e·MMC Memory

MTFC4GMWDQ-3M AIT, MTFC4GMWDQ-3M AIT A
MTFC8GLWDQ-3M AIT Z, MTFC8GLWDQ-3M AIT A
## MTFC16GLWDQ-4M AIT Z, MTFC32GJWDQ-4M AIT Z

Features

- MultiMediaCard (MMC) controller and NAND Flash
- 100-ball LBGA
  (RoHS compliant, "green package")
- V_{CC}: 2.7–3.6V
- V_{CCQ} (dual voltage): 1.65–1.95V; 2.7–3.6V
- Temperature ranges
  - Operating temperature: –40˚C to +85˚C
  - Storage temperature: –40˚C to +85˚C

MMC-Specific Features

- JEDEC/MMC standard version 4.51-compliant
  (JEDEC Standard No. 84-B451) – SPI mode not
  supported[1]
  - Advanced 11-signal interface
  - x1, x4, and x8 I/Os, selectable by host
  - SDR/DDR modes up to 52 MHz clock speed
  - HS200 mode
  - Command classes: class 0 (basic); class 2 (block
    read); class 4 (block write); class 5 (erase);
    class 6 (write protection); class 7 (lock card)
  - Temporary write protection
  - Boot operation (high-speed boot)
  - Sleep mode
  - Replay-protected memory block (RPMB)
  - Secure erase and secure trim
  - Hardware reset signal
  - Multiple partitions with enhanced attribute
  - Permanent and power-on write protection
  - High-priority interrupt (HPI)

Figure 1: Micron e·MMC Device
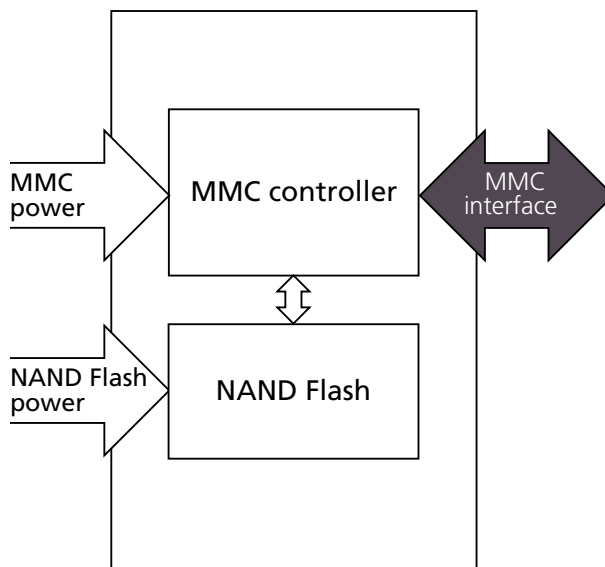

MMC-Specific Features (Continued)
  - Background operation
  - Reliable write
  - Discard and sanitize
  - Power-off notification feature
  - Backward compatible with previous MMC
- ECC and block management implemented

Note: 1. The JEDEC specification is available at
www.jedec.org/sites/default/files/docs/
JESD84-B451.pdf.

Products and specifications discussed herein are subject to change by Micron without notice.

e·MMC Performance

Table 1: HS200 Performance

Condition[1]	Typical Values				Unit
	4GB	**8GB**	**16GB**	**32GB**	
Sequential write	15	15	25	37	MB/s
Sequential read	120	120	120	150	MB/s
Random write	500	500	900	900	IOPS
Random read	4500	4500	4000	4000	IOPS

Note: 1. Bus in x8 I/O and HS200 modes. Sequential access of chunk saturated; random access of 4KB chunk over 1GB span. Additional performance data, such as system performance on a specific application board, will be provided in a separate document upon customer request.

Table 2: 52 MHz DDR2 Performance

Condition[1]	Typical Values				Unit
	4GB	**8GB**	**16GB**	**32GB**	
Sequential write	15	15	25	37	MB/s
Sequential read	80	80	80	80	MB/s
Random write	500	500	900	900	IOPS
Random read	4000	4000	3700	3700	IOPS

Note: 1. Bus in x8 I/O and 52 MHz DDR2 modes. Sequential access of chunk saturated; random access of 4KB chunk over 1GB span. Additional performance data, such as system performance on a specific application board, will be provided in a separate document upon customer request.

e·MMC Current Consumption

Table 3: HS200 Current Consumption

Condition[1]	Typical Values (I_{CC}/I_{CCQ})			Unit
	4GB, 8GB	**16GB**	**32GB**	**Unit**
Write	60/10	110/10	110/10	mA
Read	45/50	105/50	105/50	mA
Sleep	125	125	125	µA
Auto-Standby	50/125	50/125	50/125	µA

Note: 1. Bus in x8 I/O and HS200 modes. V_{CC} = 3.6V and V_{CCQ} = 1.95V. 25°C. Measurements done as average RMS current consumption. I_{CCQ} in READ operation might be affected by tester load.

Table 4: 52 MHz DDR2 Current Consumption

| Condition[1]	Typical Values (I_{CC}/I_{CCQ})			Unit
	4GB, 8GB	**16GB**	**32GB**	**Unit**
Write	30/10	110/10	110/10	mA
Read	60/50	75/85	75/85	mA
Sleep	0/125	0/125	0/125	µA
Auto-Standby	50/125	50/125	50/125	µA

Note: 1. Bus in x8 I/O and 52 MHz DDR2 modes. V_{CC} = 3.6V and V_{CCQ} = 1.95V. 25°C. Measurements done as average RMS current consumption. I_{CCQ} in READ operation might be affected by tester load.

Part Numbering Information

Micron® *e*·MMC memory devices are available in different configurations and densities.

Device Marking

Due to the size of the package, the Micron-standard part number is not printed on the top of the device. Instead, an abbreviated device mark consisting of a 5-digit alphanumeric code is used. The abbreviated device marks are cross-referenced to the Micron part numbers at the FBGA Part Marking Decoder site: www.micron.com/decoder.

Important Notes and Warnings

Micron Technology, Inc. ("Micron") reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions. This document supersedes and replaces all information supplied prior to the publication hereof. You may not rely on any information set forth in this document if you obtain the product described herein from any unauthorized distributor or other source not authorized by Micron.

Automotive Applications. Products are not designed or intended for use in automotive applications unless specifically designated by Micron as automotive-grade by their respective data sheets. Distributor and customer/distributor shall assume the sole risk and liability for and shall indemnify and hold Micron harmless against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, death, or property damage resulting directly or indirectly from any use of non-automotive-grade products in automotive applications. Customer/distributor shall ensure that the terms and conditions of sale between customer/distributor and any customer of distributor/customer (1) state that Micron products are not designed or intended for use in automotive applications unless specifically designated by Micron as automotive-grade by their respective data sheets and (2) require such customer of distributor/customer to indemnify and hold Micron harmless against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, death, or property damage resulting from any use of non-automotive-grade products in automotive applications.

Critical Applications. Products are not authorized for use in applications in which failure of the Micron component could result, directly or indirectly in death, personal injury, or severe property or environmental damage ("Critical Applications"). Customer must protect against death, personal injury, and severe property and environmental damage by incorporating safety design measures into customer's applications to ensure that failure of the Micron component will not result in such harms. Should customer or distributor purchase, use, or sell any Micron component for any critical application, customer and distributor shall indemnify and hold harmless Micron and its subsidiaries, subcontractors, and affiliates and the directors, officers, and employees of each against all claims, costs, damages, and expenses and reasonable attorneys' fees arising out of, directly or indirectly, any claim of product liability, personal injury, or death arising in any way out of such critical application, whether or not Micron or its subsidiaries, subcontractors, or affiliates were negligent in the design, manufacture, or warning of the Micron product.

Customer Responsibility. Customers are responsible for the design, manufacture, and operation of their systems, applications, and products using Micron products. ALL SEMICONDUCTOR PRODUCTS HAVE INHERENT FAILURE RATES AND LIMITED USEFUL LIVES. IT IS THE CUSTOMER'S SOLE RESPONSIBILITY TO DETERMINE WHETHER THE MICRON PRODUCT IS SUITABLE AND FIT FOR THE CUSTOMER'S SYSTEM, APPLICATION, OR PRODUCT. Customers must ensure that adequate design, manufacturing, and operating safeguards are included in customer's applications and products to eliminate the risk that personal injury, death, or severe property or environmental damages will result from failure of any semiconductor component.

Limited Warranty. In no event shall Micron be liable for any indirect, incidental, punitive, special or consequential damages (including without limitation lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort, warranty, breach of contract or other legal theory, unless explicitly stated in a written agreement executed by Micron's duly authorized representative.

General Description

Micron e.MMC is a communication and mass data storage device that includes a Multi-MediaCard (MMC) interface, a NAND Flash component, and a controller on an advanced 11-signal bus, which is compliant with the MMC system specification. Its cost per bit, small package sizes, and high reliability make it an ideal choice for automotive applications, including information and entertainment, navigation tools, advanced driving assistance systems, and a variety of other industrial and portable products.

The nonvolatile e.MMC draws no power to maintain stored data, delivers high performance across a wide range of operating temperatures, and resists shock and vibration disruption.
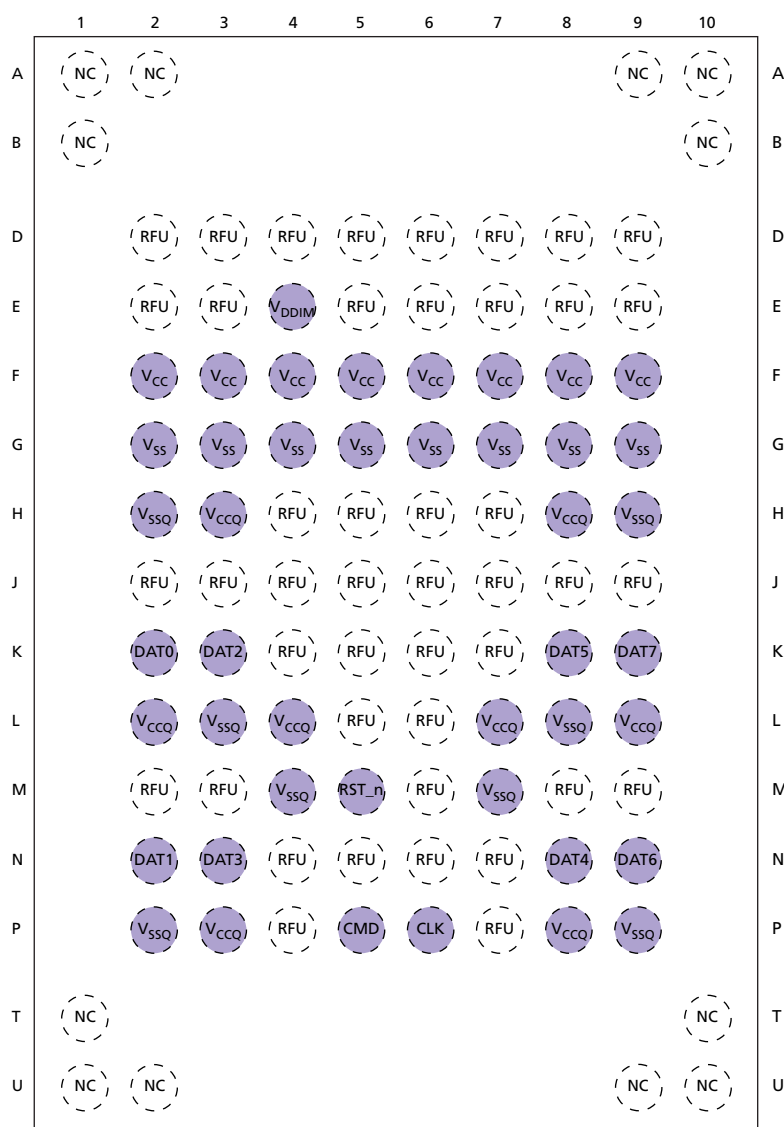

Signal Descriptions

Table 6: Signal Descriptions

Symbol	Type	Description
CLK	Input	Clock: Each cycle of the clock directs a transfer on the command line and on the data line(s). The frequency can vary between the minimum and the maximum clock frequency.
RST_n	Input	Reset: The RST_n signal is used by the host for resetting the device, moving the device to the pre-idle state. By default, the RST_n signal is temporarily disabled in the device. The host must set ECSD register byte 162, bits[1:0] to 0x1 to enable this functionality before the host can use it.
CMD	I/O	Command: This signal is a bidirectional command channel used for command and response transfers. The CMD signal has two bus modes: open-drain mode and push-pull mode (see Operating Modes). Commands are sent from the MMC host to the device, and responses are sent from the device to the host.
DAT[7:0]	I/O	Data I/O: These are bidirectional data signals. The DAT signals operate in push-pull mode. By default, after power-on or assertion of the RST_n signal, only DAT0 is used for data transfer. The MMC controller can configure a wider data bus for data transfer either using DAT[3:0] (4-bit mode) or DAT[7:0] (8-bit mode). e.MMC includes internal pull-up resistors for data lines DAT[7:1]. Immediately after entering the 4-bit mode, the device disconnects the internal pull-up resistors on the DAT[3:1] lines. Upon entering the 8-bit mode, the device disconnects the internal pull-ups on the DAT[7:1] lines.
V_{CC}	Supply	V_{CC}: NAND interface (I/F) I/O and NAND Flash power supply.
V_{CCQ}	Supply	V_{CCQ}: e.MMC controller core and e.MMC I/F I/O power supply.
V_{SS}[1]	Supply	V_{SS}: NAND I/F I/O and NAND Flash ground connection.
V_{SSQ}[1]	Supply	V_{SSQ}: e.MMC controller core and e.MMC I/F ground connection.
V_{DDIM}		Internal voltage node.
NC	–	No connect: No internal connection is present.
RFU	–	Reserved for future use: No internal connection is present. Leave it floating externally.

Note: 1. V_{SS} and V_{SSQ} are connected internally.

100-Ball Signal Assignments

Figure 3: 100 Ball (Top View, Ball Down)

|	1	2	3	4	5	6	7	8	9	10	
A	NC	NC							NC	NC	A
B	NC								NC		B
D		RFU	RFU	RFU	RFU	RFU	RFU	RFU	RFU		D
E		RFU	RFU	V_{DDIM}	RFU	RFU	RFU	RFU	RFU		E
F		V_{CC}	V_{CC}	V_{CC}	V_{CC}	V_{CC}	V_{CC}	V_{CC}	V_{CC}		F
G		V_{SS}	V_{SS}	V_{SS}	V_{SS}	V_{SS}	V_{SS}	V_{SS}	V_{SS}		G
H		V_{SSQ}	V_{CCQ}	RFU	RFU	RFU	RFU	V_{CCQ}	V_{SSQ}		H
J		RFU	RFU	RFU	RFU	RFU	RFU	RFU	RFU		J

L		V_{CCQ}	V_{SSQ}	V_{CCQ}	RFU	RFU	V_{CCQ}	V_{SSQ}	V_{CCQ}		L
M		RFU	RFU	V_{SSQ}	RST_n	RFU	V_{SSQ}	RFU	RFU		M
N		DAT1	DAT3	RFU	RFU	RFU	RFU	DAT4	DAT6		N
P		V_{SSQ}	V_{CCQ}	RFU	CMD	CLK	RFU	V_{CCQ}	V_{SSQ}		P
T	NC								NC		T
U	NC	NC							NC	NC	U

Notes:
1. Connect a 1µF decoupling capacitor from V_{DDIM} to ground.
2. Some previous versions of the JEDEC product or mechanical specification had defined reserved for future use (RFU) balls as no connect (NC) balls. NC balls assigned in the previous specifications could have been connected to ground on the system board. To enable new feature introduction, some of these balls are assigned as RFU in the v4.4 mechanical specification. Any new PCB footprint implementations should use the new ball assignments and leave the RFU balls floating on the system board.
3. V_{CC}, V_{CCQ}, V_{SS}, and V_{SSQ} balls must all be connected on the system board.

Package Dimensions

**Figure 4: 100-Ball LBGA – 14.0mm x 18.0mm x 1.4mm (Package Code: DQ)**
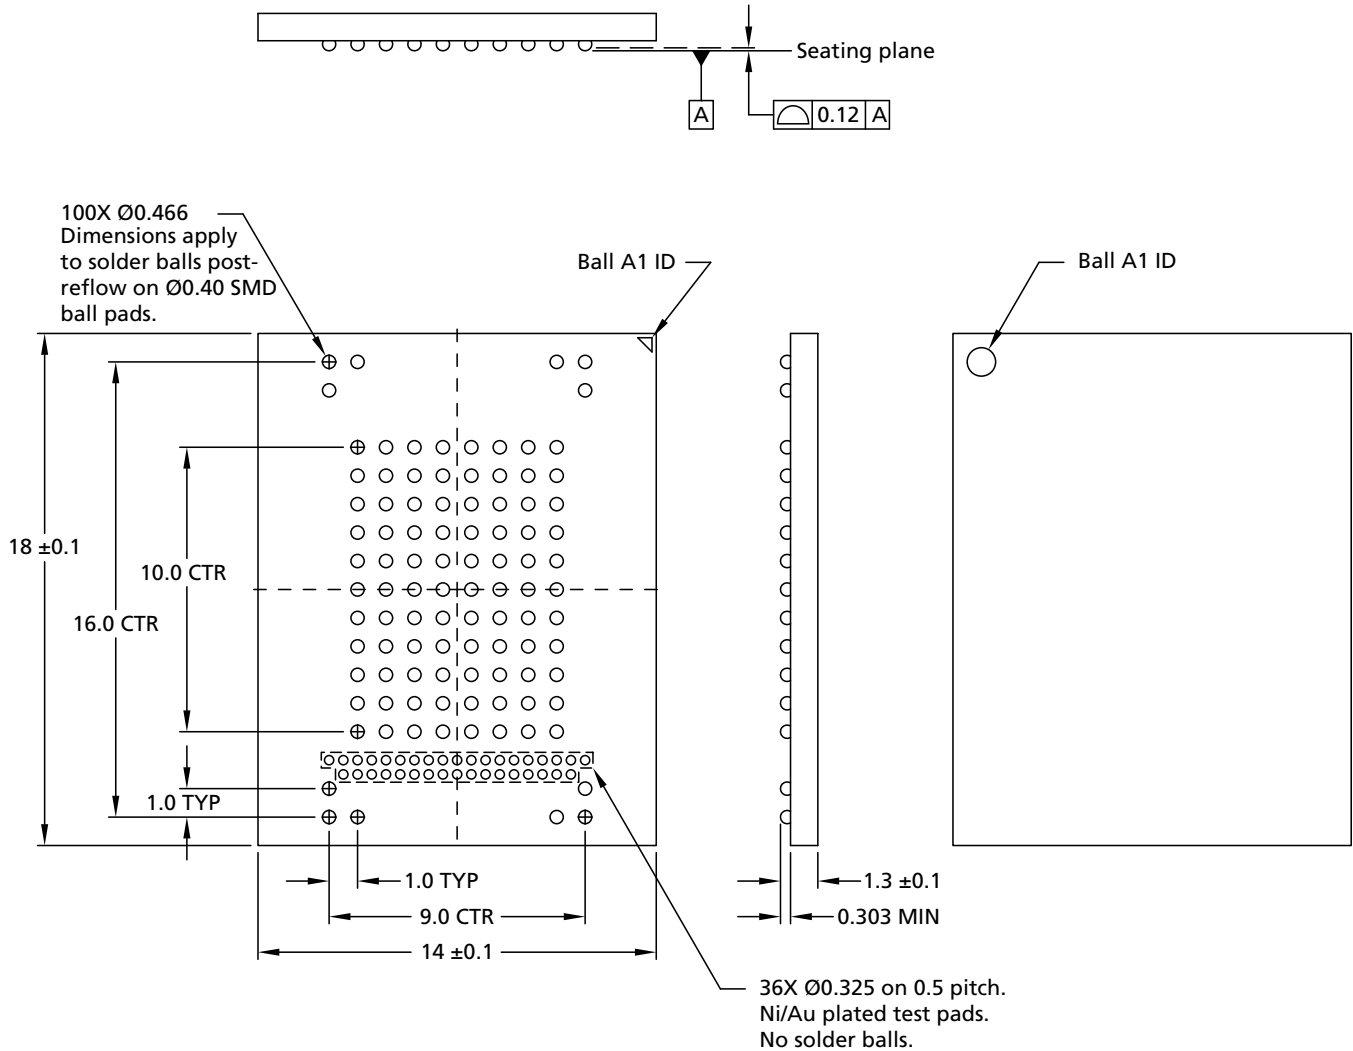

Note: 1. Dimensions are in millimeters.

Architecture

Figure 5: e.MMC Functional Block Diagram

Note: 1. V_{SS} and V_{SSQ} are internally connected.

MMC Protocol Independent of NAND Flash Technology

The MMC specification defines the communication protocol between a host and a device. The protocol is independent of the NAND Flash features included in the device. The device has an intelligent on-board controller that manages the MMC communication protocol.

The controller also handles block management functions such as logical block allocation and wear leveling. These management functions require complex algorithms and depend entirely on NAND Flash technology (generation or memory cell type).

The device handles these management functions internally, making them invisible to the host processor.

Defect and Error Management

Micron e.MMC incorporates advanced technology for defect and error management. If a defective block is identified, the device completely replaces the defective block with one of the spare blocks. This process is invisible to the host and does not affect data space allocated for the user.

The device also includes a built-in error correction code (ECC) algorithm to ensure that data integrity is maintained.

To make the best use of these advanced technologies and ensure proper data loading and storage over the life of the device, the host must exercise the following precautions:

• Check the status after WRITE, READ, and ERASE operations.
• Avoid power-down during WRITE and ERASE operations.

OCR Register

The 32-bit operation conditions register (OCR) stores the voltage profile of the card and the access mode indication. In addition, this register includes a status information bit.

Table 7: OCR Parameters

OCR Bits	OCR Value	Description
[31]	1b (ready)/0b (busy)[1]	Device power-on status bit
[30:29]	10b	Sector mode
[28:24]	0 0000b	Reserved
[23:15]	1 1111 1111b	2.7–3.6V voltage range
[14:8]	000 0000b	2.0–2.7V voltage range
[7]	1b	1.70–1.95V voltage range
[6:0]	000 0000b	Reserved

Note: 1. OCR = C0FF8080h after the device has completed power-up.

CID Register

The card identification (CID) register is 128 bits wide. It contains the device identification information used during the card identification phase as required by e.MMC protocol. Each device is created with a unique identification number.

Table 8: CID Register Field Parameters

Name	Field	Width	CID Bits	CID Value
Manufacturer ID	MID	8	[127:120]	FEh
Reserved	–	6	[119:114]	–

13

CSD Register

The card-specific data (CSD) register provides information about accessing the device contents. The CSD register defines the data format, error correction type, maximum data access time, and data transfer speed, as well as whether the DS register can be used. The programmable part of the register (entries marked with W or E in the following table) can be changed by the PROGRAM_CSD (CMD27) command.

Table 9: CSD Register Field Parameters

Name	Field		Size (Bits)	Cell Type[1]	CSD Bits	CSD Value
CSD structure	CSD_STRUCTURE		2	R	[127:126]	03h

ECC	ECC	2	R/W/E	[9:8]	00h
CRC	CRC	7	R/W/E	[7:1]	–
Reserved	–	1	–	[0]	–

Notes:
1. R = Read-only;
   R/W = One-time programmable and readable;
   R/W/E = Multiple writable with value kept after a power cycle, assertion of the RST_n signal, and any CMD0 reset, and readable
2. Reserved bits should be read as 0.
3. CMD0 restriction: CMD0 (SW RESET) is not supported during programming command. If SW RESET is issued during programming commands, a power cycle is required.
4. The $I_{PEAK, max}$ driving capability can be modified according to the actual capacitive load on the e·MMC interface signals in the user application board using CMD4. In HS200 mode, the driver strength value is set in EXT_CSD[185] using CMD6.

CMD4 Argument	Driving Capability (mA)
0x01000000	4

0x10000000	20
0x20000000	24
0x40000000	28
0x80000000	32

ECSD Register

The 512-byte extended card-specific data (ECSD) register defines device properties and selected modes. The most significant 320 bytes are the properties segment. This segment defines device capabilities and cannot be modified by the host. The lower 192 bytes are the modes segment. The modes segment defines the configuration in which the device is working. The host can change the properties of modes segments using the SWITCH command.

Notes: 1. R = Read-only;
R/W = One-time programmable and readable;

R/W/E = Multiple writable with the value kept after a power cycle, assertion of the RST_n signal, and any CMD0 reset, and readable;

R/W/C_P = Writable after the value is cleared by a power cycle and assertion of the RST_n signal (the value not cleared by CMD0 reset) and readable;

R/W/E_P = Multiple writable with the value reset after a power cycle, assertion of the RST_n signal, and any CMD0 reset, and readable;

W/E_P = Multiple writable with the value reset after power cycle, assertion of the RST_n signal, and any CMD0 reset, and not readable

2. Reserved bits should be read as 0.

3. †IH parameter in HS200 is 1.2ns. Refer to the JEDEC specification for the device input timing diagram.

4. Micron has tested power failure under best-application knowledge conditions with positive results. Customers may request a dedicated test for their specific application condition. Micron set this register during factory test and used the one-time programming option.
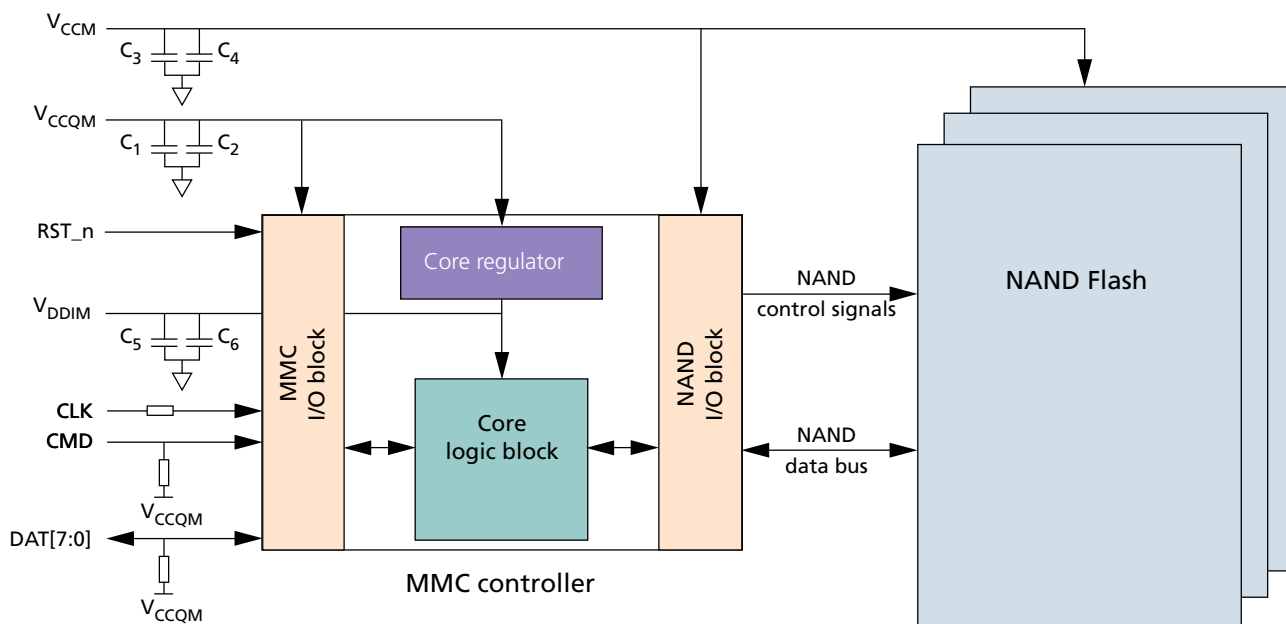

DC Electrical Specifications – Device Power

The device current consumption for various device configurations is defined in the power class fields of the ECSD register.

V_{CC} is used for the NAND Flash device and its interface voltage; V_{CCQ} is used for the controller and the e.MMC interface voltage.

Figure 6: Device Power Diagram

Table 11: Absolute Maximum Ratings

Parameters	Symbol	Min	Max	Unit
Voltage input	V_{IN}	−0.6	4.6	V
V_{CC} supply	V_{CC}	−0.6	4.6	V
V_{CCQ} supply	V_{CCQ}	−0.6	4.6	V
Storage temperature	T_{STG}	−40	85	°C

Note: 1. Voltage on any pin relative to V_{SS}.

Table 12: Capacitor and Resistance Specifications

Parameter	Symbol	Typ	Units	Notes
Pull-up resistance: CMD	R_CMD	10	kΩ	1
Pull-up resistance: DAT[7:0]	R_DAT	50	kΩ	1
Pull-up resistance: RST_n	R_RST_n	50	kΩ	2
CLK/CMD/DAT[7:0] impedance		50	Ω	3
Serial resistance on CLK	SR_CLK	22	Ω	
V_{CCQ} capacitor	C1	2.2	µF	4
	C2	0.1		
V_{CC} capacitor (≤8GB)	C3	2.2	µF	5
	C4	0.1		
V_{CC} capacitor (>8GB)	C3	4.7	µF	5
	C4	0.22		
V_{DDIM} capacitor (C_{reg})	C5	1	µF	6
	C6	0.1		

Notes: 1. Used to prevent bus floating.
2. If host does not use H/W RESET (RST_n), pull-up resistance is not needed on RST_n line (Extended_CSD[162] = 00h).
3. Impedance match.
4. The coupling capacitor should be connected with V_{CCQ} and V_{SSQ} as closely as possible.
5. The coupling capacitor should be connected with V_{CC} and V_{SS} as closely as possible.
6. The coupling capacitor should be connected with V_{DDIM} and V_{SS} as closely as possible.

Product Revision

The table below lists JEDEC v4.51 features not supported in the specified product revision. See the full JEDEC/MMC Standard No. 84-B451 specification at www.jedec.org/sites/default/files/docs/JESD84-B451.pdf for more details regarding v4.51 features.

Table 13: Product Revision

Product Revision	JEDEC Features Not Supported
1.x	Real-time clock, dynamic device capacity, extended partition types, context IDs, data tag, cache, thermal specification, native sector size, extended security protocols, packed command

Revision History

Rev. F – 1/19

- Added MPNs

Rev. E – 08/18

- Added Important Notes and Warnings section for further clarification aligning to industry standards

Rev. D – 07/15

- Changed ACC_SIZE value in ECSD Register for 16GB and 32GB device
- Changed note 3 of the ECSD Register from output to input timing diagram

Rev. C – 03/15

- Updated the values in the e·MMC Performance
- Replaced the V_{DDIM} description in the Signal Descriptions table to: "Internal voltage node"
- Changed 1.4ns to 1.2ns in note 3 of the ECSD Register Field Parameters table

Rev. B – 06/14

- Updated the values in the e·MMC Performance and e·MMC Consumption tables
- Replaced the V_{DDIM} description in the Signal Descriptions table to: "At least 0.1µF + 1µF capacitors are required to connect V_{DDIM} to ground."
- Updated the e·MMC Part Numbering Information figure
- Updated the ECSD Register table with new ECSD values
- Changed 1.1ns to 1.4ns in note 3 of the ECSD Register Field Parameters table.

Rev. A – 11/13

- Initial release

This data sheet contains minimum and maximum limits specified over the power supply and temperature range set forth herein. Although considered final, these specifications are subject to change, as further product development and data characterization sometimes occur.
