
	RDATTO		MRDATTO

39.5 DMA Specifications

This module provides two channels for DMA transfer requests: one for buffer reading and the other for buffer writing.

39.5.1 DMA for Buffer Writing

The DMA transfer request is asserted for buffer writing when the buffer has become empty while the DMAWEN bit in CE_BUF_ACC is 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in CE_BLOCK_SET) \times BLKCNT (the number of blocks for transfer set in CE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFWEN bit in CE_INT will not be asserted in this case.

If an error occurs during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

39.5.2 DMA for Buffer Reading

The DMA transfer request is asserted for buffer reading when the buffer stores data of the block size specified in CE_BLOCK_SET while the DMAREN bit in CE_BUF_ACC is 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in CE_BLOCK_SET) \times BLKCNT (the number of blocks for transfer set in CE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFREN bit in CE_INT will not be asserted in this case.

If an error occurs during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

39.6 Operation

39.6.1 Command/Response Formats

Figure 39.2 shows the format of the command to be transferred. The command index that is set in CMD[5:0] of CE_CMD_SET and the argument set in ARG[31:0] of CE_ARG are reflected in the command.

Figure 39.2 Command Format

Figure 39.3 and Figure 39.4 show the formats when a 6-byte response and 17-byte response (R2) are received, respectively. The response index is stored in RSPIDX[5:0] of CE_HOST_STS1, and the status value of the response is stored to CE_RESP0 or CE_RESP3 to CE_RESP0.

Figure 39.3 Format of 6-Byte Response

Figure 39.4 Format of 17-Byte Response (R2)

39.6.2 Data Block Format

Figure 39.5 shows the format of data blocks. For details on D0 to D3 in Figure 39.5, see section 39.6.3, Buffer Structure and Buffer Accesses. When data is written to a card, data stored in the buffer is transmitted. When data is read from a card, receive data is stored to the buffer.

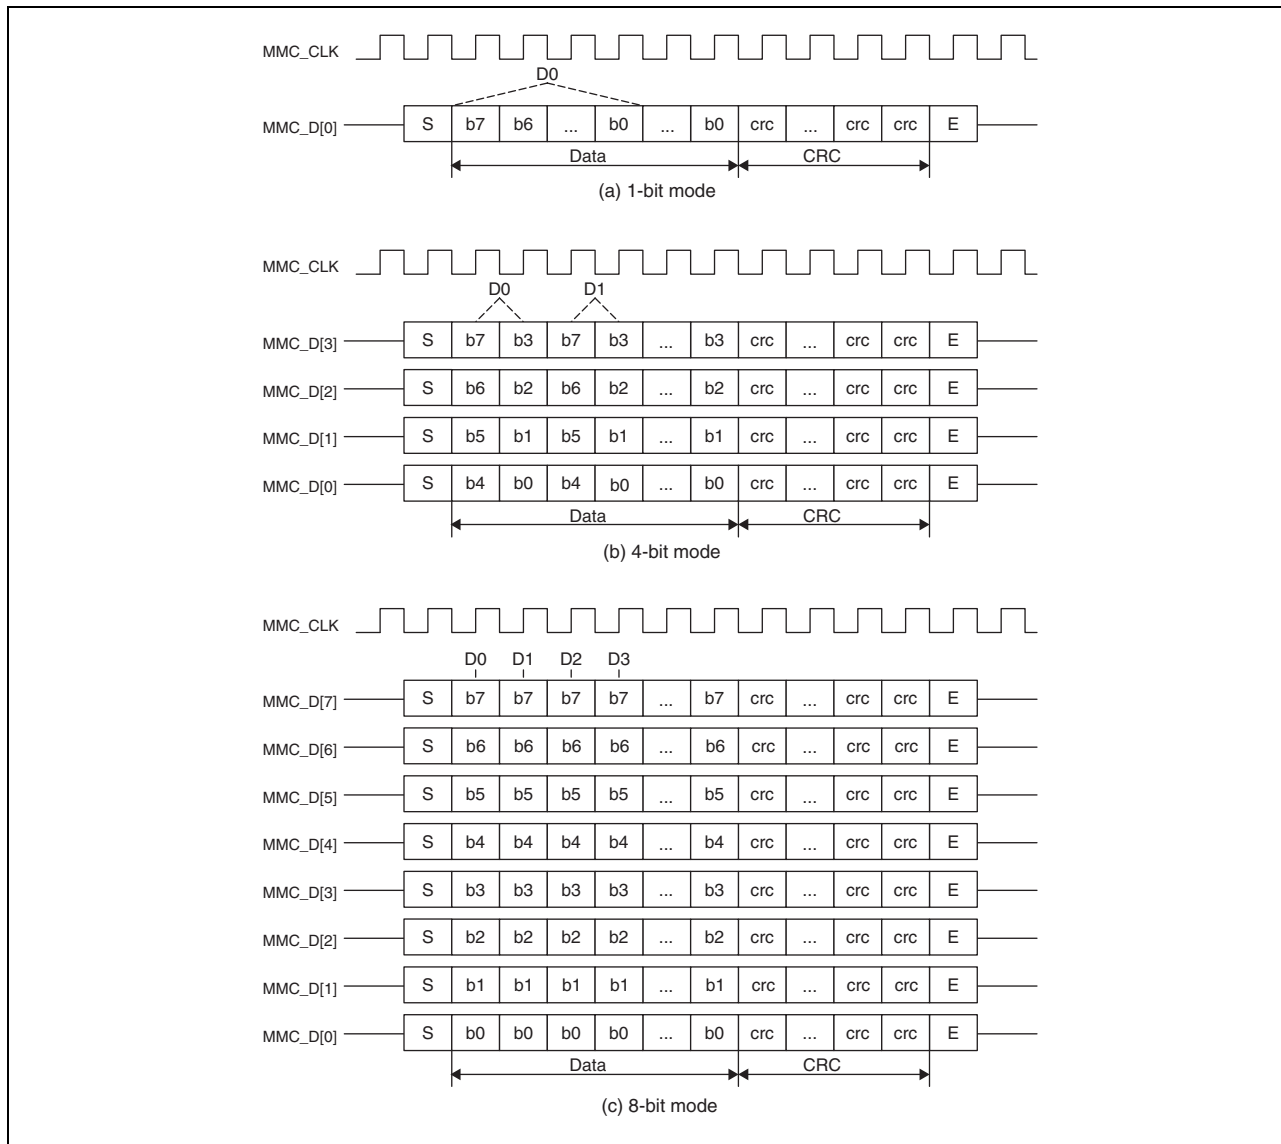

Figure 39.5 Data Block Format

39.6.3 Buffer Structure and Buffer Accesses

This module has two units of 512-byte RAM as shown in Figure 39.6. Therefore, for multi-block writing, if one block of data (512 bytes) stored in one buffer has been transmitted but the other buffer is full, the next block of data can be continuously transmitted. For multi-block reading, if one block of receive data (512 bytes) has been stored in one buffer but the other buffer is empty, the next block of receive data can be continuously stored in the buffer.

If neither of the buffers is empty for multi-block reading, the MMC clock is stopped and reception is suspended. When one of the buffers becomes empty, the MMC clock supply is started to start reception.

The buffer is accessed with CE_DATA. CE_DATA should be accessed for $4 \times (n + 1)$ bytes ($n = 0, 1, 2, 3, \dots, 127$).

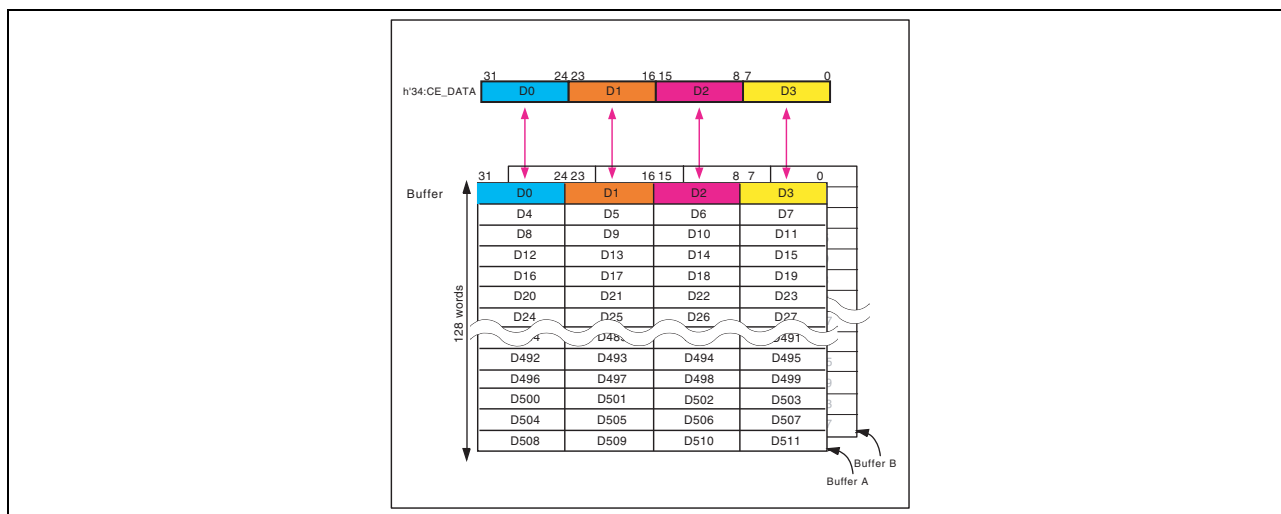

Figure 39.6 Double Buffer Structure

The buffer access select function allows byte-wise swapping of data when the buffer is accessed by writing to or reading from CE_DATA. This function is enabled by the setting of CE_BUFF_ACC. Figure 39.7 shows the specification of byte-wise swapping.

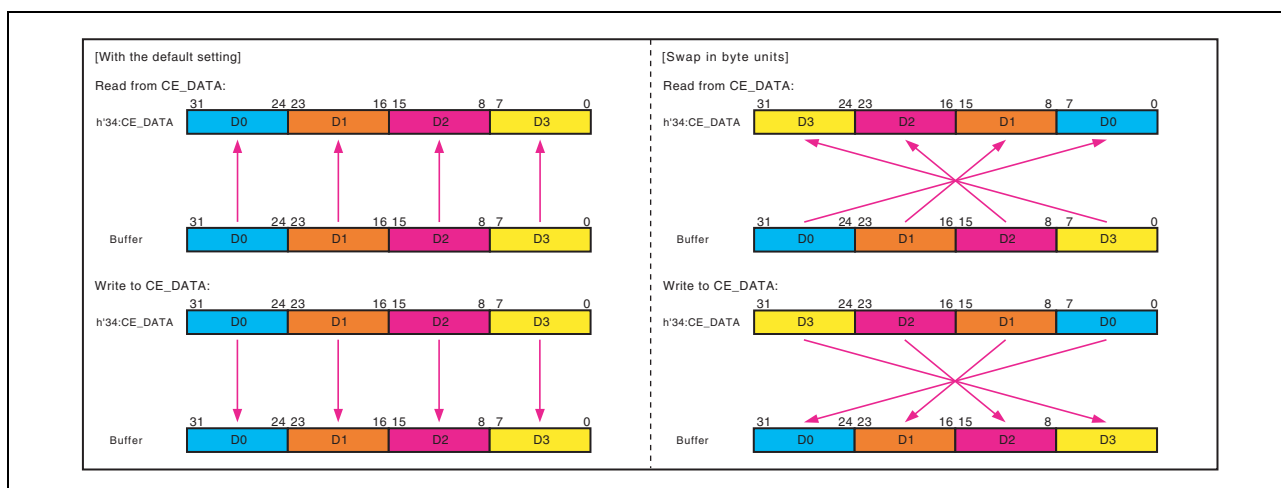

Figure 39.7 Specification of Byte-Wise Swapping

39.6.4 Automatic CMD12 Issuance

This module automatically issues CMD12 when multi-block transfer is performed with the CMD12EN bit in CE_CMD_SET set to 1.

Figure 39.8 shows the timing of automatic CMD12 issuance in multi-block read. CMD12 is issued such that the end bit of the command is sent two bits before the end bit of the data during reception of the last block.

Figure 39.8 Timing of Automatically-Issued CMD12 in Multi-Block Read (1-Bit Mode)

Figure 39.9 shows the timing of automatic CMD12 issuance in multi-block write. CMD12 is issued after the data busy after transmission of the last block has ended.

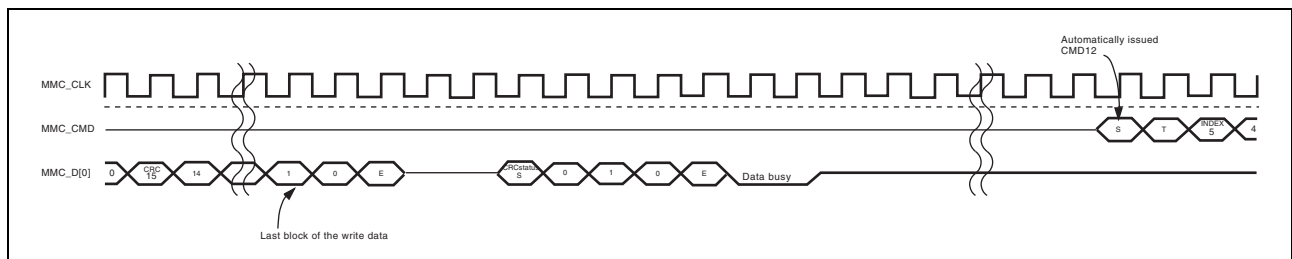

Figure 39.9 Timing of Automatically-Issued CMD12 in Multi-Block Write (1-Bit Mode)

The argument of the automatically-issued CMD12 is set by CE_ARG_CMD12. The value of [39:8] of the response to CMD12 is stored to CE_RESP_CMD12. The busy status on response reception is received.

39.6.5 High Priority Interrupt (HPI)

HPI should be executed as described below with reference to section 39.3, Register Descriptions and section 39.7, Examples of Setting.

(1) When HPI is executed during a write to the device

- (a) Terminate the command sequence forcibly.
- (b) Wait for the CMDSEQ bit in CE_HOST_STS1 to be cleared to 0.
- (c) Issue CMD12 (R1) to make the device in the rcv state enter the prg state. Note that the device does not output the response when the device is in the prg state before issuance of CMD12(R1).
- (d) Issue CMD13 (R1).
- (e) Issue the HPI command.

(2) When HPI is executed during response busy while not writing to the device

- (a) Terminate the command sequence forcibly.
- (b) Wait for the CMDSEQ bit in CE_HOST_STS1 to be cleared to 0.
- (c) Issue CMD13 (R1).
- (d) Issue the HPI command*.

The procedure above is for HPI generated in the CMD6, CMD24, CMD25 (Pre-defined), or CMD38 sequence.

Note: * CMD12 (R1b) or CMD13 (R1b) depending on the device connected

39.6.6 Background Operation

Background operation should be executed as described below with reference to section 39.3, Register Descriptions and section 39.7, Examples of Setting.

To execute background operation, issue CMD6 (R1) to write to the BKOPS_START byte in the EXT_CSD register of the device.

Completion of background operation can be determined by checking the device state with CMD13 (R1) issued after CMD6 (R1) or by polling MMCDAT[0]. When the device state is indicated as “tran” or MMCDAT[0] is high, background operation is determined to be completed.

To suspend background operation, use HPI described in section 39.6.5.

39.6.7 Operation in the Case of Error/Timeout

This module may not be stopped in case of error occurrence. If the command sequence is in progress when an error occurs (check the CMDSEQ bit in CE_HOST_STS1), terminate the sequence forcibly and perform a software reset. The data for transmission or received data that had been stored in the buffers at the time of error occurrence are not guaranteed.

This module is not stopped when a timeout has occurred. To execute the next command after a timeout error has occurred, terminate the sequence forcibly, perform a software reset.

For forcible termination, refer to section 39.7.11, Forcible Termination.

39.7 Examples of Setting

This section shows the procedures for executing typical command sequences.

39.7.1 Legends

Figure 39.10 shows the legends for the symbols used in the figures in the following subsections.

Note: • This module does not support CMD11 and CMD20.

39.8 Usage Note

39.8.1 Card Detection

The CDRISE and CDFALL bits in CE_DETECT which are used for the card detection function do not have a chattering elimination function. The chattering elimination processing should be implemented by software.

39.8.2 Multi-Block Transfer

When HPI is executed, use pre-defined multi-block transfer.

40. On-Chip RAM

This LSI has an on-chip large-capacity RAM for display area and work area (128 Kbytes of this RAM are shared with the on-chip data retention RAM) and an on-chip data retention RAM, which can retain data in deep standby mode. These memory units can be used to store instructions or data.

The operation and write access to the large-capacity RAM (including on-chip data retention RAM) can be enabled or disabled through the RAM enable bits and RAM write enable bits.

The on-chip data retention RAM is assigned to page 0 in the on-chip large-capacity RAM. Retention or non-retention of data by the on-chip data retention RAM in deep standby mode is selectable on a per-page basis.

40.1 Features

- Page
 - The on-chip large-capacity RAM consists of five pages.
 - The on-chip data retention RAM consists of four pages. Page 0 has 16-Kbytes, page 1 has 16-Kbytes, page 2 has 32-Kbytes, and page 3 has 64-Kbytes.
- Memory map

The on-chip RAM is located in the address spaces shown in Table 40.1 and Table 40.2. Pages 0 to 3 of the large-capacity RAM each have a capacity of 512 Kbytes, and page 4 of the large-capacity RAM has a capacity of 1 Mbyte.

Table 40.1 Address Spaces of On-Chip Large-Capacity RAM

Page	Address	Mirror Address
Page 0 (512KB)	H'20000000 to H'2007FFFF	H'60000000 to H'6007FFFF
Page 1 (512KB)	H'20080000 to H'200FFFFFFF	H'60080000 to H'600FFFFFFF
Page 2 (512KB)	H'20100000 to H'2017FFFF	H'60100000 to H'6017FFFF
Page 3 (512KB)	H'20180000 to H'201FFFFFFF	H'60180000 to H'601FFFFFFF
Page 4 (1024KB)	H'20200000 to H'202FFFFFFF	H'60200000 to H'602FFFFFFF

Table 40.2 Address Spaces of On-Chip Data Retention RAM

Page	Address	Mirror Address
Page 0 (16KB)	H'20000000 to H'20003FFF	H'60000000 to H'60003FFF
Page 1 (16KB)	H'20004000 to H'20007FFF	H'60004000 to H'60007FFF
Page 2 (32KB)	H'20008000 to H'2000FFFF	H'60008000 to H'6000FFFF
Page 3 (64KB)	H'20010000 to H'2001FFFF	H'60010000 to H'6001FFFF

- Ports
Each page of the on-chip large-capacity RAM has one read and write port and is connected to the AXI bus. The on-chip RAM for data retention, which has a port independent of the port in page 0, is shared with the read and write port in four pages.
- Method of arbitration
When the same port of the on-chip large-capacity RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.
- Number of access cycles
The number of cycles for access to read or write is one cycle of $B\phi$.

40.2 Usage Notes

40.2.1 Page Conflict

When the same page of the on-chip large-capacity RAM is accessed from different masters simultaneously, a conflict on the page occurs. Although each access is completed correctly, this kind of conflict degrades the memory access speed. Therefore, it is advisable to provide software measures to prevent such conflicts as far as possible. For example, no conflict will arise if different pages are accessed by each master.

40.2.2 Data Retention

Data in the large-capacity RAM (including on-chip data retention RAM) are retained in the states other than power-on reset and deep standby mode. In power-on reset and deep standby mode, these RAMs operate as described below.

(1) Power-on Reset

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are retained on a power-on reset by disabling the setting of either the VRAME or VRAMWE bit. Data are not retained when the setting of the VRAME and VRAMWE bits are both enabled.

(b) On-Chip Data Retention RAM

Data are retained on a power-on reset by disabling the setting of any of the VRAME, VRAMWE, or RRAMWE, excluding the case that deep standby mode is canceled by power-on reset. Data are not retained when the setting of the VRAME, VRAMWE and RRAMWE bits are all enabled.

(2) Deep Standby Mode

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are not retained.

(b) On-Chip Data Retention RAM

Data are retained in deep standby mode by enabling the setting of the RRAMKP bit, excluding the case that deep standby mode is canceled by power-on reset. In the case that deep standby mode is canceled by interrupt or pins for cancelling, power-on reset exception handling is executed, but the data are retained.

41. Ports

41.1 Features

The 176-pin package of this LSI has nine ports: JP0, P0 to P7. The 208-pin package of this LSI has eleven ports: JP0, P0 to P9. Each port pin is multiplexed with other peripheral module pin functions, and by setting the control registers, multiplexed pin functions (alternative functions) can be selectable.

41.1.1 Port group

This LSI has the following number of port groups.

Table 41.1 Port Group

Package	Number	Name
RZ/A1L 176-pin	9	P0 to P7, JP0
RZ/A1L 208-pin	11	P0 to P9, JP0

41.1.2 Port group index n

Throughout this section, the individual port groups are identified by the index "n" (n = 0 to 9, JP0), for example PMCN for the port mode control register, which is used for the Pn pin.

41.1.3 Base address

The address of a register used to control a JTAG port is given as the base address <JPORn_base> and the offset address from the base address. The address of a register other than the ones used to control JTAG ports is given as the base address <PORTn_base> and the offset address from the base address.

Table 41.2 Base Addresses <PORTn_base> and <JPORn_base>

<PORTn_base> address	<JPORn_base> address
H'FCFE 3000	H'FCFE 7B00

41.2 Functional Overview

41.2.1 Mode of Pin Functions

Pins can operate in three modes.

- Port mode (PMn.PMCnm bit = 0)
A pin in port mode operates as a general purpose input/output port. The I/O mode is selected by setting the PMn.PMnm bit.
- Software I/O control alternative mode (PMn.PMCnm bit = 1, PIPn.PIPCnm bit = 0)
In this mode, the pins operate as alternative functions.
The I/O mode is selected by setting the PMn.PMnm bit by using software.
- Direct I/O control alternative mode (PMn.PMCnm bit = 1, PIPn.PIPCnm bit = 1)
In this mode, the pins operate as alternative functions.
Unlike the software I/O alternative mode, however, the I/O mode is selected by the alternative function.

An overview of the register settings is given in the tables below.

Table 41.3 Pin Function Configuration (Overview)

Mode	Bit			I/O
	PMn.PMCnm	PMn.PMnm	PIPn.PIPCnm	
Port mode	0	0	X	O
		1*1		I
Software I/O control alternative mode	1*2	0	0	O
		1		I
Direct I/O control alternative mode		X	1	Controlled by the alternative function

Note 1. The input buffer is enabled only when the PIBCn.PIBCnm bit is set to 1.

Note 2. The input buffer must be enabled (PIBCnm = 1).

When the pins are in alternative mode (PMn.PMCnm = 1), one of the eight alternative functions is selected by the PFCn, PFCEn, and PFCAEn registers. For details, see Table 41.6, Alternative Mode Selection*2.

41.2.2 Pin Data Input/Output

The registers used for data input/output are described below. The location that is read via the PPRn register differs depending on the pin mode.

- Output data
In port mode (PMCn.PMCnm = 0), the value of the Pn.Pnm bit is output from the Pn_m pin.
- Input data
When the PPRn register is read, either the value of the Pn_m pin, the value of the Pn.Pnm bit, or the value output by the alternative function is returned. Which value is returned depends on the pin mode and setting of several control bits. Table 41.4 shows the different PPRn read values.

Table 41.4 PPRnm Read Values

PMCn.PMCnm	PMn.PMnm	PIBCn.PIBCnm	PIPCn.PIPCnm	Mode	PPRnm Read Value
0	1	0	X	Port input, input buffer disabled	Pn.Pnm register
		1		Port input, input buffer enabled	Pn_m pin
	0	X	Port output	Pn.Pnm register*1	
1	1	X	0	Software I/O control alternative function input	Pn_m pin
				0	Software I/O control alternative function output
	X	1	Direct I/O control alternative function output	I/O port in alternative function mode: • Input: Pn_m pin • Output: Alternative-function internal output signal*1	

Note 1. When PBDCn.PBDCnm = 1, the level of the Pn_m pin is returned as the read value of the PPRn.PPRnm bit.

41.3 Register Description

The following registers are used for setting the individual pins of the port groups:

Table 41.5 Register Configuration

Symbol	Register Name	R/W	16 Bit Access	32 Bit Access	Address
Pn	Port register	R/W	√	—	<PORTn_base> + 0000H + n × 4
PSRn	Port set/reset register	R/W	—	√	<PORTn_base> + 0100H + n × 4
PPRn	Port pin read register	R	√	—	<PORTn_base> + 0200H + n × 4
PMn	Port mode register	R/W	√	—	<PORTn_base> + 0300H + n × 4
PMCn	Port mode control register	R/W	√	—	<PORTn_base> + 0400H + n × 4
PFCn	Port function control register	R/W	√	—	<PORTn_base> + 0500H + n × 4
PFCEn	Port function control expansion register	R/W	√	—	<PORTn_base> + 0600H + n × 4
PNOTn	Port NOT register	W	√	—	<PORTn_base> + 0700H + n × 4
PMSRn	Port mode set/reset register	R/W	—	√	<PORTn_base> + 0800H + n × 4
PMCSRn	Port mode control set/reset register	R/W	—	√	<PORTn_base> + 0900H + n × 4
PFCAEn	Port Function Control Additional Expansion register	R/W	√	—	<PORTn_base> + 0A00H + n × 4
PIBCn	Port input buffer control register	R/W	√	—	<PORTn_base> + 4000H + n × 4
PBDCn	Port bi-direction control register	R/W	√	—	<PORTn_base> + 4100H + n × 4
PIPCn	Port IP control register	R/W	√	—	<PORTn_base> + 4200H + n × 4
JPPR0	Port pin read register	R	√	—	<JPORTn_base> + 0020H
JPMC0	Port mode control register	R/W	√	—	<JPORTn_base> + 0040H
JPMCSR0	Port mode control set/reset register	R/W	—	√	<JPORTn_base> + 0090H
JPIBC0	Port input buffer control register	R/W	√	—	<JPORTn_base> + 0400H
SNCRn	Serial sound interface noise canceler control register	R/W	—	√	<PORTn_base> + 0C00H

41.3.1 Port Register (Pn)

In output port mode (PMCn.PMCnm = 0 and PMn.PMnm = 0), this register holds the Pn.Pnm data to be output via the related Pn_m pin.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn15	Pn14	Pn13	Pn12	Pn11	Pn10	Pn9	Pn8	Pn7	Pn6	Pn5	Pn4	Pn3	Pn2	Pn1	Pn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	Pn[15:0]	These bits set the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

41.3.2 Port Set and Reset Register (PSRn)

This register provides an alternative method for writing data to the Pn register.

The higher 16 bits of the PSRn register specify whether data can be written to the Pn.Pnm bit specified by the lower 16 bits of the PSRn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSRn 31	PSRn 30	PSRn 29	PSRn 28	PSRn 27	PSRn 26	PSRn 25	PSRn 24	PSRn 23	PSRn 22	PSRn 21	PSRn 20	PSRn 19	PSRn 18	PSRn 17	PSRn 16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSRn 15	PSRn 14	PSRn 13	PSRn 12	PSRn 11	PSRn 10	PSRn 9	PSRn 8	PSRn 7	PSRn 6	PSRn 5	PSRn 4	PSRn 3	PSRn 2	PSRn 1	PSRn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PSRn.PSRnm bit is written to the corresponding Pn.Pnm bit. 0: Pn.Pnm is independent of PSRn.PSRnm. 1: Pn.Pnm becomes the value of the PSRn.PSRnm bit. Example: If PSRn.PSRn31 = 1, the value of PSRn.PSRn15 is written to Pn.Pn15.
15 to 0	PSRn[15:0]	These are data bits that specify the value of the Pn.Pnm bit if the corresponding higher bit, PSRn.PSRn (m+16), is 1. 0: Pn.Pnm = 0 1: Pn.Pnm = 1

41.3.3 Port Pin Read Register (PPRn/JPPR0)

The PPRn register reflects the level of the Pn_m pin, the value of the Pn.Pnm bit, or the output level of the alternative function. The read value depends on register settings as described in Table 41.4, PPRnm Read Values.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPRn 15	PPRn 14	PPRn 13	PPRn 12	PPRn 11	PPRn 10	PPRn 9	PPRn 8	PPRn 7	PPRn 6	PPRn 5	PPRn 4	PPRn 3	PPRn 2	PPRn 1	PPRn 0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit Position	Bit Name	Function
15 to 0	PPRn[15:0]	The value of the Pn_m pin, the value of the Pn.Pnm bit, or the output level of the alternative function.

- Notes:
1. For the PPRn register read value, see section 41.2.2, Pin Data Input/Output.
 2. The JPPR0[1:0] bits are control bits in the JTAG port pin read register (JPPR0).

41.3.4 Port Mode Register (PMn)

This register specifies whether the Pn_m pin is in input mode or in output mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn 15	PMn 14	PMn 13	PMn 12	PMn 11	PMn 10	PMn 9	PMn 8	PMn 7	PMn 6	PMn 5	PMn 4	PMn 3	PMn 2	PMn 1	PMn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PMn[15:0]	Specifies input/output mode of the corresponding pin: 0: Output mode (output enabled) 1: Input mode (output disabled)

- Notes:
1. To use the Pn_m pin in input port mode (PMCn.PMCnm = 0 and PMn.PMnm = 1), the PIBCn.PIBCnm bit must be set to 1 so that the input buffer is enabled.
 2. After the register is reset (PIPCn.PIPCnm is 0), the PMn.PMnm bit specifies the I/O direction in port mode (PMCn.PMCnm = 0) and alternative mode (PMCn.PMCnm = 1). For the pins that are automatically configured in boot mode (see Table 8.3, Initial States by Areas in Boot Modes 0 and 1 to 3), the alternative function (not the PMn register) is used to control the I/O direction.

41.3.5 Port Mode Control Register (PMCn/JPMC0)

This register specifies whether the Pn_m pin is in port mode or in alternative mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCn 15	PMCn 14	PMCn 13	PMCn 12	PMCn 11	PMCn 10	PMCn 9	PMCn 8	PMCn 7	PMCn 6	PMCn 5	PMCn 4	PMCn 3	PMCn 2	PMCn 1	PMCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PMCn[15:0]	Specifies the operation mode of the corresponding pin: 0: Port mode 1: Alternative mode

Caution: The input/output control is not performed just by setting alternative mode (PMCn.PMCnm). Set 1 in the PIPCn.PIPCnm bit too when the I/O control is to be performed by using the alternative function.

Note: The JPMC0[1:0] bits are control bits in the JTAG port mode control register (JPMC0).

41.3.6 Port Function Control Register (PFCn)

This register, together with the PFCEn and PFCAEn register, specifies the alternative function of the pins.

The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to 1.

For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCn 15	PFCn 14	PFCn 13	PFCn 12	PFCn 11	PFCn 10	PFCn 9	PFCn 8	PFCn 7	PFCn 6	PFCn 5	PFCn 4	PFCn 3	PFCn 2	PFCn 1	PFCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCn[15:0]	Specifies the alternative function of a pin.

Table 41.6 Alternative Mode Selection*2

PMCn.PMCnm	PFCAEn.PFCAEnm	PFCEn.PFCEnm	PFCn.PFCnm	PMn.PMnm ¹	Function			
0	X	X	X	1	Port mode/input			
				0	Port mode/output			
1	0	0	0	1	Alternative mode/1st alternative function/input			
				0	Alternative mode/1st alternative function/output			
			1	1	Alternative mode/2nd alternative function/input			
				0	Alternative mode/2nd alternative function/output			
			1	0	1	Alternative mode/3rd alternative function/input		
					0	Alternative mode/3rd alternative function/output		
			1	0	0	1	Alternative mode/4th alternative function/input	
						0	Alternative mode/4th alternative function/output	
	1	0	0	0	1	Alternative mode/5th alternative function/input		
					0	Alternative mode/5th alternative function/output		
				1	1	Alternative mode/6th alternative function/input		
					0	Alternative mode/6th alternative function/output		
				1	0	1	Alternative mode/7th alternative function/input	
						0	Alternative mode/7th alternative function/output	
				1	0	0	1	Alternative mode/8th alternative function/input
							0	Alternative mode/8th alternative function/output

Note 1. When the PIPCn.PIPCnm bit is set to 1, the I/O direction is directly controlled by the alternative function and the setting of the PMn.PMnm bit becomes invalid.

Note 2. Use alternative functions that are open to the public. Operations are not guaranteed when a mode that has not been assigned as an alternative mode is set.

41.3.7 Port Function Control Expansion Register (PFCEn)

This register, together with the PFCn and PFCAEn register, specifies the alternative function of the pins.

The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to 1.

For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn	PFCEn
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCEn[15:0]	Specifies the alternative function of a pin.

41.3.8 Port NOT Register (PNOTn)

This register allows the Pn.Pnm bit to be inverted without directly writing to the Pn register.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn	PNOTn
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit Position	Bit Name	Function
15 to 0	PNOTn[15:0]	Specifies whether to invert Pn.Pnm. 0: Pn.Pnm is not inverted ($Pnm \rightarrow Pnm$) 1: Pn.Pnm is inverted ($Pnm \rightarrow \overline{Pnm}$)

41.3.9 Port Mode Set and Reset Register (PMSRn)

This register provides an alternative method for writing data to the PMn register.

The higher 16 bits of the PMSRn register specify whether data can be written to the PMn.PMnm bit specified by the lower 16 bits of the PMSRn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSRn 31	PMSRn 30	PMSRn 29	PMSRn 28	PMSRn 27	PMSRn 26	PMSRn 25	PMSRn 24	PMSRn 23	PMSRn 22	PMSRn 21	PMSRn 20	PMSRn 19	PMSRn 18	PMSRn 17	PMSRn 16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSRn 15	PMSRn 14	PMSRn 13	PMSRn 12	PMSRn 11	PMSRn 10	PMSRn 9	PMSRn 8	PMSRn 7	PMSRn 6	PMSRn 5	PMSRn 4	PMSRn 3	PMSRn 2	PMSRn 1	PMSRn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PMSRn[31:16]	<p>These are enable bits that specify whether the value of the corresponding lower bit of the PMSRn.PMSRnm bit is written to the corresponding PMn.PMnm bit.</p> <p>0: PMn.PMnm does not depend on the PMSRn.PMSRnm bit.</p> <p>1: PMn.PMnm becomes the value of the PMSRn.PMSRnm bit.</p> <p>Example: If PMSRn.PMSRn31 = 1, the value of PMSRn.PMSRn15 is written to PMn.PMn15.</p>
15 to 0	PMSRn[15:0]	<p>These are data bits that specify the value of the PMn.PMnm bit if the corresponding higher bit, PMSRn.PMSRn (m + 16), is 1.</p> <p>0: PMn.PMnm = 0</p> <p>1: PMn.PMnm = 1</p>

41.3.10 Port Mode Control Set and Reset Register (PMCSRn/JPMCSR0)

This register provides an alternative method for writing data to the PMCn register.

The higher bits of the PMCSRn register specify whether data can be written to the PMCn.PMCnm bit specified by the lower bits of the PMCSRn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMCS Rn31	PMCS Rn30	PMCS Rn29	PMCS Rn28	PMCS Rn27	PMCS Rn26	PMCS Rn25	PMCS Rn24	PMCS Rn23	PMCS Rn22	PMCS Rn21	PMCS Rn20	PMCS Rn19	PMCS Rn18	PMCS Rn17	PMCS Rn16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCS Rn15	PMCS Rn14	PMCS Rn13	PMCS Rn12	PMCS Rn11	PMCS Rn10	PMCS Rn9	PMCS Rn8	PMCS Rn7	PMCS Rn6	PMCS Rn5	PMCS Rn4	PMCS Rn3	PMCS Rn2	PMCS Rn1	PMCS Rn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PMCSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PMCSRn.PMCn bit is written to the corresponding PMCn.PMCnm bit. 0: PMCn.PMCnm does not depend on the PMCSRn.PMCn bit. 1: PMCn.PMCnm becomes the value of the PMCSRn.PMCn bit. Example: If PMCSRn.PMCn31 = 1, the value of PMCSRn.PMCn15 is written to PMCn.PMCn15.
15 to 0	PMCSRn[15:0]	These are data bits that specify the value of the PMCn.PMCnm bit if the corresponding higher bit, PMCSRn.PMCn (m+16), is 1. 0: PMCn.PMCnm = 0 1: PMCn.PMCnm = 1

Note: The JPMCSR0[1:0] bits are control bits in the JTAG port mode control set and reset register (JPMCSR0).

41.3.11 Port Function Control Additional Expansion Register (PFCAEn)

This register, together with the PFCn and PFCEn register, specifies the alternative function of the pins.

The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCN.PIPCNm bit must be set to 1.

For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Use the PFCn.PFCnm, PFCEn.PFCEnm, and PFCAEn.PFCAEnm bits to select the alternative functions, and then set the PMCn.PMCnm bit to 1.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAE n15	PFCAE n14	PFCAE n13	PFCAE n12	PFCAE n11	PFCAE n10	PFCAE n9	PFCAE n8	PFCAE n7	PFCAE n6	PFCAE n5	PFCAE n4	PFCAE n3	PFCAE n2	PFCAE n1	PFCAE n0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCAEn[15:0]	Specifies the alternative function of a pin.

Caution: Although this LSI uses the input or output of a part of functions in two pins, only one of the pin functions can be used.

Do not set the same function in two pins. For example, when the a/b/c pin is used as the b pin, the b/d/e pin cannot be used as the b pin. Before using the b/d/e pin, set the pin as a pin other than the b pin.

Note: For the allocation of the alternative functions, see the table of the pin functions of each port.

41.3.12 Port Input Buffer Control Register (PIBCn)

This register specifies whether to enable or disable the Pn_m pin's input buffer in input port mode (PMCn.PMCnm = 0 and PMn.PMnm = 1).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBCn 15	PIBCn 14	PIBCn 13	PIBCn 12	PIBCn 11	PIBCn 10	PIBCn 9	PIBCn 8	PIBCn 7	PIBCn 6	PIBCn 5	PIBCn 4	PIBCn 3	PIBCn 2	PIBCn 1	PIBCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PIBCn[15:0]	These bits enable or disable the input buffer. 0: Input buffer disabled 1: Input buffer enabled

Note: When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally (except for P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, and P7_9).

Caution: The input buffer is enabled regardless of the settings in this register when the output buffer is enabled and PBDCn.PBDCnm = 1.

41.3.13 Port Bidirection Control Register (PBDCn/JPBDC0)

This register specifies whether to enable or disable the input buffers when the output buffers are enabled. If the input buffers are enabled when the output buffers are enabled, bidirectional mode is enabled, and the level of the Pn_m pin is always read via the PPRn.PPRnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn 15	PBDCn 14	PBDCn 13	PBDCn 12	PBDCn 11	PBDCn 10	PBDCn 9	PBDCn 8	PBDCn 7	PBDCn 6	PBDCn 5	PBDCn 4	PBDCn 3	PBDCn 2	PBDCn 1	PBDCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin: 0: Bidirectional mode disabled 1: Bidirectional mode enabled

Caution: When using the Pn_m pin as an alternative function (PMCn.PMCnm = 1 and PMn.PMnm = 0), the level of the Pn_m pin can be read at the PPRn.PPRnm bit by setting PBDCn.PBDCnm to 1. Note, however, that in this case, the level of the Pn_m pin will be input to the alternative function that the Pn_m pin is being used as.

Note: The JPBDC0[1:0] bits are control bits in the JTAG port bidirection control register (JPBDC0).

41.3.14 Port IP Control Register (PIPCn)

This register specifies whether the I/O direction of the Pn_m pin is controlled by the PMn.PMnm bit or by the alternative function in alternative mode (PMn.PMnm = 1). Set the PIPCN.PIPCnm bit to 0 to use the alternative functions listed in Table 41.7. Set the PIPCN.PIPCnm bit to 1 to use the alternative functions not listed in Table 41.7. If the PIPCN.PIPCnm bit is set to 1, the I/O direction is controlled by the alternative function, and the setting of the PMn.PMnm bit becomes invalid.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn 15	PIPCn 14	PIPCn 13	PIPCn 12	PIPCn 11	PIPCn 10	PIPCn 9	PIPCn 8	PIPCn 7	PIPCn 6	PIPCn 5	PIPCn 4	PIPCn 3	PIPCn 2	PIPCn 1	PIPCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PIPCn[15:0]	These bits specify how the I/O direction is controlled in alternative mode. 0: The I/O direction is controlled by the PMn.PMnm bit (software I/O control). 1: The I/O direction is controlled by the alternative function (direct I/O control).

Table 41.7 Alternative Functions for Which the PIPCN.PIPCnm Bit Should be Set to 0

41.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR)

This register controls the noise canceler in the input route from the LSI pin to a serial sound interface. Each bit can be set only when slave mode is selected for the corresponding channel of the serial sound interface. The bit should be used as it is the initial value (H'00000000) when master mode is selected for the corresponding channel of the serial sound interface.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SSI3N CE	SSI2N CE	SSI1N CE	SSI0N CE
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
3	SSI3NCE	Serial Sound Interface Channel 3 Noise Canceler Enable Enables or disables the noise canceler of SSISCK3, SSIWS3, and SSIRxD3. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
2	SSI2NCE	Serial Sound Interface Channel 2 Noise Canceler Enable Enables or disables the noise canceler of SSISCK2, SSIWS2, and SSIDATA2. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
1	SSI1NCE	Serial Sound Interface Channel 1 Noise Canceler Enable Enables or disables the noise canceler of SSISCK1, SSIWS1, and SSIRxD1. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
0	SSI0NCE	Serial Sound Interface Channel 0 Noise Canceler Enable Enables or disables the noise canceler of SSISCK0, SSIWS0, and SSIRxD0. 0: Noise canceler is disabled. 1: Noise canceler is enabled.

41.4 Port Function

Table 41.8 Number and Function of Ports

Port	Pin Name	Size (Number of Ports)	Input/Output	Note
JTAG Port 0	JP0_0 to 1	2 bits	input	
Port 0	P0_0 to 3	4 bits	input	
Port 1	P1_0 to 15	16 bits	input/open-drain output	Output of only the P1_0 to P1_7 pins is open-drain output.
Port 2	P2_0 to 9	10 bits	input/output	
Port 3	P3_0 to 15	16 bits	input/output	
Port 4	P4_0 to 7	8 bits	input/output	
Port 5	P5_0 to 15	16 bits	input/output	
Port 6	P6_0 to 15	16 bits	input/output	
Port 7	P7_0 to 11	12 bits	input/output	
Port 8	P8_0 to 15	16 bits	input/output	208-pin package only
Port 9	P9_0 to 5	6 bits	input/output	208-pin package only

41.5 JTAG Port 0 (JP0)

Table 41.9 Pin Function (JP0)

Port Mode		Alternative Mode	
Input	Output	Input	Output
JP0_0		TDI	
JP0_1			TDO

Note: Only input in port mode.

Table 41.10 Control Registers (JP0)

Register	Register Size	Valid Bit		Offset Address <JPORn_base>	Initial Value
		Location	R/W		
JPPR0	16	1, 0	R	H'0020	H'0000
JPMC0	16	1, 0	R/W	H'0040	H'FFFF
JPMCSR0	32	17, 16, 1, 0	W, R/W	H'0090	H'0000_FFFF
JPIBC0	16	1, 0	R/W	H'0400	H'0000

Note: An initial value is read if the bit is invalid. The write value should always be the initial value.

41.6 Port 0 (P0)

Table 41.11 Pin Function (P0)

Port Mode		Alternative Mode							
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output
P0_0				RxD0		IRQ4			
P0_1				RxD2		SSIRxD3		ADTRG	
P0_2				RxD1		IRQ7			
P0_3				RxD3		SPDIF_IN			

Note 1. Only input in port mode.

Note 2. P0_0, P0_1, P0_2, P0_3 pins are MD_BOOT0, MD_BOOT1, MD_CLK, MD_CLKS functions in the state of $\overline{RES} = L$.

Table 41.12 Control Registers (P0)

Register	Register Size	Valid Bit		Offset Address <PORTn_base>	Initial Value
		Location	R/W		
PPR0	16	3 to 0	R	H'0200	H'0000
PMC0	16	3 to 0	R/W	H'0400	H'0000
PFC0	16	3 to 0	R/W	H'0500	H'0000
PFCE0	16	3 to 0	R/W	H'0600	H'0000
PMCSR0	32	19 to 16, 3 to 0	W, R/W	H'0900	H'0000_0000
PFCAE0	16	3 to 0	R/W	H'0A00	H'0000
PIBC0	16	3 to 0	R/W	H'4000	H'0000

Note: An initial value is read if the bit is invalid. The write value should always be the initial value.

41.7 Port 1 (P1)

Table 41.13 Pin Function (P1)

Port Mode		Alternative Mode							
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output
P1_0	P1_0	RIIC0SCL		IRQ4		ET_RXD0		DV0_DATA0	
P1_1	P1_1	RIIC0SDA		IRQ5		ET_RXD1		DV0_DATA1	
P1_2	P1_2	RIIC1SCL		IRQ6		ET_RXD2		DV0_DATA2	
P1_3	P1_3	RIIC1SDA		IRQ7		ET_RXD3		DV0_DATA3	
P1_4	P1_4	RIIC2SCL		IRQ0		DREQ0		VIO_D0	
P1_5	P1_5	RIIC2SDA		IRQ1		-		VIO_D1	
P1_6	P1_6	RIIC3SCL		IRQ2		SSIRxD0		VIO_D2	
P1_7	P1_7	RIIC3SDA		IRQ3		RxD2		VIO_D3	
P1_8		AN0		IRQ0		RxD0		DV0_DATA4	
P1_9		AN1		IRQ1		RxD1		DV0_DATA5	
P1_10		AN2		IRQ2		RxD2		DV0_DATA6	
P1_11		AN3		IRQ3		RxD3		DV0_DATA7	
P1_12		AN4		IRQ4		ET_RXD0		VIO_D4	
P1_13		AN5		IRQ5		ET_RXD1		VIO_D5	
P1_14		AN6		IRQ6		ET_RXD2		VIO_D6	
P1_15		AN7		IRQ7		ET_RXD3		VIO_D7	

Note: P1_0 to P1_7 pins are input with open-drain output. P1_8 to P1_15 pins are only input.

Table 41.14 Control Registers (P1)

Register	Register Size	Valid Bit		Offset Address <PORTn_base>	Initial Value
		Location	R/W		
P1	16	7 to 0	R/W	H'0004	H'0000

41.16 Port Control Logical Diagram

The figure below is a logical diagram of the port control function.

Note: This figure shows the logic for reference, not the circuit.

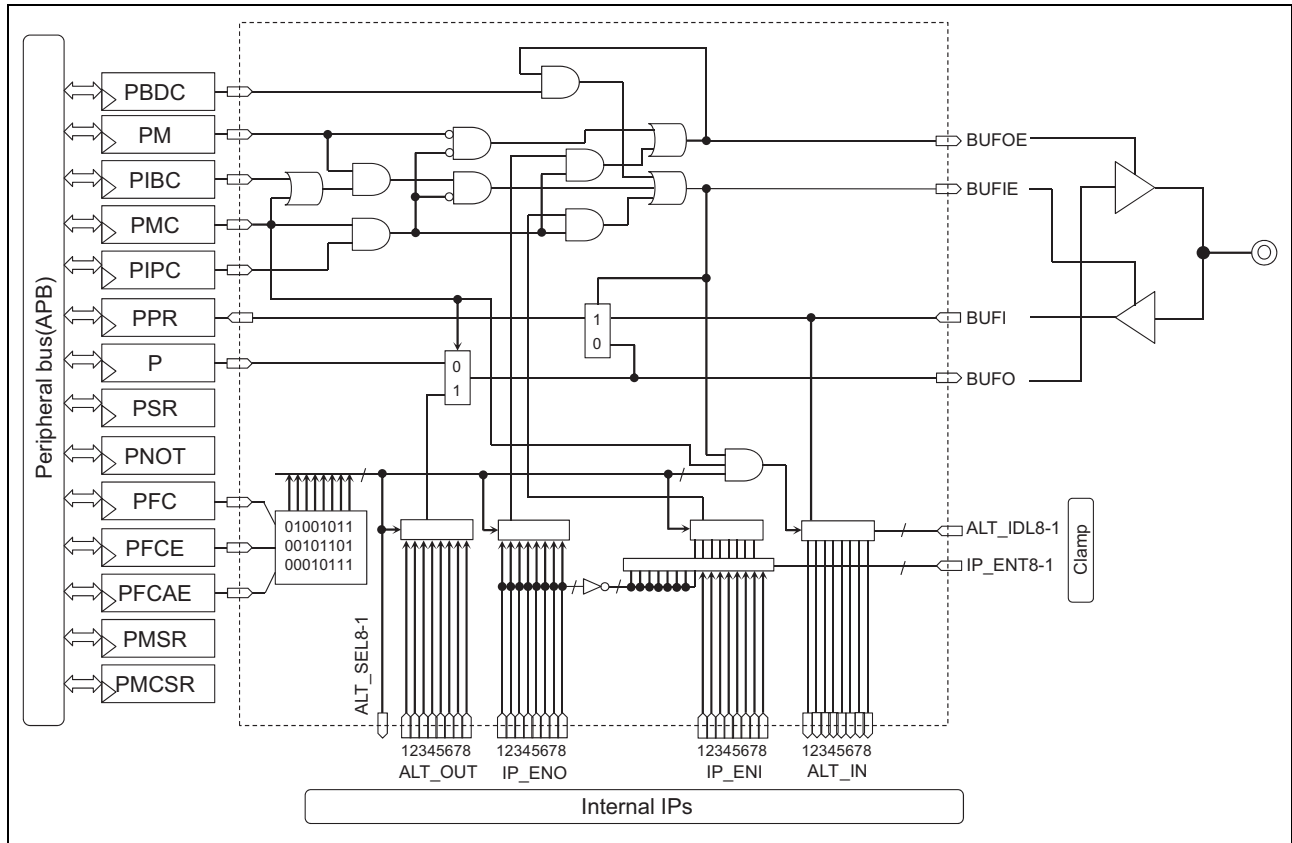

Figure 41.1 Port Control Logical Diagram

41.17 Flowchart Examples of Port Setting

(a) shows an example flow of setting the P_{n_m} pin to port mode. (b) shows an example flow of setting the P_{n_m} pin to software I/O control alternative mode. (c) shows an example flow of setting the P_{n_m} pin to direct I/O control alternative mode.

(a) In Port Mode

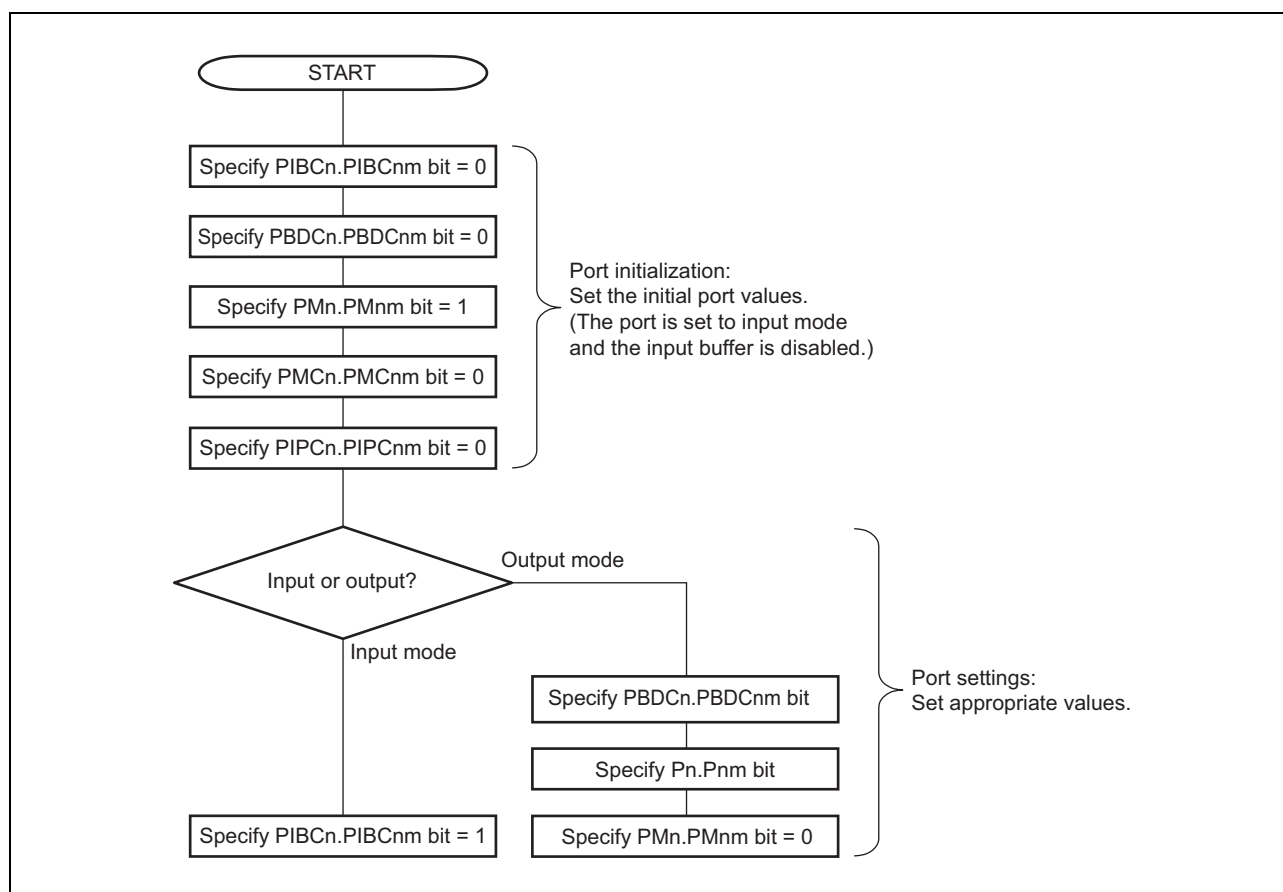

Figure 41.2 Example Flow of Port Settings (in Port Mode) (1/3)

(b) In Software I/O Control Alternative Mode

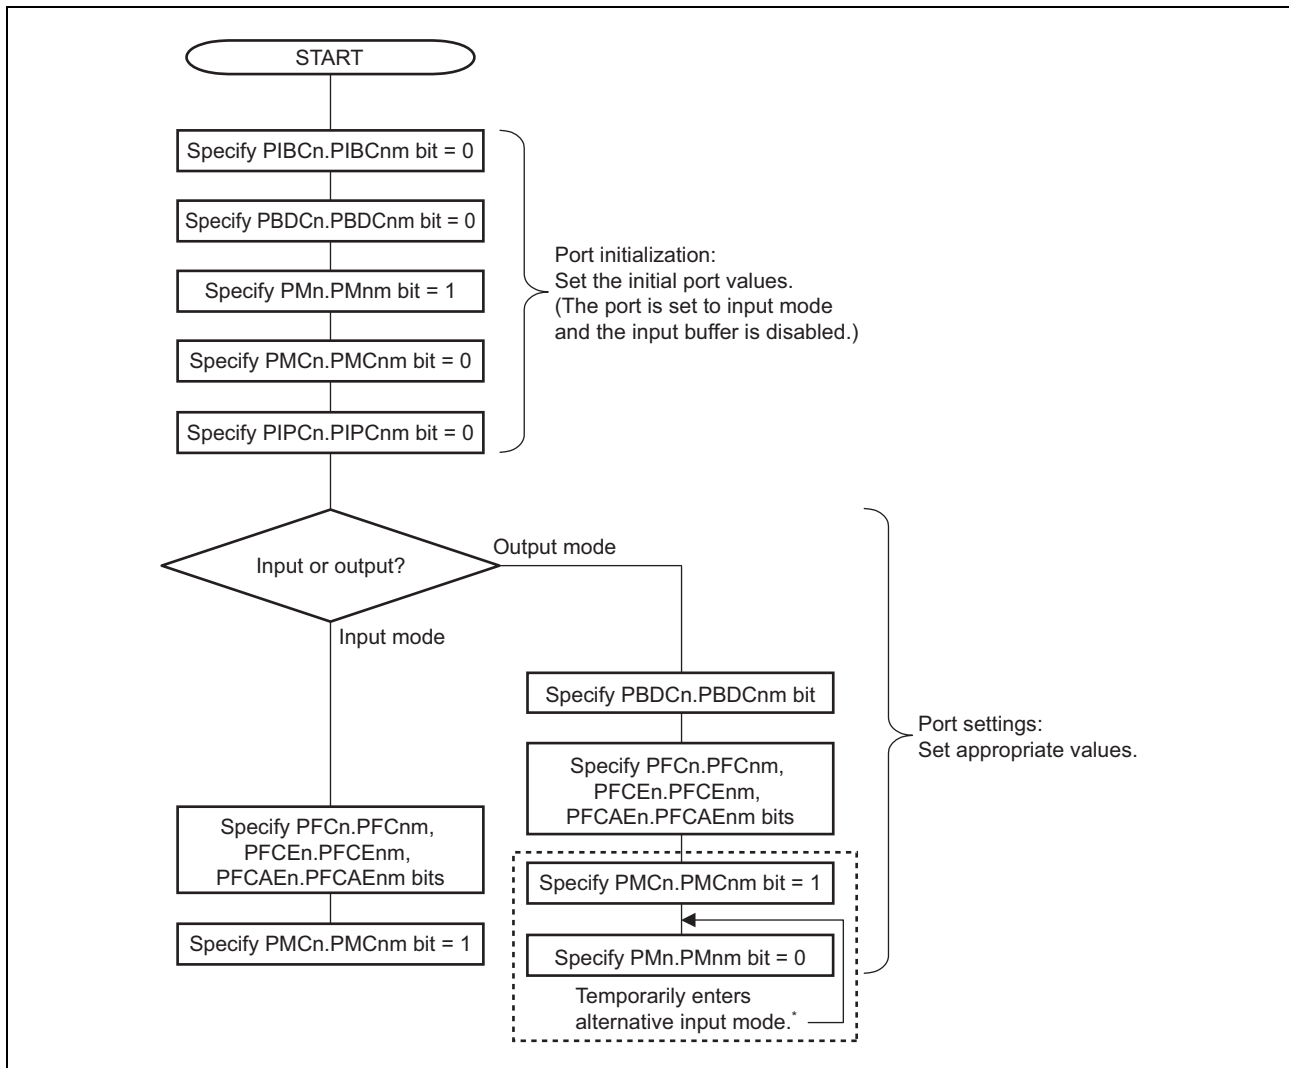

Figure 41.3 Example Flow of Port Settings (in Software I/O Control Alternative Mode) (2/3)

Note: * When the Pn_m pin is set to the output mode of the software I/O control alternative mode, alternative input mode is temporarily enabled during the period from when the PMCn.PMCnm bit is set to 1 to when the PMn.PMnm bit is set to 0. Therefore, if a signal regarding interrupt has been set for the port alternative function, configure the setting so that interrupt does not occur or becomes invalid.

(c) In Direct I/O Control Alternative Mode

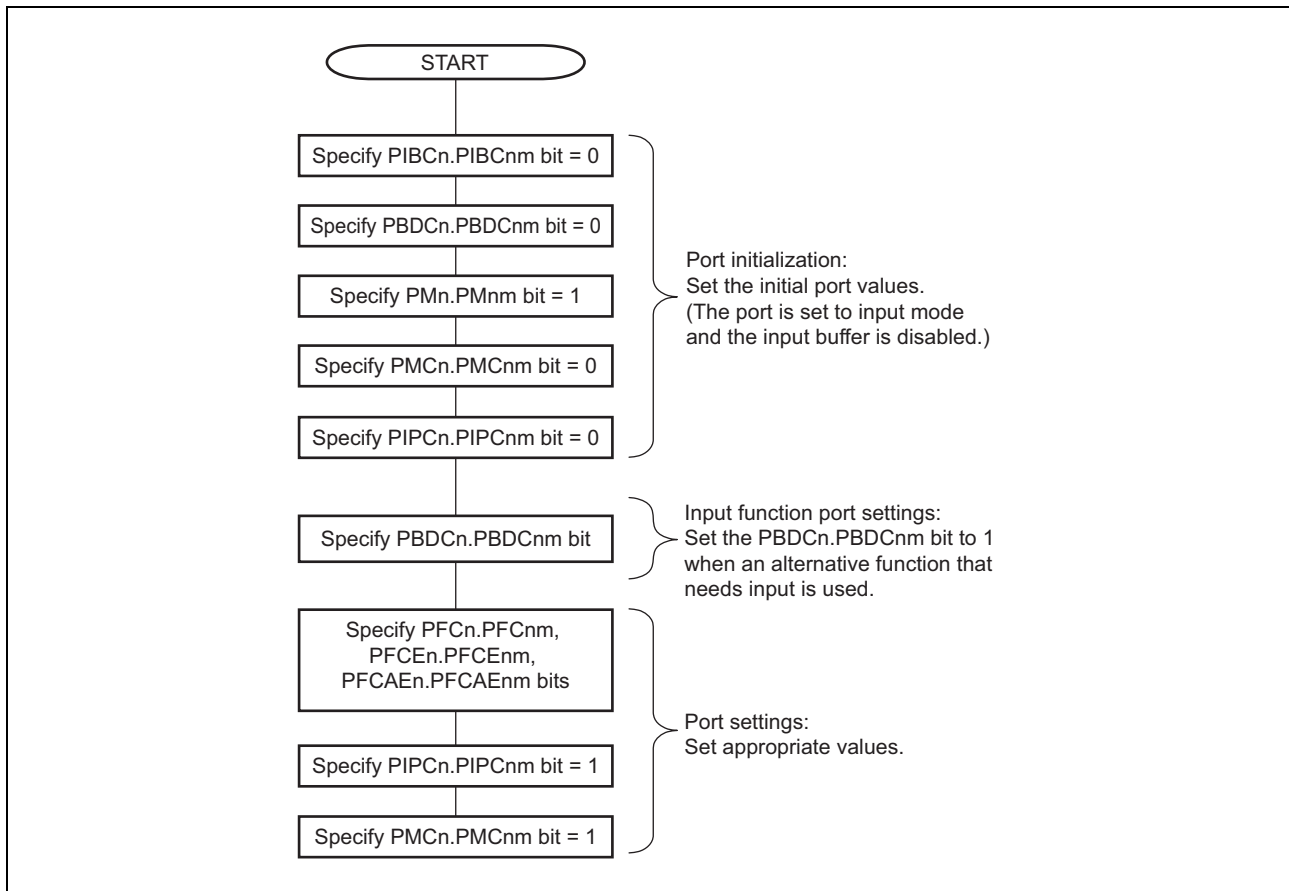

Figure 41.4 Example Flow of Port Settings (in Direct I/O Control Alternative Mode) (3/3)

42. Power-Down Modes

This LSI supports sleep mode, software standby mode, deep standby mode, and module standby mode. In power-down modes, functions of CPU, clocks, on-chip memory, or part of on-chip peripheral modules are halted or the power-supply is turned off, through which low power consumption is achieved. These modes are canceled by a reset or interrupt.

42.1 Features

42.1.1 States of Processing and Power-Down Modes

(1) States of processing

This LSI has three general states of processing: the reset state, the program execution state, and the power-down modes. Figure 42.1 shows transitions between these states.

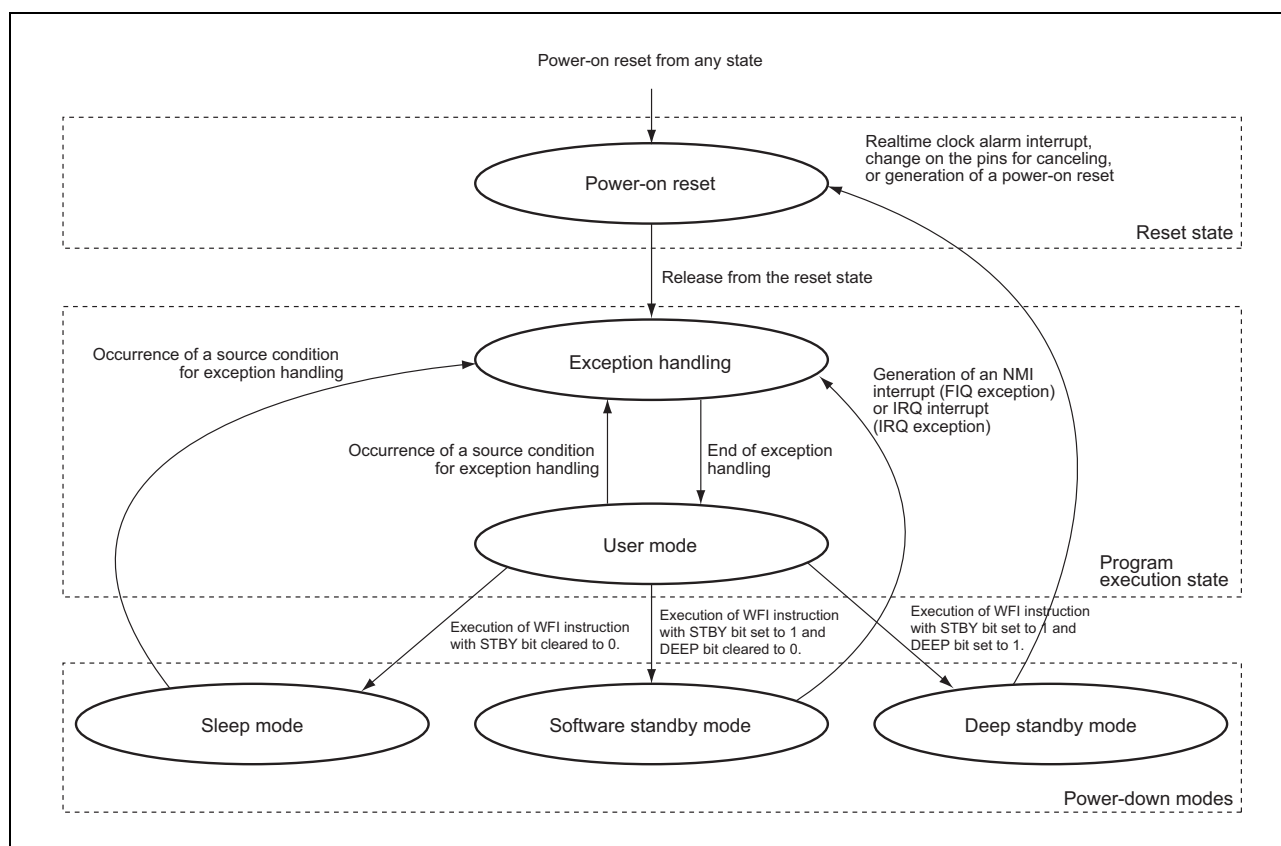

Figure 42.1 Transitions between Processing States

(2) Power-down modes

This LSI has the following power-down modes and function:

1. Sleep mode
2. Software standby mode
3. Deep standby mode
4. Module standby function

Table 42.1 shows the transition conditions for entering the modes from the program execution state, as well as the CPU and peripheral module states in each mode and the procedures for canceling each mode.

Table 42.1 States of Power-Down Modes

Power-Down Mode	Transition Conditions	State							
		CPU, CPU Register, Primary Cache, TLB	Secondary Cache	Large-Capacity On-Chip RAM (including on-chip data-retention RAM)	On-Chip Peripheral Modules	Realtime Clock	Internal Power Supply	External Memory	Canceling Procedure
Sleep mode	Execute WFI instruction with STBY bit in STBCR1 cleared to 0	Halted Contents are held.*4	Running	Running	Running	Running*1	Applied	Auto-refresh	<ul style="list-style-type: none"> Interrupt Power-on reset
Software standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1 and 0, respectively	Halted Contents are held.*4	Halted Contents are held.*4	Halted Contents are held.*5	Halted	Running*1	Applied	Self-refresh	<ul style="list-style-type: none"> NMI or IRQ interrupt Power-on reset
Deep standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1	Halted Contents are not held.	Halted Contents are not held.	Halted Contents in on-chip data-retention RAM are held*2, and the other contents in large-capacity on-chip RAM are not held.	Halted	Running*1	Shut off	Self-refresh	<ul style="list-style-type: none"> Power-on reset*3 Realtime clock alarm interrupt*3 Change on the pins for canceling*3
Module standby mode	Set the MSTP bits in STBCR2 to STBCR12 to 1	Running	Running	Running	Specified module halted	Halted	Applied	Auto-refresh	<ul style="list-style-type: none"> Clear MSTP bit to 0

Note 1. The realtime clock operates when the START bit in the RCR2 register is set to 1. For details, see section 13, Realtime Clock. When deep standby mode is canceled by a power-on reset, the running state cannot be retained. Make the initial setting for the realtime clock again.

Note 2. Setting the bits RRAMKP3 to RRAMKP0 in the RRAMKP register to 1 enables to retain the data in the corresponding area on the on-chip data-retention RAM during the transition to deep standby mode. When the deep standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 3. Deep standby mode can be canceled by a power-on reset, a realtime clock alarm interrupt, or change on the pins for canceling (P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, P7_9, and NMI). Even when deep standby mode is canceled by a source other than a power-on reset, the reset exception handling is executed instead of the interrupt exception handling.

Note 4. When sleep mode or software standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 5. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to enable accesses, the retained contents are initialized when software standby mode is canceled by a power-on reset. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to disable accesses, contents in the large-capacity on-chip RAM (including on-chip data-retention RAM) can be retained when software standby mode is canceled by a power-on reset. Note that the area at addresses from H'2002_0000 to H'2002_3FFF is used as working memory for the boot program in boot modes 1 to 3. In boot modes 2 and 3, a 28-Kbyte program is transferred from the external flash memory to the area at addresses from H'2002_4000 to H'2002_AFFF. For details, see section 3, Boot Mode.

42.2 Register Descriptions

Table 42.2 shows the register configuration.

Table 42.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Standby control register 1	STBCR1	R/W	H'00	H'FCFE0020	8

42.2.1 Standby Control Register 1 (STBCR1)

STBCR1 is an 8-bit readable/writable register that specifies the state of the power-down mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBY	DEEP	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBY	0	R/W	Software Standby, Deep Standby
6	DEEP	0	R/W	Specifies transition to software standby mode or deep standby mode. 0x: Executing WFI instruction puts chip into sleep mode. 10: Executing WFI instruction puts chip into software standby mode. 11: Executing WFI instruction puts chip into deep standby mode.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

[Legend]

x: Don't care

42.2.2 Standby Control Register 2 (STBCR2)

STBCR2 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	HIZ	-	-	-	-	-	-	MSTP 20
Initial value:	0	1	1	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	HIZ	0	R/W	Port High Impedance Selects whether the state of specific output pin is retained or high impedance in software standby mode or deep standby mode. As to which pins are controlled, see section 46.1, Pin States in section 46, States and Handling of Pins. This bit must not be set while the TME bit in WTSCR of the watchdog timer is 1. To set the output pin to high-impedance, set the HIZ bit to 1 only while the TME bit is 0. 0: The pin state is retained in software standby mode or deep standby mode. 1: The pin is set to high-impedance in software standby mode or deep standby mode.
6, 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
0	MSTP20	0	R/W	Module Stop 20*1 [not for disclosure] When the MSTP20 bit is set to 1, the clock supply to CoreSight is halted. 0: CoreSight runs. 1: Clock supply to CoreSight is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.3 Standby Control Register 3 (STBCR3)

STBCR3 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 37	MSTP 36	MSTP 35	—	MSTP 33	MSTP 32	MSTP 31	—
Initial value:	1	1	1	1	1	1	0	1
R/W:	R/W	R/W	R/W	R	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP37	1	R/W	Module Stop 37 When the MSTP37 bit is set to 1, the clock supply to the IEBus™ controller is halted. 0: The IEBus™ controller runs. 1: Clock supply to the IEBus™ controller is halted.
6	MSTP36	1	R/W	Module Stop 36 When the MSTP36 bit is set to 1, the clock supply to serial communication interface (IrDA) is halted. 0: Serial communication interface (IrDA) runs. 1: Clock supply to serial communication interface (IrDA) is halted.
5	MSTP35	1	R/W	Module Stop 35 When the MSTP35 bit is set to 1, the clock supply to the LIN interface channel 0 is halted. 0: The LIN interface channel 0 runs. 1: Clock supply to the LIN interface channel 0 is halted.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
3	MSTP33	1	R/W	Module Stop 33 When the MSTP33 bit is set to 1, the clock supply to the multi-function timer pulse unit 2 is halted. 0: The multi-function timer pulse unit 2 runs. 1: Clock supply to the multi-function timer pulse unit 2 is halted.
2	MSTP32	1	R/W	Module Stop 32 When the MSTP32 bit is set to 1, the clock supply to the CAN interface is halted. 0: The CAN interface runs. 1: Clock supply to the CAN interface is halted.
1	MSTP31	0	R/W	Module Stop 31 When the MSTP31 bit is set to 1, the clock supply to the A/D converter is halted and the analog power supply to the A/D converter is shut off. 0: Clock signal and analog voltage are supplied to the A/D converter. 1: Supply of clock signal and analog voltage to the A/D converter is shut off.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

42.2.4 Standby Control Register 4 (STBCR4)

STBCR4 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 47	MSTP 46	MSTP 45	MSTP 44	MSTP 43	—	—	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP47	1	R/W	Module Stop 47 When the MSTP47 bit is set to 1, the clock supply to channel 0 of the serial communication interface with FIFO is halted. 0: Channel 0 of the serial communication interface with FIFO runs. 1: Clock supply to channel 0 of the serial communication interface with FIFO is halted.
6	MSTP46	1	R/W	Module Stop 46 When the MSTP46 bit is set to 1, the clock supply to channel 1 of the serial communication interface with FIFO is halted. 0: Channel 1 of the serial communication interface with FIFO runs. 1: Clock supply to channel 1 of the serial communication interface with FIFO is halted.
5	MSTP45	1	R/W	Module Stop 45 When the MSTP45 bit is set to 1, the clock supply to channel 2 of the serial communication interface with FIFO is halted. 0: Channel 2 of the serial communication interface with FIFO runs. 1: Clock supply to channel 2 of the serial communication interface with FIFO is halted.
4	MSTP44	1	R/W	Module Stop 44 When the MSTP44 bit is set to 1, the clock supply to channel 3 of the serial communication interface with FIFO is halted. 0: Channel 3 of the serial communication interface with FIFO runs. 1: Clock supply to channel 3 of the serial communication interface with FIFO is halted.
3	MSTP43	1	R/W	Module Stop 43 When the MSTP43 bit is set to 1, the clock supply to channel 4 of the serial communication interface with FIFO is halted. 0: Channel 4 of the serial communication interface with FIFO runs. 1: Clock supply to channel 4 of the serial communication interface with FIFO is halted.
2 to 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

42.2.5 Standby Control Register 5 (STBCR5)

STBCR5 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 57	MSTP 56	—	—	—	—	MSTP 51	MSTP 50
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP57	1	R/W	Module Stop 57 When the MSTP57 bit is set to 1, the clock supply to channel 0 of the serial communication interface (SCI) is halted. 0: Channel 0 of the serial communication interface (SCI) runs. 1: Clock supply to channel 0 of the serial communication interface (SCI) is halted.
6	MSTP56	1	R/W	Module Stop 56 When the MSTP56 bit is set to 1, the clock supply to channel 1 of the serial communication interface (SCI) is halted. 0: Channel 1 of the serial communication interface (SCI) runs. 1: Clock supply to channel 1 of the serial communication interface (SCI) is halted.
5 to 2	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
1	MSTP51	1	R/W	Module Stop 51 When the MSTP51 bit is set to 1, the clock supply to channel 0 of the OS timer is halted. 0: Channel 0 of the OS timer runs. 1: Clock supply to channel 0 of the OS timer is halted.
0	MSTP50	1	R/W	Module Stop 50 When the MSTP50 bit is set to 1, the clock supply to channel 1 of the OS timer is halted. 0: Channel 1 of the OS timer runs. 1: Clock supply to channel 1 of the OS timer is halted.

42.2.6 Standby Control Register 6 (STBCR6)

STBCR6 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 67	MSTP 66	—	—	—	—	—	MSTP 60
Initial value:	1	1	1	1	1	1	1	0
R/W:	R/W	R/W	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP67	1	R/W	Module Stop 67 When the MSTP67 bit is set to 1, the clock supply to the A/D converter is halted. 0: The A/D converter runs. 1: Clock supply to channel 0 of the A/D converter is halted.
6	MSTP66	1	R/W	Module Stop 66*1 When the MSTP66 bit is set to 1, the clock supply to the capture engine unit is halted. 0: The capture engine unit runs. 1: Clock supply to the capture engine unit is halted.
5 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
0	MSTP60	0	R/W	Module Stop 60 When the MSTP60 bit is set to 1, the clock supply to the realtime clock is halted. 0: The realtime clock runs. 1: Clock supply to the realtime clock is halted. Note: When the realtime clock is halted, set the bits in registers shown below. • Set bit RTCEN in the control register 2 (RCR2) to 0. • Set bits RCKSEL[1:0] in the control register 5 (RCR5) to 00. After the settings above, set bit MSTP60 to 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.7 Standby Control Register 7 (STBCR7)

STBCR7 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	MSTP 74	—	—	MSTP 71	MSTP 70
Initial value:	0	0	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
4	MSTP74	1	R	Module Stop 74*1 When the MSTP74 bit is set to 1, the clock supply to the Ethernet controller is halted. 0: The Ethernet controller runs. 1: Clock supply to the Ethernet controller is halted.
3, 2	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
1	MSTP71	1	R/W	Module Stop 71 When the MSTP71 bit is set to 1, the clock supply to channel 0 of the USB 2.0 host/function module is halted. 0: Channel 0 of the USB 2.0 host/function module runs. 1: Clock supply to channel 0 of the USB 2.0 host/function module is halted.
0	MSTP70	1	R/W	Module Stop 70 When the MSTP70 bit is set to 1, the clock supply to channel 1 of the USB 2.0 host/function module is halted. 0: Channel 1 of the USB 2.0 host/function module runs. 1: Clock supply to channel 1 of the USB 2.0 host/function module is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.8 Standby Control Register 8 (STBCR8)

STBCR8 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	MSTP 84	MSTP 83	—	MST P81	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	MSTP84	1	R/W	Module Stop 84 When the MSTP84 bit is set to 1, the clock supply to the MMC host interface is halted. 0: The MMC host interface runs. 1: Clock supply to the MMC host interface is halted.
3	MSTP83	1	R/W	Module Stop 83*1 When the MSTP83 bit is set to 1, the clock supply to the media local bus is halted. 0: The media local bus runs. 1: Clock supply to the media local bus is halted.
2	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
1	MSTP81	1	R/W	Module Stop 81 When the MSTP81 bit is set to 1, the clock supply to SCUX is halted. 0: SCUX runs. 1: Clock supply to SCUX is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.9 Standby Control Register 9 (STBCR9)

STBCR9 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 97	MSTP 96	MSTP 95	MSTP 94	MSTP 93	—	MSTP 91	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP97	1	R/W	Module Stop 97 When the MSTP97 bit is set to 1, the clock supply to channel 0 of the I ² C bus interface is halted. 0: Channel 0 of the I ² C bus interface runs. 1: Clock supply to channel 0 of the I ² C bus interface is halted.
6	MSTP96	1	R/W	Module Stop 96 When the MSTP96 bit is set to 1, the clock supply to channel 1 of the I ² C bus interface is halted. 0: Channel 1 of the I ² C bus interface runs. 1: Clock supply to channel 1 of the I ² C bus interface is halted.
5	MSTP95	1	R/W	Module Stop 95 When the MSTP95 bit is set to 1, the clock supply to channel 2 of the I ² C bus interface is halted. 0: Channel 2 of the I ² C bus interface runs. 1: Clock supply to channel 2 of the I ² C bus interface is halted.
4	MSTP94	1	R/W	Module Stop 94 When the MSTP94 bit is set to 1, the clock supply to channel 3 of the I ² C bus interface is halted. 0: Channel 3 of the I ² C bus interface runs. 1: Clock supply to channel 3 of the I ² C bus interface is halted.
3	MSTP93	1	R/W	Module Stop 93 When the MSTP93 bit is set to 1, the clock supply to channel 0 of the SPI multi I/O bus controller is halted. 0: Channel 04 of the SPI multi I/O bus controller runs. 1: Clock supply to channel 0 of the SPI multi I/O bus controller is halted.
2	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
1	MSTP91	1	R/W	Module Stop 91*1 When the MSTP91 bit is set to 1, the clock supply to the video display controller 5 is halted. 0: The video display controller 5 runs. 1: Clock supply to the video display controller 5 is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.10 Standby Control Register 10 (STBCR10)

STBCR10 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 107	MSTP 106	MSTP 105	—	—	MSTP 102	MSTP 101	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP107	1	R/W	Module Stop 107 When the MSTP107 bit is set to 1, the clock supply to channel 0 of the Renesas serial peripheral interface is halted. 0: Channel 0 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 0 of the Renesas serial peripheral interface is halted.
6	MSTP106	1	R/W	Module Stop 106 When the MSTP106 bit is set to 1, the clock supply to channel 1 of the Renesas serial peripheral interface is halted. 0: Channel 1 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 1 of the Renesas serial peripheral interface is halted.
5	MSTP105	1	R/W	Module Stop 105 When the MSTP105 bit is set to 1, the clock supply to channel 2 of the Renesas serial peripheral interface is halted. 0: Channel 2 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 2 of the Renesas serial peripheral interface is halted.
4, 3	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
2	MSTP102	1	R/W	Module Stop 102 When the MSTP102 bit is set to 1, the clock supply to the CD-ROM decoder is halted. 0: The CD-ROM decoder runs. 1: Clock supply to the CD-ROM decoder is halted.
1	MSTP101	1	R/W	Module Stop 101 When the MSTP101 bit is set to 1, the clock supply to the Renesas SPDIF interface is halted. 0: The Renesas SPDIF interface runs. 1: Clock supply to the Renesas SPDIF interface is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.11 Standby Control Register 11 (STBCR11)

STBCR11 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	MSTP 115	MSTP 114	MSTP 113	MSTP 112	—	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
5	MSTP115	1	R/W	Module Stop 115 When the MSTP115 bit is set to 1, the clock supply to channel 0 of the serial sound interface is halted. 0: Channel 0 of the serial sound interface runs. 1: Clock supply to channel 0 of the serial sound interface is halted.
4	MSTP114	1	R/W	Module Stop 114 When the MSTP114 bit is set to 1, the clock supply to channel 1 of the serial sound interface is halted. 0: Channel 1 of the serial sound interface runs. 1: Clock supply to channel 1 of the serial sound interface is halted.
3	MSTP113	1	R/W	Module Stop 113 When the MSTP113 bit is set to 1, the clock supply to channel 2 of the serial sound interface is halted. 0: Channel 2 of the serial sound interface runs. 1: Clock supply to channel 2 of the serial sound interface is halted.
2	MSTP112	1	R/W	Module Stop 112 When the MSTP112 bit is set to 1, the clock supply to channel 3 of the serial sound interface is halted. 0: Channel 3 of the serial sound interface runs. 1: Clock supply to channel 3 of the serial sound interface is halted.
1, 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

42.2.12 Standby Control Register 12 (STBCR12)

STBCR12 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	MSTP 123	MSTP 122	MSTP 121	MSTP 120
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
3	MSTP123	1	R/W	Module Stop 123 When the MSTP123 bit is set to 1, the SD host interface 00 is halted. 0: The SD host interface 00 runs. 1: Clock supply to the SD host interface 00 is halted.
2	MSTP122	1	R/W	Module Stop 122 When the MSTP122 bit is set to 1, the SD host interface 01 is halted. 0: The SD host interface 01 runs. 1: Clock supply to the SD host interface 01 is halted.
1	MSTP121	1	R/W	Module Stop 121 When the MSTP121 bit is set to 1, the SD host interface 10 is halted. 0: The SD host interface 10 runs. 1: Clock supply to the SD host interface 10 is halted.
0	MSTP120	1	R/W	Module Stop 120 When the MSTP120 bit is set to 1, the SD host interface 11 is halted. 0: The SD host interface 11 runs. 1: Clock supply to the SD host interface 11 is halted.

42.2.13 Software Reset Control Register 1 (SWRSTCR1)

SWRSTCR1 is an 8-bit readable/writable register that controls a software reset for the serial sound interface and the operation of the crystal resonator for audio.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	AXT ALE	SRST 16	SRST 15	SRST 14	SRST 13	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	AXTALE	0	R/W	AUDIO_X1 Clock Control Controls the function of AUDIO_X1 pin. 0: Runs the on-chip crystal oscillator/enables the external clock input. 1: Halts the on-chip crystal oscillator/disables the external clock input.
6	SRST16	0	R/W	Serial Sound Interface Channel 0 Software Reset Controls the serial sound interface channel 0 reset with software. 0: The serial sound interface channel 0 reset is canceled. 1: The serial sound interface channel 0 is reset.
5	SRST15	0	R/W	Serial Sound Interface Channel 1 Software Reset Controls the serial sound interface channel 1 reset with software. 0: The serial sound interface channel 1 reset is canceled. 1: The serial sound interface channel 1 is reset.
4	SRST14	0	R/W	Serial Sound Interface Channel 2 Software Reset Controls the serial sound interface channel 2 reset with software. 0: The serial sound interface channel 2 reset is canceled. 1: The serial sound interface channel 2 is reset.
3	SRST13	0	R/W	Serial Sound Interface Channel 3 Software Reset Controls the serial sound interface channel 3 reset with software. 0: The serial sound interface channel 3 reset is canceled. 1: The serial sound interface channel 3 is reset.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

42.2.14 System Control Register 1 (SYSCR1)

SYSCR1 is an 8-bit readable/writable register that enables or disables access (read and write) to a specified page in the large-capacity on-chip RAM.

When a VRAMEn (n = 0 to 4) bit in SYSCR1 is set to 1, access to page n is enabled. When a VRAMEn bit is cleared to 0, page n cannot be accessed. In this case, an undefined value is returned when reading data or fetching an instruction from page n, and writing to page n is ignored. The initial value of a VRAMEn bit is 1.

SYSCR1 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR1 should be located immediately after the instruction to write to SYSCR1. If not, normal access is not guaranteed.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	VRAME 4	VRAME 3	VRAME 2	VRAME 1	VRAME 0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAME4	1	R/W	RAM Enable 4 (corresponding area: page 4* ¹ in large-capacity on-chip RAM) 0: Access to page 4 is disabled. 1: Access to page 4 is enabled.
3	VRAME3	1	R/W	RAM Enable 3 (corresponding area: page 3* ¹ in large-capacity on-chip RAM) 0: Access to page 3 is disabled. 1: Access to page 3 is enabled.
2	VRAME2	1	R/W	RAM Enable 2 (corresponding area: page 2* ¹ in large-capacity on-chip RAM) 0: Access to page 2 is disabled. 1: Access to page 2 is enabled.
1	VRAME1	1	R/W	RAM Enable 1 (corresponding area: page 1* ¹ in large-capacity on-chip RAM) 0: Access to page 1 is disabled. 1: Access to page 1 is enabled.
0	VRAME0	1	R/W	RAM Enable 0 (corresponding area: page 0* ¹ in large-capacity on-chip RAM) 0: Access to page 0 is disabled. 1: Access to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.15 System Control Register 2 (SYSCR2)

SYSCR2 is an 8-bit readable/writable register that enables or disables writing to a specified page in the large-capacity on-chip RAM.

When a VRAMWEn (n = 0 to 4) bit in SYSCR2 is set to 1, writing to page n is enabled. When a VRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a VRAMWEn bit is 1.

SYSCR2 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR2 should be located immediately after the instruction to write to SYSCR2. If not, normal access is not guaranteed.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	VRAM WE4	VRAM WE3	VRAM WE2	VRAM WE1	VRAM WE0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAMWE4	1	R/W	RAM Write Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Writing to page 4 is disabled. 1: Writing to page 4 is enabled.
3	VRAMWE3	1	R/W	RAM Write Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	VRAMWE2	1	R/W	RAM Write Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	VRAMWE1	1	R/W	RAM Write Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	VRAMWE0	1	R/W	RAM Write Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.16 System Control Register 3 (SYSCR3)

SYSCR3 is an 8-bit readable/writable register that enables or disables writing to a specified page in the on-chip data-retention RAM.

When a RRAMWEn ($n = 0$ to 3) bit in SYSCR3 is set to 1, writing to page n is enabled. When a RRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a RRAMWEn bit is 0.

SYSCR3 should be set with a program located in an area other than the on-chip data-retention RAM.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	RRAM WE3	RRAM WE2	RRAM WE1	RRAM WE0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMWE3	0	R/W	RAM Write Enable 3 (corresponding area: page 3^{*2} in on-chip data-retention RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	RRAMWE2	0	R/W	RAM Write Enable 2 (corresponding area: page 2^{*2} in on-chip data-retention RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	RRAMWE1	0	R/W	RAM Write Enable 1 (corresponding area: page 1^{*2} in on-chip data-retention RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	RRAMWE0	0	R/W	RAM Write Enable 0 (corresponding area: page 0^{*2} in on-chip data-retention RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

Note 2. When the VRAME0 bit in SYSCR1 is cleared to 0 (access to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be accessed (read and written), regardless of the setting of this bit.

When the VRAMWE0 bit in SYSCR2 is cleared to 0 (writing to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be written, regardless of the setting of this bit.

42.2.17 CPU Status Register (CPUSTS)

CPUSTS is an 8-bit readable register that indicates the status of the CPU.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	ISBUSY	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ISBUSY	0	R	State during Changing of the Frequency of CPU and Return from Software Standby Indicates that the frequency of CPU is being changed or that return from software standby is in progress. Do not execute a WFI instruction while this bit is 1. 0: The frequency of CPU is not being changed and returning from software standby is not in progress 1: The frequency of CPU is being changed or return from software standby is in progress
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

42.2.18 Standby Request Register 1 (STBREQ1)

This register is used to request notification of whether a CPU or peripheral module is ready for standby. The CPU or peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	STBRQ 15	—	—	—	—	STBRQ 10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	STBRQ15	0	R/W	Standby Request to CoreSight 0: The standby request to CoreSight is invalid. 1: The standby request to CoreSight is valid.*1
4 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STBRQ10	0	R/W	Standby Request to Capture Engine Unit 0: The standby request to the capture engine unit is invalid. 1: The standby request to the capture engine unit is valid.*1

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

42.2.19 Standby Request Register 2 (STBREQ2)

This register is used to request notification of whether a peripheral module is ready for standby. The peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBRQ 27	STBRQ 26	STBRQ 25	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBRQ27	0	R/W	Standby Request to the media local bus 0: The standby request to the media local bus is invalid. 1: The standby request to the media local bus is valid.*1
6	STBRQ26	0	R/W	Standby Request to Ethernet Controller 0: The standby request to the Ethernet controller is invalid. 1: The standby request to the Ethernet controller is valid.*1
5	STBRQ25	0	R	Standby Request to Video Display Controller 5 0: The standby request to the video display controller 5 is invalid. 1: The standby request to of the video display controller 5 is valid.*1
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.

42.2.20 Standby Acknowledgment Register 1 (STBACK1)

This register is used to provide notification that a CPU or peripheral module is in the standby ready state. The CPU or peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	—	—	STBAK 15	—	—	—	—	STBAK 10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	STBAK15	0	R	Standby Acknowledgement from CoreSight 0: The standby acknowledgement from CoreSight is invalid. 1: The standby acknowledgement from CoreSight is valid.*1
4 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STBAK10	0	R	Standby Acknowledgement from Capture Engine Unit 0: The standby acknowledgement from the capture engine unit is invalid. 1: The standby acknowledgement from the capture engine unit is valid.*1

Note 1. The bits in STBACK1 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 1.

42.2.21 Standby Acknowledge Register 2 (STBACK2)

This register is used to provide notification that a peripheral module is in the standby ready state. The peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	STBAK 27	STBAK 26	STBAK 25	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBAK27	0	R	Standby Acknowledgement from the media local bus 0: The standby acknowledgement from the media local bus is invalid. 1: The standby acknowledgement from the media local bus is valid.*1
6	STBAK26	0	R	Standby Acknowledgement from Ethernet Controller 0: The standby acknowledgement from the Ethernet controller is invalid. 1: The standby acknowledgement from the Ethernet controller is valid.*1
5	STBAK25	0	R	Standby Acknowledgement from Video Display Controller 5 0: The standby acknowledgement from the video display controller 5 is invalid. 1: The standby acknowledgement from the video display controller 5 is valid.*1
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. The bits in STBACK2 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 1.

42.2.22 On-Chip Data-Retention RAM Area Setting Register (RRAMKP)

RRAMKP is an 8-bit readable/writable register that selects whether the contents of the corresponding area of the on-chip data-retention RAM are retained or not in deep standby mode.

When the RRAMKP3 to RRAMKP0 bits are set to 1, the contents of the corresponding area of the on-chip data-retention RAM are retained in deep standby mode. When these bits are cleared to 0, the contents of the corresponding area of the on-chip data-retention RAM are not retained in deep standby mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	RRAM KP3	RRAM KP2	RRAM KP1	RRAM KP0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMKP3	0	R/W	On-Chip Data-Retention RAM Storage Area 3 (corresponding area: page 3*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
2	RRAMKP2	0	R/W	On-Chip Data-Retention RAM Storage Area 2 (corresponding area: page 2*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
1	RRAMKP1	0	R/W	On-Chip Data-Retention RAM Storage Area 1 (corresponding area: page 1*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
0	RRAMKP0	0	R/W	On-Chip Data-Retention RAM Storage Area 0 (corresponding area: page 0*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.23 Deep Standby Control Register (DSCTR)

DSCTR is an 8-bit readable/writable register that selects whether the states of the external memory control pins are retained or not when returning from deep standby mode and specifies the method to start the LSI.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	EBUS KEEPE	RAM BOOT	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	EBUSKEEPE	0	R/W	Retention of External Memory Control Pin State 0: The state of the external memory control pins is not retained when returning from deep standby mode. 1: The state of the external memory control pins is retained when returning from deep standby mode. Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
6	RAMBOOT	0	R/W	Selection of Method after Returning from Deep Standby Mode Selects an activation method after returning from deep standby mode. 0: Activated according to the boot mode specified for a reset. 1: The program is read from the on-chip data-retention RAM. Instruction fetch from H'20000000 Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

42.2.24 Deep Standby Cancel Source Select Register (DSSSR)

DSSSR is a 16-bit readable/writable register that consists of the bits for selecting a source to cancel deep standby mode. The realtime clock alarm interrupt or change on the pins for canceling (P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, P7_9, NMI) can be selected as a cancel source. The pins for canceling can be used for canceling deep standby, regardless of pin function settings in the general I/O port.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	P2_0	P7_6	P7_9	P5_10	P2_2	P7_2	NMI	—	RTCAR	P5_9	P7_3	P5_8	P2_7	P2_9	P6_7
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	P2_0	0	R/W	Cancel by Change on P2_0 0: Deep standby mode is not canceled by change on the P2_0 pin. 1: Deep standby mode is canceled by change on the P2_0 pin.
13	P7_6	0	R/W	Cancel by Change on P7_6 0: Deep standby mode is not canceled by change on the P7_6 pin. 1: Deep standby mode is canceled by change on the P7_6 pin.
12	P7_9	0	R/W	Cancel by Change on P7_9 0: Deep standby mode is not canceled by change on the P7_9 pin. 1: Deep standby mode is canceled by change on the P7_9 pin.
11	P5_10	0	R/W	Cancel by Change on P5_10 0: Deep standby mode is not canceled by change on the P5_10 pin. 1: Deep standby mode is canceled by change on the P5_10 pin.
10	P2_2	0	R/W	Cancel by Change on P2_2 0: Deep standby mode is not canceled by change on the P2_2 pin. 1: Deep standby mode is canceled by change on the P2_2 pin.
9	P7_2	0	R/W	Cancel by Change on P7_2 0: Deep standby mode is not canceled by change on the P7_2 pin. 1: Deep standby mode is canceled by change on the P7_2 pin.
8	NMI	0	R/W	Cancel by Change on NMI 0: Deep standby mode is not canceled by change on the NMI pin. 1: Deep standby mode is canceled by change on the NMI pin.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RTCAR	0	R/W	Cancel by Realtime Clock Alarm Interrupt 0: Deep standby mode is not canceled by a realtime clock alarm interrupt. 1: Deep standby mode is canceled by a realtime clock alarm interrupt.
5	P5_9	0	R/W	Cancel by Change on P5_9 0: Deep standby mode is not canceled by change on the P5_9 pin. 1: Deep standby mode is canceled by change on the P5_9 pin.
4	P7_3	0	R/W	Cancel by Change on P7_3 0: Deep standby mode is not canceled by change on the P7_3 pin. 1: Deep standby mode is canceled by change on the P7_3 pin.
3	P5_8	0	R/W	Cancel by Change on P5_8 0: Deep standby mode is not canceled by change on the P5_8 pin. 1: Deep standby mode is canceled by change on the P5_8 pin.
2	P2_7	0	R/W	Cancel by Change on P2_7 0: Deep standby mode is not canceled by change on the P2_7 pin. 1: Deep standby mode is canceled by change on the P2_7 pin.
1	P2_9	0	R/W	Cancel by Change on P2_9 0: Deep standby mode is not canceled by change on the P2_9 pin. 1: Deep standby mode is canceled by change on the P2_9 pin.

Bit	Bit Name	Initial Value	R/W	Description
0	P6_7	0	R/W	Cancel by Change on P6_7 0: Deep standby mode is not canceled by change on the P6_7 pin. 1: Deep standby mode is canceled by change on the P6_7 pin.

42.2.25 Deep Standby Cancel Edge Select Register (DSESR)

DSESR is a 16-bit readable/writable register that consists of the bits for selecting an edge to be detected for the pin specified as a deep standby cancel source with DSSSR. This register setting is always valid for canceling deep standby, regardless of the interrupt controller setting.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	P2_0E	P7_6E	P7_9E	P5_10E	P2_2E	P7_2E	NMIE	—	—	P5_9E	P7_3E	P5_8E	P2_7E	P2_9E	P6_7E
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	P2_0E	0	R/W	P2_0 Edge Detection 0: Falling edge of P2_0 is detected. 1: Rising edge of P2_0 is detected.
13	P7_6E	0	R/W	P7_6 Edge Detection 0: Falling edge of P7_6 is detected. 1: Rising edge of P7_6 is detected.
12	P7_9E	0	R/W	P7_9 Edge Detection 0: Falling edge of P7_9 is detected. 1: Rising edge of P7_9 is detected.
11	P5_10E	0	R/W	P5_10 Edge Detection 0: Falling edge of P5_10 is detected. 1: Rising edge of P5_10 is detected.
10	P2_2E	0	R/W	P2_2 Edge Detection 0: Falling edge of P2_2 is detected. 1: Rising edge of P2_2 is detected.
9	P7_2E	0	R/W	P7_2 Edge Detection 0: Falling edge of P7_2 is detected. 1: Rising edge of P7_2 is detected.
8	NMIE	0	R/W	NMI Edge Detection 0: Falling edge of NMI is detected. 1: Rising edge of NMI is detected.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	P5_9E	0	R/W	P5_9 Edge Detection 0: Falling edge of P5_9 is detected. 1: Rising edge of P5_9 is detected.
4	P7_3E	0	R/W	P7_3 Edge Detection 0: Falling edge of P7_3 is detected. 1: Rising edge of P7_3 is detected.
3	P5_8E	0	R/W	P5_8 Edge Detection 0: Falling edge of P5_8 is detected. 1: Rising edge of P5_8 is detected.
2	P2_7E	0	R/W	P2_7 Edge Detection 0: Falling edge of P2_7 is detected. 1: Rising edge of P2_7 is detected.
1	P2_9E	0	R/W	P2_9 Edge Detection 0: Falling edge of P2_9 is detected. 1: Rising edge of P2_9 is detected.
0	P6_7E	0	R/W	P6_7 Edge Detection 0: Falling edge of P6_7 is detected. 1: Rising edge of P6_7 is detected.

42.2.26 Deep Standby Cancel Source Flag Register (DSFR)

DSFR is a 16-bit readable/writable register composed of two types of bits. One is the flag that confirms which source canceled deep standby mode. The other is the bit that releases the state of pins after canceling deep standby mode. When deep standby mode is canceled by an interrupt (NMI, realtime clock alarm interrupt, or change on the pins for canceling) and changes on the pins for canceling, this register retains the previous data although power-on reset exception handling is executed. When deep standby mode is canceled by a power-on reset, this register is initialized to H'0000. All flags must be cleared immediately before transition to deep standby mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IO KEEP	P2_0F	P7_6F	P7_9F	P5_10F	P2_2F	P7_2F	NMIF	-	RTC ARF	P5_9F	P7_3F	P5_8F	P2_7F	P2_9F	P6_7F
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Note: * Only 0 can be written after reading 1 to clear the flag.

Bit	Bit Name	Initial Value	R/W	Description
15	IOKEEP	0	R/(W)* ¹	Release of Pin State Retention Releases the retention of the pin state after canceling deep standby mode 0: Pin state not retained [Clearing condition] • Writing 0 after reading 1 1: Pin state retained [Setting condition] • When deep standby mode is entered
14	P2_0F	0	R/(W)* ¹	P2_0 Flag 0: No change on the P2_0 pin 1: Change on the P2_0 pin
13	P7_6F	0	R/(W)* ¹	P7_6 Flag 0: No change on the P7_6 pin 1: Change on the P7_6 pin
12	P7_9F	0	R/(W)* ¹	P7_9 Flag 0: No change on the P7_9 pin 1: Change on the P7_9 pin
11	P5_10F	0	R/(W)* ¹	P5_10 Flag 0: No change on the P5_10 pin 1: Change on the P5_10 pin
10	P2_2F	0	R/(W)* ¹	P2_2 Flag 0: No change on the P2_2 pin 1: Change on the P2_2 pin
9	P7_2F	0	R/(W)* ¹	P7_2 Flag 0: No change on the P7_2 pin 1: Change on the P7_2 pin
8	NMIF	0	R/(W)* ¹	NMI Flag 0: No interrupt on NMI pin 1: Interrupt on NMI pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RTCARF	0	R/(W)* ¹	RTCAR Flag 0: No realtime clock alarm interrupt generated 1: Realtime clock alarm Interrupt generated
5	P5_9F	0	R/(W)* ¹	P5_9 Flag 0: No change on the P5_9 pin 1: Change on the P5_9 pin

Bit	Bit Name	Initial Value	R/W	Description
4	P7_3F	0	R/(W)*1	P7_3 Flag 0: No change on the P7_3 pin 1: Change on the P7_3 pin
3	P5_8F	0	R/(W)*1	P5_8 Flag 0: No change on the P5_8 pin 1: Change on the P5_8 pin
2	P2_7F	0	R/(W)*1	P2_7 Flag 0: No change on the P2_7 pin 1: Change on the P2_7 pin
1	P2_9F	0	R/(W)*1	P2_9 Flag 0: No change on the P2_9 pin 1: Change on the P2_9 pin
0	P6_7F	0	R/(W)*1	P6_7 Flag 0: No change on the P6_7 pin 1: Change on the P6_7 pin

Note 1. Only 0 can be written after reading 1 to clear the flag.

42.2.27 XTAL Crystal Oscillator Gain Control Register (XTALCTR)

XTALCTR is an 8-bit readable/writable register that controls the gain of the crystal oscillator for XTAL.

If the realtime clock uses the EXTAL input, the GAIN0 bit retains the previous value when software standby mode or deep standby mode is canceled by a source other than a power-on reset. If the realtime clock does not use the EXTAL input, this bit is initialized to 0 when software standby or deep standby mode is entered.

This register is initialized to H'00 when software standby or deep standby mode is canceled by a power-on reset.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GAIN0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAIN0	0	R/W	XTAL Crystal Oscillator (EXTAL or XTAL Pin) Gain Select 0: Large gain 1: Small gain

42.3 Operation

42.3.1 Sleep Mode

(1) Transition to Sleep Mode

Executing the WFI instruction when the STBY bit in STBCR1 is 0 causes a transition from the program execution state to sleep mode. Although the CPU halts immediately after executing the WFI instruction, the contents of its internal registers remain unchanged. The on-chip peripheral modules continue to run in sleep mode. The clock output from the CKIO pin is continued.

(2) Canceling Sleep Mode

Sleep mode is canceled by an interrupt (NMI, IRQ, and on-chip peripheral module) or a power-on reset.

- Canceling by an interrupt
When an NMI, IRQ, or on-chip peripheral module interrupt occurs, sleep mode is canceled and interrupt exception handling is executed. When the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, or the interrupt by the on-chip peripheral module is disabled on the module side, the interrupt request is not accepted and sleep mode is not canceled. When an interrupt request occurs with an interrupt masked by bits 6 (the FIQ mask bit) and 7 (the IRQ mask bit) in the CPSR register in the CPU, sleep mode is canceled but interrupt exception handling is not executed.
- Canceling by a reset
Sleep mode is canceled by a power-on reset.

42.3.2 Software Standby Mode

(1) Transition to Software Standby Mode

The LSI switches from a program execution state to software standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are 1 and 0 respectively. In software standby mode, not only the CPU but also the clock and on-chip peripheral modules halt. The clock output from the CKIO pin also stops.

The contents of the CPU and cache registers remain unchanged. Some registers of on-chip peripheral modules are, however, initialized. As for the states of on-chip peripheral module registers in software standby mode, see [section 44.3, Register States](#).

The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it takes one or more cycles to actually write. Therefore, execute a WFI instruction after reading STBCR1 to have the values written to STBCR1 by the CPU to be definitely reflected in the WFI instruction.

The procedure for switching to software standby mode is as follows:

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by ARM Ltd.
2. Clear the TME bit in the watchdog timer control/status register (WTCSR) of the watchdog timer to 0 to stop the watchdog timer.
3. Set the timer counter (WTCNT) of the watchdog timer to 0 and the CKS[2:0] bits in WTCSR to appropriate values to secure the specified oscillation settling time.
4. After setting the STBY and DEEP bits in STBCR1 to 1 and 0 respectively, read STBCR. Then, execute a WFI instruction.

(2) Canceling Software Standby Mode

Software standby mode is canceled by interrupts (NMI or IRQ) or a reset (power-on reset). Clock signal starts to be output from the CKIO pin.

- Canceling by an interrupt

When the falling edge or rising edge of the NMI pin (selected by the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) of the interrupt controller) or the falling edge or rising edge of an IRQ pin (IRQ7 to IRQ0) (selected by the IRQn sense select bits (IRQn1S and IRQn0S) in interrupt control register 1 (ICR1) of the interrupt controller) is detected, clock oscillation is started. This clock pulse is supplied only to the oscillation settling counter (watchdog timer) used to count the oscillation settling time.

After the elapse of the time set in the clock select bits (CKS[2:0]) in the watchdog timer control/status register (WTCSR) of the watchdog timer before the transition to software standby mode, the watchdog timer overflow occurs. Since this overflow indicates that the clock has been stabilized, the clock pulse will be supplied to the entire chip after this overflow. Software standby mode is thus cleared and NMI interrupt exception handling (IRQ interrupt exception handling in case of IRQ) is started. If the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, the interrupt request is not accepted and sleep mode is entered. So, cancel software standby mode by an interrupt whose priority level is higher than the setting of the interrupt controller execution priority register.

When canceling software standby mode by the NMI interrupt or IRQ interrupt, set the CKS[2:0] bits so that the watchdog timer overflow period will be equal to or longer than the oscillation settling time.

The clock output phase of the CKIO pin may be unstable immediately after detecting an interrupt and until software standby mode is canceled.

- Canceling by a reset

When the RES pin is driven low, software standby mode is canceled and the LSI enters the power-on reset state. After that, if the RES pin is driven high, the power-on reset exception handling is started.

Keep the RES pin low until the clock oscillation settles. The internal clock will continue to be output to the CKIO pin.

(3) Note on Transition to Software Standby Mode

Release from software standby mode is triggered by interrupts (NMI or IRQ) or a power-on reset. If, however, a WFI instruction and an interrupt other than NMI and IRQ are generated at the same time, software standby mode may be canceled due to acceptance of the interrupt.

When initiating a transition to software standby mode, make settings so that interrupts other than NMI and IRQ are not generated before execution of the WFI instruction.

(4) Note on Canceling Software Standby Mode

After software standby mode is canceled, unstable clock pulses are output from the CKIO pin during oscillation settling time. To prevent malfunction due to the unstable pulses, the CKOEN[1:0] bits in FRQCR should be modified.

42.3.3 Software Standby Mode Application Example

This example describes a transition to software standby mode on the falling edge of the NMI signal, and cancellation on the rising edge of the NMI signal. The timing is shown in Figure 42.2.

When the NMI pin is changed from high to low level while the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) is set to 0 (falling edge detection), the NMI interrupt is accepted. When the NMIE bit is set to 1 (rising edge detection) by the NMI exception service routine, the STBY and DEEP bits in STBCR1 are set to 1 and 0 respectively, and a WFI instruction is executed, software standby mode is entered. Thereafter, software standby mode is canceled when the NMI pin is changed from low to high level.

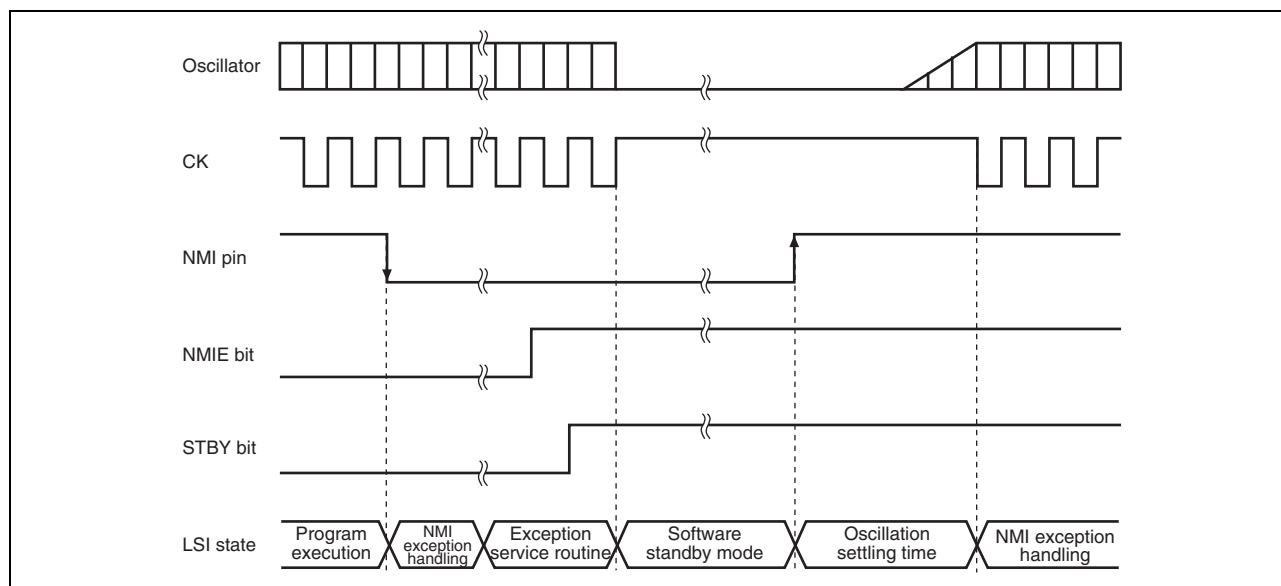

Figure 42.2 NMI Timing in Software Standby Mode (Application Example)

42.3.4 Deep Standby Mode

(1) Transition to Deep Standby Mode

The LSI switches from a program execution state to deep standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are set to 1. In deep standby mode, not only the CPU, clocks, and on-chip peripheral modules but also power supply is turned off excluding the on-chip data-retention RAM area specified by the RRAMKP3 to RRAMKP0 bits in RRAMKP and realtime clock. This can significantly reduce power consumption. Therefore, data in the registers of the CPU, cache, and on-chip peripheral modules are not retained. Pin state values immediately before the transition to deep standby mode are retained.

The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it actually takes one or more cycles to write. Therefore, execute a WFI instruction after reading STBCR1 to reflect the values written to STBCR1 by the CPU in the WFI instruction without fail.

The procedure for switching to deep standby mode is as follows. Figure 42.3 also shows its flowchart.

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by ARM Ltd.
2. Set the RRAMKP3 to RRAMKP0 bits in RRAMKP for the corresponding on-chip data-retention RAM area that must be retained. Transfer the programs to be retained to the specified areas of the on-chip data-retention RAM.
3. Set the RAMBOOT and EBUSKEEPE bits in DSCTR to specify the activation method for returning from deep standby mode and to select whether the external memory control pin status is retained or not.
4. When canceling deep standby mode by an interrupt, set the corresponding bit in DSSSR to select the pin or source to cancel deep standby mode. In this case, specify the input signal detection mode for the selected pin with the

- corresponding bit in DSESR.
5. Execute read and write of an arbitrary but the same address for each page in the on-chip data-retention RAM area. When this is not executed, data last written may not be written to the on-chip data-retention RAM. If there is a write to the on-chip data-retention RAM after this time, execute this processing after the last write to the on-chip data-retention RAM.
 6. Set the STBY and DEEP bits in the STBCR1 register to 1, and then read this register.
 7. Read out the DSFR register after clearing the flag in the DSFR register. Then execute the WFI instruction.
 8. Set the CPU interface control register (ICCICR) of the interrupt controller to 0 so that an interrupt other than NMI is not notified to the CPU. Then, read the ICCICR register.
 9. Execute the WFI instruction.
 10. The conflict between the instruction and the NMI interrupt may prevent transition to deep standby mode. After executing the WFI instruction, locate the branch instruction to return to step 9.

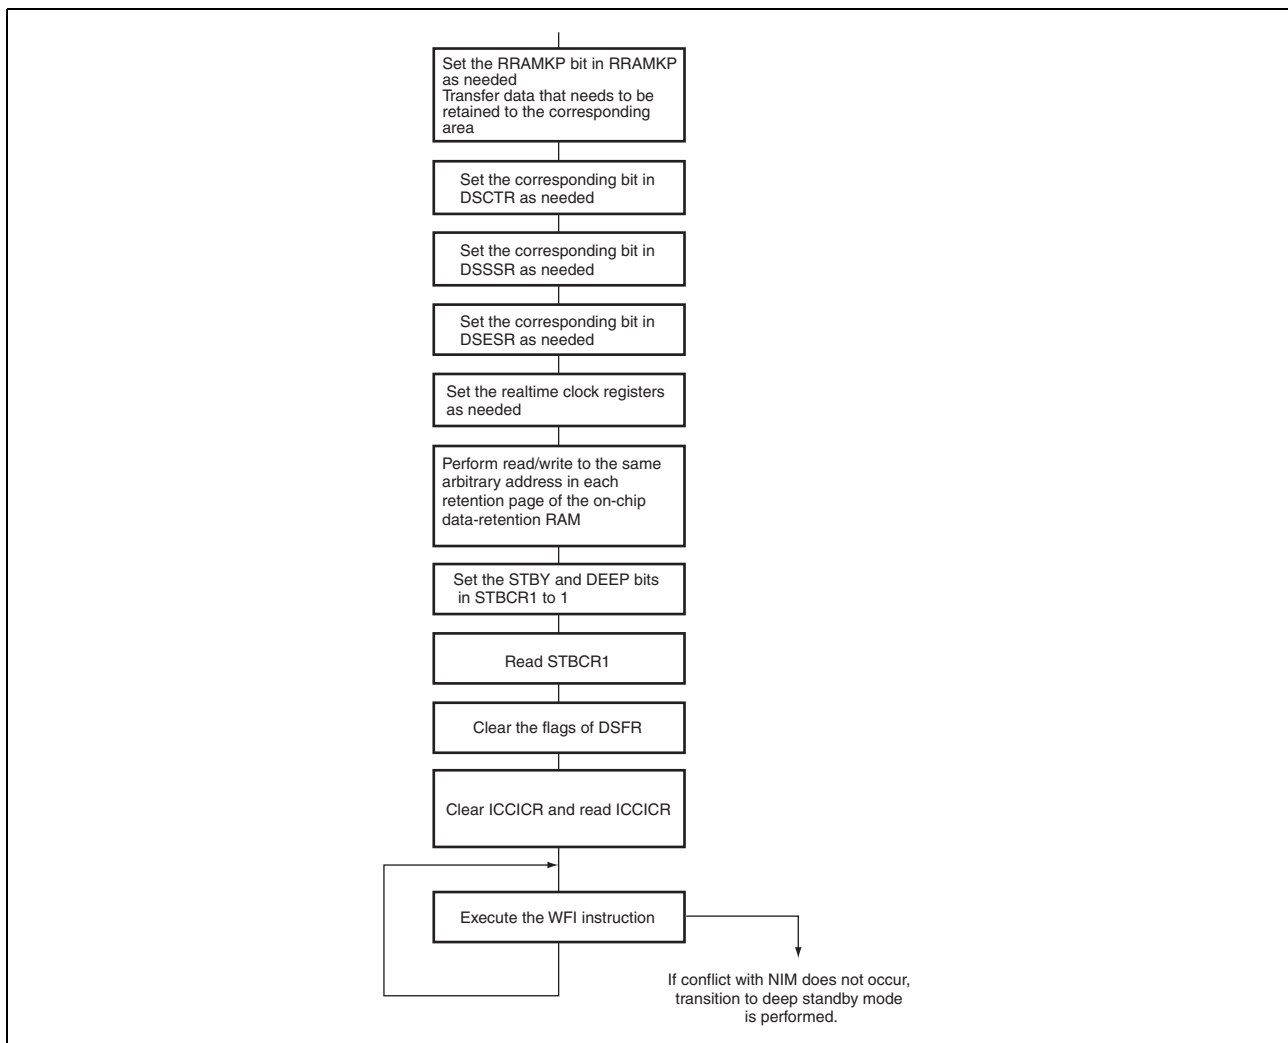

Figure 42.3 Flowchart of Transition to Deep Standby Mode

(2) Canceling Deep Standby Mode

Deep standby mode is canceled by interrupts (NMI or realtime clock alarm interrupt), change on the pins for canceling, or a reset (power-on reset). The realtime clock alarm interrupt can always cancel deep standby mode regardless of the setting of the running priority register for the interrupt controller. This interrupt can also always cancel this mode do regardless of the states of bit 6 (the FIQ mask bit) and bit 7 (the IRQ mask bit) in the CPSR register of the CPU. When canceling the mode by a source other than a reset, a power-on reset exception handling is executed instead of an interrupt exception handling.

Figure 42.4 shows the flowchart of canceling deep standby mode.

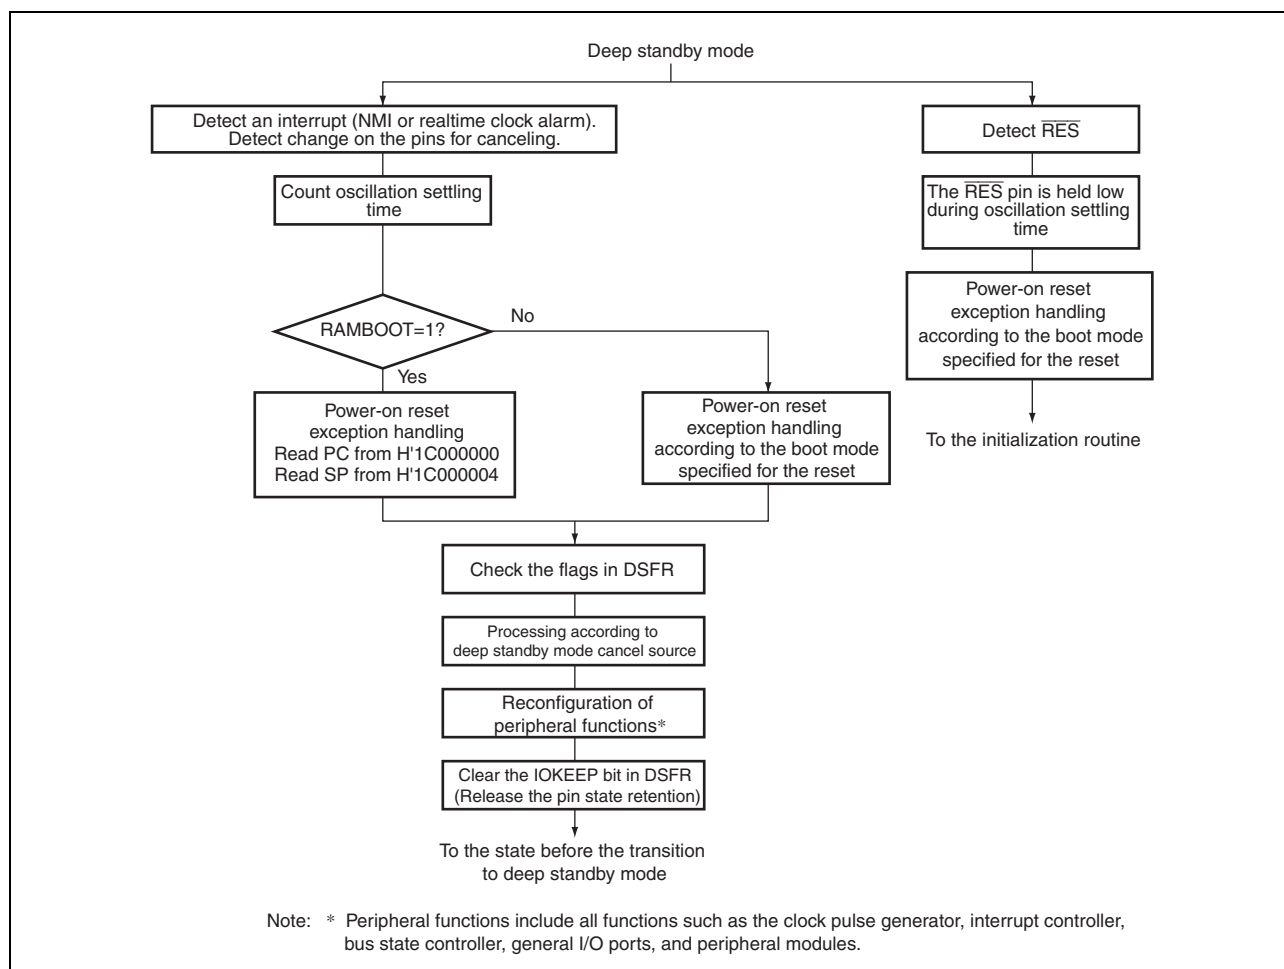

Figure 42.4 Flowchart of Canceling Deep Standby Mode

- Canceling by a source other than a reset

When the falling or rising edge of the NMI pin (selected by a corresponding bit in DSESR) or falling or rising edge of the pins for canceling (selected by a corresponding bit in DSESR) is detected or the realtime clock alarm interrupt (see section 13.4.4, Alarm Function) is generated, clock oscillation is started after the wait time for the oscillation settling time. After the oscillation settling time has elapsed, deep standby mode is canceled and the power-on reset exception handling is executed.

The clock output phase of the CKIO pin may be unstable immediately after detecting a cancel source and until deep standby mode is canceled.

The detecting of the NMI pin, the pins for canceling, and the realtime clock alarm interrupt becomes enable when the corresponding bits in DSSSR are set. The detected cancel sources are kept, but they are reflected to DSFR after canceling the deep standby mode. When the CPU accepts any interrupts and reads the interrupt response register (ICCIAR), all of the cancel sources that are kept are cleared. When the CPU enters the deep standby mode as the

detected cancel sources are kept, the deep standby mode is canceled immediately after the CPU enters the deep standby mode.

- Canceling with a reset

Driving the RES pin low cancels deep standby mode and causes a transition to the power-on reset state. After this, driving the RES pin high initiates power-on reset exception handling. Output of the internal clock from the CKIO pin also starts by driving the RES pin low.

Keep the RES pin low until the clock oscillation has settled.

(3) Operation after Canceling Deep Standby Mode

After canceling deep standby mode, the LSI can be activated through the external memory or from the on-chip data-retention RAM, which can be selected by setting the RAMBOOT bit in DSCTR. By setting the EBUSKEEPE bit, the states of the external memory control pins can be retained even after cancellation of deep standby mode. Table 42.3 shows the pin states after cancellation of deep standby mode according to the setting of each bit. Table 42.4 lists the external memory control pins.

Table 42.3 Pin States after Cancellation of Deep Standby Mode and System Activation Method by the DSCTR Settings

EBUSKEEPE Bit	RAMBOOT Bit	Activation Method	Pin States After Cancellation of Deep Standby Mode
0	0	External memory	The states of the external memory control pins are not retained. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
0	1	On-chip data-retention RAM	The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
1	0	—	Setting prohibited.
1	1	On-chip data-retention RAM	The states of the external memory control pin are retained. The retention of the states of the external memory control pins and other pins is cancelled when the IOKEEP bit is cleared.

Table 42.4 External Memory Control Pins in Different Modes

Boot Mode 0 (CS0 Area: Bus Width: 16 Bits)	Boot Mode 1 (Serial Flash Boot)	Boot Mode 2 (eSD Boot)	Boot Mode 3 (eMMC Boot)
A[20:1] D[15:0] CS0, RD, CKIO	SPBCLK_0, SPBSSL_0, SPBMO0_0, SPBMO_0	SD_CLK_0, SD_CMD_0, SD_D[3:0]_0	MMC_CLK, MMC_CMD, MMC_D[3:0]

When deep standby mode is canceled by interrupts (NMI or realtime clock alarm) or changes on the pins for canceling, the deep standby cancel source flag register (DSFR) can be used to confirm which source has canceled the mode. Pins retain the state immediately before the transition to deep standby mode. However, in system activation through the external memory, the retention of the states of the external memory control pins is cancelled so that programs can be fetched after cancellation of deep standby mode. Other pins, after cancellation of deep standby mode, continue to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. In system activation from the on-chip data-retention RAM, after cancellation of deep standby mode, both the external memory control pins and other pins continues to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. Reconfiguration of peripheral functions is required to return to the previous state of deep standby mode. Peripheral functions include all functions such as the clock pulse generator, interrupt controller, general I/O ports, and peripheral modules. After the reconfiguration, the retention of the pin state can be canceled and the LSI returns to the state prior to the transition to deep standby mode by reading 1 from the IOKEEP bit in DSFR and then writing 0 to it.

(4) Notes on Transition to Deep Standby Mode

If multiple canceling sources have been specified and multiple canceling sources are input, multiple cancel source flags will be set.

42.3.5 Module Standby Function

(1) Transition to Module Standby Function

Setting the standby control register MSTP bits to 1 halts the supply of clocks to the corresponding on-chip peripheral modules. This function can be used to reduce the power consumption in the program execution state and sleep mode.

- Transition to module standby function by setting the MSTP bit
 - Disable a module before placing it in the module standby state.
 - Do not access the module's registers while it is in the module standby state.
- Transition of modules registered in the STBREQ register to the module standby function
 - Set the corresponding bit in STBREQ to 1 to generate a request to stop the module.
 - Confirm that the module is ready to be stopped by the corresponding bit in STBACK being set to 1.
 - Set the MSTP bit of the corresponding module to 1.

Disable a module before placing it in the module standby mode. In addition, do not access the module's registers while it is in the module standby state.

For details on the states of registers, see [section 44.3, Register States](#).

(2) Canceling Module Standby Function

Release from the module standby state can be achieved in two ways: starting the module by a power-on reset while the MSTP bit is set to 1, then clearing the MSTP bit to 0, or setting the MSTP bit to 0 to activate the module, setting the MSTP bit to 1 to place the module in the standby state, and then setting the MSTP bit to 0 again.

- Clearing the MSTP bit to 0 after the activation of the module by a power-on reset while the MSTP bit is set to 1
 - Clear the MSTP bit to 0.
 - After that, dummy-read the same register. The STBREQ and SWRSTCR registers need not be used.
- Release from the module standby state after a transition to standby following activation of the module
 - When a module is released from standby by setting the MSTP bit to 0 to activate the module, setting the MSTP bit to 1 to place the module in the standby state, and then setting the MSTP bit to 0 again, these steps must be followed for each of the modules recorded in the STBREQ register. The steps must also be followed for modules recorded in the SWRSTCR register.
 - Clear the MSTP bit to 0, then dummy-read the same register.
 - For the modules recorded in the SWRSTCR register, set the SRST bit to 1, and then set it to 0, thus applying a software reset to release the module.
 - For the modules recorded in the STBREQ register, write 0 to the STBRQ bit to cancel the request.
 - Confirm that the STBAK bit in the STBACK register has been cleared to 0, indicating the completion of release from standby.

42.3.6 Adjustment of XTAL Crystal Oscillator Gain

The gain of the crystal oscillator for XTAL and the realtime clock can be adjusted using the GAIN0 bit in XTALCTR. To modify the gain of the signal on the EXTAL or XTAL pin, PLL settling time is needed. The settling time is counted using the on-chip watchdog timer.

1. The large gain is selected in the initial state.
2. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by ARM Ltd.
3. Set the watchdog timer so that the specified settling time should be obtained and stop the watchdog timer. Specifically, the following settings are necessary:
TME in WTCSR = 0: Stop the watchdog timer.
CKS[2:0] in WTCSR: Division ratio for watchdog timer count clock
WTCNT: Initial counter value
(The watchdog timer starts counting on the set clock.)
4. Set the GAIN0 bit to the desired value.
5. The LSI is internally stopped and the watchdog timer starts counting. The clock is supplied only to the watchdog timer and other internal clocks are stopped. In this state, the CKIO pin continues to output an unstable clock. To avoid malfunction due to the unstable clock, modify the CKOEN2 bit in FRQCR appropriately. Since this state is equivalent to the software standby mode state, some registers of on-chip peripheral modules are initialized. For details, see section 44.3, Register States.
6. When an overflow occurs on the watchdog timer, the specified clock supply is started and the LSI starts operation. The watchdog timer stops after an overflow.

42.4 Usage Notes

42.4.1 Usage Notes on Setting Registers

When writing to the registers related to power-down modes, note the following.

When writing to the register related to power-down modes, the CPU, after executing a write instruction, executes the next instruction without waiting for the write operation to complete.

Therefore, to reflect the change specified by writing to the register while the next instruction is executed, insert a dummy read of the same register between the register write instruction and the next instruction.

42.4.2 Usage Notes when the Realtime Clock is not Used

When the realtime clock is not used, set the MSTP60 bit in STBCR6 to 1 after setting the bits in registers of the realtime clock. For details, see section 42.2.6, Standby Control Register 6 (STBCR6).

- Set the RTCEN bit in the control register 2 (RCR2) to 0
- Set the RCKSEL[1:0] bits in the control register 5 (RCR5) to 00.

43. Debugger Interface

This LSI incorporates a debugger interface to support the boundary scan function and connection to the emulator.

43.1 Features

The debugger interface is a serial input/output interface which has a JTAG (Joint Test Action Group, IEEE Std.1149.1 and IEEE Standard Test Access Port and Boundary-Scan Architecture) interface and CoreSight debug interface.

This module has TAP controllers for the boundary scan and CoreSight debug function.

Driving the BSCANP pin high selects the boundary-scan TAP controller, and driving the BSCANP pin low selects the CoreSight debug TAP controller.

Figure 43.1 is a block diagram of this module and Table 43.1 shows the JTAG pin mode.

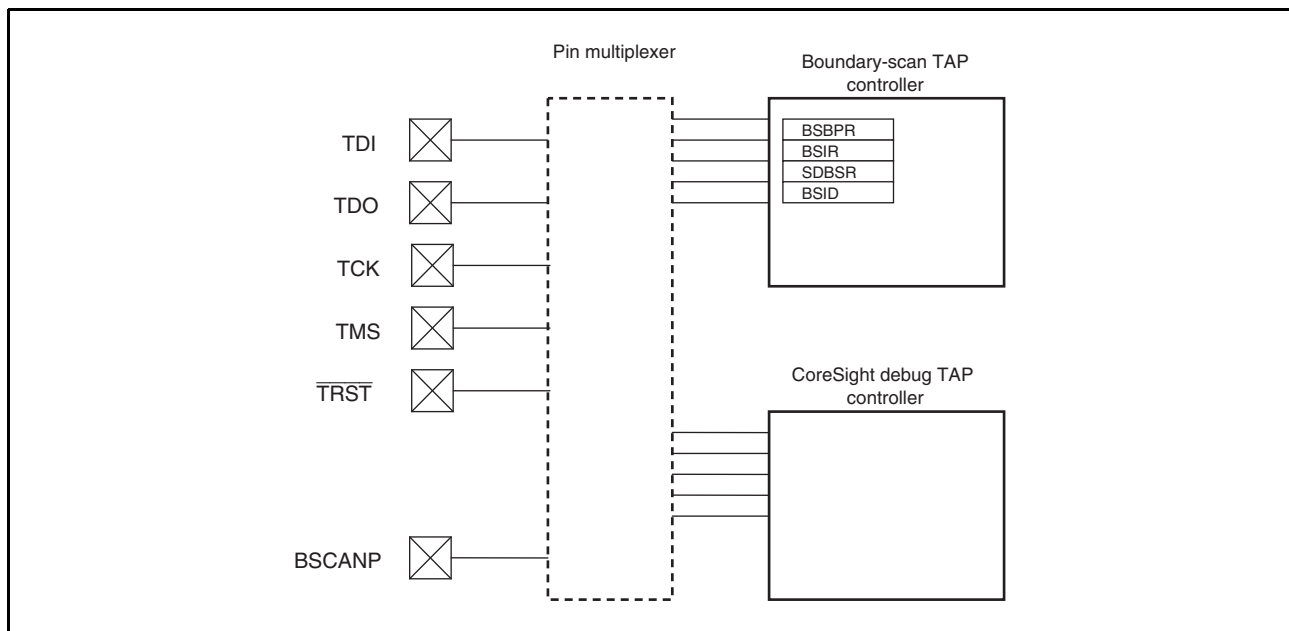

Figure 43.1 Block Diagram

Table 43.1 JTAG Pin Mode

BSCANP	JTAG Pin Mode
0	Normal operation (CoreSight debug mode)
1	Boundary-scan mode

The following lists the features of CoreSight.

- JTAG interface
Supports JTAG and serial wire debug mode (SWD)
- Trace interface
Outputs 4-bit × 66-Mbps (33-MHz DDR) trace data
4-Kbyte Embedded Trace FIFO (ETF)
- Controls by ICE registers
Control of resetting, debug-enable signal supplied to the CPU, and disabling power shut-off in deep-standby mode during debugging (fake debug mode)

Figure 43.2 is a block diagram of CoreSight, Table 43.2 to Table 43.5 show the input/output pins of the cross-trigger interface (CTI), and Table 43.6 shows the address map for CoreSight. For details of CoreSight other than ICE registers, see the technical reference manual issued by ARM Ltd.

43.2 Input/Output Pins

Table 43.7 shows the pin configuration of the debugger interface.

Table 43.7 Pin Configuration

Name	Pin Name	Input/ Output	Function
Test clock	TCK/SWDCLK	Input	Data is input in serial to this module via the data input pin (TDI) or data is output via the data output pin (TDO) in synchronization with this signal. Functions as the SWDCLK pin in serial wire debug (SWD) mode.
Test mode select	TMS/SWDIO	Input, Input/ Output	Changing this signal in synchronization with the TCK signal determines the state of the TAP controller circuit. Its protocol conforms to the subset of the JTAG standard (IEEE standard 1149.1). Functions as the SWDIO pin in serial wire debug (SWD) mode.
Test reset	$\overline{\text{TRST}}^*1$	Input	This signal is received asynchronously with the TCK signal. Asserting this signal resets this module. When power is supplied, this pin should be asserted for a given period regardless of whether or not this module function is used. For details on resetting, see section 43.5.2, Reset Signal Setting.
Test data input	TDI	Input	Data is sent to this module by changing this signal in synchronization with the TCK signal.
Test data output	TDO	Output	Data is read from this module by reading this signal in synchronization with the TCK signal.
Boundary scan setting	BSCANP	Input	Input a high-level signal during boundary-scan testing. Input a low-level signal during normal use.
Clock output	TRACECLK	Output	Trace clock output pin
Enable output	TRACECTL	Output	Trace enable output pin
Data output	TRACEDAT3 to TRACEDATA0	Output	Trace data output pins

Note 1. When designing a board that can use an emulator, the $\overline{\text{TRST}}$ pin circuit should be designed so that it can be controlled independently and can be set low during the period the $\overline{\text{RES}}$ pin is asserted low at power-on. When the $\overline{\text{TRST}}$ pin is not in use, it should be either fixed to low level or connected to the $\overline{\text{RES}}$ pin (or another pin which operates in the same manner as the $\overline{\text{RES}}$ pin).

43.3 Registers for Boundary-Scan TAP Controller

The boundary-scan TAP controller has the following registers.

Table 43.8

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Bypass register	BSBPR	—	—	—	—
Instruction register	BSIR	—	H'55	—	—
Boundary scan register	SDBSR	—	—	—	—
ID register	BSID	—	H'081A6447	—	—

43.3.1 Bypass Register (BSBPR)

BSBPR is a 1-bit register that cannot be accessed by the CPU. When the BSIR register is set to BYPASS mode, BSBPR is connected between the TDI and TDO pins. The initial value is undefined.

43.3.2 Instruction Register (BSIR)

BSIR is an 8-bit register. This register is initialized by TRST assertion or in the TAP test-logic-reset state. BSIR cannot be accessed by the CPU.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	TI[7:0]	01010101	—	Test Instruction The instructions of this module are transferred to BSIR by a serial input. For commands, see Table 43.9.

Table 43.9 Commands Supported for Boundary-Scan TAP Controller

Bits 7 to 0								Description
TI7	TI6	TI5	TI4	TI3	TI2	TI1	TI0	
0	0	0	0	0	0	0	0	EXTEST
0	1	0	0	0	0	0	0	SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	IDCODE (Initial value)
1	1	0	1	0	0	0	0	CLAMP
1	0	0	0	0	0	0	0	HIGHZ
1	1	1	1	1	1	1	1	BYPASS
Other than above								Reserved

43.3.3 Boundary Scan Register (SDBSR)

SDBSR is a shift register, located on the PAD, for controlling the input/output pins of this LSI. The initial value is undefined. The initial value is undefined.

Using the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ commands, a boundary scan test conforming to the JTAG standard can be carried out. Table 43.10 shows the correspondence between this LSI's pins and boundary scan register bits.

37	25	P2_1	Control				

Note 1. The pin names are as listed in the "Port function/dedicated function" column of Table 1.4, List of Pins in section 1.6, List of Pins.

Note 2. Open-drain pin. Setting the data bit for the pin to 0 makes the pin output a low-level signal and setting the data bit for the pin to 1 places the pin in the hi-Z state.

Note 3. Bits of type "control" are active low. When the control bit is at the low level, the corresponding pin becomes an output.

43.3.4 ID Register (BSID)

BSID is a 32-bit read-only register that cannot be accessed by the CPU. BSID can be only be read from the pins when the IDCODE command is set.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DID[31:0]	H'081A6447	—	Device IDCODE This is the ID register stipulated by JTAG. The initial value specific to this LSI is H'081A6447. Note that the higher-order four bits may be changed depending on the version of the chip.

43.4 ICE Registers

The debugger interface has the following ICE registers.

Table 43.11 Configuration of ICE Registers

Register Name	Abbreviation	R/W	Initial Value	Address		Access Size
				Viewed from CPU	Viewed from Debugger	
Mode reset control register	ICEREGMDRSTCTL	R/W	H'0000FF1E	H'FC00F000	H'8000F000	32
JTAG trace select register	ICEREGJTTRCSEL	R/W	H'00800000	H'FC00F004	H'8000F004	32
Clock power control register	ICEREGCLKPWRCTRL	R/W	H'00000000	H'FC00F014	H'8000F014	32
Lock access register	ICEREGLOCKACCES	W	—	H'FC00FFB0	H'8000FFB0	32

43.4.1 Mode Reset Control Register (ICEREGMDRSTCTL)

ICEREGMDRSTCTL is used to set the debug mode and to perform software reset.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	NIDEN_CPU0	—	—	—	DBGEN_CPU0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	RSTRB_CPU0_DERSTZ	—	—	—	RSTRB_CPU0_CPURSTZ	—	—	—	RSTRB_SYS_SYSRSTZ	—	RSTRB_CPU_PRSTD_BGZ	RSTRB_CPU_SYSRSTZ	—
Initial value:	1	1	1	1	1	1	1	0	0	0	0	1	1	1	1	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The read value is always 0.
20	NIDEN_CPU0	0	R/W	CPU Noninvasive Debug Enable Controls the noninvasive debug enable signal (NIDEN/SPNIDEN) supplied to the CPU. This bit is only effective when the PINSETEN bit in ICEREGJTTRCSEL is set to 0.
19 to 17	—	All 0	R	Reserved The read value is always 0.
16	DBGEN_CPU0	0	R/W	CPU Debug Enable Controls the debug enable signal (DBGEN/SPIDEN) supplied to the CPU. This bit is only effective when the PINSETEN bit in ICEREGJTTRCSEL is set to 0.
15 to 13	—	All 1	R	Reserved The read value is always 1.
12	RSTRB_CPU0_DERSTZ	1	R/W	NEON Reset (low-active) Resets the NEON unit in the CPU.
11 to 9	—	All 1	R	Reserved The read value is always 1.
8	RSTRB_CPU0_CPURSTZ	1	R/W	CPU Reset (low-active) Resets all systems on the CPU block other than debugging resources.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved The read value is always 0.
4	RSTRB_SYS_YSRSTZ	1	R/W	System Reset (low-active) Resets all systems on the chip other than debugging resources.
3	—	1	R/W	Reserved The read value is always 1. The write value should always be 1.
2	RSTRB_CPU_PRSTDBGZ	1	R/W	CPU Subsystem Debug Peripheral Reset (low-active) Resets the debug-APB block in the CPU subsystem.
1	RSTRB_CPU_YSRSTZ	1	R/W	CPU Subsystem Reset (low-active) Resets the CPU subsystem other than those for debugging.
0	—	0	R	Reserved The read value is always 0.

43.4.2 JTAG Trace Select Register (ICEREGJTTRCSEL)

ICEREGJTTRCSEL is used to control trace data output to the respective pins and debug enable signal supplied to the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	PINSET EN	—	—	TRCMU X_SEL	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	0	R/W	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The read value is always 0.
23	PINSETEN	1	R/W	Selects control method of debug enable signal supplied to the CPU. 0: Supply of the DBGEN and NIDEN signals is determined by the ICEREGMDRSTCTL register. 1: Supply of the DBGEN and NIDEN signals is determined by the BSCANP pin.
22, 21	—	All 0	R	Reserved The read value is always 0.
20	TRCMUX_SEL	0	R/W	Sets the priority of the function multiplexed on the pins to which trace output is assigned. 0: The function of the pins depends on the general I/O port setting. 1: The pins act as trace outputs regardless of the general I/O port setting.
19 to 0	—	All 0	R	Reserved The read value is always 0.

43.4.3 Clock Power Control Register (ICEREGCLKPWRCTRL)

ICEREGCLKPWRCTRL is used to set the fake debug mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	FAKED BGCTRL	—	—	—	—	—	—	FAKED BG
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The read value is always 0.
7	FAKEDBGCTRL	0	R/W	Enables or disables the fake debug mode. 0: The power control is determined by the standby control register 1 (STBCR1). 1: The power control is determined by this register.
6 to 1	—	All 0	R	Reserved The read value is always 0.
0	FAKEDBG	0	R/W	Selects whether or not to stop the power supply in deep standby mode. 0: The power supply is actually stopped in deep standby mode. 1: The power supply is not stopped even in deep standby mode.

43.4.4 Lock Access Register (ICEREGLOCKACCESS)

ICEREGLOCKACCESS is used to enable access to ICE registers by the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ICEREGLOCKACCESS	—	W	To enable access to ICE registers by the CPU, first write H'C5AC CE55 to this register.

43.5 Operation

43.5.1 TAP Controller

Figure 43.3 shows the internal states of the TAP controller. State transitions basically conform to the JTAG standard.

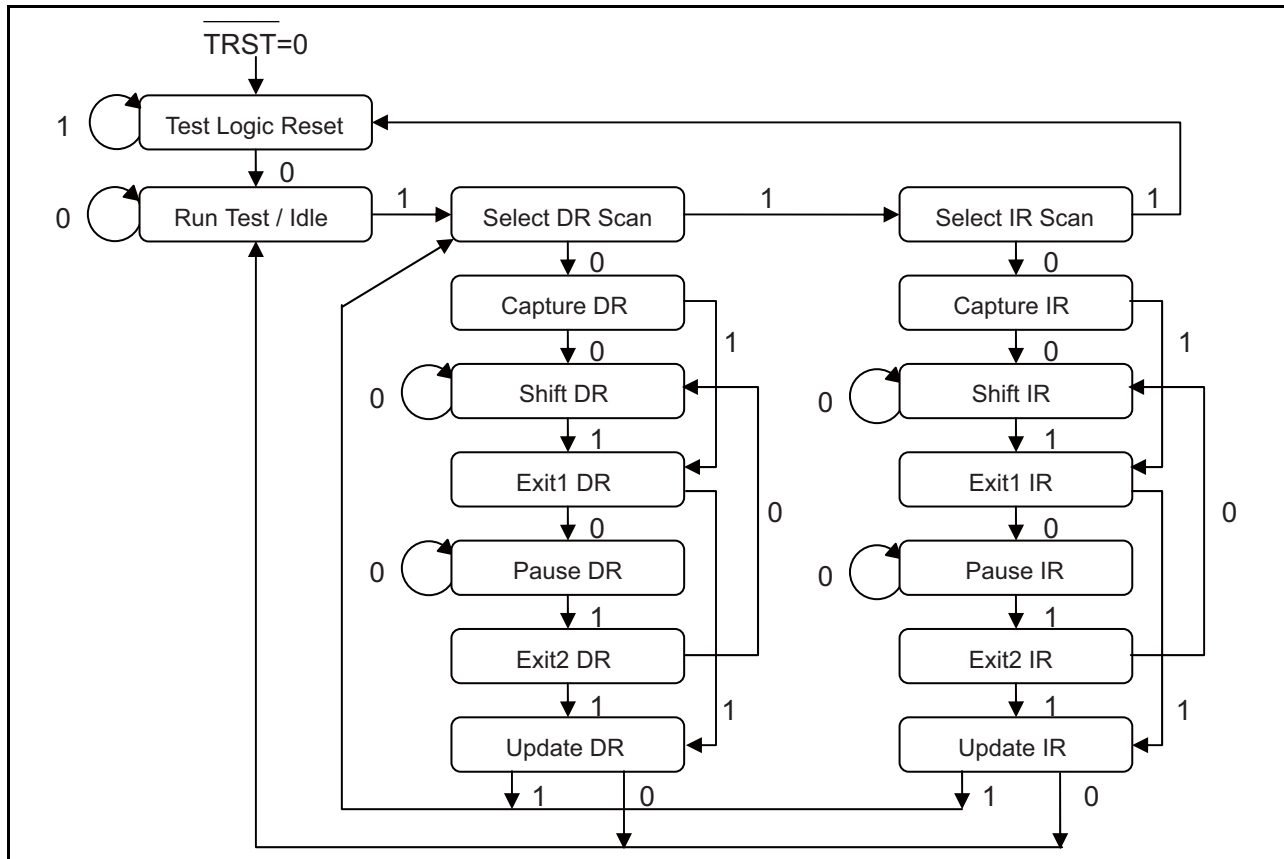

Figure 43.3 State Transitions of TAP Controller

Note: State transition occur according to the TMS value at the rising edge of the TCK signal. The TDI value sampled at the rising edge of the TCK signal and shifted at the falling edge of the TCK signal. TDO value is output at the rising edge of the TCK signal. The TDO signal is in a Hi-Z state for TAP controller states other than Shift-DR and Shift-IR. A transition to the Test-Logic-Reset state by clearing $\overline{\text{TRST}}$ to 0 is performed asynchronously with the TCK signal.

43.5.2 Reset Signal Setting

Table 43.12 Reset Signal Setting

$\overline{\text{RES}}$	$\overline{\text{TRST}}$	Chip State
L	L	The chip is power-on reset and this module is reset.*1
	H	The chip is power-on reset.*1
H	L	This module is only reset.*2
	H	Normal operation*2

Note 1. By asserting the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ signals, the CPU and CoreSight enter the reset state. Set the debugging function while asserting the $\overline{\text{RES}}$ signal after negating the $\overline{\text{TRST}}$ signal.

Note 2. When the chip is in CoreSight debugging mode, do not negate the $\overline{\text{TRST}}$ signal while the $\overline{\text{RES}}$ signal is at the high-level.

43.6 Boundary Scan

Commands can be set in BSIR by this module to place this module's pins in boundary scan mode stipulated by JTAG.

43.6.1 Supported Instructions

This LSI supports three mandatory instructions stipulated by JTAG standard (BYPASS, SAMPLE/PRELOAD, and EXTEST) and three option instructions (IDCODE, CLAMP, and HIGHZ).

(1) BYPASS

BYPASS is a mandatory instruction that operates the bypass register. This instruction is used to shorten the shift path to speed up serial data transfer involving other LSI on the printed circuit board. This LSI's system circuits are not affected by execution of this instruction.

(2) SAMPLE/PRELOAD

SAMPLE/PRELOAD is used to input data from this LSI's internal circuit to the boundary scan register, outputs data from the scan path, and loads data onto the scan path. While this instruction is being executed, signals input to this LSI pins are transmitted directly to the internal circuit, and the values of the internal circuit are directly output externally from the output pins. This LSI's system circuits are not affected by execution of this instruction.

In a SAMPLE operation, a snapshot of a value to be transferred from an input pin to the internal circuit, or a value to be transferred from the internal circuit to an output pin, is latched into the boundary scan register and read from the scan path. Snapshot latching is performed in synchronization with the rising edge of the TCK signal in the Capture-DR state. Snapshot latching does not affect normal operation of this LSI.

In a PRELOAD operation, an initial value is set in the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. Without a PRELOAD operation, when the EXTEST instruction was executed an undefined value would be output from the output pin until completion of the initial scan sequence (transfer to the output latch) (with the EXTEST instruction, the parallel output latch value is constantly output to the output pin).

(3) EXTEST

This instruction is provided to test external circuit when this LSI is mounted on a printed circuit board. When this instruction is executed, output pins are used to output test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed circuit board, and input pins are used to latch test results into the boundary scan register from the printed circuit board. If testing is carried out by using the EXTEST instruction N times, the Nth test data is scanned-in when test data (N-1) is scanned out. The data loaded into the output pin boundary scan register in the Capture-DR state are not used for external circuit testing (data are replaced by the shift operation).

(4) IDCODE

Commands can be set in BSIR via pins of this module to place the module's pins in the IDCODE mode stipulated by JTAG. When this module is initialized ($\overline{\text{TRST}}$ is asserted or TAP is in the Test-Logic-Reset state), the IDCODE mode is entered.

(5) CLAMP, HIGHZ

Commands can be set in BSIR via pins of this module to place the module's pins in the CLAMP or HIGHZ mode stipulated by JTAG.

43.6.2 Points for Attention

1. Boundary scan mode does not cover clock-related signals (EXTAL, XTAL, CKIO, AUDIO_X1, AUDIO_X2, USB_X1, USB_X2, RTC_X1, and RTC_X2).
2. Boundary scan mode does not cover reset-related signal ($\overline{\text{RES}}$).
3. Boundary scan mode does not cover this module's signals (TCK, TDI, TDO, TMS, $\overline{\text{TRST}}$, and BSCANP).
4. Boundary scan mode does not cover USB-related signals (DP0, DP1, DM0, DM1, VBUS0, VBUS1, and REFRIN).
5. Boundary scan mode does not cover P0_3.

43.7 Usage Notes

1. Once a command of this module is set, it will not be modified unless another command is reissued. If the same command is given continuously, the command must be set after a command (BYPASS, etc.) that does not affect LSI operations is once set.
2. Regardless of whether or not this module is to be used, it should be initialized by asserting the $\overline{\text{TRST}}$ signal when power is supplied and on release from deep standby mode (excluding fake debug mode) through assertion of the $\overline{\text{RES}}$ signal.
3. Be sure to wait for at least 200 ns after negating the $\overline{\text{TRST}}$ signal before starting TAP controller operation.
4. Be sure to fix the TMS pin to the high level until 200 ns have elapsed after negation of the $\overline{\text{TRST}}$ signal.

44. List of Registers

44.1 Register Addresses

Table 44.1 Register Addresses

Module	Register Name	Abbreviation	Number of Bits	Address	Access Size

	All registers other than above*9	Retained	Initialized*10	Retained	Retained	Retained

Note 1. Retained on internal power-on reset by the watchdog timer.

Note 2. Flag processing continues.

Note 3. Counting up continues.

Note 4. Transfer can proceed.

Note 5. The value of RTCEN bit is retained.

Note 6. The GAIN0 bit is initialized when the realtime clock is not using the EXTAL pin.

Note 7. Initialized on assertion of $\overline{\text{TRST}}$ or when the TAP controller is placed in Test-Logic-Reset state.

Note 8. Access to these registers from the I/O area (SLV6) is not possible while $\overline{\text{TRST}}$ is asserted.

Note 9. Initialized on assertion of $\overline{\text{TRST}}$.

Note 10. Retained in FAKE debug mode.

45. Electrical Characteristics

45.1 Absolute Maximum Ratings

Table 45.1 Absolute Maximum Ratings

Item	Symbol	Value	Unit	
Power supply voltage (I/O)	PV _{CC}	-0.3 to 4.2	V	
Power supply voltage (Internal)	V _{CC}	-0.3 to 1.6	V	
PLL power supply voltage	PLL _{VCC}	-0.3 to 1.6	V	
Analog power supply voltage	AV _{CC}	-0.3 to 4.2	V	
Analog reference voltage	AV _{ref}	-0.3 to AV _{CC} +0.3	V	
USB transceiver analog power supply voltage (I/O)	USBAP _{VCC}	-0.3 to 4.2	V	
USB transceiver digital power supply voltage (I/O) Note: Products in BGA packages do not have this pin.	USBDP _{VCC}	-0.3 to 4.2	V	
USB transceiver analog power supply voltage (internal)	USBA _{VCC}	-0.3 to 1.6	V	
USB transceiver digital power supply voltage (internal) Note: Products in BGA packages do not have this pin.	USBD _{VCC}	-0.3 to 1.6	V	
Power supply for USB 480 MHz (internal) Note: Products in BGA packages do not have this pin.	USB _{UVCC}	-0.3 to 1.6	V	
Input voltage	VBUS	V _{in}	-0.3 to 5.5	V
	Other input pins	V _{in}	-0.3- to 3.3-V power supply (PV _{CC} , AV _{CC} , USBAP _{VCC} , USBDP _{VCC}) +0.3	V
Operating temperature	T _{opr}	-40 to +85	°C	
Storage temperature	T _{stg}	-55 to +125	°C	

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

45.2 Power-On/Power-Off Sequence

The 1.2-V power supply (V_{CC}, PLL_{VCC}, USBA_{VCC}, USBD_{VCC}, and USB_{UVCC}) and 3.3-V power supply (PV_{CC}, AV_{CC}, USBAP_{VCC}, and USBDP_{VCC}) can be turned on and off in any order.

When turning on the power, be sure to drive both the $\overline{\text{TRST}}$ and $\overline{\text{RES}}$ pins low; otherwise, the output pins and input/output pins output undefined levels, resulting in system malfunction.

When turning off the power, drive the $\overline{\text{TRST}}$ and $\overline{\text{RES}}$ pins low if the undefined output may cause a problem.

45.3 DC Characteristics

- Conditions used to obtain DC characteristics (2) in Table 45.2 other than current consumption
 $V_{CC} = USBDV_{CC} = USBUV_{CC} = 1.10$ to 1.26 V, $PV_{CC} = USBDPV_{CC} = 3.0$ to 3.6 V, $PLL_{VCC} = 1.10$ to 1.26 V,
 $AV_{CC} = 3.0$ to 3.6 V, $USBAPV_{CC} = 3.0$ to 3.6 V, $USBAV_{CC} = 1.10$ to 1.26 V,
 $V_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0$ V,
 $T_a = -40$ to 85 °C
- Conditions used to obtain DC characteristics (2) in Table 45.2 for current consumption
 $V_{CC} = USBDV_{CC} = USBUV_{CC} = 1.18$ V, $PV_{CC} = USBDPV_{CC} = 3.3$ V, $PLL_{VCC} = 1.18$ V, $AV_{CC} = 3.3$ V,
 $USBAPV_{CC} = 3.3$ V, $USBAV_{CC} = 1.18$ V,
 $V_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0$ V, $AV_{ref} = 3.3$ V, $VBUS = 5.0$ V,
 $T_a = -40$ to 85 °C
 $I_{\phi} = 400.00$ MHz, $B_{\phi} = 133.33$ MHz, $P1_{\phi} = 66.67$ MHz, $P0_{\phi} = 33.33$ MHz

Note: Products in BGA packages do not have $USBDV_{CC}$, $USBUV_{CC}$, $USBDPV_{CC}$, $USBDV_{SS}$, $USBAV_{SS}$, $USBDPV_{SS}$, $USBAPV_{SS}$, and $USBUV_{SS}$ pins.

Table 45.2 DC Characteristics (1) [Common Items]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Power supply voltage		PV_{CC}	3.0	3.3	3.6	V	
		V_{CC}	1.10	1.18	1.26	V	
PLL power supply voltage		PLL_{VCC}	1.10	1.18	1.26	V	
Analog power supply voltage		AV_{CC}	3.0	3.3	3.6	V	
USB power supply voltage		$USBAPV_{CC}$	3.0	3.3	3.6	V	
Note: Products in BGA packages do not have $USBDPV_{CC}$, $USBDV_{CC}$, and $USBUV_{CC}$ pins.		$USBAV_{CC}$	1.10	1.18	1.26	V	
		$USBDV_{CC}$					
		$USBUV_{CC}$					
Input leakage current	All input pins	$ I_{in} $	—	—	1.0	μ A	$V_{in} = 0.5$ to $PV_{CC} - 0.5$ V
Three-state leakage current	All input/output pins, all output pins (except P1_0 to P7_0) (off state)	$ I_{STI} $	—	—	1.0	μ A	$V_{in} = 0.5$ to $PV_{CC} - 0.5$ V
	P1_0 to P7_0		—	—	10	μ A	
Input capacitance	all input/output pins, all input pins	C_{in}	—	—	10	pF	

Table 45.2 DC Characteristics (2) [Current Consumption]

Item	Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions	
Current consumption in normal operation	V _{CC}	I _{CC}	384	492	mA		
	PLL _{VCC}	PLL _I CC	6.4	8	mA		
	PV _{CC}	PI _{CC}	70*1*2	—	mA		
	AV _{CC}	AI _{CC}	2.7	4	mA	During A/D conversion	
	AV _{ref}	AI _{ref}	0.6	1	mA	During A/D conversion	
	USBAV _{CC}	UA _I CC	5	6	mA	When the USB host/function is in use.	
	USBDV _{CC} + USBUV _{CC}	UDI _{CC} *3	17	20	mA	In USB high-speed operation (2ch)	
	USBAPV _{CC}	UA _{PI} CC	3.3	4	mA	When the USB host/function is in use.	
	USBDPV _{CC}	UD _{PI} CC*4	70*1*2	—	mA	In USB high-speed operation (2ch)	
	VBUS	VI _{CC}	8	10	μA		
Current consumption in sleep mode	V _{CC}	I _{sleep}	175	300	mA		
For the other power supply, the current consumption is the same as in normal operation.							
Current consumption in software standby mode	V _{CC} + PLL _{VCC} + USBAV _{CC} + USBDV _{CC} + USBUV _{CC}	I _{sstby}	32	120	mA	T _a > 50 °C	
			PV _{CC} + AV _{CC} + AV _{ref} + USBAPV _{CC} + USBDPV _{CC}	PI _{sstby}	20	26	μA
					VBUS	VI _{sstby}	8
	V _{CC} + PLL _{VCC} + USBAV _{CC} + USBDV _{CC} + USBUV _{CC}	I _{sstby}	13	55	mA	T _a ≤ 50 °C	
			PV _{CC} + AV _{CC} + AV _{ref} + USBAPV _{CC} + USBDPV _{CC}	PI _{sstby}	17	20	μA
					VBUS	VI _{sstby}	8

Table 45.2 DC Characteristics (2) [Current Consumption]

Item		Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions	
Current consumption in deep standby mode	Ta > 50 °C	V _{CC} + PLL _{VCC} + USB _{AVCC} + USB _{DVCC} + USB _{UVCC}	I _{dstby}	27	119	μA	RAM 0 Kbytes retained, RTC_X1 selected	
				32	137	μA	RAM 16 Kbytes retained, RTC_X1 selected	
				37	155	μA	RAM 32 Kbytes retained, RTC_X1 selected	
				42	191	μA	RAM 64 Kbytes retained, RTC_X1 selected	
				62	263	μA	RAM 128 Kbytes retained, RTC_X1 selected	
	When the EXTAL 13 MHz is selected, 5 μA and 7 μA are added to the "Typ." and "Max." values above, respectively.							
	Ta ≤ 50 °C	V _{CC} + PLL _{VCC} + USB _{AVCC} + USB _{DVCC} + USB _{UVCC}	I _{dstby}		17	54	μA	RAM 0 Kbytes retained, RTC_X1 selected
					21	71	μA	RAM 16 Kbytes retained, RTC_X1 selected
					25	88	μA	RAM 32 Kbytes retained, RTC_X1 selected
					33	122	μA	RAM 64 Kbytes retained, RTC_X1 selected
					49	190	μA	RAM 128 Kbytes retained, RTC_X1 selected
	When the EXTAL 13 MHz is selected, 5 μA and 7 μA are added to the "Typ." and "Max." values above, respectively.							
	Ta > 50 °C	P _{VCC} + A _{VCC} + A _{Vref} + USB _{APVCC} + USB _{DPVCC}	P _{Idstby}		13	15	μA	RTC is not operating
					20	25	μA	RTC_X1 selected
				1	—	mA	EXTAL 13 MHz selected, small gain*1	
V _{BUS}				V _{Idstby}	8	10	μA	
Ta ≤ 50 °C				P _{VCC} + A _{VCC} + A _{Vref} + USB _{APVCC} + USB _{DPVCC}	P _{Idstby}		12	13
		19	23			μA	RTC_X1 selected	
		1	—			mA	EXTAL 13 MHz selected, small gain*1	
	V _{BUS}	V _{Idstby}	8			10	μA	

Note 1. Reference value. The actual operating current greatly depends on the system (such as slow rising/falling edges caused by IO load and toggle frequency). Be sure to determine the value using the actual system.

Note 2. The sum of P_{ICC} and UD_{PICC} must be equal to or lower than 150 mA.

Note 3. In the products in BGA packages, UD_{ICC} is added to I_{CC}.

Note 4. In the products in BGA packages, UD_{PICC} is added to P_{ICC}.

Table 45.2 DC Characteristics (3) [Except I²C Bus Interface, and USB 2.0 Host/Function Module-Related Pins]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions	
Input high voltage*	V _{IH}	2.2	—	PV _{CC} + 0.3	V		
Input low voltage*	V _{IL}	-0.3	—	0.8	V		
Schmitt trigger input characteristics	V _{T+}	PV _{CC} × 0.665	—	—	V		
	V _{T-}	—	—	0.8	V		
	V _{T+} - V _{T-}	0.2	—	—	V		
Output high voltage	V _{OH}	PV _{CC} - 0.5	—	—	V	I _{OH} = -2.0 mA	
Output low voltage	V _{OL}	—	—	0.4	V	I _{OL} = 2.0 mA	
RAM standby voltage	Software standby mode (large-capacity on-chip RAM)	V _{RAMS}	0.85	—	—	V	Measured with V _{CC} as parameter
	Deep standby mode (only the on-chip RAM for data retention)	V _{RAMD}	1.10	—	—	V	

Note: * Except for the Schmitt pins and the input of data for the boundary scanning of pins P5_0 to P5_15 and P6_0 to P6_15.

Table 45.2 DC Characteristics (4) [I²C Bus Interface Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V _{IH}	PV _{CC} × 0.7	—	PV _{CC} + 0.3	V	
Input low voltage	V _{IL}	-0.3	—	PV _{CC} × 0.3	V	
Schmitt trigger input characteristics	V _{IH} - V _{IL}	PV _{CC} × 0.05	—	—	V	
Output low voltage	V _{OL}	—	—	0.4	V	I _{OL} = 3.0 mA

Note: * The P1_0 to P7_0 pins are open-drain pins.

Table 45.2 DC Characteristics (5) [USB 2.0 Host/Function Module-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Reference resistance	R _{REF}	5.6 kΩ ± 1%	5.6 kΩ ± 1%	5.6 kΩ ± 1%		
Input high voltage (VBUS1, VBUS0)	V _{IH}	4.02	—	5.25	V	
Input low voltage (VBUS1, VBUS0)	V _{IL}	-0.3	—	0.5	V	
Input high voltage (USB_X1)	V _{IH}	PV _{CC} - 0.5	—	PV _{CC} + 0.3	V	
Input low voltage (USB_X1)	V _{IL}	-0.3	—	0.5	V	

Note: * REFRIN, VBUS1, VBUS0, USB_X1, and USB_X2 pins

Table 45.2 DC Characteristics (6) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed, Full-Speed, and High-Speed Common Items)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
DP pull-up resistance (when function is selected)	R _{pu}	0.900	—	1.575	kΩ	In idle mode
		1.425	—	3.090	kΩ	In transmit/receive mode
DP and DM pull-down resistance (when host is selected)	R _{pd}	14.25	—	24.80	kΩ	

Note: * DP1, DP0, DM1, and DM pins

Table 45.2 DC Characteristics (7) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed and Full-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V _{IH}	2.0	—	—	V	
Input low voltage	V _{IL}	—	—	0.8	V	
Differential input sensitivity	V _{DI}	0.2	—	—	V	(DP) – (DM)
Differential common mode range	V _{CM}	0.8	—	2.5	V	
Output high voltage	V _{OH}	2.8	—	3.6	V	I _{OH} = –200 μA
Output low voltage	V _{OL}	0.0	—	0.3	V	I _{OL} = 2 mA
Output signal crossover voltage	V _{CRS}	1.3	—	2.0	V	C _L = 50 pF (full-speed) C _L = 200 to 600 pF (low-speed)

Note: * DP1, DP0, DM1, and DM pins

Table 45.2 DC Characteristics (8) [USB 2.0 Host/Function Module-Related Pins* (High-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Squelch detection threshold voltage (differential voltage)	V _{HSSQ}	100	—	150	mV	
Common mode voltage range	V _{HSCM}	–50	—	500	mV	
Idle state	V _{HSOI}	–10.0	—	10.0	mV	
Output high voltage	V _{HSOH}	360	—	440	mV	
Output low voltage	V _{HSOL}	–10.0	—	10.0	mV	
Chirp J output voltage (difference)	V _{CHIRPJ}	700	—	1100	mV	
Chirp K output voltage (difference)	V _{CHIRPK}	–900	—	–500	mV	

Note: * DP1, DP0, DM1, and DM pins

Table 45.3 Permissible Output Currents

Item	Symbol	Min.	Typ.	Max.	Unit
Permissible output low current (per pin)	P1_0 to P7_0	—	—	10	mA
	Output pins other than above	—	—	2	mA
Permissible output high current (per pin)	–I _{OH}	—	—	2	mA
Permissible output current (total)	ΣI _O	—	—	150	mA

Caution: To protect the LSI's reliability, do not exceed the output current values in Table 45.3.

45.4 AC Characteristics

Signals input to this LSI are basically handled as signals in synchronization with a clock. The setup and hold times for input pins must be followed.

Conditions for AC characteristics: $V_{CC} = USBDV_{CC} = USBUV_{CC} = 1.10$ to 1.26 V, $PV_{CC} = USBDPV_{CC} = 3.0$ to 3.6 V, $PLL_{V_{CC}} = 1.10$ to 1.26 V, $AV_{CC} = 3.0$ to 3.6 V, $USBAPV_{CC} = 3.0$ to 3.6 V, $USBAV_{CC} = 1.10$ to 1.26 V, $V_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0$ V, $T_a = -40$ to 85 °C

Note: Products in BGA packages do not have $USBDV_{CC}$, $USBUV_{CC}$, $USBDPV_{CC}$, $USBDV_{SS}$, $USBAV_{SS}$, $USBDPV_{SS}$, $USBAPV_{SS}$, and $USBUV_{SS}$ pins.

Table 45.4 Operating Frequency

Item		Symbol	Min.	Max.	Unit	Remarks
Operating frequency	CPU clock ($I\phi$)	f	100.00	400.00	MHz	
	Internal bus clock ($B\phi$)		100.00	133.33	MHz	
	Peripheral clock 1 ($P1\phi$)		50.00	66.67	MHz	
	Peripheral clock 0 ($P0\phi$)		25.00	33.33	MHz	

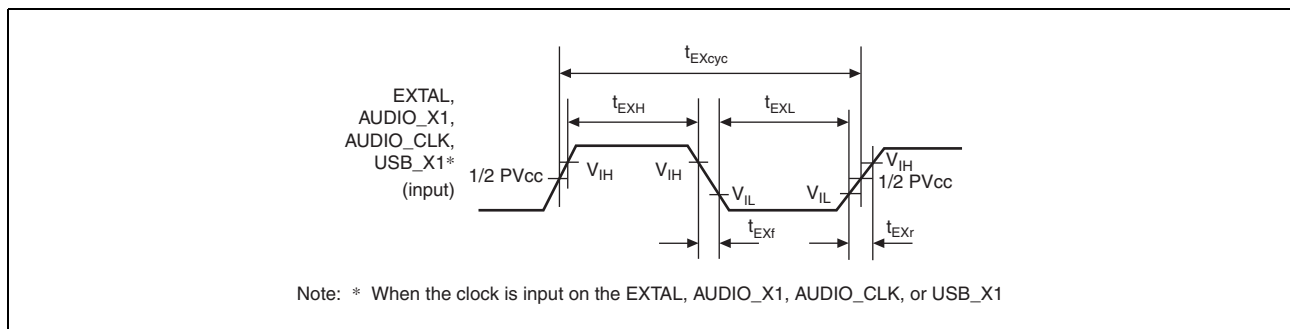

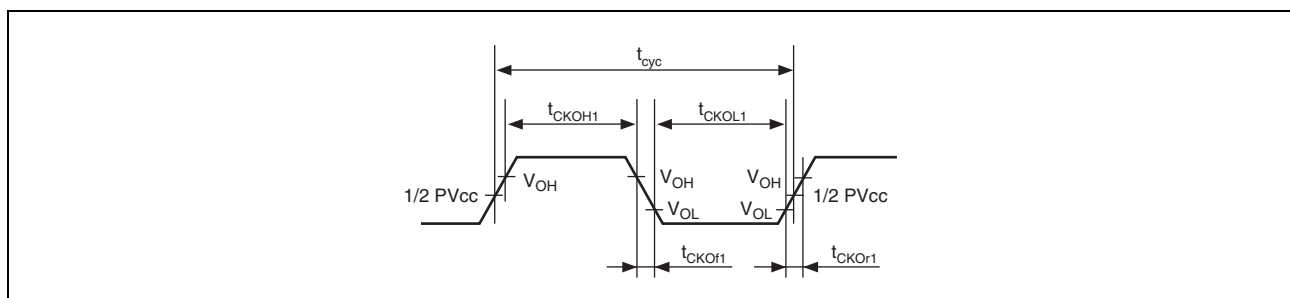

45.4.1 Clock Timing

Table 45.5 Clock Timing

Item	Symbol	Min.	Max.	Unit	Figure
EXTAL clock input frequency (when the clock is supplied to USB 2.0 host/function module)	f_{EX}	12MHz \pm 100ppm			Figure 45.1
EXTAL clock input frequency (when the clock isn't supplied to USB 2.0 host/function module)		10.00	13.33	MHz	
EXTAL clock input cycle time (when the clock isn't supplied to USB 2.0 host/function module)	t_{EXcyc}	75.00	100.00	ns	
AUDIO_X1 clock input frequency (crystal resonator connected)	f_{EX}	10.00	50.00	MHz	
AUDIO_X1 clock input cycle time (crystal resonator connected)	t_{EXcyc}	20.00	100.00	ns	
AUDIO_X1, AUDIO_CLK clock input frequency (external clock input)	f_{EX}	1.00	50.00	MHz	
AUDIO_X1, AUDIO_CLK clock input cycle time (external clock input)	t_{EXcyc}	20.00	1000.00	ns	
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module and high-speed transfer function is used)	f_{EX}	48 MHz \pm 100 ppm			
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module, high-speed transfer function is not used, and host controller function is used)		48 MHz \pm 500 ppm			
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module, high-speed transfer function is not used, and host controller function is not used)		48 MHz \pm 2500 ppm			
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input low pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input high pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}

DQM delay time 1	t _{DQMD1}	2	12	ns	Figure 45.16 to Figure 45.29
CKE delay time 1	t _{CKED1}	2	12	ns	Figure 45.31
AH delay time	t _{AHD}	1/2t _{cyc}	1/2t _{cyc} + 12	ns	Figure 45.12
Multiplexed address delay time	t _{MAD}	—	12	ns	Figure 45.12
Multiplexed address hold time	t _{MAH}	1	—	ns	Figure 45.12
Address setup time for AH	t _{AVVH}	1/2t _{cyc} - 2	—	ns	Figure 45.12
DACK, TEND delay time	t _{DACD}	Refer to the direct memory access controller timing		ns	Figure 45.8 to Figure 45.29

Note 1. The maximum value (fmax) of CKIO (external bus clock) depends on the number of wait cycles and the system configuration of your board.

Note 2. 1/2 t_{cyc} indicated in minimum and maximum values for the item of delay, setup, and hold times represents a half cycle from the rising edge with a clock. That is, 1/2 t_{cyc} describes a reference of the falling edge with a clock.

Note 3. Values when SDRAM is used.

Data setup time	t _{SU:DAT}	I/O	250	-	100*3	-	ns
SDA and SCL signal rise time	t _R	Input	-	1000	20	300	ns
SDA and SCL signal fall time*3	t _F	Input	-	300	20 × (PV _{cc} /5.5V)	300	ns
		Output	-	250	20 × (PV _{cc} /5.5V)	250	ns
Setup time for STOP condition	t _{SU:STO}	I/O	4.0	-	0.6	-	μs
Capacitive load for each bus line	C _b	-	-	400*4	-	400*4	pF
Pulse width of spikes that must be suppressed by the input filter	t _{SP}	Input	-	-	0	50*5	ns

In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the SCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time (t_{SU:DAT} 250 [ns]) must be satisfied.

If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released (t_{Rmax} + t_{SU:DAT} = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICφ) and the NF[1:0] bits in RIICnMR3. For details, refer to section 18, I²C Bus Interface.

46. States and Handling of Pins

This section describes pin states in each operating mode and how to handle pins.

46.1 Pin States

Table 46.1 shows the pin states in each operating mode.

As for the input/output functions, input buffers are listed on the upper column and output buffers on the lower column.

Table 46.1 Pin States

Pin Function			Pin State						
Type	Pin Name		Normal State (Other than States at Right)	Power-On Reset ¹	Pin State Retained ²		Power-Down State

[Legend]

I: Input
O: Output
H: High-level output
L: Low-level output
Z: High-impedance

Note 1. Indicates the power-on reset by low-level input to the $\overline{\text{RES}}$ pin. The pin states after a power-on reset by the watchdog timer overflow is the same as the initial pin states at normal operation (see section 41, Ports).

- Note 2. After the chip has been released from deep standby mode by the input on pins for canceling the standby mode such as NMI, the pins retain the state until the IOKEEP bit in the deep standby cancel source flag register (DSFR) is cleared (see section 42, Power-Down Modes).
- Note 3. The EBUSKEEPE bit in deep standby control register (DSTCR) (see section 42, Power-Down Modes).
- Note 4. This LSI enters the power-on reset state for a certain period after recovery from deep standby control mode (see section 42, Power-Down Modes).
- Note 5. Depends on the setting of the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 13, Realtime Clock).
- Note 6. When pins for the connection with a crystal resonator are not used, the input pins (EXTAL, RTC_X1, AUDIO_X1, and USB_X1) must be fixed (pull-up/down resistor, power supply, or ground.) and the output pins (XTAL, RTC_X2, AUDIO_X2, and USB_X2) must be open.
- Note 7. Depends on the setting of the CKOEN bit in the frequency control register (FRQCR) of the clock pulse generator (see section 6, Clock Pulse Generator).
- Note 8. Depends on the setting of the PIPCnm bit in the port IP control register (PIPCn) of the general I/O ports.
- Note 9. Depends on the setting of the HIZ bit in the standby control register 2 (STBCR2) (see section 42, Power-Down Modes).
- Note 10. Depends on the setting of the HIZMEM bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
- Note 11. Depends on the setting of the HIZCNT bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
- Note 12. Depends on the setting of the corresponding bit in the deep standby cancel source select register (DSSSR) and the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 42, Power-Down Modes).
- Note 13. Depends on the setting of the RTCEN bit in the realtime clock control register 2 (RCR2) and the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 13, Realtime Clock).
- Note 14. Z when the TAP controller is neither the Shift-DR nor Shift-IR state.
- Note 15. When this is an output, the output is fixed to either the High or Low level. There is no oscillation.

46.2 Treatment of Unused Pins

How unused pins are to be handled is indicated below.

Table 46.2 Handling of Unused Pins (Except for Debugger Interface Pins)

Pin Name	Handling
NMI	Fix this pin at a high level (pull up or connect to a power supply).
DP1, DP0, DM1, DM0, VBUS1, VBUS0	- Connect these pins to USBDPVss (QFP package). - Connect them to Vss (BGA package).
REFRIN	Connect this pin, via a $5.6\text{ k}\Omega \pm 20\%$ resistor, to USBAPVcc.
1.18-V power dedicated to the USB (USBAPVcc, USBDVcc, USBUVcc)	Supply power at 1.18 V. Note: Products in BGA packages do not have pins USBDVcc and USBUVcc.
3.3-V power dedicated to the USB (USBAPVcc, USBDPVcc)	Supply power at 3.3 V. Note: Products in BGA packages do not have the USBDPVcc pin.
Dedicated USB ground (USBAPVss, USBDPVss, USBAPVss, USBDVss, USBUVss)	Connect to ground. Note: Products in BGA packages do not have the dedicated USB ground pins.
AVref	Connect this pin to AVcc.
Dedicated A/D power (AVcc)	Supply power at 3.3 V.
Dedicated A/D ground (AVss)	Connect to ground.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
Input/output pins other than those listed above	Make the input-pin settings and then fix the level (pull them up or down); alternatively, make the output-pin settings and leave the pins open-circuit.
Dedicated output pins	Open-circuit

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 k Ω to 100 k Ω .

Table 46.3 Handling of Debugger Interface Pins (when Emulator is not Used)

Pin	Handling
BSCANP	Fix this pin at a low level (pull down or connect to the ground level).
$\overline{\text{TRST}}$	Fix this pin at a low level (pull down or connect to the ground level). Or connect to another pin which operates in the same manner as the RES pin
TCK, TMS, TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
TDO	Open-circuit

Note 1. When using the emulator, handle these pins as described in the manual for the emulator.

Note 2. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 k Ω to 100 k Ω .

46.3 Handling of Pins in Deep Standby Mode

How pins are to be handled in deep standby mode is indicated below.

For the states of pins in deep standby mode, refer to the corresponding items under section 46.1, Pin States. Handling of unused pins as described under section 46.2, Treatment of Unused Pins, also applies in deep standby mode.

Table 46.4 Handling of Pins in Deep Standby Mode

Pin	Handling
1.2-V power (Vcc, USBDVcc, USBUVcc, USBAVcc, PLLVcc)	Supply power at 1.2 V. Note: Products in BGA packages do not have pins USBDVcc and USBUVcc.
3.3-V power (PVcc, AVcc, USBDPVcc, USBAPVcc)	Supply power at 3.3 V. Note: Products in BGA packages do not have the USBDPVcc pin.
Ground (Vss, USBDVss, USBUVss, USBAVss, AVss, USBDPVss, USBAPVss)	Connect to ground. Note: Products in BGA packages do not have the USBDVss, USBAVss, USBUVss, USBDPVss, and USBAPVss pins.
VBUS1, VBUS0	Fix the level on this pin (pull it up or down, or connect it to the power supply or ground level) or open circuit. However, note that current as indicated in table 45.2, DC Characteristics (2) [Current Consumption] will be drawn by the pin fixed to the high level.
REFRIN	Connect this pin to USBAPVss via 5.6 kΩ ± 1 % resistor (QFP package). Connect this pin to Vss via 5.6 kΩ ± 1% resistor (BGA package).
DP1, DP0, DM1, DM0	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) or open circuit.
EXTAL, RTC_X1, AUDIO_X1, USB_X1	Connect the pins to the crystal oscillator or the clock-input signal, or to a fixed level (pull them up or down, or connect them to the power supply or ground level)
XTAL, RTC_X2, AUDIO_X2, USB_X2	Connect the pins to the crystal oscillator or open circuit.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
Input/output pins (other than those listed above) in the input state	Fix the level on the pins (pull them up or down).
Input/output pins (other than those listed above) in the high-impedance state	Fix the level on the pins (pull them up or down) or open circuit.
Input/output pins (other than those listed above) in the output state	Open-circuit
Dedicated output pins other than those listed above	Open-circuit

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

46.4 Recommended Combination of Bypass Capacitor

Mount a multilayer ceramic capacitor between a pair of the power supply pins as a bypass capacitor. These capacitors must be placed as close as the power supply pins of the LSI. The capacitance of the capacitors should be used 0.1 μF to 0.33 μF (recommended values). For details of the capacitor related to the crystal resonator, see section 6, Clock Pulse Generator.

Figure 46.1 and Figure 46.2 are examples of the externally allocated capacitor in the products in 208-pin and 176-pin QFP packages, respectively.

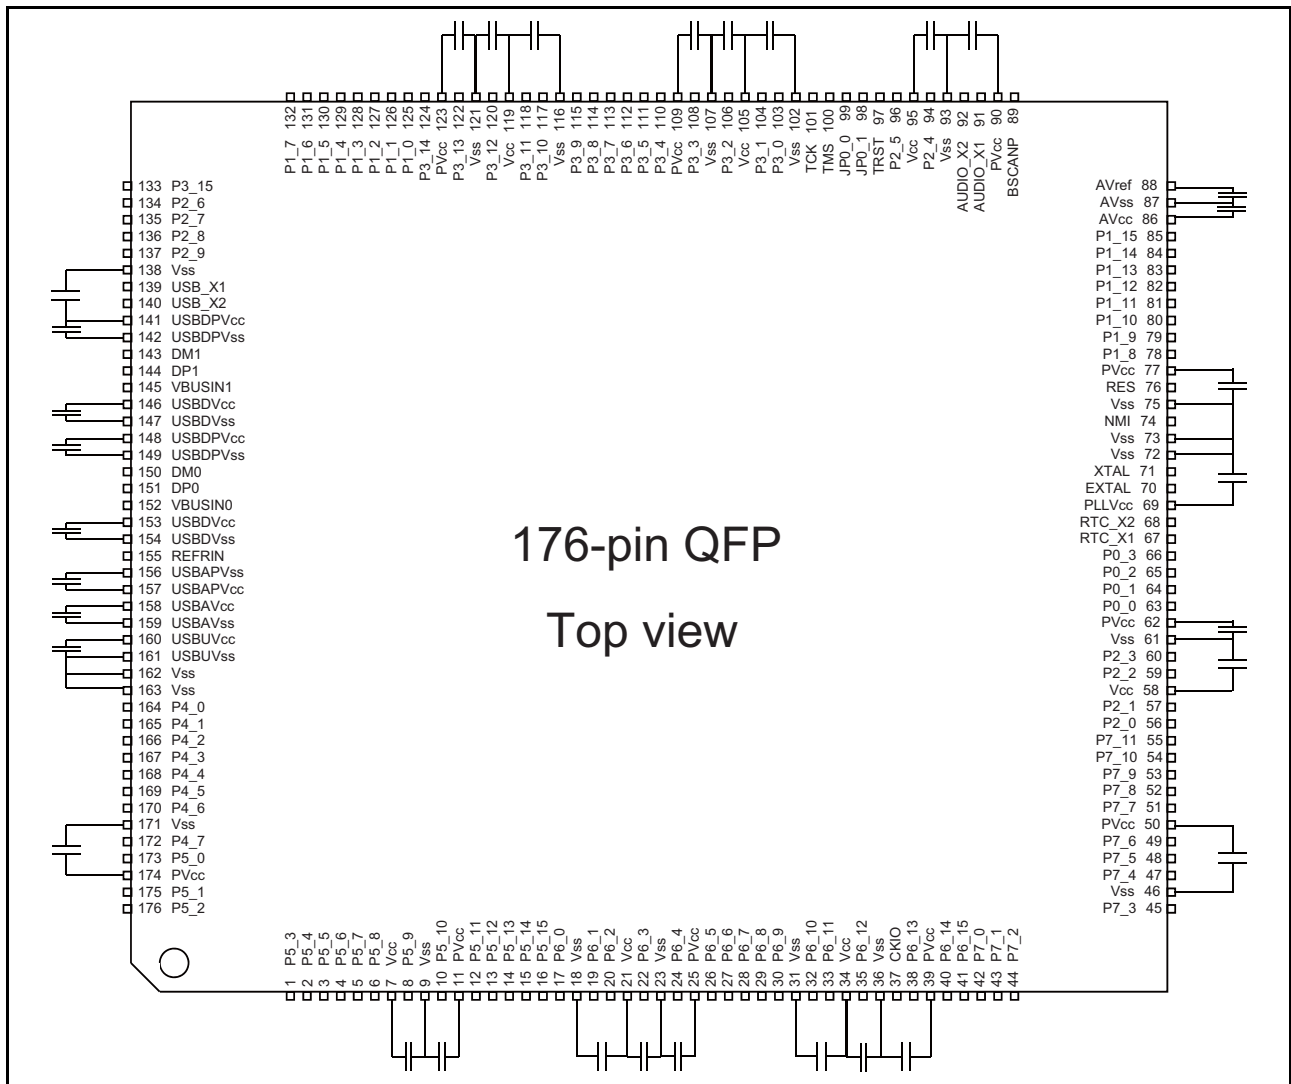

Figure 46.2 Example of Externally Allocated Capacitors in the Products in 176-Pin QFP Packages
