Notification Text:

SYST-24ASAY719

Microchip has released a new Product Documents for the SST26VF032B / SST26VF032BA 2.5V/3.0V 32 Mbit Serial Quad I/O (SQI) Flash Memory of devices. If you are using one of these devices please read the document located at SST26VF032B / SST26VF032BA 2.5V/3.0V 32 Mbit Serial Quad I/O (SQI) Flash Memory.

Notification Status: Final

Description of Change: Updated DC Electrical Characteristics table value for current consumption ISB2 and corrected the comment in JEDEC Flash Parameter Table: 11th DWORD.

Impacts to Data Sheet: None

Reason for Change: To Improve Productivity

Change Implementation Status: Complete

Date Document Changes Effective: 28 Sep 2020

NOTE: Please be advised that this is a change to the document only the product has not been changed.

2.5V/3.0V 32-Mbit Serial Quad I/OTM (SQITM) Flash Memory

Features

- · Single Voltage Read and Write Operations:
 - 2.7V-3.6V or 2.3V-3.6V
- Serial Interface Architecture:
 - Nibble-wide multiplexed I/O's with SPI-like serial command structure
 - Mode 0 and Mode 3
 - x1/x2/x4 Serial Peripheral Interface (SPI) Protocol
- · High-Speed Clock Frequency:
 - 2.7V-3.6V: 104 MHz maximum
 - 2.3V-3.6V: 80 MHz maximum
- · Burst Modes:
 - Continuous linear burst
 - 8/16/32/64 Byte linear burst with wrap-around
- · Superior Reliability:
 - Endurance: 100,000 Cycles (minimum)
 - Greater than 100 years Data Retention
- · Low-Power Consumption:
 - Active Read current: 15 mA (typical @ 104 MHz)
 - Standby Current: 15 µA (typical)
- Fast Erase Time:
 - Sector/Block Erase: 18 ms (typ), 25 ms (maximum)
 - Chip Erase: 35 ms (typical), 50 ms (maximum)
- · Page-Program:
 - 256 bytes per page in x1 or x4 mode
- · End-of-Write Detection:
 - Software polling BUSY bit in STATUS register
- · Flexible Erase Capability:
 - Uniform 4-Kbyte sectors
 - Four 8-KByte top and bottom parameter overlay blocks
 - One 32-Kbyte top and bottom overlay block
 - Uniform 64-Kbyte overlay blocks
- · Write-Suspend:
 - Suspend Program or Erase operation to access another block/sector
- · Software Reset (RST) mode
- · Software Write Protection:
 - Individual-Block Write Protection with permanent lock-down capability
 - 64-Kbyte blocks, two 32-Kbyte blocks, and eight 8-Kbyte parameter blocks
 - Read Protection on top and bottom 8-Kbyte parameter blocks

- · Security ID:
 - One-Time Programmable (OTP) 2-KByte, Secure ID:
 - 64-bit unique, factory preprogrammed identifier
 - User-programmable area
- · Temperature Range:
 - Industrial: -40°C to +85°C
 - Industrial Plus: -40°C to +105°C
 - Extended: -40°C to +125°C
- Automotive AEC-Q100 Grade 1, Grade 2 and Grade 3
- · Packages Available:
 - 8-contact WDFN (6 mm x 5 mm)
 - 8-lead SOIJ (5.28 mm)
 - 24-ball TBGA (6 mm x 8 mm)
- · All Devices are RoHS Compliant

Product Description

The Serial Quad I/O™ (SQI™) family of Flash memory devices features a six-wire, 4-bit I/O interface that allows for low-power, high-performance operation in a low pin-count package. SST26VF032B/032BA also support full command-set compatibility to traditional Serial Peripheral Interface (SPI) protocol. System designs using SQI Flash devices occupy less board space and ultimately lower system costs.

All members of the 26 Series, SQI family are manufactured with proprietary, high-performance CMOS SuperFlash® technology. The split-gate cell design and thick-oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches.

SST26VF032B/032BA significantly improve performance and reliability, while lowering power consumption. These devices write (Program or Erase) with a single power supply of 2.3-3.6V. The total energy consumed is a function of the applied voltage, current, and time of application. Since for any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time, the total energy consumed during any Erase or Program operation is less than alternative Flash memory technologies.

Two configurations are available upon order. SST26VF032B default at power-up has the WP# and HOLD# pins enabled, and the SIO2 and SIO3 pins disabled, to initiate SPI-protocol operations. SST26VF032BA default at power-up has the WP# and HOLD# pins disabled, and the SIO2 and SIO3 pins enabled, to initiate Quad I/O operations. See Section 4.5.8 "I/O Configuration (IOC)" for more information about configuring WP#/HOLD# and SIO2/SIO3 pins. See Figure 2-1 for pin assignments.

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Website at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Website; http://www.microchip.com
- Your local Microchip sales office (see last page)

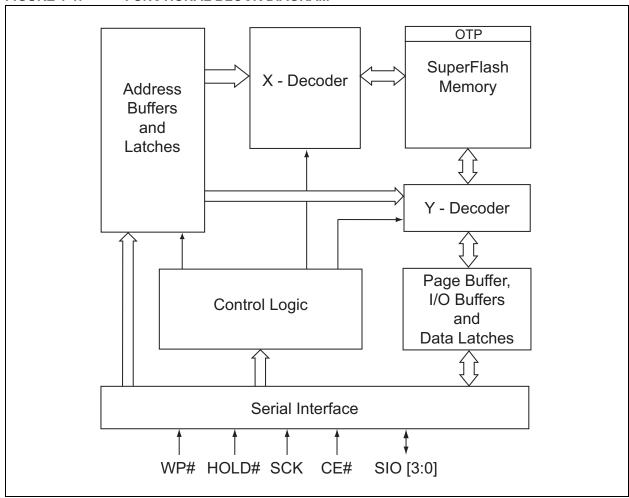

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our website at www.microchip.com to receive the most current information on all of our products.

1.0 BLOCK DIAGRAM

FIGURE 1-1: FUNCTIONAL BLOCK DIAGRAM

2.0 PIN DESCRIPTION

FIGURE 2-1: PIN ASSIGNMENTS

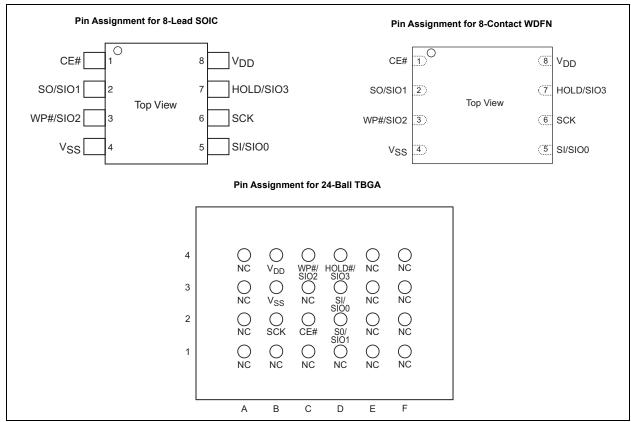

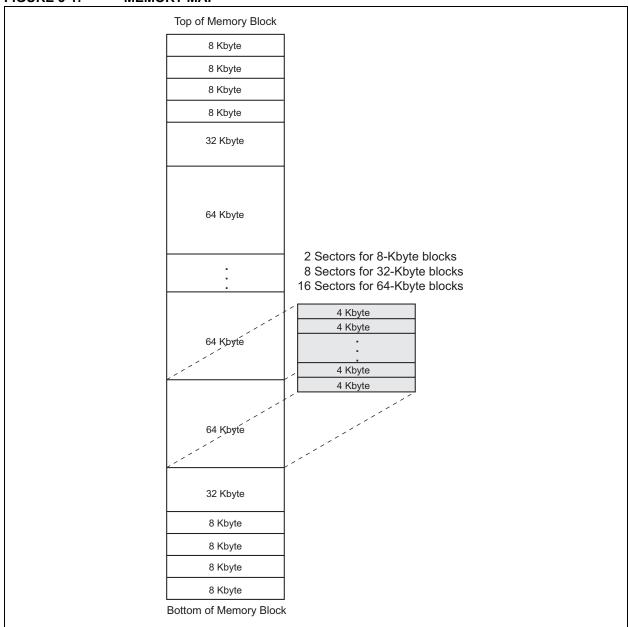

TABLE 2-1: PIN DESCRIPTION

Symbol	Pin Name	Functions
SCK	Serial Clock	To provide the timing of the serial interface. Commands, addresses or input data are latched on the rising edge of the clock input, while output data is shifted out on the falling edge of the clock input.
SIO[3:0]	Serial Data Input/Output	To transfer commands, addresses or data serially into the device or data out of the device. Inputs are latched on the rising edge of the serial clock. Data is shifted out on the falling edge of the serial clock. The Enable Quad I/O (EQIO) command instruction configures these pins for Quad I/O mode.
SI	Serial Data Input for SPI mode	To transfer commands, addresses or data serially into the device. Inputs are latched on the rising edge of the serial clock. SI is the default state after a power on reset.
SO	Serial Data Output for SPI mode	To transfer data serially out of the device. Data is shifted out on the falling edge of the serial clock. SO is the default state after a power on reset.
CE#	Chip Enable	The device is enabled by a high-to-low transition on CE#. CE# must remain low for the duration of any command sequence; or in the case of write operations, for the command/data input sequence.
WP#	Write-Protect	The Write-Protect (WP#) is used in conjunction with the WPEN and IOC bits in the Configuration register to prohibit write operations to the Block Protection register. This pin only works in SPI, single-bit and dual-bit Read mode.
HOLD#	Hold	Temporarily stops serial communication with the SPI Flash memory while the device is selected. This pin only works in SPI, single-bit and dual-bit Read mode and must be tied high when not in use.
VDD	Power Supply	To provide power supply voltage.
Vss	Ground	

3.0 MEMORY ORGANIZATION

The SST26VF032B/032BA SQI memory array is organized in uniform, 4-Kbyte erasable sectors with the following erasable blocks: eight 8-Kbyte parameter, two 32-Kbyte overlay, and sixty-two 64-Kbyte overlay blocks. See Figure 3-1.

FIGURE 3-1: MEMORY MAP

4.0 DEVICE OPERATION

SST26VF032B/032BA support both Serial Peripheral Interface (SPI) bus protocol and a 4-bit multiplexed SQI bus protocol. To provide backward compatibility to traditional SPI Serial Flash devices, the device's initial state after a Power-on Reset is SPI mode which supports multi-I/O (x1/x2/x4) read/write commands. A command instruction configures the device to SQI mode. The dataflow in the SQI mode is similar to the SPI mode, except it uses four multiplexed I/O signals for command, address, and data sequence.

SQI Flash Memory supports both Mode 0 (0,0) and Mode 3 (1,1) bus operations. The difference between the two modes is the state of the SCK signal when the

bus master is in stand-by mode and no data is being transferred. The SCK signal is low for Mode 0 and SCK signal is high for Mode 3. For both modes, the Serial Data I/O (SIO[3:0]) is sampled at the rising edge of the SCK clock signal for input, and driven after the falling edge of the SCK clock signal for output. The traditional SPI protocol uses separate input (SI) and output (SO) data signals as shown in Figure 4-1. The SQI protocol uses four multiplexed signals, SIO[3:0], for both data in and data out, as shown in Figure 4-2. This means the SQI protocol quadruples the traditional bus transfer speed at the same clock frequency, without the need for more pins on the package.

FIGURE 4-1: SPI PROTOCOL (TRADITIONAL 25 SERIES SPI DEVICE)

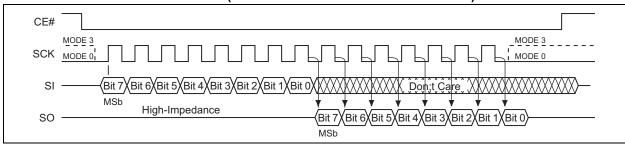

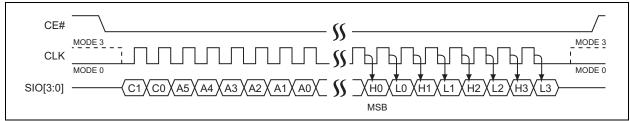

FIGURE 4-2: SQI SERIAL QUAD I/O PROTOCOL

4.1 Device Protection

SST26VF032B/032BA offer a flexible memory protection scheme that allows the protection state of each individual block to be controlled separately. In addition, the Write Protection Lock-Down register prevents any change of the lock status during device operation. To avoid inadvertent writes during power-up, the device is write-protected by default after a Power-on Reset cycle. A Global Block Protection Unlock command offers a single command cycle that unlocks the entire memory array for faster manufacturing throughput.

For extra protection, there is an additional nonvolatile register that can permanently write-protect the Block Protection register bits for each individual block. Each of the corresponding lock-down bits are one time programmable (OTP) once written, they cannot be erased. Data that had been previously programmed into these blocks cannot be altered by programming or erase and is not reversible

4.1.1 INDIVIDUAL BLOCK PROTECTION

SST26VF032B/032BA have a Block Protection register which provides a software mechanism to write-lock the individual memory blocks and write-lock, and/or read-lock, the individual parameter blocks. The Block Protection register is 80 bits wide: two bits each for the eight 8-Kbyte parameter blocks (write-lock and read-lock), and one bit each for the remaining 32-Kbyte and 64-Kbyte overlay blocks (write-lock). See Table 5-6 for address range protected per register bit.

Each bit in the Block Protection register (BPR) can be written to a '1' (protected) or '0' (unprotected). For the parameter blocks, the most significant bit is for readlock, and the least significant bit is for write-lock. Readlocking the parameter blocks provides additional security for sensitive data after retrieval (e.g., after initial boot). If a block is read-locked all reads to the block return data 00H.

The Write Block Protection Register command is a two-cycle command which requires that Write Enable (WREN) is executed prior to the Write Block Protection Register command. The Global Block Protection Unlock command clears all write protection bits in the Block Protection register.

4.1.2 WRITE PROTECTION LOCK-DOWN (VOLATILE)

To prevent changes to the Block Protection register, use the Lock-Down Block Protection Register (LBPR) command to enable Write Protection Lock-Down. Once Write Protection Lock-Down is enabled, the Block Protection register can not be changed. To avoid inadvertent Lock-Down, the WREN command must be executed prior to the LBPR command.

To reset Write Protection Lock-Down, performing a power cycle on the device is required. The Write Protection Lock-Down status may be read from the STATUS register.

4.1.3 WRITE LOCK LOCK-DOWN (NONVOLATILE)

The nonvolatile Write Lock Lock-Down register is an alternate register that permanently prevents changes to the block-protect bits. The nonvolatile Write Lock Lock-Down register (nVWLDR) is 72-bits wide per device: one bit each for the eight 8-Kbyte parameter blocks, and one bit each for the remaining 32-Kbyte and 64-Kbyte overlay blocks. See Table 5-6 for address range protected per register bit.

Writing '1' to any or all of the nVWLDR bits disables the change mechanism for the corresponding Write Lock bit in the BPR, and permanently sets this bit to a '1' (protected) state. After this change, both bits will be set to '1', regardless of the data entered in subsequent writes to either the nVWLDR or the BPR. Subsequent writes to the nVWLDR can only alter available locations that have not been previously written to a '1'. This method provides write protection for the corresponding memory-array block by protecting it from future program or erase operations.

Writing a '0' in any location in the nVWLDR has no effect on either the nVWLDR or the corresponding Write Lock bit in the BPR.

Note that if the Block Protection register had been previously locked down, see **Section 4.1.2** "Write Protection Lock-Down (Volatile)", the device must be power cycled before using the nVWLDR. If the Block Protection register is locked down and the Write nVWLDR command is accessed, the command will be ignored.

4.2 Hardware Write Protection

The hardware Write Protection pin (WP#) is used in conjunction with the WPEN and IOC bits in the Configuration register to prohibit write operations to the Block Protection and Configuration registers. The WP# pin function only works in SPI single-bit and dual-bit read mode when the IOC bit in the Configuration register is set to '0'.

The WP# pin function is disabled when the WPEN bit in the Configuration register is '0'. This allows installation of the SST26VF032B/032BA in a system with a grounded WP# pin while still enabling Write to the Block Protection register. The Lock-Down function of the Block Protection register supersedes the WP# pin, see Table 4-1 for Write Protection Lock-Down states.

The factory default setting at power-up of the WPEN bit is '0', disabling the Write-Protect function of the WP# after power-up. WPEN is a nonvolatile bit; once the bit is set to '1', the Write-Protect function of the WP# pin continues to be enabled after power-up. The WP# pin only protects the Block Protection register and Configuration register from changes. Therefore, if the WP# pin is set to low before or after a Program or Erase command, or while an internal Write is in progress, it will have no effect on the Write command.

The IOC bit takes priority over the WPEN bit in the Configuration register. When the IOC bit is '1', the function of the WP# pin is disabled and the WPEN bit serves no function. When the IOC bit is '0' and WPEN is '1', setting the WP# pin active-low prohibits Write operations to the Block Protection register.

WP#	IOC	WPEN	WPLD	Execute WBPR Instruction	Configuration Register		
L	0	1	1	Not Allowed	Protected		
L	0	0	1	Not Allowed	Writable		
L	0	1	0	Not Allowed	Protected		
L	0(1)	0(2)	0	Allowed	Writable		
Н	0	X	1	Not Allowed	Writable		
Н	0	X	0	Allowed	Writable		
Х	1	X	1	Not Allowed	Writable		
Х	1 ⁽³⁾	O ⁽²⁾	0	Allowed	Writable		

TABLE 4-1: WRITE PROTECTION LOCK-DOWN STATES

- Note 1: Default at power-up Register settings for SST26VF032B
 - 2: Factory default setting is '0'. This is a nonvolatile bit; default at power-up is the value set prior to power-down.
 - 3: Default at power-up Register settings for SST26VF032BA

4.3 Security ID

SST26VF032B/032BA offer a 2-Kbyte Security ID (Sec ID) feature. The Security ID space is divided into two parts – one factory-programmed, 64-bit segment and one user-programmable segment. The factory-programmed segment is programmed during manufacturing with a unique number and cannot be changed. The user-programmable segment is left unprogrammed for the customer to program as desired.

Use the Program Security ID (PSID) command to program the Security ID using the address shown in Table 5-5. The Security ID can be locked using the Lockout Security ID (LSID) command. This prevents any future write operations to the Security ID.

The factory-programmed portion of the Security ID can't be programmed by the user; neither the factory-programmed nor user-programmable areas can be erased.

4.4 Hold Operation

The HOLD# pin pauses active serial sequences without resetting the clocking sequence. This pin is active after every power up and only operates during SPI single-bit and dual-bit modes. Two factory configurations are available: SST26VF032B ships with the IOC bit set to '0' and the HOLD# pin function enabled;

SST26VF032BA ships with the IOC bit set to '1' and the HOLD# pin function disabled. The HOLD# pin is always disabled in SQI mode and only works in SPI single-bit and dual-bit read mode.

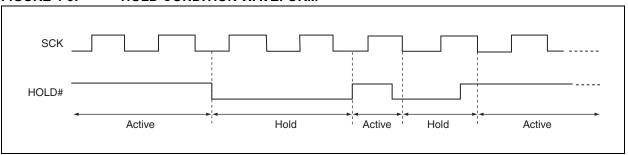

To activate the Hold mode, CE# must be in active-low state. The Hold mode begins when the SCK active-low state coincides with the falling edge of the HOLD# signal. The Hold mode ends when the HOLD# signal's rising edge coincides with the SCK active-low state.

If the falling edge of the HOLD# signal does not coincide with the SCK active-low state, then the device enters Hold mode when the SCK next reaches the active-low state. Similarly, if the rising edge of the HOLD# signal does not coincide with the SCK active-low state, then the device exits Hold mode when the SCK next reaches the active-low state. See Figure 4-3.

Once the device enters Hold mode, SO will be in high impedance state while SI and SCK can be VIL or VIH.

If CE# is driven active high during a Hold condition, it resets the internal logic of the device. As long as HOLD# signal is low, the memory remains in the Hold condition. To resume communication with the device, HOLD# must be driven active high, and CE# must be driven active-low.

4.5 STATUS Register

The STATUS register is a read-only register that provides the following status information: whether the Flash memory array is available for any read or write operation, if the device is Write enabled, whether an erase or program operation is suspended, and if the Block Protection register and/or Security ID are locked

down. During an internal erase or program operation, the STATUS register may be read to determine the completion of an operation in progress. Table 4-2 describes the function of each bit in the STATUS register.

TABLE 4-2: STATUS REGISTER

Bit	Name	Function	Default at Power-up	Read/Write (R/W)
0	BUSY	Write operation status 1 = Internal Write operation is in progress 0 = No internal Write operation is in progress	0	R
1	WEL	Write Enable Latch status 1 = Device is write-enabled 0 = Device is not write-enabled	0	R
2	WSE	Write Suspend-Erase status 1 = Erase suspended 0 = Erase is not suspended	0	R
3	WSP	Write Suspend-Program status 1 = Program suspended 0 = Program is not suspended	0	R
4	WPLD	Write Protection Lock-Down status 1 = Write Protection Lock-Down enabled 0 = Write Protection Lock-Down disabled	0	R
5	SEC ⁽¹⁾	Security ID status 1 = Security ID space locked 0 = Security ID space not locked	0 ⁽¹⁾	R
6	RES	Reserved for future use	0	R
7	BUSY	Write operation status 1 = Internal Write operation is in progress 0 = No internal Write operation is in progress	0	R

Note 1: The Security ID status will always be '1' at power-up after a successful execution of the Lockout Security ID instruction, otherwise default at power-up is '0'.

4.5.1 WRITE ENABLE LATCH (WEL)

The Write Enable Latch (WEL) bit indicates the status of the internal memory's Write Enable Latch. If the WEL bit is set to '1', the device is write enabled. If the bit is set to '0' (reset), the device is not write enabled and does not accept any memory program or erase, Protection Register Write, or Lock-Down commands. The Write-Enable Latch bit is automatically reset under the following conditions:

- · Power-up
- Reset
- Write Disable (WRDI) instruction
- · Page Program instruction completion
- · Sector Erase instruction completion
- · Block Erase instruction completion
- · Chip Erase instruction completion
- · Write Block Protection register instruction
- · Lock-Down Block Protection register instruction
- · Program Security ID instruction completion
- · Lockout Security ID instruction completion
- · Write Suspend instruction
- SPI Quad Page program instruction completion
- · Write STATUS Register

4.5.2 WRITE SUSPEND ERASE STATUS (WSE)

The Write Suspend Erase status (WSE) indicates when an erase operation has been suspended. The WSE bit is '1' after the host issues a suspend command during an Erase operation. Once the suspended Erase resumes, the WSE bit is reset to '0'.

4.5.3 WRITE SUSPEND PROGRAM STATUS (WSP)

The Write Suspend Program status (WSP) bit indicates when a Program operation has been suspended. The WSP is '1' after the host issues a suspend command during the Program operation. Once the suspended Program resumes, the WSP bit is reset to '0'.

4.5.4 WRITE PROTECTION LOCK-DOWN STATUS (WPLD)

The Write Protection Lock-Down status (WPLD) bit indicates when the Block Protection register is locked-down to prevent changes to the protection settings. The WPLD is '1' after the host issues a Lock-Down Block Protection command. After a power cycle, the WPLD bit is reset to '0'.

4.5.5 SECURITY ID STATUS (SEC)

The Security ID Status (SEC) bit indicates when the Security ID space is locked to prevent a Write command. The SEC is '1' after the host issues a Lockout SID command. Once the host issues a Lockout SID command, the SEC bit can never be reset to '0.'

4.5.6 BUSY

The BUSY bit determines whether there is an internal Erase or Program operation in progress. If the BUSY bit is '1', the device is busy with an internal Erase or Program operation. If the bit is '0', no Erase or Program operation is in progress.

4.5.7 CONFIGURATION REGISTER

The Configuration register is a Read/Write register that stores a variety of configuration information. See Table 4-3 for the function of each bit in the register.

TABLE 4-3:	CONFIGURATIO	N REGISTER
-------------------	--------------	------------

Bit	Name	Function	Default at Power-up	Read/Write (R/W)
0	RES	Reserved	0	R
1	I/O Configuration for SPI Mode 1 = WP# and HOLD# pins disabled 0 = WP# and HOLD# pins enabled		0 ⁽¹⁾	R/W
2	RES	Reserved	0	R
3	BPNV	Block Protection Volatility State 1 = No memory block has been permanently locked 0 = Any block has been permanently locked	1	R
4	RES	Reserved	0	R
5	RES	Reserved	0	R
6	RES	Reserved	0	R
7	WPEN	Write Protection Pin (WP#) Enable 1 = WP# enabled 0 = WP# disabled	0 ⁽²⁾	R/W

Note 1: SST26VF032B default at Power-up is '0'. SST26VF032BA default at Power-up is '1'.

2: Factory default setting. This is a nonvolatile bit; default at power-up will be the setting prior to power-down.

4.5.8 I/O CONFIGURATION (IOC)

The I/O Configuration (IOC) bit re-configures the I/O pins. The IOC bit is set by writing a '1' to Bit 1 of the Configuration register. When IOC bit is '0' the WP# pin and HOLD# pin are enabled (SPI or Dual Configuration setup). When IOC bit is set to '1' the SIO2 pin and SIO3 pin are enabled (SPI Quad I/O Configuration setup). The IOC bit must be set to '1' before issuing the following SPI commands: SQOR (6BH), SQIOR (EBH), RBSPI (ECH), and SPI Quad page program (32H). Without setting the IOC bit to '1', those SPI commands are not valid. The I/O configuration bit does not apply when in SQI mode. The default at power-up for SST26VF032B is '0' and for SST26VF032BA is '1'.

4.5.9 BLOCK PROTECTION VOLATILITY STATE (BPNV)

The Block Protection Volatility State bit indicates whether any block has been permanently locked with the nVWLDR. When no bits in the nVWLDR have been set, the BPNV is '1'; this is the default state from the factory. When one or more bits in the nVWLDR are set to '1', the BPNV bit will also be '0' from that point forward, even after power-up.

4.5.10 WRITE-PROTECT ENABLE (WPEN)

The Write-Protect Enable (WPEN) bit is a nonvolatile bit that enables the WP# pin.

The Write-Protect (WP#) pin and the Write-Protect Enable (WPEN) bit control the programmable hardware write-protect feature. Setting the WP# pin to low, and the WPEN bit to '1', enables hardware write protection. To disable hardware write protection, set either the WP# pin to high or the WPEN bit to '0'. There is latency associated with writing to the WPEN bit. Poll the BUSY bit in the STATUS register, or wait TWPEN, for the completion of the internal, self-timed Write operation. When the chip is hardware write-protected, only Write operations to Block Protection and Configuration registers are disabled. See Section 4.2 "Hardware Write Protection" and Table 4-1 for more information about the functionality of the WPEN bit.

5.0 INSTRUCTIONS

Instructions are used to read, write (erase and program), and configure the SST26VF032B/032BA. The complete list of the instructions is provided in Table 5-1.

TABLE 5-1: DEVICE OPERATION INSTRUCTIONS FOR SST26VF032B/032BA

IABLE 3-1	5-1. DEVICE OPERATION INSTRUCTIONS FOR SS126VF032B/032BA

- Note 1: Command cycle is two clock periods in SQI mode and eight clock periods in SPI mode.
 - 2: Address bits above the most significant bit of each density can be VIL or VIH.
 - 3: Address, Dummy/Mode bits, and Data cycles are two clock periods in SQI and eight clock periods in SPI mode.
 - **4:** The maximum frequency for all instructions is up to 104 MHz for 2.7V-3.6V and up to 80 MHz for 2.3V-3.6V unless otherwise noted. For Extended temperature (125°C), max frequency is up to 80 MHz.
 - 5: RST command only executed if RSTEN command is executed first. Any intervening command will disable Reset.
 - **6:** Device accepts eight-clock command in SPI mode, or two-clock command in SQI mode.
 - 7: Data cycles are two clock periods. IOC bit must be set to '1' before issuing the command.
 - **8:** Address, Dummy/Mode bits, and data cycles are two clock periods. IOC bit must be set to '1' before issuing the command.
 - **9:** Data cycles are four clock periods.
 - **10:** Address, Dummy/Mode bits, and Data cycles are four clock periods.
 - 11: Sector Addresses: Use AMS-A12, remaining address are don't care, but must be set to VIL or VIH.
 - **12:** Blocks are 64-Kbyte, 32-Kbyte, or 8-Kbyte, depending on location. Block Erase Address: AMS-A₁₆ for 64 Kbyte; AMS-A₁₅ for 32 Kbyte; AMS-A₁₃ for 8 Kbyte. Remaining addresses are don't care, but must be set to VIL or VIH.

5.1 No Operation (NOP)

The No Operation command only cancels a Reset Enable command. ${\tt NOP}$ has no impact on any other command.

5.2 Reset Enable (RSTEN) and Reset (RST)

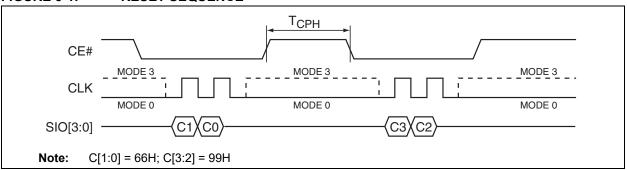

The Reset operation is used as a system (software) reset that puts the device in normal operating Ready mode. This operation consists of two commands: Reset Enable (RSTEN) followed by Reset (RST).

To reset the SST26VF032B/032BA, the host drives CE# low, sends the Reset-Enable command (66H), and drives CE# high. Next, the host drives CE# low again, sends the Reset command (99H), and drives CE# high, see Figure 5-1.

The Reset operation requires the Reset-Enable command followed by the Reset command. Any command other than the Reset command after the Reset Enable command will disable the Reset Enable.

Once the Reset Enable and Reset commands are successfully executed, the device returns to normal operation Read mode and then does the following: resets the protocol to SPI mode, resets the burst length to 8 bytes, clears all the bits, except for bit 4 (WPLD) and bit 5 (SEC), in the STATUS register to their default states, and clears bit 1 (IOC) in the Configuration register to its default state. A device reset during an active program or erase operation aborts the operation, which can cause the data of the targeted address range to be corrupted or lost. Depending on the prior operation, the reset timing may vary. Recovery from a write operation requires more latency time than recovery from other operations. See Table 8-2 for Reset timing parameters.

FIGURE 5-1: RESET SEQUENCE

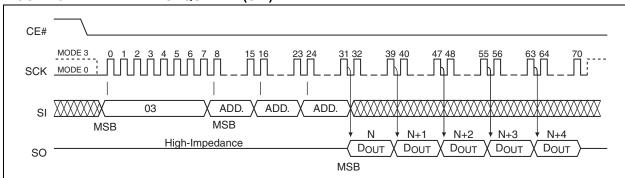

5.3 Read (40 MHz)

The Read instruction, 03H, is supported in SPI bus protocol only with clock frequencies up to 40 MHz. This command is not supported in SQI bus protocol. The device outputs the data starting from the specified address location, then continuously streams the data output through all addresses until terminated by a low-to-high transition on CE#. The internal Address Pointer will automatically increment until the highest memory

address is reached. Once the highest memory address is reached, the Address Pointer will automatically return to the beginning (wrap-around) of the address space.

Initiate the Read instruction by executing an 8-bit command, 03H, followed by address bits A[23:0]. CE# must remain active-low for the duration of the Read cycle. See Figure 5-2 for Read Sequence.

FIGURE 5-2: READ SEQUENCE (SPI)

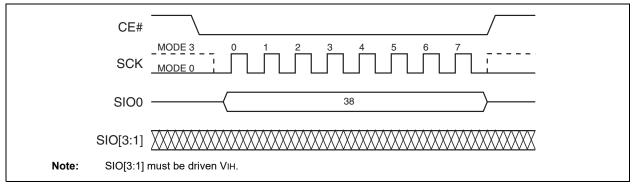

5.4 Enable Quad I/O (EQIO)

The Enable Quad I/O (EQIO) instruction, 38H, enables the Flash device for SQI bus operation. Upon completion of the instruction, all instructions thereafter are

expected to be 4-bit multiplexed input/output (SQI mode) until a power cycle or a "Reset Quad I/O instruction" is executed. See Figure 5-3.

FIGURE 5-3: ENABLE QUAD I/O SEQUENCE

5.5 Reset Quad I/O (RSTQIO)

The Reset Quad I/O instruction, FFH, resets the device to 1-bit SPI protocol operation or exits the Set Mode configuration during a read sequence. This command allows the Flash device to return to the default I/O state (SPI) without a power cycle, and executes in either 1-bit or 4-bit mode. If the device is in the Set Mode configuration, while in SQI High-Speed Read mode, the RSTQIO command will only return the device to a state

where it can accept new command instruction. An additional RSTQIO is required to reset the device to SPI mode.

To execute a Reset Quad I/O operation, the host drives CE# low, sends the Reset Quad I/O command cycle (FFH) then, drives CE# high. Execute the instruction in either SPI (8 clocks) or SQI (2 clocks) command cycles. For SPI, SIO[3:1] are don't care for this command, but should be driven to VIH or VIL. See Figure 5-4 and Figure 5-5.

FIGURE 5-4: RESET QUAD I/O SEQUENCE (SPI)

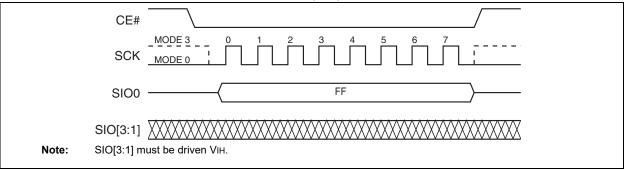

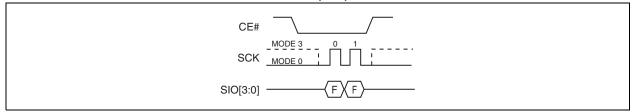

FIGURE 5-5: RESET QUAD I/O SEQUENCE (SQI)

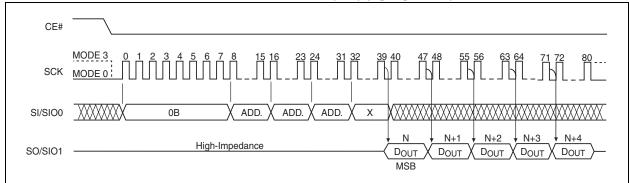

5.6 High-Speed Read

The High-Speed Read instruction, 0BH, is supported in both SPI bus protocol and SQI protocol. This instruction supports frequencies of up to 104 MHz from 2.7V-3.6V and up to 80 MHz from 2.3V-3.6V. On power-up, the device is set to use SPI.

Initiate High-Speed Read by executing an 8-bit command, 0BH, followed by address bits A[23:0] and a dummy byte. CE# must remain active-low for the duration of the High-Speed Read cycle. See Figure 5-6 for the High-Speed Read sequence for SPI bus protocol.

FIGURE 5-6: HIGH-SPEED READ SEQUENCE (SPI) (C[1:0] = 0BH)

In SQI protocol, the host drives CE# low then send the Read command cycle command, 0BH, followed by three address cycles, a Set Mode Configuration cycle, and two dummy cycles. Each cycle is two nibbles (clocks) long, most significant nibble first.

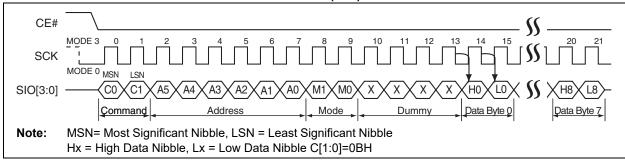

After the dummy cycles, the device outputs data on the falling edge of the SCK signal starting from the specified address location. The device continually streams data output through all addresses until terminated by a low-to-high transition on CE#. The internal Address Pointer automatically increments until the highest memory address is reached, at which point the Address Pointer returns to address location 000000H. During this operation, blocks that are Read-locked will output data 00H.

The Set Mode Configuration bit M[7:0] indicates if the next instruction cycle is another SQI High-Speed Read command. When M[7:0] = AXH, the device expects the next continuous instruction to be another read com-

mand, 0BH, and does not require the op-code to be entered again. The host may initiate the next Read cycle by driving CE# low, then sending the four-bits input for address A[23:0], followed by the Set Mode configuration bits M[7:0], and two dummy cycles. After the two dummy cycles, the device outputs the data starting from the specified address location. There are no restrictions on address location access.

When M[7:0] is any value other than AXH, the device expects the next instruction initiated to be a command instruction. To reset/exit the Set Mode configuration, execute the Reset Quad I/O command, FFH. While in the Set Mode configuration, the RSTQIO command will only return the device to a state where it can accept new command instruction. An additional RSTQIO is required to reset the device to SPI mode. See Figure 5-10 for the SPI Quad I/O Mode Read sequence when M[7:0] = AXH.

FIGURE 5-7: HIGH-SPEED READ SEQUENCE (SQI)

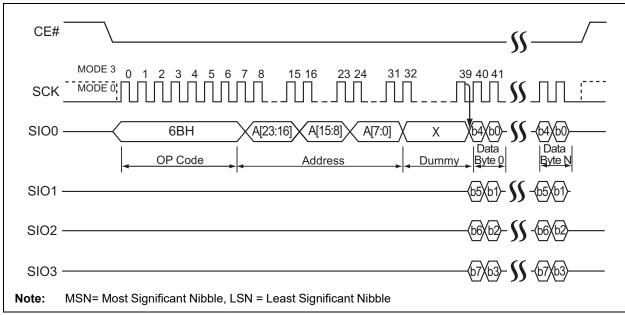

5.7 SPI Quad-Output Read

The SPI Quad-Output Read instruction supports frequencies of up to 104 MHz from 2.7V-3.6V and up to 80 MHz from 2.3V-3.6V. SST26VF032B requires the IOC bit in the Configuration register to be set to '1' prior to executing the command. Initiate SPI Quad-Output Read by executing an 8-bit command, 6BH, followed by address bits A[23:0] and a dummy byte. CE# must remain active-low for the duration of the SPI Quad Mode Read. See Figure 5-8 for the SPI Quad Output Read sequence.

Following the dummy byte, the device outputs data from SIO[3:0] starting from the specified address location. The device continually streams data output through all addresses until terminated by a low-to-high transition on CE#. The internal Address Pointer automatically increments until the highest memory address is reached, at which point the Address Pointer returns to the beginning of the address space.

FIGURE 5-8: SPI QUAD OUTPUT READ

5.8 SPI Quad I/O Read

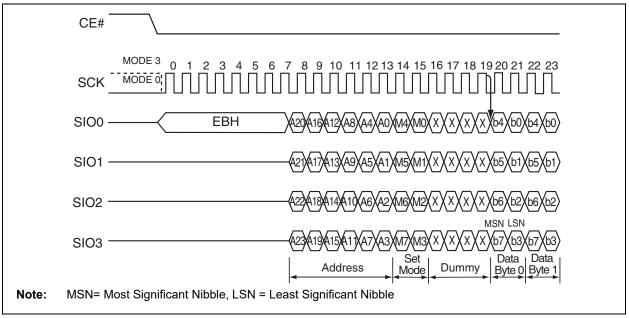

The SPI Quad I/O Read (SQIOR) instruction supports frequencies of up to 104 MHz from 2.7V-3.6V and up to 80 MHz from 2.3V-3.6V. SST26VF032B requires the IOC bit in the Configuration register to be set to '1' prior to executing the command. Initiate SQIOR by executing an 8-bit command, EBH. The device then switches to 4-bit I/O mode for address bits A[23:0], followed by the Set Mode configuration bits M[7:0], and two dummy bytes.CE# must remain active-low for the duration of the SPI Quad I/O Read. See Figure 5-9 for the SPI Quad I/O Read sequence.

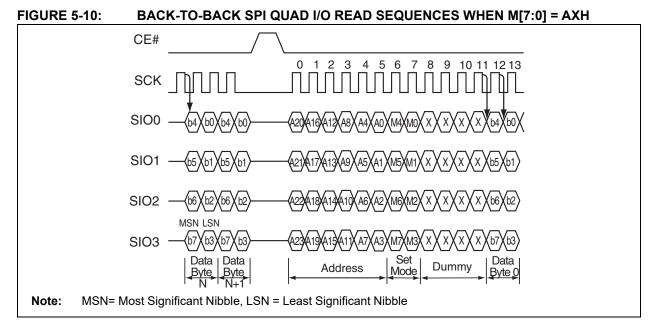

Following the dummy bytes, the device outputs data from the specified address location. The device continually streams data output through all addresses until terminated by a low-to-high transition on CE#. The internal Address Pointer automatically increments until the highest memory address is reached, at which point the Address Pointer returns to the beginning of the address space.

The Set Mode Configuration bit M[7:0] indicates if the next instruction cycle is another SPI Quad I/O Read command. When M[7:0] = AXH, the device expects the next continuous instruction to be another Read command, EBH, and does not require the op-code to be entered again. The host may set the next SQIOR cycle by driving CE# low, then sending the four-bit wide input for address A[23:0], followed by the Set Mode configuration bits M[7:0], and two dummy cycles. After the two dummy cycles, the device outputs the data starting from the specified address location. There are no restrictions on address location access.

When M[7:0] is any value other than AXH, the device expects the next instruction initiated to be a command instruction. To reset/exit the Set Mode configuration, execute the Reset Quad I/O command, FFH. See Figure 5-10 for the SPI Quad I/O Mode Read sequence when M[7:0] = AXH.

FIGURE 5-9: SPI QUAD I/O READ SEQUENCE

5.9 Set Burst

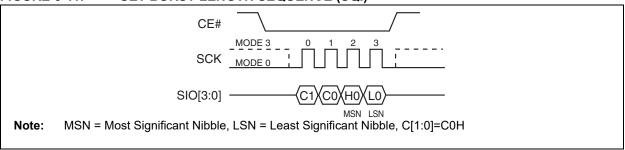

The Set Burst command specifies the number of bytes to be output during a Read Burst command before the device wraps around. It supports both SPI and SQI protocols. To set the burst length the host drives CE# low,

sends the Set Burst command cycle (C0H) and one data cycle, then drives CE# high. After power-up or reset, the burst length is set to eight bytes (00H). See Table 5-2 for burst length data and Figure 5-11 and Figure 5-12 for the sequences.

TABLE 5-2: BURST LENGTH DATA

Burst Length	High Nibble (H0)	Low Nibble (L0)
8 Bytes	0h	0h
16 Bytes	0h	1h
32 Bytes	0h	2h
64 Bytes	0h	3h

Troto: Groto. 1] made so anven viji.

SQI Read Burst with Wrap (RBSQI)

5.10

SQI Read Burst with wrap is similar to High Speed Read in SQI mode, except data will output continuously within the burst length until a low-to-high transition on CE#. To execute a SQI Read Burst operation, drive CE# low then send the Read Burst command cycle (0CH), followed by three address cycles, and then three dummy cycles. Each cycle is two nibbles (clocks) long, most significant nibble first.

After the dummy cycles, the device outputs data on the falling edge of the SCK signal starting from the specified address location. The data output stream is continuous through all addresses until terminated by a low-to-high transition on CE#.

During RBSQI, the internal Address Pointer automatically increments until the last byte of the burst is reached, then it wraps around to the first byte of the burst. All bursts are aligned to addresses within the burst length, see Table 5-3. For example, if the burst length is 8 bytes, and the start address is 06h, the burst sequence would be: 06h, 07h, 00h, 01h, 02h, 03h, 04h, 05h, 06h, etc. The pattern repeats until the command is terminated by a low-to-high transition on CE#.

During this operation, blocks that are Read-locked will output data 00H.

5.11 SPI Read Burst with Wrap (RBSPI)

SPI Read Burst with Wrap (RBSPI) is similar to SPI Quad I/O Read except the data will output continuously within the burst length until a low-to-high transition on CE#. To execute a SPI Read Burst with Wrap operation, drive CE# low, then send the Read Burst command cycle (ECH), followed by three address cycles, and then three dummy cycles.

After the dummy cycle, the device outputs data on the falling edge of the SCK signal starting from the specified address location. The data output stream is continuous through all addresses until terminated by a low-to-high transition on CE#.

During RBSPI, the internal Address Pointer automatically increments until the last byte of the burst is reached, then it wraps around to the first byte of the burst. All bursts are aligned to addresses within the burst length, see Table 5-3. For example, if the burst length is 8 bytes, and the start address is 06h, the burst sequence would be: 06h, 07h, 00h, 01h, 02h, 03h, 04h, 05h, 06h, etc. The pattern repeats until the command is terminated by a low-to-high transition on CE#.

During this operation, blocks that are Read-locked will output data 00H.

TABLE 5-3: BURST ADDRESS RANGES

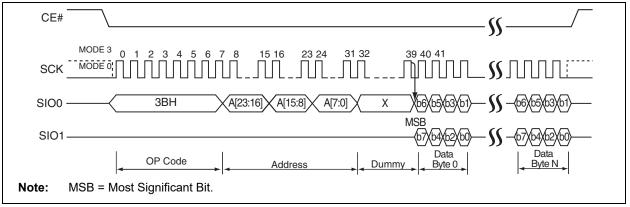

171DEE 0 0. DOIGE 71	ADDE O OF DOTTO FAIR OLD				
Burst Length	Burst Address Ranges				
8 Bytes	00-07H, 08-0FH, 10-17H, 18-1FH				
16 Bytes	00-0FH, 10-1FH, 20-2FH, 30-3FH				
32 Bytes	00-1FH, 20-3FH, 40-5FH, 60-7FH				
64 Bytes	00-3FH, 40-7FH, 80-BFH, C0-FFH				

5.12 SPI Dual-Output Read

The SPI Dual-Output Read instruction supports frequencies of up to 104 MHz from 2.7V-3.6V and up to 80 MHz from 2.3V-3.6V. Initiate SPI Dual-Output Read by executing an 8-bit command, 3BH, followed by address bits A[23:0] and a dummy byte. CE# must remain active-low for the duration of the SPI Dual-Output Read operation. See Figure 5-13 for the SPI Quad Output Read sequence.

Following the dummy byte, the SST26VF032B/032BA outputs data from SIO[1:0] starting from the specified address location. The device continually streams data output through all addresses until terminated by a low-to-high transition on CE#. The internal Address Pointer automatically increments until the highest memory address is reached, at which point the Address Pointer returns to the beginning of the address space.

FIGURE 5-13: FAST READ, DUAL-OUTPUT SEQUENCE

5.13 SPI Dual I/O Read

The SPI Dual I/O Read (SDIOR) instruction supports up to 80 MHz frequency. Initiate SDIOR by executing an 8-bit command, BBH. The device then switches to 2-bit I/O mode for address bits A[23:0], followed by the Set Mode configuration bits M[7:0]. CE# must remain active-low for the duration of the SPI Dual I/O Read. See Figure 5-14 for the SPI Dual I/O Read sequence.

Following the Set Mode configuration bits, the SST26VF032B/032BA outputs data from the specified address location. The device continually streams data output through all addresses until terminated by a low-to-high transition on CE#. The internal Address Pointer automatically increments until the highest memory address is reached, at which point the Address Pointer returns to the beginning of the address space.

The Set Mode Configuration bit M[7:0] indicates if the next instruction cycle is another SPI Dual I/O Read command. When M[7:0] = AXH, the device expects the next continuous instruction to be another SDIOR command, BBH, and does not require the op-code to be entered again. The host may set the next SDIOR cycle by driving CE# low, then sending the two-bit wide input for address A[23:0], followed by the Set Mode configuration bits M[7:0]. After the Set Mode configuration bits, the device outputs the data starting from the specified address location. There are no restrictions on address location access.

When M[7:0] is any value other than AXH, the device expects the next instruction initiated to be a command instruction. To reset/exit the Set Mode configuration, execute the Reset Quad I/O command, FFH. See Figure 5-15 for the SPI Dual I/O Read sequence when M[7:0] = AXH.

FIGURE 5-14: SPI DUAL I/O READ SEQUENCE

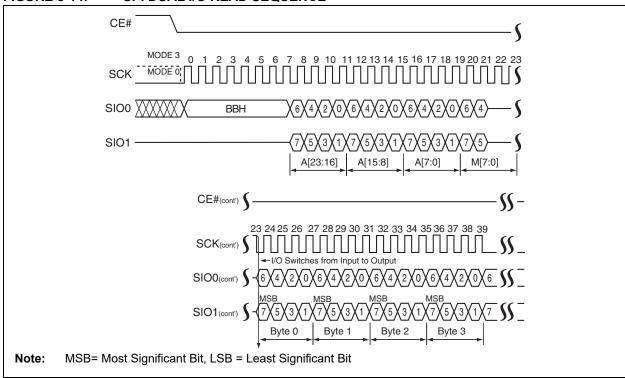

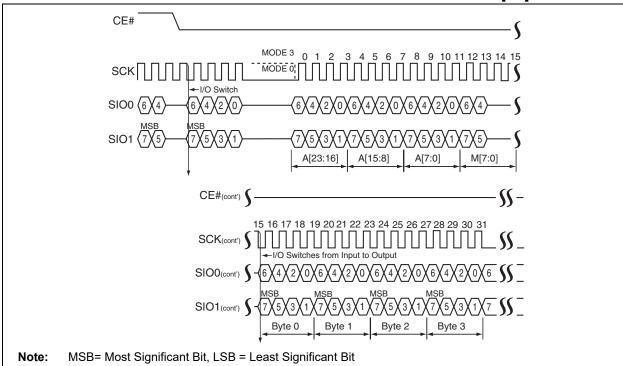

FIGURE 5-15: BACK-TO-BACK SPI DUAL I/O READ SEQUENCES WHEN M[7:0] = AXH

5.14 JEDEC-ID Read (SPI Protocol)

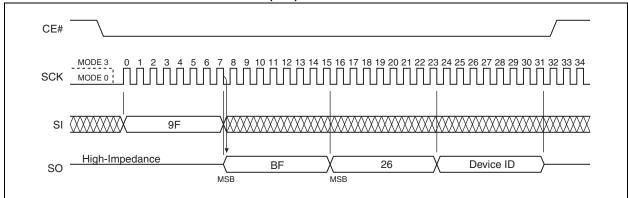

Using traditional SPI protocol, the JEDEC-ID Read instruction identifies the device as SST26VF032B/032BA and the manufacturer as Microchip. To execute a JECEC-ID operation the host drives CE# low then sends the JEDEC-ID command cycle (9FH).

Immediately following the command cycle, SST26VF032B/032BA output data on the falling edge of the SCK signal. The data output stream is continuous until terminated by a low-to-high transition on CE#. The device outputs 3 bytes of data: manufacturer, device type, and device ID, see Table 5-4. See Figure 5-16 for instruction sequence.

TABLE 5-4: DEVICE ID DATA OUTPUT

		Device ID		
Product	Manufacturer ID (Byte 1)	Device Type (Byte 2)	Device ID (Byte 3)	
SST26VF032B/032BA	BFH	26H	42H	

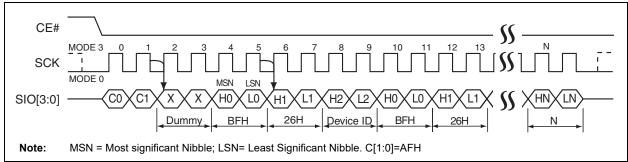

5.15 Read Quad J-ID Read (SQI Protocol)

The Read Quad J-ID Read instruction identifies the device as SST26VF032B/032BA and manufacturer as Microchip. To execute a Quad J-ID operation the host drives CE# low and then sends the Quad J-ID command cycle (AFH). Each cycle is two nibbles (clocks) long, most significant nibble first.

Immediately following the command cycle and one dummy cycle, SST26VF032B/032BA output data on the falling edge of the SCK signal. The data output stream is continuous until terminated by a low-to-high transition of CE#. The device outputs 3 bytes of data: manufacturer, device type, and device ID, see Table 5-4. See Figure 5-17 for instruction sequence.

FIGURE 5-17: QUAD J-ID READ SEQUENCE

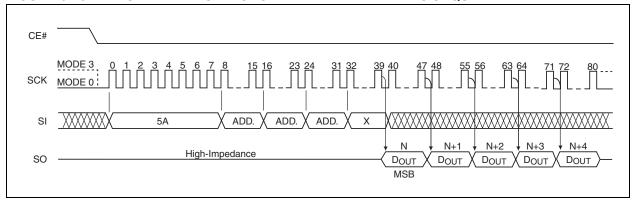

5.16 Serial Flash Discoverable Parameters (SFDP)

The Serial Flash Discoverable Parameters (SFDP) contain information describing the characteristics of the device. This allows device-independent, JEDEC ID-

independent, and forward/backward compatible software support for all future Serial Flash device families. See Table 11-1 for address and data values.

Initiate SFDP by executing an 8-bit command, 5AH, followed by address bits A[23:0] and a dummy byte. CE# must remain active-low for the duration of the SFDP cycle. For the SFDP sequence, see Figure 5-18.

FIGURE 5-18: SERIAL FLASH DISCOVERABLE PARAMETERS SEQUENCE

5.17 Sector Erase

The Sector Erase instruction clears all bits in the selected 4-KByte sector to '1,' but it does not change a protected memory area. Prior to any write operation, the Write Enable (WREN) instruction must be executed.

To execute a Sector Erase operation, the host drives CE# low, then sends the Sector Erase command cycle (20H) and three address cycles, and then drives CE#

high. Address bits [AMS:A12] (AMS = Most Significant Address) determine the sector address (SAX); the remaining address bits can be VIL or VIH. To identify the completion of the internal, self-timed, Write operation, poll the BUSY bit in the STATUS register, or wait Tse. See Figure 5-19 and Figure 5-20 for the Sector Erase sequence.

FIGURE 5-19: 4-KBYTE SECTOR-ERASE SEQUENCE- SQI MODE

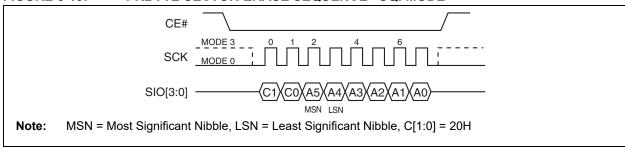

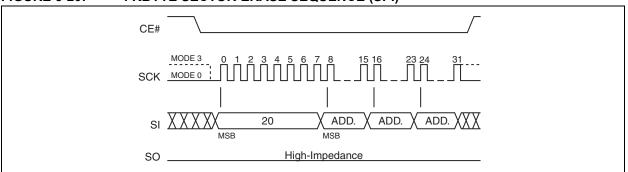

FIGURE 5-20: 4 KBYTE SECTOR-ERASE SEQUENCE (SPI)

5.18 Block Erase

The Block Erase instruction clears all bits in the selected block to '1'. Block sizes can be 8-Kbyte, 32-Kbyte or 64-Kbyte depending on address, see Figure 3-1, Memory Map, for details. A Block Erase instruction applied to a protected memory area will be ignored. Prior to any write operation, execute the WREN instruction. Keep CE# active-low for the duration of any command sequence.

To execute a Block Erase operation, the host drives CE# low then sends the Block Erase command cycle (D8H), three address cycles, then drives CE# high. Address bits AMS-A13 determine the block address (BAx); the remaining address bits can be VIL or VIH. For 32-Kbyte blocks, A14:A13 can be VIL or VIH. For 64-Kbyte blocks, A15:A13 can be VIL or VIH. Poll the BUSY bit in the STATUS register, or wait TBE, for the completion of the internal, self-timed, Block Erase operation. See Figure 5-21 and Figure 5-22 for the Block Erase sequence.

FIGURE 5-21: BLOCK-ERASE SEQUENCE (SQI)

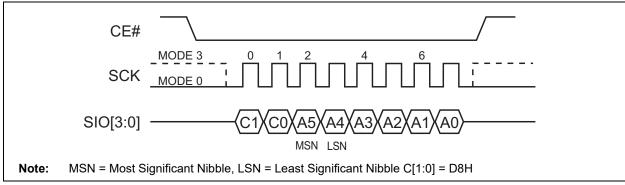

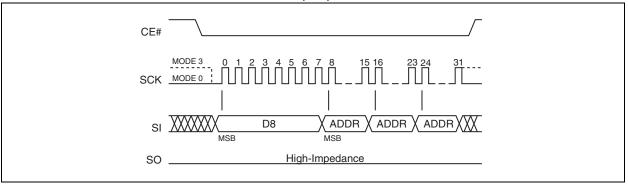

FIGURE 5-22: BLOCK-ERASE SEQUENCE (SPI)

5.19 Chip Erase

The Chip Erase instruction clears all bits in the device to '1.' The Chip Erase instruction is ignored if any of the memory area is protected. Prior to any write operation, execute the \mathtt{WREN} instruction.

To execute a Chip Erase operation, the host drives CE# low, sends the Chip Erase command cycle (C7H), then drives CE# high. Poll the BUSY bit in the STATUS register, or wait TSCE, for the completion of the internal, self-timed, Write operation. See Figure 5-23 and Figure 5-24 for the Chip Erase sequence.

FIGURE 5-23: CHIP-ERASE SEQUENCE (SQI)

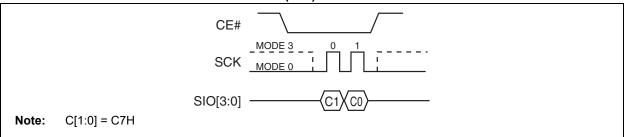

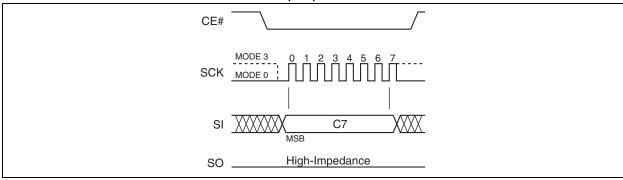

FIGURE 5-24: CHIP-ERASE SEQUENCE (SPI)

5.20 Page Program

The Page Program instruction programs up to 256 bytes of data in the memory, and supports both SPI and SQI protocols. The data for the selected page address must be in the erased state (FFH) before initiating the Page Program operation. A Page-Program applied to a protected memory area will be ignored. Prior to the program operation, execute the WREN instruction.

To execute a Page Program operation, the host drives CE# low then sends the Page Program command cycle (02H), three address cycles followed by the data to be programmed, then drives CE# high. The programmed data must be between 1 to 256 bytes and in whole byte increments; sending less than a full byte will cause the partial byte to be ignored. Poll the BUSY bit in the STATUS register, or wait TPP, for the completion of the internal, self-timed, write operation. See Figure 5-25 and Figure 5-26 for the Page Program sequence.

When executing Page Program, the memory range for the SST26VF032B/032BA is divided into 256 byte page boundaries. The device handles shifting of more than 256 bytes of data by maintaining the last 256 bytes of data as the correct data to be programmed. If the target address for the Page Program instruction is not the beginning of the page boundary (A[7:0] are not all zero), and the number of bytes of data input exceeds or overlaps the end of the address of the page boundary, the excess data inputs wrap around and will be programmed at the start of that target page.

FIGURE 5-25: PAGE PROGRAM SEQUENCE (SQI)

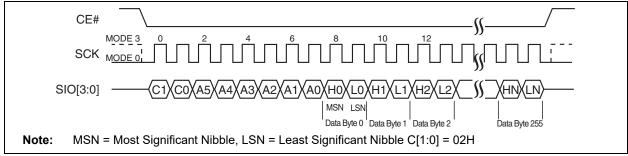

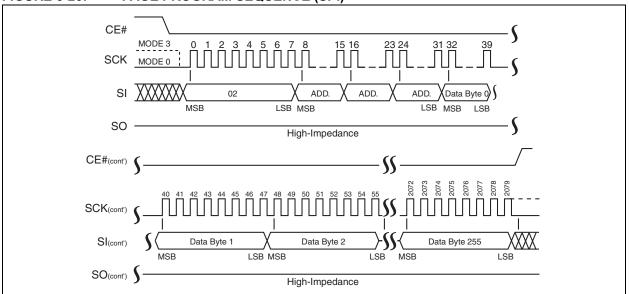

FIGURE 5-26: PAGE PROGRAM SEQUENCE (SPI)

5.21 SPI Quad Page Program

The SPI Quad Page Program instruction programs up to 256 bytes of data in the memory. The data for the selected page address must be in the erased state (FFH) before initiating the SPI Quad Page Program operation. A SPI Quad Page Program applied to a protected memory area will be ignored. SST26VF032B requires the ICO bit in the Configuration register to be set to '1' prior to executing the command. Prior to the program operation, execute the WREN instruction.

To execute a SPI Quad Page Program operation, the host drives CE# low then sends the SPI Quad Page Program command cycle (32H), three address cycles followed by the data to be programmed, then drives CE# high. The programmed data must be between 1 to 256 bytes and in whole Byte increments. The command cycle is eight clocks long, the address and data

cycles are each two clocks long, most significant bit first. Poll the BUSY bit in the STATUS register, or wait TPP, for the completion of the internal, self-timed, Write operation. See Figure 5-27.

When executing SPI Quad Page Program, the memory range for the SST26VF032B/032BA is divided into 256 byte page boundaries. The device handles shifting of more than 256 bytes of data by maintaining the last 256 bytes of data as the correct data to be programmed. If the target address for the SPI Quad Page Program instruction is not the beginning of the page boundary (A[7:0] are not all zero), and the of bytes of data input exceeds or overlaps the end of the address of the page boundary, the excess data inputs wrap around and will be programmed at the start of that target page.

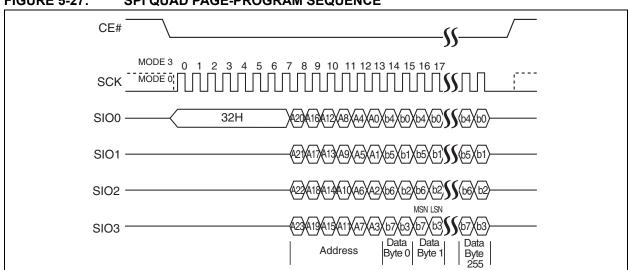

FIGURE 5-27: SPI QUAD PAGE-PROGRAM SEQUENCE

5.22 Write Suspend and Write Resume

Write Suspend allows the interruption of Sector Erase, Block Erase, SPI Quad Page Program, or Page Program operations in order to erase, program, or read data in another portion of memory. The original operation can be continued with the Write Resume command. This operation is supported in both SQI and SPI protocols.

Only one write operation can be suspended at a time; if an operation is already suspended, the device will ignore the Write Suspend command. Write Suspend during Chip Erase is ignored; Chip Erase is not a valid command while a write is suspended. The Write Resume command is ignored until any write operation (program or erase) initiated during the Write Suspend is complete. The device requires a minimum of 500 µs between each Write Suspend command.

5.23 Write Suspend During Sector Erase or Block Erase

Issuing a Write Suspend instruction during Sector Erase or Block Erase allows the host to program or read any sector that was not being erased. The device will ignore any programming commands pointing to the suspended sector(s). Any attempt to read from the suspended sector(s) will output unknown data because the Sector or Block Erase will be incomplete.

To execute a Write Suspend operation, the host drives CE# low, sends the Write Suspend command cycle (B0H), then drives CE# high. The STATUS register indicates that the erase has been suspended by changing the WSE bit from '0' to '1,' but the device will not accept another command until it is ready. To determine when the device will accept a new command, poll the BUSY bit in the STATUS register or wait Tws.

5.24 Write Suspend During Page Programming or SPI Quad Page Programming

Issuing a Write Suspend instruction during Page Programming allows the host to erase or read any sector that is not being programmed. Erase commands pointing to the suspended sector(s) will be ignored. Any attempt to read from the suspended page will output unknown data because the program will be incomplete.

To execute a Write Suspend operation, the host drives CE# low, sends the Write Suspend command cycle (B0H), then drives CE# high. The STATUS register indicates that the programming has been suspended by changing the WSP bit from '0' to '1', but the device will not accept another command until it is ready. To determine when the device will accept a new command, poll the BUSY bit in the STATUS register or wait Tws.

5.25 Write Resume

Write Resume restarts a write command that was suspended, and changes the suspend status bit in the STATUS register (WSE or WSP) back to '0'.

To execute a Write Resume operation, the host drives CE# low, sends the Write Resume command cycle (30H), then drives CE# high. To determine if the internal, self-timed write operation completed, poll the BUSY bit in the STATUS register, or wait the specified time TSE, TBE or TPP for Sector Erase, Block Erase, or Page Programming, respectively. The total write time before suspend and after resume will not exceed the uninterrupted write times TSE, TBE or TPP.

5.26 Read Security ID

The Read Security ID operation is supported in both SPI and SQI modes. To execute a Read Security ID (SID) operation in SPI mode, the host drives CE# low, sends the Read Security ID command cycle (88H), two address cycles, and then one dummy cycle. To execute

a Read Security ID operation in SQI mode, the host drives CE# low and then sends the Read Security ID command, two address cycles, and three dummy cycles.

After the dummy cycles, the device outputs data on the falling edge of the SCK signal, starting from the specified address location. The data output stream is continuous through all SID addresses until terminated by a low-to-high transition on CE#. See Table 5-5 for the Security ID address range.

5.27 Program Security ID

The Program Security ID instruction programs one to 2040 bytes of data in the user-programmable, Security ID space. This Security ID space is One-Time Programmable (OTP). The device ignores a Program Security ID instruction pointing to an invalid or protected address, see Table 5-5. Prior to the program operation, execute WREN.

To execute a Program SID operation, the host drives CE# low, sends the Program Security ID command cycle (A5H), two address cycles, the data to be programmed, then drives CE# high. The programmed data must be between 1 to 256 bytes and in whole byte increments.

The device handles shifting of more than 256 bytes of data by maintaining the last 256 bytes of data as the correct data to be programmed. If the target address for the Program Security ID instruction is not the beginning of the page boundary, and the number of data input exceeds or overlaps the end of the address of the page boundary, the excess data inputs wrap around and will be programmed at the start of that target page.

The Program Security ID operation is supported in both SPI and SQI mode. To determine the completion of the internal, self-timed Program SID operation, poll the BUSY bit in the software STATUS register, or wait TPSID for the completion of the internal self-timed Program Security ID operation.

TABLE 5-5: PROGRAM SECURITY ID

Program Security ID	Address Range
Unique ID Preprogrammed at factory	0000 – 0007H
User Programmable	0008H – 07FFH

5.28 Lockout Security ID

The Lockout Security ID instruction prevents any future changes to the Security ID, and is supported in both SPI and SQI modes. Prior to the operation, execute WREN.

To execute a Lockout SID, the host drives CE# low, sends the Lockout Security ID command cycle (85H), then drives CE# high. Poll the BUSY bit in the software STATUS register, or wait TPSID, for the completion of the Lockout Security ID operation.

5.29 Read STATUS Register (RDSR) and Read Configuration Register (RDCR)

The Read STATUS Register (RDSR) and Read Configuration Register (RDCR) commands output the contents of the STATUS and Configuration registers. These

commands function in both SPI and SQI modes. The STATUS register may be read at any time, even during a write operation. When a write is in progress, poll the BUSY bit before sending any new commands to assure that the new commands are properly received by the device.

To read the STATUS or Configuration registers, the host drives CE# low, then sends the Read STATUS Register command cycle (05H) or the Read Configuration Register command (35H). A dummy cycle is required in SQI mode. Immediately after the command cycle, the device outputs data on the falling edge of the SCK signal. The data output stream continues until terminated by a low-to-high transition on CE#. See Figure 5-28 and Figure 5-29 for the instruction sequence.

FIGURE 5-28: READ STATUS REGISTER AND READ CONFIGURATION REGISTER SEQUENCE (SQI)

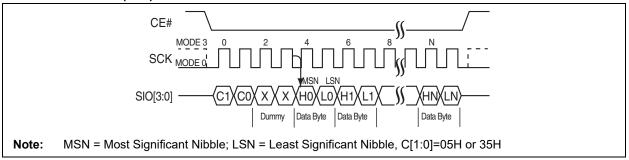

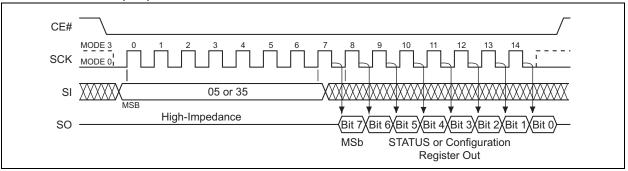

FIGURE 5-29: READ STATUS REGISTER AND READ CONFIGURATION REGISTER SEQUENCE (SPI)

5.30 Write STATUS Register (WRSR)

The Write STATUS Register (WRSR) command writes new values to the Configuration register. To execute a Write STATUS Register operation, the host drives CE#

low, then sends the Write STATUS Register command cycle (01H), two cycles of data, and then drives CE# high. Values in the second data cycle will be accepted by the device. See Figure 5-30 and Figure 5-31.

FIGURE 5-30: WRITE STATUS REGISTER SEQUENCE (SQI)

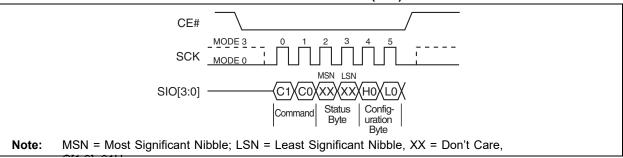

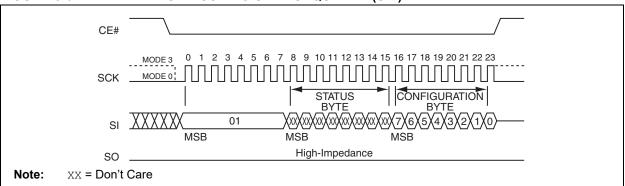

FIGURE 5-31: WRITE STATUS REGISTER SEQUENCE (SPI)

5.31 Write Enable (WREN)

The Write Enable (WREN) instruction sets the Write-Enable Latch bit in the STATUS register to '1,' allowing write operations to occur. The WREN instruction must be executed prior to any of the following operations: Sector Erase, Block Erase, Chip Erase, Page Program, Program Security ID, Lockout Security ID, Write Block

Protection Register, Lock-Down Block Protection Register, nonvolatile Write Lock Lock-Down Register, SPI Quad Page program, and Write STATUS Register. To execute a Write Enable the host drives CE# low then sends the Write Enable command cycle (06H) then drives CE# high. See Figure 5-32 and Figure 5-33 for the WREN instruction sequence.

FIGURE 5-32: WRITE ENABLE SEQUENCE (SQI)

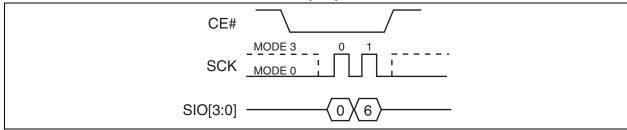

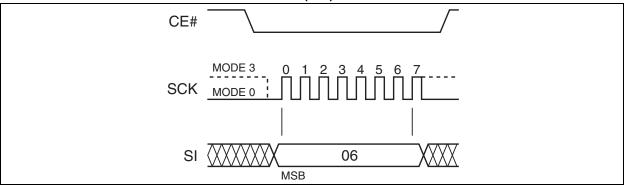

FIGURE 5-33: WRITE ENABLE SEQUENCE (SPI)

5.32 Write Disable (WRDI)

The Write Disable (WRDI) instruction sets the Write-Enable Latch bit in the STATUS register to '0', preventing write operations. The WRDI instruction is ignored

during any internal write operations. Any write operation started before executing WRDI will complete. Drive CE# high before executing WRDI.

To execute a Write Disable, the host drives CE# low, sends the Write Disable command cycle (04H), then drives CE# high. See Figure 5-34 and Figure 5-35.

FIGURE 5-34: WRITE DISABLE (WRDI) SEQUENCE (SQI)

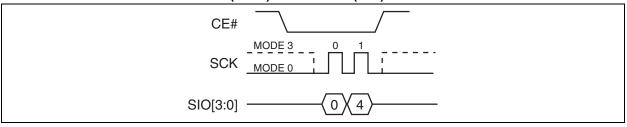

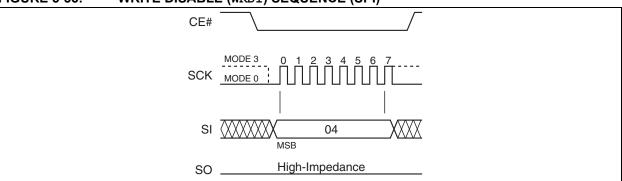

FIGURE 5-35: WRITE DISABLE (WRDI) SEQUENCE (SPI)

5.33 Read Block Protection Register (RBPR)

The Read Block Protection Register instruction outputs the Block Protection register data which determines the protection status. To execute a Read Block Protection Register operation, the host drives CE# low, and then sends the Read Block Protection Register command cycle (72H). A dummy cycle is required in SQI mode.

After the command cycle, the device outputs data on the falling edge of the SCK signal starting with the most significant bit(s), see Table 5-6 for definitions of each bit in the Block Protection register. The RBPR command does not wrap around. After all data has been output, the device will output 0H until terminated by a low-to-high transition on CE#. See Figure 5-36 and Figure 5-37.

FIGURE 5-36: READ BLOCK PROTECTION REGISTER SEQUENCE (SQI)

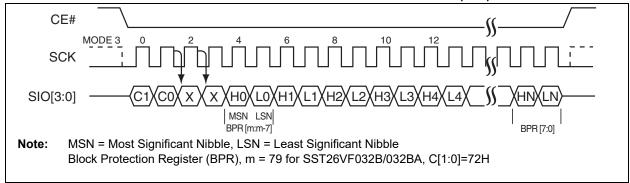

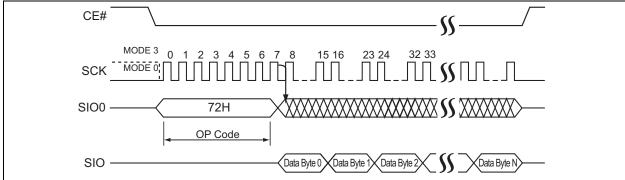

FIGURE 5-37: READ BLOCK PROTECTION REGISTER SEQUENCE (SPI)

5.34 Write Block Protection Register (WBPR)

The Write Block Protection Register (WBPR) command changes the Block Protection register data to indicate the protection status. Execute WREN before executing WBPR.

To execute a Write Block Protection Register operation the host drives CE# low, sends the Write Block Protection Register command cycle (42H), sends 18 cycles of data, and finally drives CE# high. Data input must be most significant bit(s) first. See Table 5-6 for definitions of each bit in the Block Protection register. See Figure 5-38 and Figure 5-39.

FIGURE 5-38: WRITE BLOCK PROTECTION REGISTER SEQUENCE (SQI)

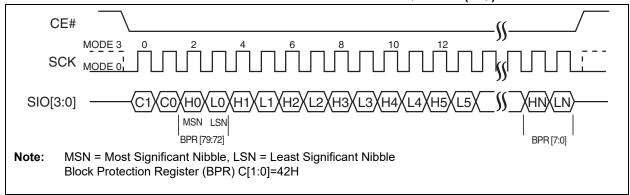

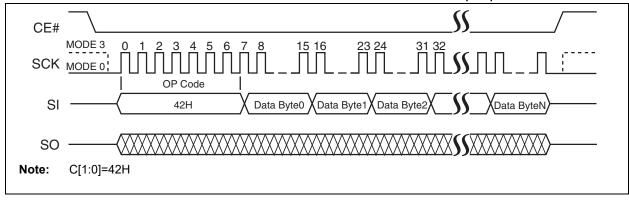

FIGURE 5-39: WRITE BLOCK PROTECTION REGISTER SEQUENCE (SPI)

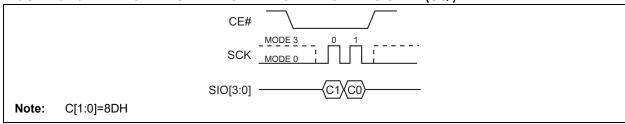

5.35 Lock-Down Block Protection Register (LBPR)

The Lock-Down Block Protection Register instruction prevents changes to the Block Protection register during device operation. Lock-Down resets after power

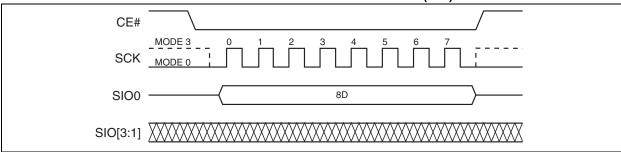

cycling; this allows the Block Protection register to be changed. Execute <code>WREN</code> before initiating the Lock-Down Block Protection Register instruction.

To execute a Lock-Down Block Protection Register, the host drives CE# low, then sends the Lock-Down Block Protection Register command cycle (8DH), then drives CE# high.

FIGURE 5-40: LOCK-DOWN BLOCK PROTECTION REGISTER (SQI)

5.36 Nonvolatile Write Lock Lock-Down Register (nVWLDR)

The nonvolatile Write Lock Lock-Down Register (nVWLDR) instruction controls the ability to change the Write Lock bits in the Block Protection register. Execute WREN before initiating the nVWLDR instruction.

To execute <code>nVWLDR</code>, the host drives CE# low, then sends the <code>nVWLDR</code> command cycle (E8H), followed by 18 cycles of data, and then drives CE# high.

After CE# goes high, the nonvolatile bits are programmed and the programming time-out must complete before any additional commands, other than Read STATUS Register, can be entered. Poll the BUSY bit in the STATUS register, or wait TPP, for the completion of the internal, self-timed, Write operation. Data inputs must be most significant bit(s) first.

FIGURE 5-42: WRITE LOCK LOCK-DOWN REGISTER SEQUENCE (SQI)

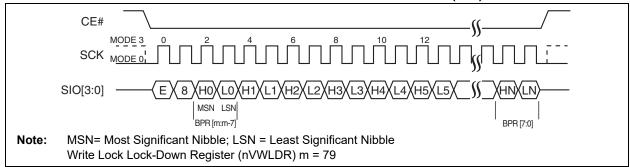

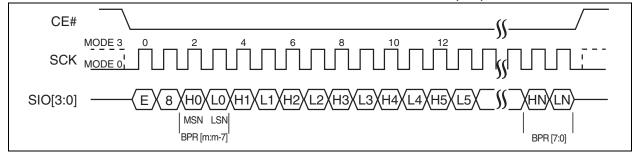

FIGURE 5-43: WRITE LOCK LOCK-DOWN REGISTER SEQUENCE (SPI)

5.37 Global Block Protection Unlock (ULBPR)

The Global Block Protection Unlock (ULBPR) instruction clears all write protection bits in the Block Protection register, except for those bits that have been locked down with the ${\tt nVWLDR}$ command. Execute WREN before initiating the ULBPR instruction.

To execute a $\tt ULBPR$ instruction, the host drives CE# low, then sends the $\tt ULBPR$ command cycle (98H), and then drives CE# high.

2: nVWLDR bits are One-Time Programmable. Once a nVWLDR bit is set, the protection state of that particular block is permanently write-locked.

6.0 ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings (†)

Temperature under bias	55°C to +125°C
Storage temperature	65°C to +150°C
DC voltage on any pin to ground potential	0.5V to VDD+0.5V
Transient voltage (<20 ns) on any pin to ground potential	2.0V to VDD+2.0V
Package power dissipation capability (TA = 25°C)	1.0W
Surface mount solder reflow temperature	260°C for 10 seconds
Output short circuit current ⁽¹⁾	50 mA

† NOTICE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Note 1: Output shorted for no more than one second. No more than one output shorted at a time.

TABLE 6-1: OPERATING RANGE

Range Ambient Temp.		VDD
Industrial	-40°C to +85°C	
Industrial Plus	-40°C to +105°C	2.3V-3.6V
Extended	-40°C to +125°C	

TABLE 6-2: AC CONDITIONS OF TEST⁽¹⁾

Input Rise/Fall Time	Output Load
3 ns	CL = 30 pF

Note 1: See Figure 8-5.

6.1 Power-Up Specifications

All functionalities and DC specifications are specified for a V_{DD} ramp rate of greater than 1V per 100 ms (0V to 3.0V in less than 300 ms). See Table 6-3 and Figure 6-1 for more information.

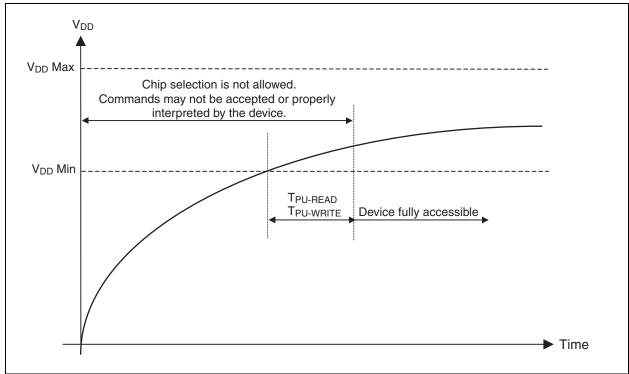

When VDD drops from the operating voltage to below the minimum VDD threshold at power-down, all operations are disabled and the device does not respond to commands. Data corruption may result if a power-down occurs while a Write Registers, program, or erase operation is in progress. See Figure 6-2.

TABLE 6-3: RECOMMENDED SYSTEM POWER-UP/DOWN TIMINGS

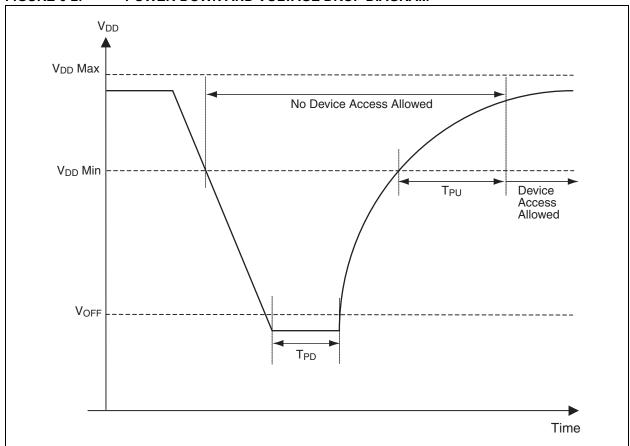

Symbol	Parameter	Minimum	Max	Units	Condition
TPU-READ ⁽¹⁾	VDD Minimum to Read Operation	100	_	μs	
TPU-WRITE ⁽¹⁾	VDD Minimum to Write Operation	100	_	μs	
TPD ⁽¹⁾	Power-down Duration	100		ms	
Voff	VDD off time	_	0.3	V	0V recommended

Note 1: This parameter is measured only for initial qualification and after a design or process change that could affect this parameter.

7.0 DC CHARACTERISTICS

Legend:	Υ	Part number or part number code) Year code (last digit of calendar year)
	ΥΥ	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code (2 characters for small packages)
	e 3	Pb-free JEDEC® designator for Matte Tin (Sn)

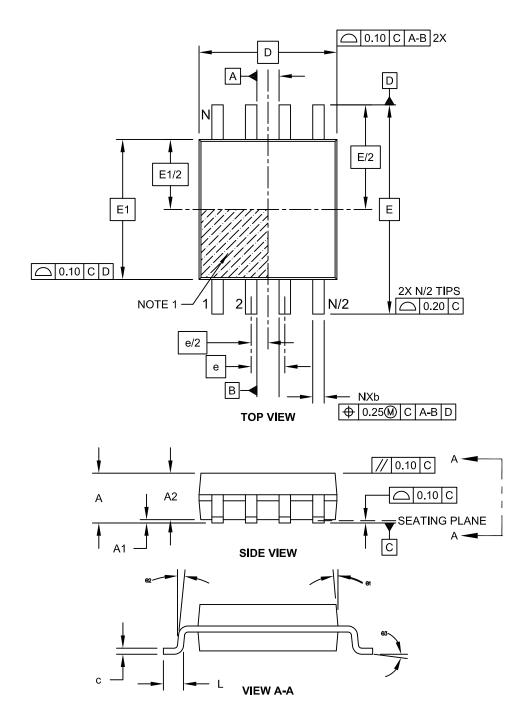

Note: For very small packages with no room for the Pb-free JEDEC® designator

(e3) , the marking will only appear on the outer carton or reel label.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

APPENDIX A: REVISION HISTORY

Revision J (August 2020)

Updated DC Electrical Characteristics table value for current consumption ISB2 and corrected the comment in JEDEC Flash Parameter Table: 11th DWORD.

Revision H (February 2020)

Updated template; added description and operating values for Extended temperature.

Revision G (May 2019)

Corrected SDIOR Maximum Frequency value in Table 5-1.

Revision F (February 2018)

Added Automotive AECQ-100 information.

Revision E (May 2016)

Updated Note 1 in Table 5-6.

Revision D (July 2015)

Added 2.3V-3.6V information throughout. Updated "Product Description".

Revision C (February 2015)

Revised "Product Description". Added Part Markings. Added footnote to Table 7-4.

Revision B (April 2014)

Updated "Features", Figure 5-29 and Figure 5-31. Revised "SPI Dual I/O Read". Revised Table 11-1.

Revision A (October 2013)

Initial release of the document.

11.0 APPENDIX

TABLE 11-1: SERIAL FLASH DISCOVERABLE PARAMETER (SFDP)

TABLE 11-1: SERIAL FLASH DISCOVERABLE PARAMETER (SFDP)						
Address	Bit Address	Data	Comments			
SFDP Header						
SFDP Heade	er: 1 st DWORD					
00H	A7:A0	53H	SFDP Signature			
01H	A15:A8	46H	SFDP Signature=50444653H			
02H	A23:A16	44H

Note 1: See Section 11.1 "Mapping Guidance Details" for more detailed mapping information

11.1 Mapping Guidance Details

The SFDP Memory Organization/Block Protection Bit Mapping defines the memory organization including uniform sector/block sizes and different contiguous sectors/blocks sizes. In addition, this bit defines the number of these uniform and different sectors/blocks from address 000000H to the full range of Memory and the associated Block Locking Register bits of each sector/block.

Each major Section is defined as follows:

TABLE 11-2: SECTION DEFINITION

Major Section X	Section X: Sector Type Number
	Section X: Number of Sectors
	Section X: Block Protection Register Bit Start Location
	Section X: Block Protection Register Bit End Location

<6ptHelv>

A Major Section consists of Sector Type Number, Number of Sector of this type, and the Block Protection Bit Start/End locations. This is tied directly to JEDEC Flash Parameter Table Sector Size Type (in 7th DWORD and 8th DWORD section). Note that the contiguous 4-Kbyte Sectors across the full memory range are not included on this section because they are not defined in the JEDEC Flash Parameter Table Sector Size Type section. Only the sectors/blocks that are dependently tied with the Block Protection Register bits are defined. A major section is a partition of contiguous same-size sectors/blocks. There will be several Major Sections as you dissect across memory from 000000h to the full range. Similar sector/block size that re-appear may be defined as a different Major Section.

11.1.1 SECTOR TYPE NUMBER

Sector Type Number is the sector/block size type defined in JEDEC Flash Parameter Table: SFDP address locations 4CH, 4EH, 50H, and 52H. Sector Type 1, which is represented by 01H, is located at address 4CH. Sector Type 2, which is represented by 02H, is located at address location 4EH. Sector Type 3, which is represented by 03H, is located at address location 50H. Sector Type 4, represented by 04H, is located at address location 52H. Contiguous Same Sector Type # Size can re-emerge across the memory range and this Sector Type # will indicate that it is a separate/independent Major Section from the previous contiguous sectors/blocks.

11.1.2 NUMBER OF SECTORS

Number of Sectors represents the number of contiguous sectors/blocks with similar size. A formula calculates the contiguous sectors/blocks with similar size. Given the sector/block size, type, and the number of sectors, the address range of these sectors/blocks can be determined along with specific Block Locking Register bits that control the read/write protection of each sectors/blocks.

11.1.3 BLOCK PROTECTION REGISTER BIT START LOCATION (BPSL)

Block Protection Register Bit Start Location (BPSL) designates the start bit location in the Block Protection Register where the first sector/block of this Major Section begins. If the value of BPSL is 00H, this location is the 0 bit location. If the value is other than 0, then this value is a constant value adder (c) for a given formula, $(2^m + 1) + (c)$. See **Section 11.1.5 "Memory Configuration"**.

From the initial location, there will be a bit location for every increment by 1 until it reaches the Block Protection Register Bit End Location (BPEL). This number range from BPSL to BPEL will correspond to, and be equal to, the number of sectors/blocks on this Major Section.

11.1.4 BLOCK PROTECTION REGISTER BIT END LOCATION (BPEL)

Block Protection Register Bit End Location designates the end bit location in the Block Protection Register bit where the last sector/block of this Major Section ends. The value in this field is a constant value adder (c) for a given formula or equation, $(2^m + 1) + (c)$. See Section 11.1.5 "Memory Configuration"

11.1.5 MEMORY CONFIGURATION

For the SST26VF032B/032BA family, the memory configuration is setup with different contiguous block sizes from bottom to the top of the memory. For example, starting from bottom of memory it has four 8-Kbyte blocks, one 32-Kbyte block, x number of 64-Kbyte blocks depending on memory size, then one 32-Kbyte block, and four 8-Kbyte block on the top of memory. See Table 11-3.

TABLE 11-3: MEMORY BLOCK DIAGRAM REPRESENTATION

8 Kbyte Bottom Block	Section 1: Sector Type Number
(from 000000H)	Section 1: Number of Sectors
	Section 1: Block Protection Register Bit Start Location
	Section 1: Block Protection Register Bit End Location
32 Kbyte	Section 2: Sector Type Number
	Section 2: Number of Sectors
	Section 2: Block Protection Register Bit Start Location
	Section 2: Block Protection Register Bit End Location
64 Kbyte	Section 3: Sector Type Number
	Section 3: Number of Sectors
	Section 3: Block Protection Register Bit Start Location
	Section 3: Block Protection Register Bit End Location
32 Kbyte	Section 4: Sector Type Number
	Section 4: Number of Sectors
	Section 4: Block Protection Register Bit Start Location
	Section 4: Block Protection Register Bit End Location
8 Kbyte (Top Block)	Section 5: Sector Type Number
	Section 5: Number of Sectors
	Section 5: Block Protection Register Bit Start Location
	Section 5: Block Protection Register Bit End Location

Classifying these sector/block sizes via the Sector Type derived from JEDEC Flash Parameter Table: SFDP address locations 4EH, 50H, and 52H are as follows:

- 8-Kbyte Blocks are classified as Sector Type 2 (@4EH of SFDP)
- 32-Kbyte Blocks are classified as Sector Type 3 (@50H of SFDP)
- 64-Kbyte Blocks are classified as Sector Type 4 (@52H of SFDP)

For the Number of Sectors associated with the contiguous sectors/blocks, a formula is used to determine the number of sectors/blocks of these Sector Types:

- 8-Kbyte Block (Type 2) is calculated by 2ⁿ. n is a byte.
- 32-Kbyte Block (Type 3) is calculated by 2ⁿ. n is a byte.
- 64-Kbyte Block (Type 4) is calculated by (2m 2).
 m can either be a 4, 5, 6, 7 or 8 depending on the
 memory size. This m field is going to be used for the
 64-Kbyte Block Section and will also be used for the
 Block Protection Register Bit Location formula.

 $\ensuremath{\mathtt{m}}$ will have a constant value for specific densities and is defined as:

- 8 Mbit = 4
- 16 Mbit = 5
- 32 Mbit = 6
- 64 Mbit = 7
- 128 Mbit = 8

Block Protect Register Start/End Bits are mapped in the SFDP by using the formula $(2^m + 1) + (c) \cdot m$ is a constant value that represents the different densities from 8 Mbit to 128 Mbit (used also in the formula calculating number of 64-Kbyte Blocks above). The values that are going to be placed in the Block Protection Bit Start/End field table are the constant value adder (c) in the formula and are represented in two's compliment except when the value is 00H. If the value is 00H, this location is the 0 bit location. If the value is other than 0, then this is a constant value adder (c) that will be used in the formula. The most significant (left most) bit indicates the sign of the integer; it is sometimes called the sign bit. If the sign bit is zero, then the number is greater than or equal to zero, or positive. If the sign bit is one, then the number is less than zero, or negative.

See Table 11-4 for an example of this formula.

TABLE 11-4: BPSL/BPEL EQUATION WITH ACTUAL CONSTANT ADDER DERIVED FROM THE FORMULA $(2^M + 1) + (C)$

Block Size	8 Mbit to 128 Mbit	Comments
8 Kbyte (Type 2) Bottom	BPSL = (2 ^m + 1) + 0FFH BPEL = (2 ^m + 1) + 04H	OFFH = -1; 06H = 6 Odd address bits are Read-Lock bit locations and even address bits are Write Lock bit locations.
32 Kbyte (Type 3)	BPSL = BPEL= (2 ^m + 1) + 0FDH	0FDH= -3
64 Kbyte (Type 4)	BPSL = 00H BPEL = (2 ^m + 1) + 0FCH	00H is Block Protection Register bit 0 location; 0FCH = -4
32 Kbyte (Type 3)	BPSL = BPEL= (2 ^m + 1) + 0FEH	0FEH=-2
8 Kbyte (Type 2) Top	BPSL = (2 ^m + 1) + 07H BPEL = (2 ^m + 1) + 0EH	07H = 7; 0EH = 14 Odd address bits are Read-Lock bit locations and even address bits are Write Lock bit locations.

THE MICROCHIP WEBSITE

Microchip provides online support via our website at www.microchip.com. This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- Product Support Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- · Distributor or Representative
- · Local Sales Office
- · Field Application Engineer (FAE)
- · Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the website at: http://microchip.com/support

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO. Device	Tape and Reel Operating Temperature Package Option Frequency	Examples: Valid Combinations: SST26VF032B-104I/MF SST26VF032BT-104I/MF SST26VF032BA-104I/MF
Device:	SST26VF032B = 32 Mbit, 2.5/3.0V, SQI Flash Memory WP#/Hold# pin Enable at power-up = 32 Mbit, 2.5/3.0V, SQI Flash Memory WP#/Hold# pin Disable at power-up	SST26VF032BAT-104I/MF SST26VF032B-104V/MF SST26VF032BT-104V/MF SST26VF032B-104I/SM SST26VF032BT-104I/SM SST26VF032BA-104I/SM
Tape and Reel Option:	Blank = Standard packaging (tube or tray) T = Tape and Reel ⁽¹⁾	SST26VF032BAT-104I/SM SST26VF032B-104V/SM SST26VF032BT-104V/SM
Operating Frequency:	104 = 104 MHz 80 = 80 MHz	SST26VF032B-104I/TD SST26VF032B-80E/SM SST26VF032BT-80E/SM
Temperature Range:	I = -40°C to +85°C (Industrial) V = -40°C to +105°C E = -40°C to +125°C (Extended)	SST26VF032B-80E/MF SST26VF032BT-80E/MF Note 1: Tape and Reel identifier only appears in the catalog part number description. This
Package:	MF = WDFN (6 mm x 5 mm Body), 8-lead SM = SOIJ (5.28 mm), 8-lead TD = TBGA(>1 mm pitch, <1.2 mm height), 24-lead	identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option. 2: Contact your Microchip Sales Office for Automotive AECQ-100 ordering information. Valid automotive part numbers are not listed on this page.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication is provided for the sole purpose of designing with and using Microchip products. Information regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WAR-RANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDI-RECT, SPECIAL, PUNITIVE, INCIDENTAL OR CONSEQUEN-TIAL LOSS, DAMAGE, COST OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
