Flow Sens FS1
Thermal Mass Flow Sensor for all-purpose use in Gases

Product
The Flow sensor element consists of two temperature depending platinum-resistors, both deposited on one chip. The low-ohm resistor with a small area is used as a heater, whereas the other high-ohm resistor serves to measure the reference temperature. Using a bridge circuit, the differing resistance value of two elements leads to different (self) heating. The (self) heating is dependent upon the applied voltage, the mass flow, and the media in which the sensor is located. Higher voltage increases self heating, a higher flow rate increases cooling. If the self heating is kept constantly by a suitable controller, the voltage increases with higher flow rates and therefore becomes a measure for the mass flow. As a result of its little thermal mass, this sensor has fast heating and cooling response times. The measuring principle of the sensor can be used for large operation ranges, from 0…0.1m/s up to 100m/s. The Flow Sens is also available with a plastic housing of ø 6mm. This option provides the user with ideal opportunities to incorporate the element into custom-built applications or specific housings, e.g. into a T-piece.

Advantages
- Easy adaptable for different applications or into housings
- Simple signal processing and calibration
- No mechanical moved components
- Excellent reproducibility
- Excellent long-term stability
- Best price-performance ratio

Applications
- HVAC and building control solutions
- Automotive industry
- Medical devices
- Device monitoring
- Cooling devices
- Food industry
Flow Sens FS1
Thermal Mass Flow Sensor for all-purpose use in Gases

Technical Data

- Measuring principle: thermal
- Measuring range: 0 ... 100 m/s
- Response sensitivity: 0.01 m/s
- Accuracy: < 3% current measuring value (dependent on electronic and calibration)
- Response time $t_{63\%}$: Ca. < 2 s
- Temperature range: -20 ... + 150 °C
- Temperature sensitivity: < 0.1 %/K (dependent on electronic)
- Electrical connection: 3 pins, Leads AWG30, insulated with PTFE, or custom specific
- Heater: $R_H(0°C) = 45 \ \Omega \pm 1%$
- Referenz element: $R_S(0°C) = 1200 \ \Omega \pm 1%$
- Required voltages: typical 2 - 5 V at $\Delta T = 30 \ K$ ($0 \leq V_{ström} \leq 100 m/s$)
- Max. heater voltage@0 m/s: 3V
- Substrate material: ceramic

In general: All data are temporary and valid in air. Other media and higher requirements upon request. No responsibility accepted.

Electronic circuit recommendation
As shown on the scheme to the right, the heater $R_H$ and sensor $R_S$ need to be connected in a bridge circuit. It is essential to determine the correct values of the resistors $R_1$, $R_2$, and $R_3$. The bridge is in balance as soon as the desired temperature difference between $R_S$ and $R_H$ has reached e.g. 30K. At a changing flow the bridge voltage $U_{Bs}$ needs to be controlled in dependence of the bridge balance $V1-V2$. The values for $R1...R3$ are depending on the temperature difference $\Delta T$ and the medium which should be measured. We will provide you with the values of $R1...R3$, depending on the application.
For calibration the $R_2$ needs to be adjusted within a range of $\pm 5\%$.
The method of adjustment relies on the application.

Typical signal – curve between 0 .... 5 m/s

Customer-specific preparation
The electrical connection and the sensor packaging we are are able to develop and to produce customized.
