

DESCRIPTION

The MP9989 is a fast turn-off, intelligent rectifier for flyback converters that integrates a 100V MOSFET. It can replace a diode rectifier for higher efficiency and power density. The chip regulates the forward voltage drop of the internal power switch to 40mV⁽¹⁾ and turns off before the drain-source voltage reverses.

The MP9989 can generate its own supply voltage without the need for auxiliary winding, which makes it suitable for charger applications with a low output voltage requirement or any other adaptor applications with high-side set-up. The internal ringing detection circuitry prevents the MP9989 from falsely turning on during discontinuous conduction mode (DCM) or quasi-resonant operations.

The MP9989 is available in SOIC-8 and QFN4x5-8 packages.

FEATURES

- Integrated 100V/10mΩ MOSFET
- Wide Output Range down to 0V
- No Need for Auxiliary Winding for High-Side or Low-Side Rectification
- Ringing Detection Prevents False Turn-On during DCM Operations
- Compatible with Energy Star
- 110µA Quiescent Current
- Supports DCM, CCM, and Quasi-Resonant Operations
- Available in SOIC-8 and QFN4x5-8 Packages

APPLICATIONS

- Laptop Adapters
- QC and USB PD Charger
- High-Efficiency Flyback Converters

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS", the MPS logo, and "Simple, Easy Solutions" are registered trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

PACKAGE REFERENCE

PIN FUNCTIONS

Pin # SOIC-8	Pin # QFN4x5-8	Name	Description
1	1	VDD	Linear regulator output. VDD is the supply of the MP9989.
2	2	SENSE	MOSFET drain voltage sensing. SENSE is also used as the linear regulator input.
3, 4	3, 4	VS	MOSFET source. VS is also used as a reference for VDD.
5, 6, 7, 8	5, 6, 7, 8	VD	MOSFET drain.

ABSOLUTE MAXIMUM RATINGS ⁽²⁾

VDD to VS	-0.3V to +14V
VD to VS	-0.7V to +100V
SENSE to VS	-0.7V to +180V
Continuous drain current (T _C = 25°C)	
SOIC-8	14.9A
QFN4x5-8	28.1A
Continuous drain current (T _C = 100°C)	
SOIC-8	9.42A
QFN4x5-8	17.8A
Pulsed drain current ⁽³⁾	
SOIC-8	50A
QFN4x5-8	94A
Maximum power dissipation ⁽⁴⁾	
SOIC-8	1.7W
QFN4x5-8	3.1W
Junction temperature	150°C
Lead temperature (solder)	260°C
Storage temperature	-55°C to +150°C

Recommended Operation Conditions ⁽⁵⁾

VDD to VS	4.5V to 13V
Operating junction temp (T _J)	-40°C to +125°C

Thermal Resistance ⁽⁶⁾ θ_{JA} θ_{JC}

SOIC-8	70	32	°C/W
QFN4x5-8	40	9	°C/W

Notes:

- 2) Exceeding these ratings may damage the device.
- 3) Repetitive rating: Pulse width = 100μs, duty cycle limited by maximum junction temperature.
- 4) T_A = +25°C. The maximum allowable power dissipation is a function of the maximum junction temperature T_J (MAX), the junction-to-ambient thermal resistance θ_{JA}, and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = (T_J (MAX) - T_A) / θ_{JA}. Exceeding the maximum allowable power dissipation produces an excessive die temperature, causing the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 5) The device is not guaranteed to function outside of its operating conditions.
- 6) Measured on JESD51-7, 4-layer PCB.

ELECTRICAL CHARACTERISTICS

VDD = 6.7V, T_J = -40 to about +125°C, unless otherwise noted.

Parameter	Symbol	Conditions	Min	Typ	Max	Units

FUNCTIONAL BLOCK DIAGRAM

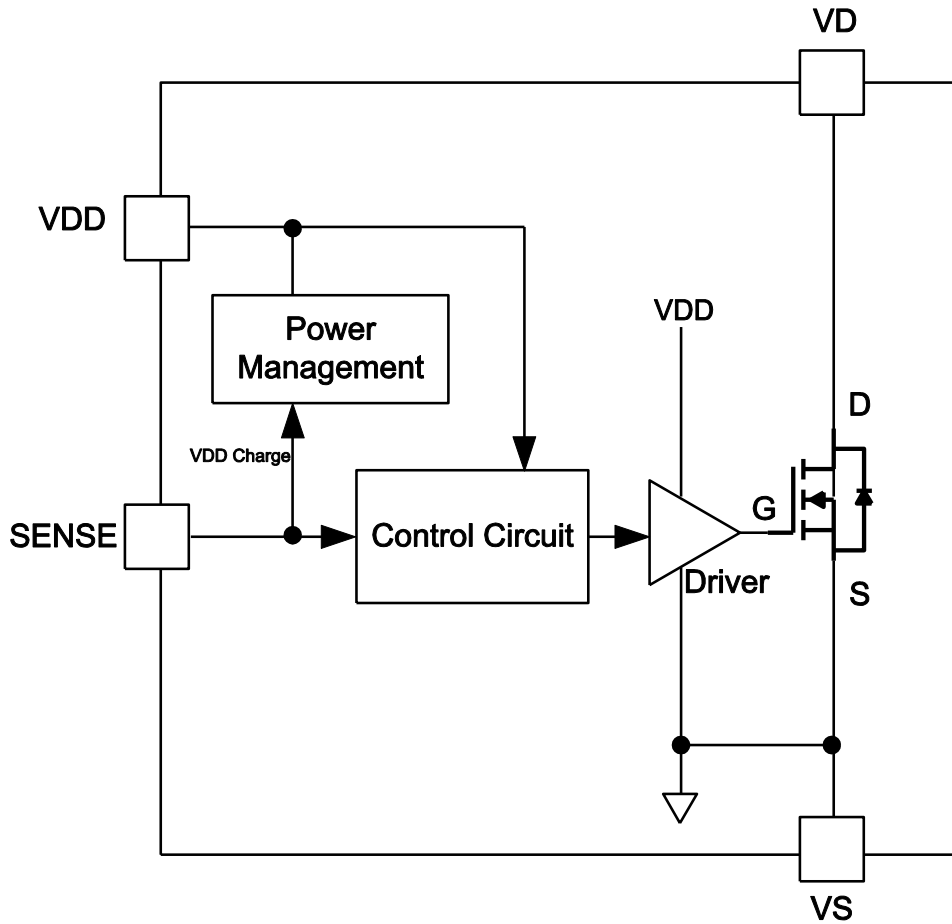

Figure 1: Functional Block Diagram

OPERATION

The MP9989 supports operation in discontinuous conduction mode (DCM), continuous conduction mode (CCM), and quasi-resonant flyback converters. The control circuitry controls the gate in forward mode and turns the gate off when the synchronous rectification (SR) MOSFET current drops to zero.

VDD Generation

SENSE is the input for the linear regulator, the output of which is VDD. VDD supplies the MP9989, and is regulated at 6.7V.

When SENSE is under 4.7V, a 40mA current source from SENSE charges up VDD. When SENSE is above 4.7V, the linear regulator's maximum charging current is limited at I_{VDD} to charge the external capacitor at VDD.

Start-Up and Under-Voltage Lockout (UVLO)

When VDD rises above 4.2V, the MP9989 exits under-voltage lockout (UVLO) and is enabled. Once VDD drops below 4.0V, the MP9989 enters sleep mode and V_{GS} is kept low.

Turn-On Phase

When V_{DS} drops to $\sim 2V$, a turn-on timer begins. If V_{DS} reaches the $-80mV$ turn-on threshold from 2V within the slew rate detection time ($\sim 30ns$), the MOSFET is turned on after a turn-on delay t_{Don} ($\sim 20ns$) (see Figure 2). If V_{DS} crosses $-80mV$ after the timer ends, the gate voltage remains off. This turn-on timer prevents the MP9989 from falsely turning on due to ringing from DCM and quasi-resonant operations.

Turn-On Blanking

The control circuitry contains a blanking function. When the MOSFET turns on, the control circuit ensures that the on state lasts for a specific period of time. The turn-on blanking time is t_{B-ON} ($\sim 1.2\mu s$) to prevent an accidental turn off due to ringing. However, if V_{DS} reaches 1.8V within the turn-on blanking time, V_{GS} is pulled low immediately.

Conduction Phase

When V_{DS} rises above the forward voltage drop, V_{fwd} ($-40mV$), according to the decrease of the switching current, the MP9989 lowers the gate

voltage level to enlarge the on resistance of the synchronous MOSFET.

Figure 2: Turn-On/Turn-Off Timing Diagram

With this control scheme, V_{DS} is adjusted to be around V_{fwd} even when the current through the MOSFET is fairly low. This function keeps the driver voltage at a very low level when the synchronous MOSFET is turned off, which boosts the turn-off speed and is especially important to CCM operation.

Turn-Off Phase

When V_{DS} rises to trigger the turn-off threshold ($-3mV$), the gate voltage is pulled to zero after a short turn-off delay of t_{Doff} (about 25ns) (see Figure 2).

Turn-Off Blanking

After the gate driver (V_{GS}) is pulled to zero by V_{DS} reaching the turn-off threshold ($-3mV$), a turn-off blanking time is applied, during which the gate driver signal is latched off. The turn-off blanking is removed when V_{DS} rises above V_{B-OFF} (2V) (see Figure 2).

APPLICATION INFORMATION

Slew Rate Detection Function

In DCM operations, the demagnetizing ringing may bring V_{DS} below 0V. If V_{DS} reaches the turn-on threshold during the ringing, SR controllers without the slew rate detection function may turn on the MOSFET by mistake. This not only increases power loss, but may also lead to shoot-through if the primary side MOSFET is turned on within the minimum on time.

Considering the slew rate of the ringing is always much less than when the primary MOSFET is completely turned off, this false turn-on situation can be prevented by the slew rate detection function. When the slew rate is less than the threshold, the IC does not turn on the gate even when V_{DS} reaches the turn-on threshold. For more details, see the Turn-On Phase section on page 8.

External Resistor on SENSE

Over-voltage conditions may lead to damage to the device, so there must be appropriate application design to guarantee safe operation, especially on the high voltage pin.

One common over-voltage condition is when the body diode of the SR MOSFET is turned on, as the forward voltage drop may exceed the negative rating on the SENSE pin. In this case, it is recommended to place an external resistor between SENSE and the MOSFET drain. In general, the resistance is recommended to be about 100Ω to 300Ω.

On the other hand, this resistor also cannot be too large, because it may compromise the VDD supply and slow down the slew rate on the V_{DS} detection. In general, it is not recommended to use a resistor greater than 300Ω, but for each use case, it should be checked based on the condition of VDD supply and the slew rate.

Typical System Implementations

Figure 3 and Figure 4 show the typical system IC implementation in low-side rectification and high-side rectification, respectively.

Figure 3: Low-Side Rectification

Figure 4: High-Side Rectification

Maximum Output Current

The allowed temperature rise of the MP9989 limits the maximum output current the device can handle. The temperature rise is determined by its own power loss. Generally, for a universal input adapter the recommended rated output current for MP9989 is 4A. For certain designs, the power loss of the MP9989 can be calculated, so the maximum output current can be deduced.

The power loss of the MP9989 can be separated into several parts: controller consumption, integrated MOSFET conduction loss, and so on. If the MP9989 works in continuous conduction mode (CCM), reverse-recovery loss of the integrated MOSFET must also be considered. Each part of the loss can be calculated based on Equation (1), Equation (2), and Equation (3):

$$P_{\text{Loss_Controller}} = V_{\text{SENSE_P}} \times I_{\text{DD}} \quad (1)$$

$$P_{\text{Loss_SR_Conduction}} = \frac{1}{t_{\text{s_on}}} \times \int_0^{t_{\text{s_on}}} V_{\text{SR_SD}}(t) \times I_{\text{SR_SD}}(t) dt \quad (2)$$

$$P_{\text{Loss_SR_rr}} = \frac{1}{2} \times V_{\text{DS}} \times I_{\text{rr}} \times t_{\text{rr}} \times f_{\text{s}} \quad (3)$$

Where I_{DD} is the current of the MP9989, and $V_{\text{SENSE_P}}$ is the corresponding plateau voltage in the SENSE pin when SR turns off. $t_{\text{s_on}}$ is the SR on period, $V_{\text{SR_SD}}$ is the voltage drop from the SR, and $I_{\text{SR_SD}}$ is the current flowing from the SR. I_{rr} is the peak reverse current and the t_{rr} is reverse recovery time.

The total loss of the MP9989 (P_{Loss}) is the sum of the above losses. If a RC snubber is used, the power loss caused by this snubber must also be taken into consideration.

The junction and case temperature rises can be calculated with the thermal resistance of the junction-to-ambient (θ_{JA}) and junction-to-case (θ_{JC}). The junction temperature must be within ABS (typically 150°C). Calculate ΔT_{JA} and ΔT_{JC} with Equation (4) and Equation (5):

$$\Delta T_{JA} = P_{Loss} \times \theta_{JA} \quad (4)$$

$$\Delta T_{JC} = P_{Loss} \times \theta_{JC} \quad (5)$$

The thermal resistance can be reduced in one of several ways to lower the temperature: a thicker copper layer attached to VD and VS, additional vias for thermal dissipation, or heatsinks. The real maximum output current can be set combining the real tested data.
