Low Voltage Reference

Features

- Low Bias Current - 50 μ A Min
- Low Dynamic Impedance
- Low Reverse Voltage
- Low Cost

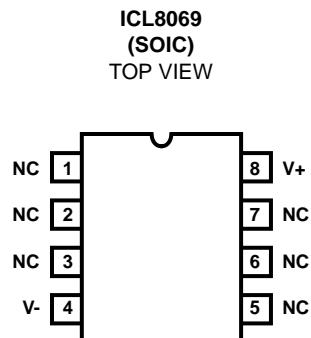

Description

The ICL8069 is a 1.2V temperature compensated voltage reference. It uses the band-gap principle to achieve excellent stability and low noise at reverse currents down to 50 μ A. Applications include analog-to-digital converters, digital-to-analog converters, threshold detectors, and voltage regulators. Its low power consumption makes it especially suitable for battery operated equipment.

NOTES:

1. If circuit strays in excess of 200pF are anticipated, a 4.7 μF shunt capacitor will ensure stability under all operating conditions.
2. In normal use, the reverse voltage cannot exceed the reference voltage. However when plugging units into a powered-up test fixture, an instantaneous voltage equal to the compliance of the test circuit will be seen. This should not exceed 20V.
3. For the military part, measurements are made at $+25^\circ\text{C}$, -55°C , and $+125^\circ\text{C}$. The unit is then classified as a function of the worst case TC from $+25^\circ\text{C}$ to -55°C , or $+25^\circ\text{C}$ to $+125^\circ\text{C}$.
