LINEAR FILM RESISTORS

RF Behavior of Resistors

Figures below show the following:

- Typical values of the actual impedance related to the nominal resistance $|Z|/R$ depending on the frequency
 - Whether the impedance is mainly influenced by inductive or capacitive parasitic elements
 - Whether the impedance is lower or higher than the nominal resistance
- The resistors were measured using a vector network analyzer (S-parameter measurement).

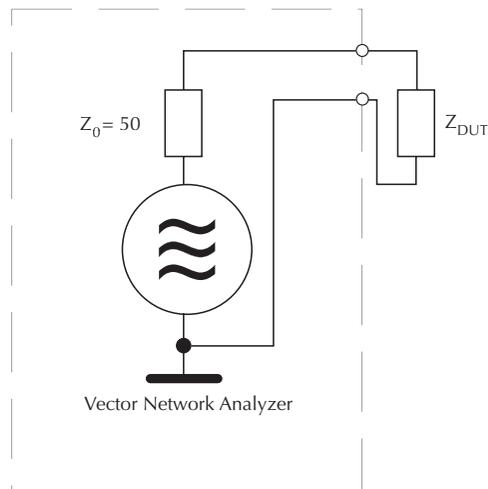

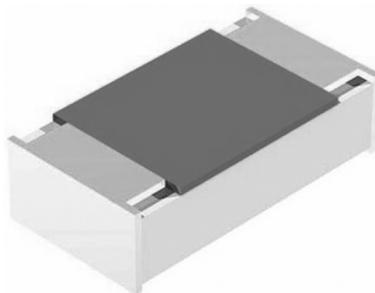

Figure 1. S11 test circuit

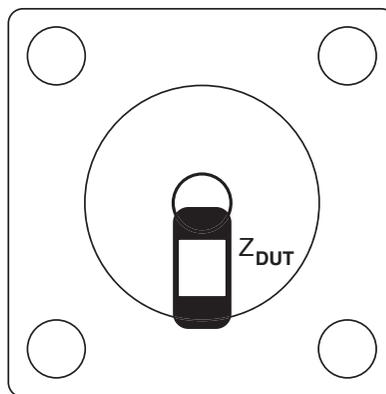

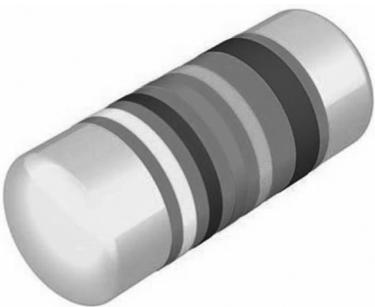

Figure 2. Device under test (DUT)

Linear Resistors

Vishay

Other related parameters such as:

reflection coefficient $r = \frac{Z - Z_0}{Z + Z_0}$

return loss $RL = 20 \lg|r|$

and standing wave ratio $SWR = \frac{1 + |r|}{1 - |r|}$

can be calculated using the relevant diagrams in the data specifications. The table below gives some typical impedance values for a given return loss.

Typical impedance values for a given return loss				
R.L. (dB)	r	SWR 1:	Z(Ω)	
0	1	∞	∞	0
-6	0.5	≈ 3	150	17
-10	≈ 0.3	≈ 2	96	26
-20	0.1	≈ 1.2	61	41
-30	0.03	1.07	53	47
