7. Absolute Maximum Ratings

Parameter	Symbol	Min	Max	Unit	Notes
Supply Voltage for Logic	Vdd	3.3	5	V	1, 2
Supply Voltage for Display	Vcc	0	15	V	1, 2
Operating Temperature	Top	-40	85	°C	-
Storage Temperature	Tst	-45	90	°C	-

Note 1: All the above voltages are on the basis of “VSS = 0V”.

Note 2: When this module is used beyond the above absolute maximum ratings, permanent breakage of the module may occur. Also, for normal operations, it is desirable to use this module under the conditions according to Section 3. “Optics & Electrical Characteristics”. If this module is used beyond these conditions, malfunctioning of the module can occur and the reliability of the module may deteriorate.

8. ELECTRICAL CHARACTERISTICS

Viewing Angle – Bottom	AV		—	80	—	
Viewing Angle – Left	AH		—	80	—	
Viewing Angle – Right	AH		—	80	—	

Contrast Ratio	Cr		2000:1	—	—	—
Response Time (rise)	Tr	—	—	10	—	us
Response Time (fall)	Tf	—	—	10	—	us
Brightness		50% checkerboard	100	120	—	cd/m2
Lifetime		Ta=25°C, 50% checkerboard	10,000	—	—	Hrs

Note: Lifetime at typical temperature is based on accelerated high - temperature operation. Lifetime is tested at average 50% pixels on and is rated as Hours until Half - Brightness. The Display OFF command can be used to extend the lifetime of the display.

Luminance of active pixels will degrade faster than inactive pixels. Residual (burn - in) images may occur. To avoid this, every pixel should be illuminated uniformly.

12. GDDRAM

12.1 GDDRAM structure in Gray Scale mode

The GDDRAM address map in Table 8-6 shows the GDDRAM in Gray Scale mode. Since in Gray

Scale mode, there are 16 gray levels. Therefore four bits (one nibble) are allocated for each pixel. For example D30480[3:0] in Table 8-6 corresponds to the pixel located in (COM127, SEG2). So the lower nibble and higher nibble of D0, D1, D2, ..., D30717, D30718, D30719 in Table 8-6 represent the 480x128 data nibbles in the GDDRAM.

14 . DESIGN AND HANDING PRECAUTION

14.1 The LCD panel is made by glass. Any mechanical shock (eg. Dropping form high place) will damage the LCD module. Do not add excessive force on the surface of the

display, which may cause the Display color change abnormally.

14.2 The polarizer on the LCD is easily get scratched. If possible, do not remove the LCD protective film until the last step of installation.

14.3 Never attempt to disassemble or rework the LCD module.

14.4 Only Clean the LCD with Isopropyl Alcohol or Ethyl Alcohol. Other solvents (eg. water) may damage the LCD.

14.5 When mounting the LCD module, make sure that it is free from twisting, warping and distortion.

14.6 Ensure to provide enough space(with cushion) between case and LCD panel to prevent external force adding on it, or it may cause damage to the LCD or degrade the display result

14.7 Only hold the LCD module by its side. Never hold LCD module by add force on the heat seal or TAB.

14.8 Never add force to component of the LCD module. It may cause invisible damage or degrade of the reliability.

14.9 LCD module could be easily damaged by static electricity. Be careful to maintain an optimum anti-static work environment to protect the LCD module.

14.10 When peeling of the protective film from LCD, static charge may cause abnormal display pattern. It is normal and will resume to normal in a short while.

14.11 Take care and prevent get hurt by the LCD panel edge.

14.12 Never operate the LCD module exceed the absolute maximum ratings.

14.13 Keep the signal line as short as possible to prevent noisy signal applying to LCD module.

14.14 Never apply signal to the LCD module without power supply.

14.15 IC chip (eg. TAB or COG) is sensitive to the light. Strong lighting environment could possibly cause malfunction. Light sealing structure casing is recommend.

14.16 LCD module reliability may be reduced by temperature shock.

14.17 When storing the LCD module, avoid exposure to the direct sunlight, high humidity, high temperature or low temperature. They may damage or degrade the LCD module
