Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.

- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.

- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

- Microchip is willing to work with the customer who is concerned about the integrity of their code.

- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

Preface

INTRODUCTION

This chapter contains general information that will be useful to know before using the Low Pin Count USB Development Kit. Items discussed in this chapter include:

• Document Layout
• Conventions Used in this Guide
• Recommended Reading
• The Microchip Web Site
• Customer Support
• Document Revision History

DOCUMENT LAYOUT

This document describes how to use the Low Pin Count USB Development Kit as a development tool to emulate and debug firmware on a target board. The manual layout is as follows:

• Chapter 1. “Overview”
• Chapter 2. “Getting Started Project Labs”
• Appendix A. “Schematics”
CONVENTIONS USED IN THIS GUIDE

This manual uses the following documentation conventions:

RECOMMENDED READING

This user’s guide describes how to use the Low Pin Count USB Development Kit. Other useful documents are listed below. The following Microchip documents are available and recommended as supplemental reference resources.

Readme Files
For the latest information on using other tools, read the tool-specific Readme files in the Readmes subdirectory of the MPLAB® IDE installation directory. The Readme files contain update information and known issues that may not be included in this user’s guide.

Design Center
Microchip has a USB design center which can be found on www.microchip.com/usb.

The following Microchip Application Notes are available and recommended as supplemental reference resources.

THE MICROCHIP WEB SITE

Microchip provides online support via our web site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user’s guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives
CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

• Distributor or Representative
• Local Sales Office
• Field Application Engineer (FAE)
• Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com

DOCUMENT REVISION HISTORY

Revision A (September 2008)

• Initial Release of this Document.
Chapter 1. Overview

INTRODUCTION

The Low Pin Count USB Development Kit provides an easy, low cost way to evaluate the functionality of Microchip’s PIC18F14K50 and PIC18F13K50 20-pin USB microcontrollers. The all-inclusive kit contains the hardware, software, and code examples necessary to bring your next USB design from concept to first prototype. Created with the USB novice in mind, the kit includes “Getting Started with Microchip’s Low Pin Count USB Solutions”, a self-directed course and lab material designed to ease the learning curve associated with adding USB connectivity to embedded systems.

HIGHLIGHTS

This chapter discusses:
• Low Pin Count USB Development kit contents
• Low Pin Count USB Development Board construction and layout

LOW PIN COUNT USB DEVELOPMENT KIT CONTENTS

The Low Pin Count USB Development Kit contains the following:
• (1) fully populated Low Pin Count USB Development Board
• (1) unpopulated spare development board
• (1) PIC18F14K50 ICD populated expansion header
• (1) CD containing the user guide, course materials and product documentation.
• (1) PICkit™ 2 Debugger/Programmer with cable.

FIGURE 1-1: LOW PIN COUNT USB DEVELOPMENT KIT

Low Pin Count USB Development Kit with PICkit™ 2 Debugger/Programmer (Part #DV164126)
LOW PIN COUNT USB DEVELOPMENT BOARD CONSTRUCTION AND LAYOUT

The Low Pin Count USB Development Board and populated components are shown in Figure 1-2.

FIGURE 1-2: LOW PIN COUNT USB DEVELOPMENT BOARD

1. USB mini-B connector
2. J9 regulated 5V connection header
3. J14 connects either VBUS (Provided by USB) or J9 regulated 5V to PIC18F14K50 Vdd supply
4. PICkit™ 2 Debugger/Programmer connection header
5. LEDs connected to PORTC (RC0, RC1, RC2, RC3)
6. PICkit™ Serial Analyzer connection header
7. MAX3232 RS-232 line driver/receiver
8. RS-232 connector
9. Area provided for user PID/VID information
10. Potentiometer
11. J12 connects/disconnects VUSB on PIC18F14K50
12. Pushbutton
13. 12 MHz crystal
14. PIC18F14K50 MCU
15. Prototyping area
16. PICtail™ daughter board expansion header
17. SSOP Expansion

Note: J2-J5, J7, J8 are shunted on the bottom side of the board and thus the functions default connected even though no jumper is installed. Cut the jumper to disable the circuitry attached to each pin.
PIC18F14K50 ICD DEBUG HEADER

The Low Pin Count USB Development Kit includes a debug header populated with a PIC18F14K50 ICD MCU to enable for use with the PICkit™ 2 debugger/programmer.

FIGURE 1-3: PIC18F14K50 POPULATED MPLAB ICD 2 DEBUG HEADER

To use the debug header, simply remove the PIC18F14K50 mounted in the MCU socket (U2) on the Low Pin Count USB Development Board. Using the included pin header, connect the debug header into the MCU socket and connect the PICkit™ 2 programmer/pebugger to the provided connection header.

“GETTING STARTED WITH MICROCHIP’S LOW PIN COUNT USB SOLUTIONS” SELF-DIRECTED COURSE

The Low Pin Count USB Development Kit includes the self-directed course “Getting Started with Microchip’s Low Pin Count USB Solutions”. This course provides an introductory overview to the USB 2.0 protocol and implementation on the PIC18F14K50 MCU. Microchip’s USB Device Firmware Framework is introduced as a resource providing a library of firmware code for USB operation that handles “low-level” tasks and a number of reference projects. The user is guided through a number of “hands-on” labs to reinforce covered concepts.
INTRODUCTION

This section of the user’s guide will walk the user through a number of project labs that will ease the development of original USB design applications. Labs are formatted so that the user is guided through each project’s source code to uncomment or copy and paste sections of code. This format was chosen to force the developer to explore significant sections of the Framework and familiarize themselves with the overall structure of the source files presented.

Lab files can be located in the folder \C:\LPCUSB\Labs\Labx\files. Each lab folder will contain both the source files for the labs and a folder containing the solutions with working code.

Four labs are presented:

1. Project Lab 1 (Enumeration): This lab introduces the user to developing unique descriptors in their own applications that will be used by the Host (PC) to enumerate and ultimately configure the PIC18F14K50.

2. Project Lab 2 (HID Mouse): This lab expands on concepts learned in Project Lab 1 using the descriptors defined. The user will walk through the development of application specific functions within the mouse.c firmware file. The end application will behave like a Human Interface Device Class (HID) mouse by moving the pointer on the PC screen.

3. Project Lab 3 (HID Keyboard): In this lab the user is required to alter the descriptors to implement a HID keyboard-based application. The potentiometer on the Low Pin Count USB Development Board is rotated to change the HID specification unicode value transmitted through the USB to the PC that will print characters based on an ADC conversion.

4. Project Lab 4 (CDC Serial Emulator): Finally, the user will implement a communication protocol converter using the Communication Device Class (CDC) driver.

PREREQUISITES

These labs assume that the user:

1. Has completed the self-directed course “Getting Started with Microchip’s Low Pin Count USB Solutions” provided on the accompanying CD.

2. Is familiar with the MPLAB IDE and C18 compiler.

3. Has some programming experience using the C language.

4. Is familiar with Microchip’s PIC18F family of microcontrollers.

RESOURCES REQUIRED TO COMPLETE PROJECT LABS

In order to complete the Project Labs, the user should have:

1. The most current version of the MPLAB IDE and C18 compiler installed on their PC.

2. The most current version of the PICkit 2 programmer software.

5. A copy of the PIC18F13K50/14K50 data sheet (DS41350)

6. A copy of the USB Revision 2.0 Specification available for download from: http://www.usb.org/developers/docs/
   This will prove useful as reference throughout the labs.

8. Downloaded the USB HID Descriptor Tool available free at: http://www.usb.org/developers/hidpage/dt2_4.zip

9. A copy of the Universal Serial Bus Class Definitions for Communications Devices document available for download at: http://www.usb.org/developers/devclass_docs

10. Unzipped the LPCUSBDK_Labs.zip file to the C: directory.

PROJECT LAB 1 (ENUMERATION)

**Note:** In this and all subsequent project labs, the USB cable must be disconnected from the USB mini-B connector on the Low Pin Count USB Development Board when programming with the PICkit 2 programmer.

**Purpose**

The purpose of this lab is intended to introduce the user to creating a project in the MPLAB IDE using Microchip’s Full-Speed USB Firmware Framework. Though many application examples in the Framework can be used to create original code, building the Framework from scratch is a great way to get familiar to the overall functionality of this multi-tasking tool.

The user will create a project, ensure that the IDE is configured accordingly, and alter the `usb_descriptor.c` file to enable the enumeration of the PIC18F14K50 as a HID mouse device.

**Procedure**

**BUILDING THE FRAMEWORK**

1. Open the MPLAB IDE by selecting Start>Programs>Microchip>MPLAB IDE
2. Once in the MPLAB IDE, start the Project Wizard by selecting Project>Project Wizard
3. Select the PIC18F14K50 as the device, select the MPLAB C18 C Compiler as the language toolsuite, and create a new project folder in the following directory: C:\Microchip Solutions\Project Lab 1\Project Lab 1
4. In the Add Existing Files to Your Project window, navigate to
   C:\LPCUSBDK\Labs\Lab1_files and copy the following files:
   a) enumeration.c
   b) usb_descriptors.c
   c) HardwareProfile.h
   d) usb_config.h

   **Note:** These files are the user files that will need to be changed to implement any
   application.

   This next section will add the files that will build the Framework that takes care of the
   low level USB functions. This does not need to be done for every application. The
   included example projects could be easily converted to suit the needs of a custom
   application. However, in the interest of providing an intuitive introduction to the Frame-
   work, this lab builds this application from scratch.

   **Note:** These files are used by all the applications in the Framework. Therefore,
   changing these files will affect all applications. If any of these files are
   inadvertently altered, it is recommended that the Framework be reinstalled.

5. Next, navigate to
   C:\Microchip Solutions\Microchip\Include and copy over the
   following files:
   a) Compiler.h
   b) GenericTypeDefs.h

6. While in the Add Existing Files to Your Project window, navigate to
   C:\Microchip Solutions\Microchip\Include\Usb and copy the
   following files:
   a) usb.h
   b) usb_ch9.h
   c) usb_common.h
   d) usb_device.h
   e) usb_function_hid.h (file defines components specific to the HID class)
   f) usb_hal.h
   g) usb_hal_pic18.h (file defines components specific to the PIC18
      architecture)

7. Next, navigate to C:\Microchip Solutions\Microchip\Usb and copy the
   following file:
   a) usb_device.c

8. Next, navigate to
   C:\Microchip Solutions\Microchip\Usb\HID Device Driver to copy the
   HID specific source file:
   a) usb_function_hid.c

9. Finally, navigate to C:\MCC18\lkr and copy the 18f14k20.lkr linker file.
10. Click **Next>Next** to exit the project wizard. The Project window should now
    resemble Figure 2-1.
FIGURE 2-1: PROJECT WINDOW FOR LAB 1

Next the MPLAB IDE will need to be configured for the Framework.

11. In the MPLAB IDE, select Project>Build Options…>Project. The Build Options dialog will appear (Figure 2-2).

12. Click on the Directories tab and select Output Directory and create and click New to add a new path. Navigate to C:\LPCUSB DK_Labs\Lab1_files and create a new folder called output. Highlight the folder and click OK. This will now be the folder where the output files are placed.

13. Within the “Show directories for” drop down menu, select the “Include Search Path” directory. Select New and navigate to C:\Microchip Solutions\Microchip\Include and click OK to add to the directory. Repeat these steps to add the application folder C:\LPCUSB DK_Labs\Lab1_files.

14. Ensure that the Library Search Path points to the “lib” directory and the Linker-Script Path points to “lkr” directory both in the C:\MCC18 folder.
15. Click OK to apply these settings and close the Build Options window. At this point, Framework has been built.

DEFINING PROJECT DESCRIPTORS

The enumeration.c file's ProcessIO() is empty. Therefore, this application will do nothing. The intention of this lab is to introduce the user to properly configure the firmware so that the PIC18F14K50 will enumerate as a HID mouse once connected to the Host PC. Therefore, the usb_descriptors.c file will need to be altered accordingly. As a reference, the USB Revision 2.0 specification should be opened to Section 9-5 “Descriptors”. This section details the various components required in each type of descriptor (device, configuration, interface etc…). This usb_descriptors.c file should be an exact replica of the source file of the same name found in the Framework folder

C:\Microchip Solutions\USB Device - HID - Mouse\HID - Mouse - Firmware\usb_descriptor.c

This file can be used as a reference during debugging.

16. In the MPLAB IDE Project window, select and open the usb_descriptors.c source file.

   Note #include ".\USB\usb_function_hid.h" at the top of the file. If a different class of device is being defined for a given application, the appropriate class header file will need to be included here.
17. Scroll down to the device descriptor section and copy and paste the code in Example 2-1 between the curly brackets in the section labeled:

//ADD DEVICE DESCRIPTOR CODE HERE

**Note:** The user may wish to clean up the look of the code by spacing comment sections accordingly. Tabs were ignored to ensure completeness for this document.

**EXAMPLE 2-1: DEVICE DESCRIPTOR FOR LAB 1**

```
0x12 // Size of this descriptor in bytes
USB_DESCRIPTOR_DEVICE, // DEVICE descriptor type
0x0110, // USB Spec Release Number in BCD format
0x00, // Class Code
0x00, // Subclass code
0x00, // Protocol code
USB_EP0_BUFF_SIZE, // Max packet size for EP0, see
                    // usbcfg.h
MY_VID,          // Vendor ID
MY_PID,          // Product ID
0x0003, // Device release number in BCD format
0x01, // Manufacturer string index
0x02, // Product string index
0x00, // Device serial number string index
0x01 // Number of possible configurations
```

18. Scroll down to the configuration, class specific and interface descriptor section. Copy and paste the code in Example 2-2 between the brackets between the curly brackets in the section labeled:

//ADD CONFIGURATION, CLASS SPECIFIC AND INTERFACE DESCRIPTOR CODE HERE
EXAMPLE 2-2: CONFIGURATION, CLASS SPECIFIC AND INTERFACE

```c
0x09, //sizeof(USB_CFG_DSC), // Size of this descriptor in bytes
USB_DESCRIPTOR_CONFIGURATION, // CONFIGURATION descriptor type
DESC_CONFIG_WORD(0x0022), // Total length of data for this cfg
1, // Number of interfaces in this cfg
1, // Index value of this configuration
0, // Configuration string index
_DEFAULT|_SELF, // Attributes, see usbd.h
50, // Max power consumption (2X mA)

/* Interface Descriptor */
0x09, //sizeof(USB_INTF_DSC), // Size of this descriptor
USB_DESCRIPTOR_INTERFACE, // INTERFACE descriptor type
0, // Interface Number
0, // Alternate Setting Number
1, // Number of endpoints in this intf
HID_intf, // Class code
BOOT_intf_SUBCLASS, // Subclass code
HID_PROTOCOL_MOUSE, // Protocol code
0, // Interface string index

/* HID Class-Specific Descriptor */
0x09, //sizeof(USB_HID_DSC)+3, // Size of this descriptor in bytes
DSC_HID, // HID descriptor type
DESC_CONFIG_WORD(0x0111), // HID Spec Release Number in BCD format(1.11)
0x00, // Country Code (0x00 for Not supported)
HID_NUM_OF_DSC, // Number of class descriptors, see usbcfg.h
DSC_RPT, // Report descriptor type
DESC_CONFIG_WORD(50), // sizeof(hid_rpt01), // Size of the report descriptor

/* Endpoint Descriptor */
0x07, /*sizeof(USB_EP_DSC)*/
USB_DESCRIPTOR_ENDPOINT, // Endpoint Descriptor
HID_EP | _EP_IN, // EndpointAddress
_INT, // Attributes
DESC_CONFIG_WORD(3), // size
0x01 // Interval
```

The user is encouraged to take some time and compare the code in the preceding code examples against the descriptor definitions in the USB Revision 2.0 specification Section 9-5 “Descriptors”. Comments have been included to make the code intuitive and easier to reference with the USB specification. Definition sources can be located by highlighting the definition name and selecting Edit>Find in Files in the MPLAB IDE. This will locate all instances of the definition within the project and list them in the Output window.
19. Scroll down to the string descriptor section. String descriptors can be used to
describe a device for the user. At enumeration, the string descriptor will appear
at the lower right hand section of the screen notifying the user of the intended
purpose of the device. Copy and paste the code between the curly brackets for
both the manufacturer string descriptor and product string descriptor in
Example 2-3 and Example 2-4 in the sections labeled:

//ADD MANUFACTURER STRING DESCRIPTOR CODE HERE

and

//ADD PRODUCT STRING DESCRIPTOR CODE HERE

EXAMPLE 2-3: MANUFACTURER STRING DESCRIPTOR FOR LAB 1
'M', 'i', 'c', 'h', 'i', 'p', 'T', 'e', 'c', 'h', 'n', 'o', 'l', 'o', 'g', 'y', '
M', 'o', 'u', 's', 'e', 'E', 'm', 'u', 'n', 'e', 'r', 'a', 't', 'i', 'o', 'n', 'D', 'e', 'm', 'o'

EXAMPLE 2-4: PRODUCT STRING DESCRIPTOR FOR LAB 1
'M', 'i', 'c', 'h', 'i', 'p', 'T', 'e', 'c', 'h', 'n', 'o', 'l', 'o', 'g', 'y', '
M', 'o', 'u', 's', 'e', 'E', 'm', 'u', 'n', 'e', 'r', 'a', 't', 'i', 'o', 'n', 'D', 'e', 'm', 'o'

Finally, the last descriptor to be added is the report descriptor.

Early in the development of the HID class specification, subclasses were
intended to be used to identify different HID device categories. However, it
became clear that due to the diverse variety of devices that could be imple-
mented in this class, a more robust definition method was required. Therefore,
this class does not use subclasses to define most protocols. Instead, a mecha-
nism called the report descriptor identifies data protocol and the types of data
provided for a device. It is here that such things as the number of buttons on a
mouse, the unicode key value ranges for a keyboard, and other such
characteristics are defined.

The USB organization has provided a number of documents and tools
specifically designed to implement the report descriptor that can be accessed at:
http://www.usb.org/developers/hidpage/

The user is encouraged to download the HID Usage Tables that define a report
descriptor for a given device. Also, the USB organization has further developed
a HID Descriptor Tool that will assist the developer in designing their own report
descriptors. The tool also includes predefined descriptors for commonly used
HID devices such as a mouse and keyboard. This document and tool can be
found at the links listed in Section “Resources Required to Complete Project
Labs”.

20. Scroll down to the report descriptor section and copy and paste the code in
Example 2-5 between the curly brackets in the section labeled:

//ADD REPORT DESCRIPTOR CODE HERE
EXAMPLE 2-5: REPORT DESCRIPTOR FOR LAB 1

```
0x05, 0x01, /* Usage Page (Generic Desktop) */
0x09, 0x02, /* Usage (Mouse) */
0xA1, 0x01, /* Collection (Application) */

0x95, 0x02, /* Report Count (2) */
0x81, 0x06, /* Input (Data, Variable, Relative) */
```

The descriptor definitions are now complete.

21. Compile the project. There should be no errors.

**Testing The Application**

22. Configure the Low Pin Count USB Development Board so that the J14 jumper is on the two right-most pins. This application will use power supplied by $V_{BUS}$ off of the USB cable.

23. Disconnect the J12 jumper.

24. Connect the PICkit 2 programmer to the PC USB port and then to the J6 connector on the Low Pin Count USB Development Board.

25. Open the PICkit 2 programmer environment by selecting *Start>Programs>Microchip PICkit 2 vx.xx*.

26. The PICkit 2 programmer software should recognize that the PICkit 2 is connected and identify the PIC18F14K50 device.

27. Within the PICkit 2 programmer software, navigate to the *C:\LPCUSBDK_Labs\Lab1\files\output* folder and download the *Project Lab 1.hex* file to the PIC18F14K50.

28. Plug the USB cable into the mini B connector, J1.

Once connected, the enumeration process should begin. The Host PC should recognize the connection of a new device and display a notification at the right corner of the screen indicating the "Mouse Enumeration Demo" text placed in the product string earlier in this lab.
29. Next, the device driver will be checked on the Host PC. Navigate to Device Manager on the Host PC by selecting Start>Settings>Control Panel>System to open the System Properties window. Select the Hardware tab and click the Device Manager button.

30. In the Device Manager window, expand the Human Interface Devices. Right click on each driver and select Properties until the “Mouse Enumeration Demo” driver is located. See Figure 2-3.

EXAMPLE 2-6: DEVICE MANAGER WINDOW AND HID DRIVERS INSTALLED

The user is encouraged to familiarize themselves with the HID Usage Tables and HID Descriptor Tool. Changing various aspects of the descriptors and then repeating the enumeration lab steps will help build on these concepts.

PROJECT LAB 2 (HID MOUSE)

Purpose

This lab implements the Low Pin Count USB Demo Board in a HID mouse application that moves the mouse pointer on the Host PC in a circle.

Note: The source code developed here is an exact replica of the USB Device - HID – Mouse application found in the Framework.

C:\Microchip Solutions\USB Device - HID - Mouse\HID - Mouse – Firmware

The user is encouraged to use these files as a reference when needed.
Overview of the HID Mouse Firmware

As with most of the Framework applications, the user defined source code is called from the `ProcessIO()` function in the `<application>.c` file. The user defined firmware will manipulate the Host PC mouse pointer to move in a single direction for 14 times through the main loop. After 14 times, the mouse pointer changes direction ultimately moving in a complete circle. A bit flag is initialized named `emulate_mode` that will toggle HIGH/LOW whenever the pushbutton on the Low Pin Count USB Development Board is pressed. The status of this flag will start or stop pointer movement on the screen by not calling the user defined function, `emulate_mouse()`, which handles the mouse movement routines.

The flowchart for the user defined function is shown in Figure 2-3.

**FIGURE 2-3: FLOWCHART FOR THE EMULATE_MOUSE()**

In the flowchart of Figure 2-3, it can be seen that if the `emulate_mode` flag is '0', the directional data transmitted along the USB is cleared. Note that data is transmitted from the PIC18F14K50 regardless of whether or not the flag is set. Data is transmitted only when the SIE is capable of transmitting it. This check is implemented in code by using the `if(HIDTxHandleBusy(lastTransmission) == 0)` conditional statement. The `lastTransmission` is loaded at the time of transmission and processed by the `HIDTxHandleBusy` macro in the conditional 'if' statement.

If the `emulate_mode` flag is set, the function enters into the mouse pointer movement algorithm. This is accomplished by keeping track of a counter variable, `movement_length`. When this variable exceeds 14, a buffer array is loaded with new directional data as supplied by the `dir_table` array defined at the top of the `mouse.c` file. Each element of the array is accessed by incrementing the vector variable counter. The buffer array is then loaded into a `hid_report_in[]` buffer array that is used by the `HIDTxPacket` macro to transmit the data along the USB to the Host PC.
Procedure

This lab expands on the descriptor code developed in Lab 1.

1. Create a new project “Project Lab 2”, as was done in Lab 1, only this time use the source files found in
   C:\LPCUSBDF_Labs\Lab2_files
2. In the Project window open the mouse.c source file.
3. Scroll down to find the variable definitions and uncomment the variables and arrays that will be used by the user defined function:
   a) BYTE old_sw2,old_sw3;
   b) BOOL emulate_mode;
   c) BYTE movement_length;
   d) BYTE vector = 0;
   e) char buffer[3];
   f) USB_HANDLE lastTransmission;
4. ROM signed char dir_table[]={-4,-4,-4, 0, 4, 4, 4, 0};
   Scroll down to the private prototype section and uncomment the user function prototype
   void Emulate_Mouse(void);
5. Scroll down to the UserInit(). It is here that all components pertinent to the application at hand are initialized. Note the variables and function calls that are initialized. Locate the // emulate_mode = TRUE; and uncomment the flag initialization.
6. Scroll down to the ProcessIO() function. Note the pushbutton check that toggles the emulate_mode flag. Uncomment the code:
   //emulate_mode = !emulate_mode;
7. Finally, scroll down to the Emulate_Mouse function and insert the code in Example 2-7 between the curly brackets in the section marked:

   //ADD EMULATE MOUSE CODE HERE
EXAMPLE 2-7: USER DEFINED FUNCTIONAL CODE FOR EMULATE_MOUSE()

if (emulate_mode == TRUE)
{
    //go 14 times in the same direction before changing
    if (movement_length > 14)
    {
        buffer[0] = 0;
        buffer[1] = dir_table[(vector & 0x07)]; //X-Vector
        buffer[2] = dir_table [(vector+2) & 0x07]; //Y-Vector
        // go to the next direction in the table vector++;
        //reset the counter for when to change again movement_length
        = 0;
    }
    } //end if (movement_length > 14)
else
{
    //don't move the mouse
}
if(HIDTxHandleBusy(lastTransmission) == 0)
{
    //copy over the data to the HID buffer
    hid_report_in[0] = buffer[0];
    hid_report_in[1] = buffer[1];
    //Send the 3 byte packet over USB to the host.
    lastTransmission = HIDTxPacket(HID_EP, (BYTE*)hid_report_in,
    0x03);
    //increment the counter to change the data sent
    movement_length++;
}

Note that the HID mouse transmits in 3-byte packets. The format of this packet is as follows:

- This byte is typically used to identify mouse buttons. Since this application does not require any mouse clicks, this byte is always zero.
- The second and third bytes represent horizontal (X) and Vertical (Y) displacements.

Compile the project. There should be no errors.

Testing the Application

8. Ensure that the Low Pin Count USB Development Board is configured as in Lab 1.
9. Connect the PICkit 2 Programmer and open the PICkit 2 programming software.
10. Navigate to the .hex file for this lab and download to the PIC18F14K50.
11. Disconnect the PICkit 2 and connect the Low Pin Count USB Demo Board to the Host PC port.
12. The device should enumerate and the LEDs on the board flash in accordance with the BlinkUSBStatus() discussed in the self-directed course.
13. Pressing the pushbutton should start and subsequently stop the mouse pointer moving in a circle on the Host PC screen.

The user is encouraged to experiment with this application by altering the length of time that the mouse pointer moves until a directional change or altering the values in the ROM signed char dir_table[] ={-4,-4,-4, 0, 4, 4, 4, 0};
In this lab, the PIC18F14K50 is implemented as a HID keyboard device. The ADC peripheral is configured to perform conversions on the voltage level present on the port pin connected to the potentiometer on the Low Pin Count USB Development Board. The value in the ADC result register is then used to create a numeric value between 4 and 29 that will display an alphabetic character between ‘a’ and ‘z’ on the Host PC screen (refer to HID Usage Tables document Section 10 “Keyboard/Keypad Page” (0x07)). As the potentiometer is rotated, the character outputted to the screen will change accordingly. The user should note that this application could be applied to a data logger application with the potentiometer on the Low Pin Count USB Development Board simulating a mixed signal interface to monitor an off-chip application. The data generated and transmitted via the USB could be connected and interpreted by a Graphical User Interface on the Host PC to monitor real-time application behavior or used to store essential data for later analysis.

Overview of the HID Keyboard Firmware

The `keyboard()` is the user-defined function that is called from `ProcessIO()` to parse the data received from the ADC module, transmit the numeric value along the USB and display the appropriate character on the screen. This function is implemented as a state machine. The state diagram for this function is shown in Figure 2-4.
Referring to the state diagram, the individual states perform these general tasks:

1. **STATE 0**: this is a delay state used to ensure that the hold capacitor on the ADC peripheral has sufficient time to charge before a conversion is initiated.

2. **STATE 1**: this state begins the conversion process by setting the GO\_DONE bit in the ADCON0 control register.

3. **STATE 2**: checks for a completed conversion (GO\_DONE = 0) before allowing the state machine to move to the next state.

4. **STATE 3**: this final state reads the ADC result register, converts the result to a value between 4 ('a') and 29 ('z'), loads a HID buffer and transmits the resulting data along the USB to the Host PC for output to an opened .txt document.

The main point the user should take away from this lab is this: since the USB Framework is a multitasking environment, no blocking code should be used. Therefore, as shown in this lab, state machines will become the norm in many applications. The keyboard() state machine is called each time through the main loop. If the condition that changes the current state to the next state is not met, the state machine simply returns from the function without changing states. The next time through the main loop, the condition is once again checked. If the state condition has been met, the state is changed to the next sequential state. The state variable is declared as a type static as this will allow the current value in the state variable to remain after a return from the keyboard().
Procedure

This application will require a few changes to the *usb_descriptor.c* file to configure the PIC18F14K50 as a HID keyboard. Note: the changes made to the report descriptor were done using the HID Descriptor Tool downloaded from [http://www.usb.org/developers/hidpage/](http://www.usb.org/developers/hidpage/). The user is encouraged to spend some time reviewing the contents of this page and the resources available for developing HID applications.

1. Create a new project “Project Lab 3” as was done in the previous labs. The source files for Lab 3 can be found in:
   C:\LPCUSB DK_Labs\Lab3_files

2. Open the *usb_descriptor.c* file and scroll down to the interface descriptor. Uncomment the Protocol Code definition `//HID_PROTOCOL_KEYBOARD`,

3. Scroll down to the HID class specific descriptor and uncomment the size of the HID report macro `//DESC_CONFIG_WORD(63)`, The report descriptor has changed from the previous lab and will contain 63 components that the Host PC will need to identify this device’s keyboard attributes.

4. Scroll down to the report descriptor and add the code in Example 2-8 in the section labeled:

   `//ADD REPORT DESCRIPTOR HERE`
EXAMPLE 2-8: REPORT DESCRIPTOR FOR KEYBOARD()

```
0x05, 0x01,   // USAGE_PAGE (Generic Desktop)
0x09, 0x06,   // USAGE (Keyboard)
0x11, 0x01,   // COLLECTION (Application)
0x05, 0x07,   // USAGE_PAGE (Keyboard)
0x19, 0xe0,   // USAGE_MINIMUM (Keyboard LeftControl)
0x29, 0xe7,   // USAGE_MAXIMUM (Keyboard Right GUI)
0x15, 0x00,   // LOGICAL_MINIMUM (0)
0x25, 0x01,   // LOGICAL_MAXIMUM (1)
0x75, 0x01,   // REPORT_SIZE (1)
0x95, 0x08,   // REPORT_COUNT (8)
0x81, 0x02,   // INPUT (Data,Var,Abs)
0x95, 0x01,   // REPORT_COUNT (1)
0x75, 0x08,   // REPORT_SIZE (8)
0x81, 0x03,   // INPUT (Cnst,Var,Abs)
0x95, 0x05,   // REPORT_COUNT (5)
0x75, 0x01,   // REPORT_SIZE (1)
0x05, 0x08,   // USAGE_PAGE (LEDs)
0x19, 0x01,   // USAGE_MINIMUM (Num Lock)
0x29, 0x05,   // USAGE_MAXIMUM (Kana)
0x91, 0x02,   // OUTPUT (Data,Var,Abs)
0x95, 0x01,   // REPORT_COUNT (1)
0x75, 0x03,   // REPORT_SIZE (3)
0x91, 0x03,   // OUTPUT (Cnst,Var,Abs)
0x95, 0x06,   // REPORT_COUNT (6)
0x75, 0x08,   // REPORT_SIZE (8)
0x15, 0x00,   // LOGICAL_MINIMUM (0)
0x25, 0x65,   // LOGICAL_MAXIMUM (101)
0x05, 0x07,   // USAGE_PAGE (Keyboard)
0x19, 0x00,   // USAGE_MINIMUM (Reserved (no event indicated))
0x29, 0x65,   // USAGE_MAXIMUM (Keyboard Application)
0x81, 0x00,   // INPUT (Data,Ary,Abs)
0xc0
```

Next, the keyboard.c source file will be configured.

5. In the Project window, open the keyboard.c source file and scroll down to the UserInit(). Uncomment the port and ADC initialization code. The user is urged to review the PIC18F14K50 data sheet as to the significance of these initializations for the appropriate peripheral.

```
// ADCON0=0x29;
// ADCON1 = 0X00;
// ADCON2=0x3F;
```

Scroll down to the keyboard() and copy and paste the code in Example 2-9 between the curly braces in the switch at:

```
//ADD STATE MACHINE CODE HERE
```
EXAMPLE 2-9:  KEYBOARD() STATE MACHINE CODE

```c
//delay to allow the hold capacitor on the ADC to charge
case 0:  if(++delaycounter>9000)
{                  
   delaycounter = 0;
   state = 1;
}
break;

case 1: ADCON0bits.GO_DONE = 1; //Start an ADC conversion
        state = 2;
        break;

case 2:  if(ADCON0bits.GO_DONE == 0) //Check if conversion is
         //completed
{                     
   state = 3;
}
break;

case 3:  HIDoutput = ADRESH>>3;//shift the result in ADRESH
         //left by three

if(HIDoutput<=4) HIDoutput = 4;
if(HIDoutput>=29) HIDoutput = 29;

//Can the SIE transmit?
if((HIDTxHandleBusy(lastTransmission) == 0))
{
   //Load the HID buffer
   hid_report_in[0] = 0;
   hid_report_in[1] = 0;
   hid_report_in[3] = 0;
   hid_report_in[4] = 0;
   hid_report_in[5] = 0;
   hid_report_in[6] = 0;
   hid_report_in[7] = 0;

   //Send the 8 byte packet over USB to the host.
   lastTransmission = HIDTxPacket(HID_EP,
                                (BYTE*)hid_report_in, 0x08);
   state = 0;
}
break;
```
Note that the HID keyboard transmits in 8-byte packets along the USB. The format of this packet is as follows:

- The first byte is used for a modifier such as a shift or ctrl character. (i.e., a simultaneous shift and character press on the typical keyboard.)
- The second byte is reserved.
- The remaining bytes are used to carry numeric values that contain the desired keyboard characters pressed.

Compile the project. There should be no errors.

Testing the Application

6. Connect the PICkit 2 Programmer and open the PICkit 2 programming software
7. Navigate to the .hex file for this lab and download to the PIC18F14K50.
8. Disconnect the PICkit 2. Open a new notepad, word document or other text editor program and click inside the document to place the cursor.
9. Connect the Low Pin Count USB Demo Board to the Host PC port. The device should enumerate as “Keyboard Demo”.
10. Within the selected text editor, a series of character entries should appear.
11. Turn the potentiometer on the Low Pin Count USB Demo Board to change the character on the screen.

The user is encouraged to experiment with this application by referring to the Keyboard Usage Page and changing the keyboard packet transmitted in the state machine.
PROJECT LAB 4 (CDC – SERIAL EMULATOR)

In this lab, the PIC18F14K50 is used as a serial emulator taking an RS-232 data transmission using the Enhanced Universal Asynchronous Synchronous Receiver Transmitter (EUSART) peripheral and converting it to the USB protocol within firmware. Many embedded applications continue to use the RS-232 interface to communicate with external systems. However, as USB becomes more prevalent, RS-232 ports are disappearing from newer PC’s. A simple solution is to emulate RS-232 over the USB. In this example, a Virtual COM Port is created that will allow the USB connection to appear as an RS-232 COM connection. Furthermore, this example makes use of Windows drivers that already exist eliminating the need to alter existing software such as the Hyper Terminal application.

Microchip’s Full-Speed USB Firmware Framework provides information files (.inf) for all of its CDC application examples that automate Windows driver alterations freeing the user from doing this manually. Once the PIC18F14K50 has been programmed and then connected to the PC USB port, Windows “New Hardware Found Wizard” will prompt the user for additional driver information. At this point, the user need only direct Windows to the directory containing the appropriate .inf file.

Note: The only information that is required by the user in the .inf is the Vendor Identification (VID) and Product Identification (PID) numbers specific to their original design.

Microchip’s Full-Speed USB Firmware Framework provides all the source code necessary to perform low-level RS-232 functions, thereby abstracting this from the user.

Note: The user will be required to supply an RS-232 serial cable. Also, the CDC – Serial Emulator lab requires the use of a Gender Changer to connect the female DB9 connector on the Low Pin Count USB Kit to the female-type connector found on all RS-232 connected PCs. In normal usage, the Low Pin Count USB Development Kit is designed to serve as an intermediary between a USB-connected PC and an RS-232 peripheral – such as an alarm panel or a remote control.

Overview of the CDC – Serial Emulator Firmware

The CDC Serial Emulator firmware flow is shown in Figure 2-5.
FIGURE 2-5: FLOWCHART FOR CDC SERIAL EMULATOR CODE

- ProcessID( )
- RS232 OUT Buffer available and USB OUT Buffer NOT EMPTY
  - YES: Copy USB OUT Buffer to RS232 OUT Buffer
  - NO: RS232 OUT Buffer NOT EMPTY and EUSART is EMPTY
    - YES: Copy next byte to EUSART
    - NO: EUSART has a byte
      - YES: Add byte to RS232 IN Buffer
      - NO: RS232 IN Buffer has data and USB IN Buffer available
        - YES: Copy USB IN Buffer to USB Buffer
        - NO: CDCTxService( )
Referring to the flowchart in Figure 2-5, the firmware located in the `ProcessIO()` first checks if the previous RS-232 transmission has been sent via the USB using the `RS232_Out_Data_Rdy` flag. If this flag is cleared (indicating previous transmission has been sent), firmware then checks if any new data has been sent from the RS-232 connection and is ready to be transmitted via the USB using the `getsUSBUSART()`. This function copies data into a buffer and returns the number of bytes the buffer contains. The function ensures that only the expected numbers of bytes, in this case 64, are actually copied into this buffer. Also, if there is no data available, the function returns a zero value indicating no data is available. In this way the function does not wait for data and is therefore, non-blocking, keeping in mind that all firmware must conform to this multitasking environment.

Following the RS-232 data check, the firmware then checks if the EUSART transmit register, TXREG, is empty. This is accomplished using the `mTxRdyUSART()` macro, which checks the TRMT bit in the TXSTA (Transmit Status Control) register in the EUSART peripheral. If the TRMT bit is cleared, the TXREG is Full, and Empty if the TRMT bit is set. Note that this bit is automatically set following a successful transmission from the TXREG. If set, the data collected into the buffer by the `getsUSBUSART()` is then transferred into the TXREG one byte at a time each time through the main loop. Again, such macros take care of the low-level RS-232 communication in a non-blocking fashion so the user doesn’t have to. If the TXREG isn’t empty, then the previous data has not been transmitted via the USB and should not be overwritten.

The firmware next checks to see if the CDC class device is ready to transmit data. This is accomplished by using the `mUSBUSARTIsTxrfReady()` flag. The user must ensure that this flag is set to ‘1’ before calling the `putUSBUSART()` function. As a safety precaution, this function checks the state one more time to make sure it does not override any pending transactions. This function writes data to the USB.

The `CDCTxService()` services the transfer of data to the host. This function keeps track of a state machine and breaks up long strings of data into multiple USB data packets. It is called once each time through the main program loop. The state machine for the `CDCTxService()` is shown in Figure 2-6 and the source code can be found in the `usb_function_cdc.c` source file. The reader is encouraged to reference this firmware and compare it against the state diagram at their leisure.
Procedure

This application requires significant changes to the `usb_descriptor.c` file to configure the PIC18F14K50 as a CDC device. Note the absence of the report descriptor. The user is encouraged to spend some time reviewing the `usb_descriptor.c` file and compare it against the information found in the Universal Serial Bus Class Definitions for Communications Devices document referenced at the beginning of this chapter. Note that this lab applies the same firmware found in the CDC – Serial Emulator application example in Microchip’s Full-Speed USB Firmware Framework application examples and can be used as a reference for this lab.

1. Create a new project “Project Lab 4” as was done in the previous labs. The `usb_descriptor.c` and `main.c` source files for Lab 4 can be found in:
   
   C:\LPCUSBDK_Labs\Lab4_files
   
   This time, the project will be set up to resemble the application examples in the Framework using sub-folders to distinguish and organize the different source files in the Project window.

2. Right click on the Source Files folder in the Project window and select Create Subfolder...
Name the new folder “USB Stack”.

3. Right click on this new USB Stack folder and select Add Files. In the Add Files to Project window, navigate to C:\Microchip Solutions\Microchip\Usb and select the usb_device.c source file. Ensure that “System: File(s) are External to Project, Use Absolute Path” is selected then click Open.

This should add the usb_device.c to the “USB Stack” folder in the Project window.
Repeat this step to add the *usb_function_cdc.c* file from the `C:\Microchip Solutions\Microchip\USB\CDC Device Driver` directory to the same “USB Stack” folder.

4. In the Project window create two new sub-folders under the Header Files folder called “USB Stack” and “Common” as per step 2 of this lab.

5. Right click on the “USB Stack” folder and add the following files from the `C:\Microchip Solutions\Microchip\Include\Usb` directory as was done in step 3 of this lab:
   - *usb.h*
   - *usb_ch9.h*
   - *usb_common.h*
   - *usb_device.h*
   - *usb_function_cdc.h*
   - *usb_hal.h*
   - *usb_hal_pic18.h*

6. Right click on the “Common” folder and add the following files from the `C:\Microchip Solutions\Microchip\Include` directory as was done in step 3 of this lab:
   - *Compiler.h*
   - *GenericTypeDefs.h*

7. Ensure that the Project Build Options are configured as was done in Lab 1 steps 11 through 15.

8. Compile the project. There should be no errors.

The Project window should now resemble Figure 2-9.
9. Next, the EUSART peripheral will need to be initialized to enable asynchronous communication with a baud rate of 19200. To do this, open the main.c file and scroll down to the InitializeUSART(). This function is called by the UserInit(). Note that in this function, code has been formatted to allow configuration dependant on the specific device and compiler used. Copy and paste the contents of Example 2-10 into the section of the InitializeUSART() function labeled:

//ADD C18 PIC18F14K50 EUSART INITIALIZATION CODE HERE
EXAMPLE 2-10: INITIALIZEUSART() CODE

```c
#if defined(__18CXX)
    unsigned char c;
#endif
#if defined(__18F14K50)
    ANSELHbits.ANS11 = 0;  // Make RB5 digital so USART can
                          // use pin for Rx
#endif
UART_TRISRx=1;  // RX
UART_TRISTx=0;  // TX
TXSTA = 0x24;   // TX enable BRGH=1
RCSTA = 0x90;   // Single Character RX
SPBRG = 0x70;   // 0x0271 for 48MHz -> 19200 baud
SPBRGH = 0x02;  // 0x0271 for 48MHz -> 19200 baud
BAUDCON = 0x08; // BRG16 = 1
c = RCREG;      // read
#endif
```

The reader is encouraged to review the data sheet for the PIC18F14K50 EUSART section for more information on the specifics of the configuration code.

Next, the application specific code will be added that will implement the flowchart shown in Figure 2-5.

10. Scroll down to the `ProcessIO()` and copy and paste the contents of Example 2-11 into the section labeled:
    ```
    /******************************************************************************
    ADD CODE TO CHECK IF RS232 HAS BEEN SENT ALONG USB
    AND THE CODE TO CHECK IF ANY NEW RS232 TRANSMISSION HAS BEEN RECEIVED AND STORED
    ******************************************************************************
    ```

As per the flowchart in Figure 2-5, this code will ensure that the buffer containing the data transmitted from the RS-232 has been sent to the USB firmware. If so, the code then checks for any new RS-232 data that has been stored in the buffer.
EXAMPLE 2-11: RS-232 BUFFER CHECK

// only check for new USB buffer if the old RS232 buffer is // empty. // Additional USB packets will be NAK'd // until the buffer is free.

if (RS232_Out_Data_Rdy == 0)
{
    LastRS232Out = getsUSBUSART(RS232_Out_Data, 64);
    if (LastRS232Out > 0)
    {
        RS232_Out_Data_Rdy = 1; // signal // buffer full
        RS232cp = 0; // Reset the current position
    }
}

11. Next the code that will check and then load the EUSART Transmit shift register (TXREG) with the contents of the RS-232 buffer will be entered. Copy and paste the contents of Example 2-12 into the section labeled:

******************************************************************************
ADD THE CODE THAT WILL CHECK IF THE EUSART TXREG IS EMPTY.
IF SO, BEGIN SENDING DATA FROM RS232 TRANSMISSION INTO
THE TXREG ONE BYTE AT A TIME
******************************************************************************

EXAMPLE 2-12: TXREG CHECK AND LOAD CODE

if(RS232_Out_Data_Rdy && mTxRdyUSART())
{
    putcUSART(RS232_Out_Data[RS232cp]);
    ++RS232cp;
    if (RS232cp == LastRS232Out)
        RS232_Out_Data_Rdy = 0;
}

12. Finally, the code to check if the CDC class device is ready to send data into the USB transmit buffer will be entered. Copy and paste the contents of code in Example 2-13 into the section labeled:

******************************************************************************
ADD THE CODE THAT WILL CHECK IF THE CDC CLASS DEVICE IS READY TO LOAD THE USB BUFFER
******************************************************************************
EXAMPLE 2-13: CHECK CDC CLASS DEVICE CODE

```c
if((mUSBUSARTIsTxTrfReady()) && (NextUSBOut > 0))
{
    putUSBUSART(&USB_Out_Buffer[0], NextUSBOut);
    NextUSBOut = 0;
}
```

13. At this point, all the necessary code to run the CDC – Serial Emulator application is complete. Compile the project. There should be no errors.

Installing Application Drivers

14. Connect the PICkit 2 Programmer and open the PICkit 2 programming software
15. Navigate to the `.hex` file for this lab and download to the PIC18F14K50.
16. Disconnect the PICkit 2.
17. Connect the Low Pin Count USB Demo Board to the Host PC port. Windows should recognize the PIC18F14K50 as “CDC RS232 Emulation Demo”.

Windows will now prompt the user for driver information.

18. In the “Welcome to the Found New Hardware Wizard” window, select “No, not this time” and then Next. (see Figure 2-10)

**FIGURE 2-10: FOUND NEW HARDWARE WIZARD WINDOW**
19. The wizard will then prompt the user for a location from which to load the software for the communication port. Select "Install from a list or specific location (Advanced)" and click Next. (see Figure 2-11)

FIGURE 2-11: SELECTING SOFTWARE LOCATION FOR COMMUNICATIONS PORT

The wizard now prompts the user for the location of the .inf file that Windows will use to automatically configure the binary driver files (.sys files) to create the Virtual COM Port connection for the USB. Ensure that both "Search for the best driver in these locations" and "Include this location in the search" are both selected. Select Browse and navigate to the lab 4 source files in the C:\LPCUSBDK_Labs\Lab4_files\inf\win2k_winxp directory. (see Figure 2-12)
The window should now begin loading the software. If any warnings are issued, select Continue Anyway.

20. The wizard should indicate that the software for the Communications port was successfully installed. Select Finish. (See Figure 2-13)

FIGURE 2-13: SUCCESSFUL SOFTWARE INSTALLATION WINDOW
Next, the Virtual COM Port will be checked in the Device Manager to identify the COM port number.

Establish Communication

21. Using step 29 in Project Lab to navigate to the Device Manager, expand the ports (COM and LPT). The new Virtual COM Port created by the .inf file should be found in the drop-down list. If there is difficulty locating the Virtual COM Port, right click on each driver and select Properties until the CDC RS232 Emulation Demo is located. Note the COM port number for both the Virtual COM Port and the COM port used for an RS-232 connection (Serial Port Connection on the Host PC). Figure 2-14 shows a list of COM ports available. The reader’s list may differ.

**FIGURE 2-14: EXAMPLE LIST OF AVAILABLE COM PORTS IN THE DEVICE MANAGER**

This COM port number will be used in the Hyper Terminal program to establish connectivity to both the USB and RS-232 connections between the Low Pin Count USB Development Board and Host PC.

22. Open a Hyper Terminal window by selecting within Windows,

   `Start>Programs>Accessories>Communications>HyperTerminal`

   The Hyper Terminal Program should now prompt the user for a “Connection Description”.

23. Name this first connection “USB Connection” and click **OK**. (See Figure 2-15).
24. In the “Connect To” window, select the Virtual COM Port that was noted in step 21 in the “Connect Using” drop-down menu and select **OK**. In Figure 2-16, the Virtual COM Port is on COM7. Note that this may differ on the user’s PC.

25. In the COM Properties window, configure the connection as shown in Figure 2-17 with a baud rate of 19200 and click **Apply** then **OK**.
This now establishes a connection between the Low Pin Count USB Development Board USB connector and the Host PC COM port.

26. Next, connect the RS-232 serial cable to the connector on the Low Pin Count USB Development Board and to a serial port connector on the Host PC using a “Gender Changer” adapter.

27. Repeat steps 22 to 25 to establish an RS-232 connection using the related port noted in step 21 for the Serial Port Connector on the Host PC. Name this connection “RS232 Connection” and ensure that the COM properties resemble Figure 2-17.

Testing the Application

28. Once connected, click inside the RS232 Connection COM window and type a message. Note that unless configured to echo locally, the originating message COM window will not print the message. The message should be printed in the “USB Connection” COM window as shown in Figure 2-18.
This will confirm communication from the Host PC via an RS-232 connection into the PIC18F14K50 which in turn transmits data received back to the Host PC. In other words, an RS-232 to USB conversion.
Appendix A. Schematics

A.1 INTRODUCTION

This appendix contains the Low Pin Count USB Development Kit hardware diagrams.
