

Self Protected Very Low Iq High Side Driver with Analog Current Sense

NCV84140

The NCV84140 is a fully protected single channel high side driver that can be used to switch a wide variety of loads, such as bulbs, solenoids, and other actuators. The device incorporates advanced protection features such as active inrush current management, over-temperature shutdown with automatic restart and an overvoltage active clamp. A dedicated Current Sense pin provides precision analog current monitoring of the output as well as fault indication of short to V_D , short circuit to ground and OFF state open load detection. An active high Current Sense Enable pin allows all diagnostic and current sense features to be enabled.

Features

- Short Circuit Protection with Inrush Current Management
- CMOS (3 V / 5 V) Compatible Control Input
- Very Low Standby Current
- Very Low Current Sense Leakage
- Proportional Load Current Sense
- Current Sense Enable
- Off State Open Load Detection
- Output Short to V_D Detection
- Overload and Short to Ground Indication
- Thermal Shutdown with Automatic Restart
- Undervoltage Shutdown
- Integrated Clamp for Inductive Switching
- Loss of Ground and Loss of V_D Protection
- ESD Protection
- Reverse Battery Protection with External Components
- AEC-Q100 Qualified
- This is a Pb-Free Device

Typical Applications

- Switch a Variety of Resistive, Inductive and Capacitive Loads
- Can Replace Electromechanical Relays and Discrete Circuits
- Automotive / Industrial

FEATURE SUMMARY

R_{DSon} (typical) $T_J = 25^\circ\text{C}$	R_{ON}	140	$\text{m}\Omega$
Output Current Limit (typical)	I_{lim}	12	A
OFF-state Supply Current (max)	$I_{D(off)}$	0.5	μA

Table 3. MAXIMUM RATINGS

Rating	Symbol	Value		Unit
DC Supply Voltage	V_D	-0.3	38	V
Max Transient Supply Voltage (Note 1) Load Dump – Suppresses	U_S^*	-	45	V
Input Voltage	V_{IN}	-10	10	V
Input Current	I_{IN}	-5	5	mA
Reverse Ground Pin Current	I_{GND}	-	-200	mA
Output Current (Note 2)	I_{OUT}	-6	Internally Limited	A
Reverse CS Current	I_{CS}	-	-200	mA
CS Voltage	V_{CS}	$V_D - 41$	V_D	V
CS_EN Voltage	V_{CS_EN}	-10	10	V
CS_EN Current	I_{CS_EN}	-5	5	mA
Power Dissipation $T_c = 25^\circ\text{C}$ (Note 5)	P_{tot}	1.17		W
Electrostatic Discharge (Note 3) (HBM Model 100 pF / 1500 Ω)	V_{ESD}			DC
Input		4	-	kV
Current Sense		4	-	kV
Current Sense Enable		4	-	kV
Output		4	-	kV
V_D		4	-	kV
Charged Device Model CDM-AEC-Q100-011		750	-	V
Single Pulse Inductive Load Switching Energy ($L = 5\text{ mH}$, $I_L = 3.84\text{ A}$, $T_{Jstart} = 150^\circ\text{C}$, V_D tied to GND during inductive discharge)	E_{AS}	-	36.8	mJ
Operating Junction Temperature	T_J	-40	+150	$^\circ\text{C}$
Storage Temperature	$T_{storage}$	-55	+150	$^\circ\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Load Dump Test B (with centralized load dump suppression) according to ISO16750-2 standard. Guaranteed by design. Not tested in production. Passed Class C (or A, B) according to ISO16750-1.
2. Reverse Output current has to be limited by the load to stay within absolute maximum ratings and thermal performance.
3. This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per AEC-Q100-002 (JS-001-2017)
 Field Induced Charge Device Model ESD characterization is not performed on plastic molded packages with body sizes smaller than $2 \times 2\text{ mm}$ due to the inability of a small package body to acquire and retain enough charge to meet the minimum CDM discharge current waveform characteristic defined in JEDEC JS-002-2018

Table 4. THERMAL RESISTANCE RATINGS

Parameter	Symbol	Max. Value	Units
Thermal Resistance			$^\circ\text{C}/\text{W}$
Junction-to-Lead (Note 4)	$R_{\theta JL}$	29	
Junction-to-Ambient (Note 4)	$R_{\theta JA}$	65	
Junction-to-Ambient (Note 5)	$R_{\theta JA}$	106	

4. 645 mm^2 pad size, mounted on four-layer 1s2p PCB – FR4, 2 oz. Cu thickness for top layer and 1 oz. Cu thickness for inner layers (planes not electrically connected)
5. 2 cm^2 pad size, mounted on single-layer 1s0p PCB – FR4, 2 oz. Cu thickness

Functional Status					
Class	Functional Status				
A	All functions of a device perform as designed during and after exposure to disturbance.				
B	All functions of a device perform as designed during exposure. However, one or more of them can go beyond specified tolerance. All functions return automatically to within normal limits after exposure is removed. Memory functions shall remain class A.				
C	One or more functions of a device do not perform as designed during exposure but return automatically to normal operation after exposure is removed.				
D	One or more functions of a device do not perform as designed during exposure and do not return to normal operation until exposure is removed and the device is reset by simple "operator/use" action.				
E	One or more functions of a device do not perform as designed during and after exposure and cannot be returned to proper operation without replacing the device.				

APPLICATION INFORMATION

Figure 33. Application Schematic

Loss of Ground Protection

When device or ECU ground connection is lost and load is still connected to ground, the device will turn the output OFF. In loss of ground state, the output stage is held OFF independent of the state of the input. Input resistors are recommended between the device and microcontroller.

Reverse Battery Protection

Solution 1: Resistor in the GND line only (no parallel Diode)

The following calculations are true for any type of load.

In the case for no diode in parallel with R_{GND} , the calculations below explain how to size the resistor.

Consider the following parameters:

$-I_{GND}$ Maximum = 200 mA for up to $-V_D = 32$ V.

Where $-I_{GND}$ is the DC reverse current through the GND pin and $-V_D$ is the DC reverse battery voltage.

$$-I_{GND} = \frac{-V_D}{R_{GND}} \quad (\text{eq. 1})$$

Since this resistor can be used amongst multiple High-Side devices, please take note the sum of the maximum active GND currents ($I_{GND(On)max}$) for each device when sizing the resistor. Please note that if the microprocessor GND is not shared by the device GND, then R_{GND} produces a shift of ($I_{GND(On)max} \times R_{GND}$) in the input thresholds and CS output values. If the calculated power dissipation leads to too large of a resistor size or several devices have to share the same resistor, please look at the second solution for Reverse Battery Protection. Refer to Figure 35 for selecting the proper R_{GND} .

Figure 34. Reverse Battery R_{GND} Considerations

Solution 2: Diode (D_{GND}) in parallel with R_{GND} in the ground line.

A resistor value of $R_{GND} = 1$ kOhm should be selected and placed in parallel to D_{GND} if the device drives an inductive load. The diode (D_{GND}) provides a ~600–700 mV shift in

the input threshold and current sense values if the micro controller ground is not common to the device ground. This shift will not vary even in the case of multiple high-side devices using the same resistor/diode network.

Undervoltage Protection

The device has two under-voltage threshold levels, V_{D_MIN} and V_{UV} . Switching function (ON/OFF) requires supply voltage to be at least V_{D_MIN} . The device features a lower supply threshold V_{UV} , above which the output can

remain in ON state. While all protection functions are guaranteed when the switch is ON, diagnostic functions are operational only within nominal supply voltage range V_D .

Figure 35. Undervoltage Behavior

Overvoltage Protection

The NCV84140 has two Zener diodes Z_{VD} and Z_{CS} , which provide integrated overvoltage protection. Z_{VD} protects the logic block by clamping the voltage between supply pin V_D and ground pin GND to V_{ZVD} . Z_{CS} limits voltage at current sense pin CS to $V_D - V_{ZCS}$. The output power MOSFET's output clamping diodes provide protection by clamping the voltage across the MOSFET (between V_D pin and OUT pin) to V_{CLAMP} . During overvoltage protection, current flowing through Z_{VD} , Z_{CS} and the output clamp must be limited. Load impedance Z_L limits the current in the body diode Z_{Body} . In order to limit the current in Z_{VD} a resistor, R_{GND} (150 Ω), is required in the GND path. External resistors R_{CS} and R_{SENSE} limit the current flowing through Z_{CS} and out of the CS pin into the micro-controller I/O pin. With R_{GND} , the GND pin voltage is elevated to $V_D - V_{ZVD}$ when the supply voltage V_D rises above V_{ZVD} . ESD diodes Z_{ESD} pull up the voltage at logic pins IN, CS_EN close to the GND pin voltage $V_D - V_{ZVD}$. External resistors R_{IN} , and R_{CS_EN} are required to limit the current flowing out of the logic pins into the micro-controller I/O pins. During overvoltage exposure, the device transitions into a self-protection state, with

automatic recovery after the supply voltage comes back to the normal operating range. The specified parameters as well as short circuit robustness and energy capability cannot be guaranteed during overvoltage exposure.

Overload Protection

Current limitation as well as overtemperature shutdown mechanisms are integrated into NCV84140 to provide protection from overload conditions such as bulb inrush or short to ground.

Current Limitation

In case of overload, NCV84140 limits the current in the output power MOSFET to a safe value. Due to high power dissipation during current limitation, the device's junction temperature increases rapidly. In order to protect the device, the output driver is shut down by one of the two overtemperature protection mechanisms. The output current limit is dependent on the device temperature, and will fold back once the die reaches thermal shutdown. If the input remains active during the shutdown, the output power MOSFET will automatically be re-activated after a minimum OFF time or when the junction temperature returns to a safe level.

Output Clamping with Inductive Load Switch Off

The output voltage V_{OUT} drops below GND potential when switching off inductive loads. This is because the inductance develops a negative voltage across the load in response to a decaying current. The integrated clamp of the device clamps the negative output voltage to a certain level

relative to the supply voltage V_{BAT} . During output clamping with inductive load switch off, the energy stored in the inductance is rapidly dissipated in the device resulting in high power dissipation. This is a stressful condition for the device and the maximum energy allowed for a given load inductance should not be exceeded in any application.

Figure 36. Inductive Load Switching

Figure 37. Maximum Switch-Off Current vs. Load Inductance, $V_D = 13.5\text{ V}$, $R_L = 0\ \Omega$

Open Load Detection in OFF State

Open load diagnosis in OFF state can be performed by activating an external resistive pull-up path (R_{PU}) to V_{BAT} . To calculate the pull-up resistance, external leakage

currents (designed pull-down resistance, humidity-induced leakage etc) as well as the open load threshold voltage V_{OL} have to be taken into account.

Figure 38. Open Load Detection in Off State

Current Sense in PWM Mode

When operating in PWM mode, the current sense functionality can be used, but the timing of the input signal and the response time of the current sense need to be considered. When operating in PWM mode, the following performance is to be expected. The CS_EN pin should be held high to eliminate any unnecessary delay time to the circuit. When V_{IN} switches from low to high, there will be a typical delay (t_{CS_High2}) before the current sense responds. Once this timing delay has passed, the rise time of the current

sense output (Δt_{CS_High2}) also needs to be considered. When V_{IN} switches from high to low a delay time (t_{CS_Low1}) needs to be considered. As long as these timing delays are allowed, the current sense pin can be operated in PWM mode.

EMC Performance

If better EMC performance is needed, connect a $C_1 = 100$ nF, $C_2 = C_3 = 10$ nF ceramic capacitors to the pins as close to the device as possible according to Figure 39.

PACKAGE DIMENSIONS

SOIC-8 NB CASE 751-07 ISSUE AK

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. 751-01 THRU 751-06 ARE OBSOLETE. NEW STANDARD IS 751-07.

DIM	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
A	4.80	5.00	0.189	0.197
