# Panasonic INDUSTRY

Safety Relays

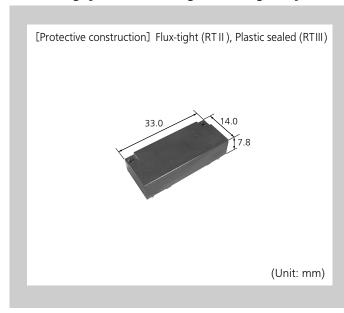

# **SF-M** RELAYS

# Flat type safety relays (1 Form A 1Form B)

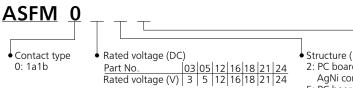

### **FEATURES**

- $lue{}$  Small size: 14 mm ( W )  $\times$  33 mm ( L )  $\times$  7.8 mm ( H )
- Forcibly guided contact structure: Compliant with: IEC61810-3 (EN50205)
- Low operating power: 270 mW (Holding Power: 100 mW)
- Reflow mountable (RT II)
- RT III type is also available

### TYPICAL APPLICATIONS

- Safety relay unit and PLC
- Robot
- Machine Tools

### **ORDERING INFORMATION**

Structure (Protection/ Soldering) 2: PC board terminal type, Flux-tight(RTII), AgNi contact, Reflow mountable

5: PC board terminal type, Plastic sealed (RTIII), AgSnO<sub>2</sub> contact

Packaging presentation S: Stick packaging
X: Tape packaging\*

1

\*1: RTII type is applicable for reflow soldering.

Note) The "S" and "X" at the end of the part number (packaging presentation) only appears on the inner and outer packaging. It does not appear on the relay itself.

### **TYPES**

Contact	Rated coil voltage	Part No.		Standard packing	
arrangement	hated coll voltage			Carton	Case
1 Form A 1 Form B 1 2	3 V DC	ASFM0032S ( X ) * 1	ASFM0035S	Stick packaging 20 pcs / 1 stick	500 pcs
	5 V DC	ASFM0052S ( X ) * 1	ASFM0055S		
	12 V DC	ASFM0122S ( X ) * 1	ASFM0125S		
	16 V DC	ASFM0162S ( X ) * 1	ASFM0165S		
	18 V DC	ASFM0182S ( X ) * 1	ASFM0185S		
	21 V DC	ASFM0212S ( X ) * 1	ASFM0215S	250 pcs /1 reel	
	24 V DC	ASFM0242S ( X ) * 1	ASFM0245S		

<sup>\*1:</sup> Tape packaging can be selected only by the "X" at the end of the part number.

# RATING

### ■ Coil data

• Operating characteristics such as "Operate voltage" and "Release voltage" are influenced by mounting conditions, ambient

Therefore, please use the relay within ±5% of rated coil voltage.

• "Initial" means the condition of products at the time of delivery.

Contact arrangement	Rated coil voltage	Operate voltage*¹ ( at 20℃ )	Release voltage*¹ ( at 20℃ )	Rated operating current (±10% at 20℃)	Coil resistance (±10% at 20℃)	Rated operating power	Max. allowable voltage*² ( at 20℃ )
	3 V DC			90 mA	33.3 Ω	270 mW (When input) 100 mW (When retained)	120 % V of rated voltage
1 Form A 1 Form B  5 V DC 12 V DC 16 V DC 18 V DC 21 V DC 24 V DC	5 V DC			54 mA	92.6 Ω		
	12 V DC	Max. 75% of	1	23 mA	533 Ω		
	16 V DC	rated voltage		17 mA	948 Ω		
	18 V DC	( initial )		15 mA	1,200 Ω		
	21 V DC			13 mA	1,633 Ω		
	24 V DC			11 mA	2,133 Ω		

<sup>\*1:</sup> Square, pulse drive

### ■ Specifications

Characteristics	ltem	Specifications		
	Coil arrangement	1 Form A 1 Form B		
	Contact resistance, max ( Initial )	Max. 100 m $\Omega$ ( By voltage drop 6 V DC 1 A )		
	Contact material	RT II : Au flashed AgNi type RT III : Au flashed AgSnO2 type		
	Contact rating ( resistive )	NO contact ( 5-6 terminal ) ; 6 A 250 V AC, 6 A 30 V DC NC contact ( 3-4 terminal ) ; 4 A 250 V AC, 4 A 30 V DC		
Contact	Max. switching power ( resistive )	NO contact ( 5-6 terminal ); 1,500 VA, 180 W ( 85 W : when load voltage exceeds 30 V DC ) NC contact ( 3-4 terminal ) ; 1,000 VA, 120 W ( 85 W : when load voltage exceeds 30 V DC )		
	Max. switching voltage	250 V AC, 125 V DC		
	Max. switching current	NO contact ( 5-6 terminal ) : 6 A AC, 6 A DC NC contact ( 3-4 terminal ) : 4 A AC, 4 A DC		
	Min. switching load ( reference value ) *1	1 mA 10 V DC		
insulation resistance ( initial )		Min. 1,000 M $\Omega$ at 500 V DC ( Measured portion is the same as the case of dielectric voltage. )		
D: 1	Between open contacts	1,500 Vrms for 1 min ( Detection current: 10 mA )		
Dielectric strength ( initial )	Between contact and coil	NO contact ( 5-6 terminal ) – coil; 4,000 Vrms for 1 min NC contact ( 3-4 terminal ) – coil; 2,500 Vrms for 1 min		
Coil hold voltage *2		60% of rated voltage ( −40°C to 85°C )		
Time characteristics	Operate time	Max. 15 ms ( at rated voltage, at 20℃, without bounce )		
(initial)	Release time *3	Max. 10 ms (at rated voltage, at 20°C, without bounce, without diode)		
Shock resistance	Functional	200 m/s² ( half-sine shock pulse: 11 ms, detection time: 10 μs )		
SHOCK TESISTATICE	Destructive	1,000 m/s <sup>2</sup> ( half-sine shock pulse: 6 ms )		
Vibration resistance	Functional	10 Hz to 55 Hz ( at double amplitude of 2.5 mm, detection time: 10µs )		
vibration resistance	Destructive	10 Hz to 55 Hz ( at double amplitude of 3.5 mm )		
Expected life	Mechanical life	Min. 10×10 <sup>6</sup> ( at 180 times/min )		
Conditions Conditions for usage, transport and storage *4		Ambient temperature: $-40^{\circ}$ C to $85^{\circ}$ C Humidity: 5% RH to 85 % RH ( Avoid icing and condensation )		
Unit weight		Approx. 6.5 g		

<sup>\*1:</sup> This value can change due to the switching frequency, environmental conditions, and desired reliability level, therefore it is recommended to check this with the actual load.

### Expected electrical life

Condition: Resistive load, at 6 times/min (ON: OFF = 1 s: 9 s)

Туре		Switching capacity	Number of operations
	RT II , RT III  RT II , RT III  NC contact ( 3-4 terminal )	6A 250 V AC ( resistive )	100×10³
RT II , RT III		6A 30 V DC ( resistive )	100×10³
		4A 250 V AC ( resistive )	100×10³
		4A 30 V DC ( resistive )	100×10³

<sup>\*2:</sup> It is not allowed to apply the continuous maximum voltage to the coil. In order to obtain the specified performance, please apply the rated voltage.

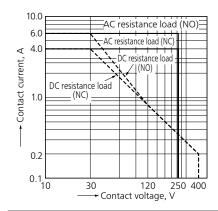

<sup>\*2:</sup> Coil holding voltage is the coil voltage after 100 ms from the application of rated coil voltage.

<sup>\*3:</sup> If a diode is connected across the coil in parallel, the release time will be delayed. Check this under actual operating conditions.
\*4: For ambient temperature, please read "GUIDELINES FOR RELAY USAGE".

# REFERENCE DATA

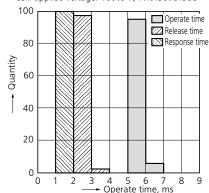

### 1. Maximum switching capacity

AC resistance load, DC resistance load

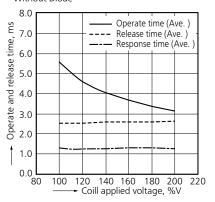

### 2. Operate/response/release time

Tested sample: ASFM0\*\*\*\* n = 100 pcs Ambient temperature: 25°C Coill applied voltage: 100% V, Without Diode

### 3. Operating time for coil applied voltage

Tested sample: ASFM0\*\*\*\* n = 6 pcs Ambient temperature:  $25^{\circ}$ C Without Diode

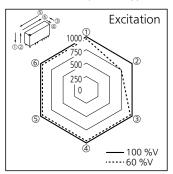

### 4. Malfunctional shock

Tested sample: ASFM0\*\*\*\*

n = 6 pcs

Ambient temperature: 25°C Impact is applied three times in each direction (6 directions), and contact deviation and contact check are confirmed. Coil applied voltage: Excitation (100%/, 60%V), Non-excitation Standard value: 200 m/s $^2$  (Value of applied shock: 200 m/s $^2$   $\sim$  1000 m/s $^2$ )

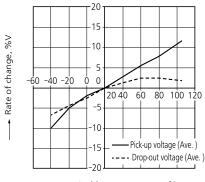

### 5. Ambient temperature characteristics shock

Tested sample: ASFM0\*\*\*\*

n = 6 pcs

Ambient temperature: -40°C ⇔ 105°C Coill applied voltage: 100% V

→ Ambient temperature, °C

# INSULATION CHARACTERISTIC (IEC61810-1)

Item	Characterisitics	
Clearance/Creepage distance ( IEC61810-1 )	( Between NO contact and coil )	5.5/5.5
Clearance/Creepage distance ( IEC61610-1 )	( Between NC contact and coil )	3.0/3.0
Category of protection (IEC61810-1)		RT II , RT III
Tracking resistance ( IEC60112 )		PTI 175
Insulation material group	III a	
Over voltage category	III	
Rated voltage	250V	
Pollution degree	2	
Type of insulation	( Between NO contact and coil )	Reinforced insulation
Type of insulation	( Between NC contact and coil )	Basic insulation
Type of insulation ( Between open contacts )	Micro disconnection	

Note) Actual value.

# **GUIDELINES FOR USAGE**

■ For cautions for use, please read "GUIDELINES FOR RELAY USAGE". https://industrial.panasonic.com/ac/e/control/relay/cautions\_use/index.jsp

### Contact gaps when a pair of contacts are welded.

The table below shows the state of the other contacts. If NO contact is welded, 0V is applied to the coil. If NC contact is welded, the rated voltage is applied.

		Other contacts state		
		NC contact ( 3-4 terminal )	NO contact ( 5-6 terminal )	
Welded	NC contact ( 3-4 terminal )	_	>0.5	
contact terminal No.	NO contact (5-6 terminal)	>0.5	-	

>0.5: contact gap is kept at min. 0.5 mm

Note) Contact gaps are shown at the initial state.

If the material transfer of the contacts occurs, it is necessary to check the actual loading.

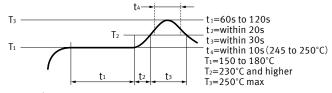

### SOLDERING (RT II )

In case of automatic soldering, following conditions should be observed.

[Condition of I.R.S (recommended)]

recommended condition:

reflow; 1 time, measurement area; PCB surface where the relay is soldered

### Caution

Even if used in the recommended condition, the relay may be affected by heat stress caused by a busy layout, reflow heating process, PCB type(metal etc.), and so on. Therefore, please check the quality and reliability under the actual worst condition.

Please refer to "the latest product specifications" when designing your product.

# GUIDELINES FOR POWER, HIGH-CAPACITY DC CUT OFF AND SAFETY RELAYS USAGE

■For cautions for use, please read "GUIDELINES FOR RELAY USAGE".

https://industrial.panasonic.com/ac/e/control/relay/cautions\_use/index.jsp

### **Precautions for Coil Input**

### ■Long term current carrying

A circuit that will be carrying a current continuously for long periods without relay switching operation. (circuits for emergency lamps, alarm devices and error inspection that, for example, revert only during malfunction and output warnings with form B contacts) Continuous, long-term current to the coil will facilitate deterioration of coil insulation and characteristics due to heating of the coil itself. For circuits such as these, please use a magnetic-hold type latching relay. If you need to use a single stable relay, use a sealed type relay that is not easily affected by ambient conditions and make a failsafe circuit design that considers the possibility of contact failure or disconnection.

### **■**DC Coil operating power

Steady state DC current should be applied to the coil. The wave form should be rectangular. If it includes ripple, the ripple factor should be less than 5%.

However, please check with the actual circuit since the electrical characteristics may vary. The rated coil voltage should be applied to the coil and the set/reset pulse time of latching type relay differs for each relays, please refer to the relay's individual specifications.

#### ■ Coil connection

When connecting coils of polarized relays, please check coil polarity (+,-) at the internal connection diagram (Schematic). If any wrong connection is made, it may cause unexpected malfunction, like abnormal heat, fire and so on, and circuit do not work. Avoid impressing voltages to the set coil and reset coil at the same time.

### Maximum allowable voltage and temperature rise

Proper usage requires that the rated coil voltage be impressed on the coil. Note, however, that if a voltage greater than or equal to the maximum continuous voltage is impressed on the coil, the coil may burn or its layers short due to the temperature rise. Furthermore, do not exceed the usable ambient temperature range listed in the catalog.

In DC relays, after continuous passage of current in the coil, if the current is turned OFF, then immediately turned ON again, due to the temperature rise in the coil, the pick-up voltage will become somewhat higher. Also, it will be the same as using it in a higher temperature atmosphere. The resistance/temperature relationship for copper wire is about 0.4% for 1°C, and with this ratio the coil resistance increases. That is, in order to operate of the relay, it is necessary that the voltage be higher than the pick-up voltage and the pick-up voltage rises in accordance with the increase in the resistance value. However, for some polarized relays, this rate of change is considerably smaller.

### **Ambient Environment**

### ■Usage, Transport, and Storage Conditions

During usage, storage, or transportation, avoid locations subjected to direct sunlight and maintain normal temperature, humidity and pressure conditions.

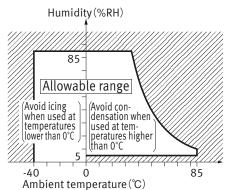

### ● Temperature/Humidity/Pressure

When transporting or storing relays while they are tube packaged, there are cases the temperature may differ from the allowable range. In this case be sure to check the individual specifications. Also allowable humidity level is influenced by temperature, please check charts shown below and use relays within mentioned conditions. (Allowable temperature values differ for each relays, please refer to the relay's individual specifications.)

### 1) Temperature:

The tolerance temperature range differs for each relays, please refer to the relay's individual specifications

- 2) Humidity: 5 to 85 % RH
- 3) Pressure: 86 to 106 kPa

### Dew condensation

Condensation occurs when the ambient temperature drops suddenly from a high temperature and humidity, or the relay is suddenly transferred from a low ambient temperature to a high temperature and humidity. Condensation causes the failures like insulation deterioration, wire disconnection and rust etc.

Panasonic Corporation does not guarantee the failures caused by condensation.

The heat conduction by the equipment may accelerate the cooling of device itself, and the condensation may occur.

Please conduct product evaluations in the worst condition of the actual usage. (Special attention should be paid when high temperature heating parts are close to the device. Also please consider the condensation may occur inside of the device.)

### Icing

Condensation or other moisture may freeze on relays when the temperature become lower than 0°C. This icing causes the sticking of movable portion, the operation delay and the contact conduction failure etc. Panasonic Corporation does not guarantee the failures caused by the icing.

The heat conduction by the equipment may accelerate the cooling of relay itself and the icing may occur. Please conduct product evaluations in the worst condition of the actual usage.

### Low temperature and low humidity

The plastic becomes brittle if the switch is exposed to a low temperature, low humidity environment for long periods of time.

### High temperature and high humidity

Storage for extended periods of time (including transportation periods) at high temperature or high humidity levels or in atmospheres with organic gases or sulfide gases may cause a sulfide film or oxide film to form on the surfaces of the contacts and/ or it may interfere with the functions. Check out the atmosphere in which the units are to be stored and transported.

# GUIDELINES FOR POWER, HIGH-CAPACITY DC CUT OFF AND SAFETY RELAYS USAGE

### Package

In terms of the packing format used, make every effort to keep the effects of moisture, organic gases and sulfide gases to the absolute minimum.

#### Silicon

When a source of silicone substances (silicone rubber, silicone oil, silicone coating materials and silicone filling materials etc.) is used around the relay, the silicone gas (low molecular siloxane etc.) may be produced.

This silicone gas may penetrate into the inside of the relay. When the relay is kept and used in this condition, silicone compound may adhere to the relay contacts which may cause the contact failure. Do not use any sources of silicone gas around the relay (Including plastic seal types).

#### NOx Generation

When relay is used in an atmosphere high in humidity to switch a load which easily produces an arc, the NOx created by the arc and the water absorbed from outside the relay combine to produce nitric acid

This corrodes the internal metal parts and adversely affects operation.

Avoid use at an ambient humidity of 85%RH or higher (at 20°C). If use at high humidity is unavoidable, please contact our sales representative.

### Others

### ■ Cleaning

- Although the environmentally sealed type relay (plastic sealed type, etc.) can be cleaned, avoid immersing the relay into cold liquid (such as cleaning solvent) immediately after soldering. Doing so may deteriorate the sealing performance.
- Cleaning with the boiling method is recommended (The temperature
  of cleaning liquid should be 40°C or lower).
   Avoid ultrasonic cleaning on relays. Use of ultrasonic cleaning may
  cause breaks in the coil or slight sticking of the contacts due to
  ultrasonic energy.

Please refer to "the latest product specifications" when designing your product.
