

24-Bit, 192 kHz D/A Converter for Digital Audio

Features

- 24 Bit Conversion
- Up to 192 kHz Sample Rates
- 120 dB Dynamic Range
- -100 dB THD+N
- Advanced Dynamic-Element Matching
- Low Clock Jitter Sensitivity
- Digital De-emphasis for 32 kHz, 44.1 kHz and 48 kHz
- External Reference Input

Description

The CS4396 is a complete high performance 24-bit 48/96/192 kHz stereo digital-to-analog conversion system. The device includes a digital interpolation filter followed by a oversampled multi-bit delta-sigma modulator which drives dynamic-element-matching (DEM) selection logic. The output from the DEM block controls the input to a multi-element switched capacitor DAC/low-pass filter, with fully-differential outputs. This multi-bit architecture features significantly lower out-of-band noise and jitter sensitivity than traditional 1-bit designs, and the advanced DEM guarantees low noise and distortion at all signal levels.

ORDERING INFORMATION

CS4396-KS	-10° to 70° C	28-pin Plastic SOIC

MCLK Frequency (Single-speed 512 F_s , Double speed 256 F_s or Quad-speed, 128 F_s)		8.192	-	25.6	MHz
MCLK Frequency (Single-speed 768 F_s , Double speed 384 F_s or Quad-speed, 192 F_s)		12.288	-	38.4	MHz
MCLK Duty Cycle		40	50	60	%
SCLK Frequency (Single-speed mode)		-	-	$256 \times F_s$	Hz
(Double-speed mode)		-	-	$128 \times F_s$	Hz
(Quad-speed mode)		-	-	$64 \times F_s$	Hz
SCLK rising to LRCK edge delay	t_{slrd}	20	-	-	ns
SCLK rising to LRCK edge setup time	t_{slrs}	20	-	-	ns
SDATA valid to SCLK rising setup time	t_{sdhrs}	20	-	-	ns
SCLK rising to SDATA hold time	t_{sdh}	20	-	-	ns

Figure 1. Serial Audio Input Timing

SWITCHING CHARACTERISTICS - CONTROL PORT

($T_A = 25\text{ }^\circ\text{C}$; $V_D = 5.25\text{ V}$ to 3.0 Volts ; Inputs: logic 0 = AGND, logic 1 = V_D , $C_L = 30\text{ pF}$)

Parameter	Symbol	Min	Max	Unit
<i>I²C[®] Mode</i>				
SCL Clock Frequency	f_{scl}	-	100	KHz
RST Rising Edge to Start	t_{irs}	500	-	ns
Bus Free Time Between Transmissions	t_{buf}	4.7	-	μs
Start Condition Hold Time (prior to first clock pulse)	t_{hdst}	4.0	-	μs
Clock Low time	t_{low}	4.7	-	μs
Clock High Time	t_{high}	4.0	-	μs
Setup Time for Repeated Start Condition	t_{sust}	4.7	-	μs
SDA Hold Time from SCL Falling (Note 8)	t_{hdd}	0	-	μs
SDA Setup time to SCL Rising	t_{sud}	250	-	ns
Rise Time of Both SDA and SCL Lines	t_r	-	1	μs
Fall Time of Both SDA and SCL Lines	t_f	-	300	ns
Setup Time for Stop Condition	t_{susp}	4.7	-	μs

Notes: 8. Data must be held for sufficient time to bridge the 300 ns transition time of SCL.

Figure 2. I²C Control Port Timing

SWITCHING CHARACTERISTICS - CONTROL PORT

($T_A = 25\text{ }^\circ\text{C}$; $V_D = 5.25\text{ V}$ to 3.0 Volts ; Inputs: logic 0 = AGND, logic 1 = V_D , $C_L = 30\text{ pF}$)

Parameter	Symbol	Min	Max	Unit
SPI Mode				
CCLK Clock Frequency	f_{sclk}	-	6	MHz
RST Rising Edge to CS Falling	t_{srs}	500	-	ns
CCLK Edge to $\overline{\text{CS}}$ Falling (Note 9)	t_{spi}	500	-	ns
$\overline{\text{CS}}$ High Time Between Transmissions	t_{csh}	1.0	-	μs
$\overline{\text{CS}}$ Falling to CCLK Edge	t_{css}	20	-	ns
CCLK Low Time	t_{scl}	66	-	ns
CCLK High Time	t_{sch}	66	-	ns
CDIN to CCLK Rising Setup Time	t_{dsu}	40	-	ns
CCLK Rising to DATA Hold Time (Note 10)	t_{dh}	15	-	ns
Rise Time of CCLK and CDIN (Note 11)	t_{r2}	-	100	ns
Fall Time of CCLK and CDIN (Note 11)	t_{f2}	-	100	ns
CCLK Falling to CDOOUT valid	t_{ov}	45	-	ns

Notes: 9. t_{spi} only needed before first falling edge of $\overline{\text{CS}}$ after $\overline{\text{RST}}$ rising edge. $t_{\text{spi}} = 0$ at all other times.

10. Data must be held for sufficient time to bridge the transition time of CCLK.

11. For $F_{\text{SCK}} < 1\text{ MHz}$

Figure 3. SPI Control Port Timing

2.0 TYPICAL CONNECTION DIAGRAM

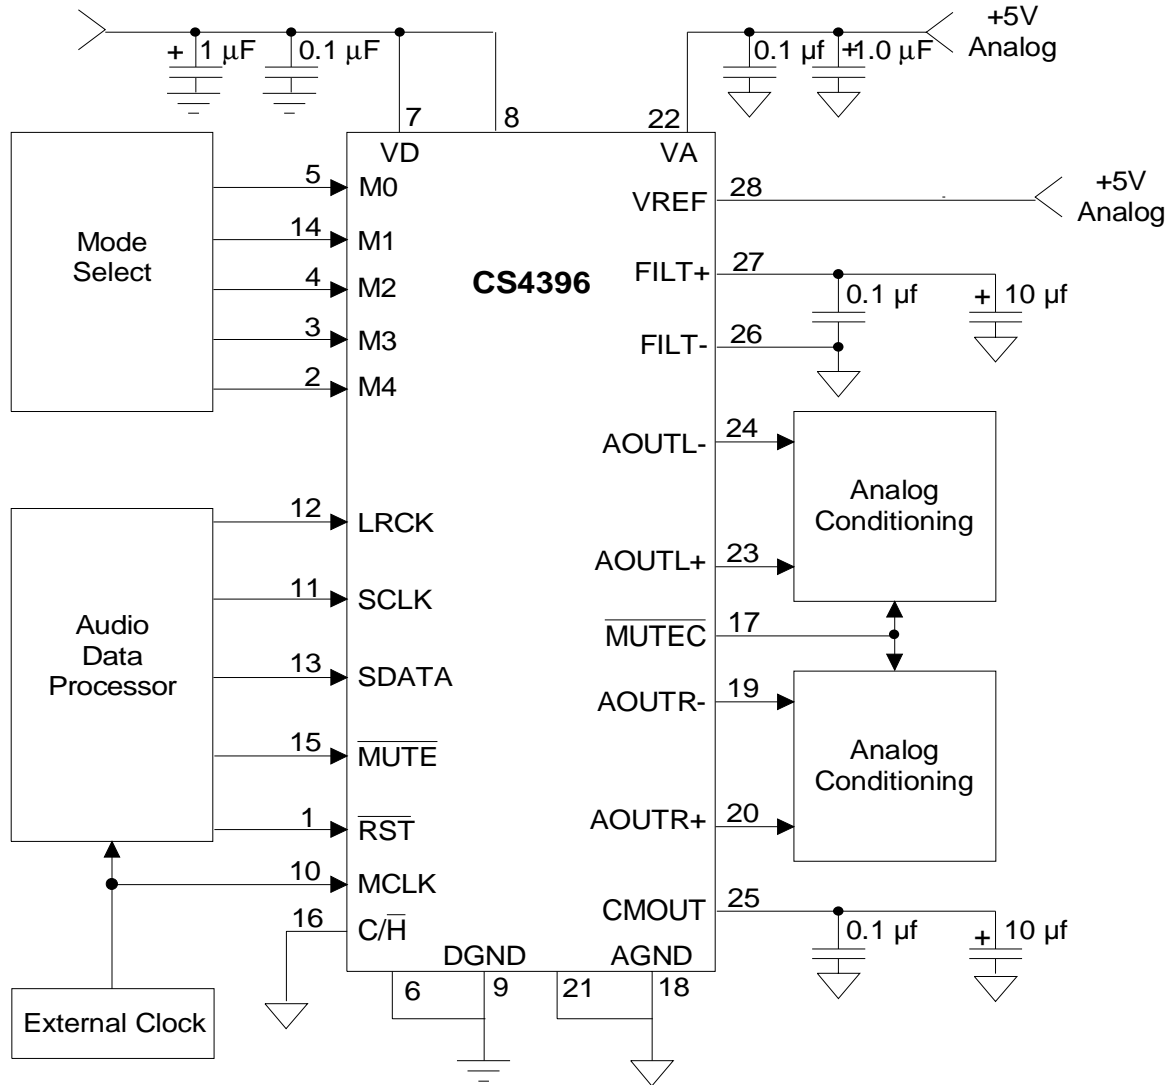

Figure 4. Typical Connection Diagram - Hardware Mode (Control Port Mode)

3.0 REGISTER DESCRIPTION

3.1 DIFFERENTIAL DC OFFSET CALIBRATION

Mode Control Register (address 01h)

7	6	5	4	3	2	1	0
CAL	$\overline{\text{MUTE}}$	M4	M3	M2	M1	M0	PDN

Access:

R/W in I²C and SPI.

Default:

0 - Disabled

Function:

Enabling this function will initiate a calibration to minimize the differential DC offset. This function will be automatically reset following completion of the calibration sequence.

CAL	MODE
0	Disabled : CAL complete
1	Enabled : CAL initiated

Table 1.

3.2 SOFT MUTE

Mode Control Register (address 01h)

7	6	5	4	3	2	1	0
CAL	$\overline{\text{MUTE}}$	M4	M3	M2	M1	M0	PDN

Access:

R/W in I²C and SPI.

Default:

0 - Enabled

Function:

The analog outputs will ramp to a muted state when enabled. The ramp requires 1152 left/right clock cycles in Single Speed, 2304 cycles in Double Speed and 4608 cycles in Quad Speed mode. The bias voltage on the outputs will be retained and MUTE_{EC} will go low at the completion of the ramp period.

The analog outputs will ramp to a normal state when this function transitions from the enabled to disabled state. The ramp requires 1152 left/right clock cycles in Single Speed, 2304 cycles in Double Speed and 4608 cycles in Quad Speed mode. The MUTE_{EC} will go high immediately on disabling of MUTE.

$\overline{\text{MUTE}}$	MODE
0	Enabled
1	Disabled

Table 2.

3.3 MODE SELECT

Mode Control Register (address 01h)

7	6	5	4	3	2	1	0
CAL	MUTE	M4	M3	M2	M1	M0	PDN

Access:

R/W in I²C and SPI.

Default:

00000

Function:

The Mode Select pins determine the operational mode of the device as detailed in Tables 7-10. The options include:

Selection of the Digital Interface Format which determines the required relationship between the Left/Right clock, serial clock and serial data as detailed in Figures 20-23

Selection of the standard 15 μs/50 μs digital de-emphasis filter response, Figure 28, which requires re-configuration of the digital filter to maintain the proper filter response for 32, 44.1 or 48 kHz sample rates.

Selection of the appropriate clocking mode to match the input sample rates.

3.4 POWER DOWN

Mode Control Register (address 01h)

7	6	5	4	3	2	1	0
CAL	MUTE	M4	M3	M2	M1	M0	PDN

Access:

R/W in I²C and SPI.

Default:

1 - Powered Down

Function:

The analog and digital sections will be placed into a power-down mode when this function is enabled. This bit must be cleared to resume normal operation.

PDN	MODE
0	Disabled
1	Enabled

Table 3.

Reset - **RST**

Pin 1, Input

Function:

The device enters a low power mode and all internal state machines registers are reset when low. When high, the device will be in a normal operation mode .

RST	DESCRIPTION
0	Enabled
1	Normal operation mode

Digital Ground - **DGND**

Pins 6 and 9, Inputs

Function:

Digital ground reference.

Digital Power - **VD**

Pins 7 and 8, Input

Function:

Digital power supply. Typically 5.0 to 3.0 VDC.

Master Clock - **MCLK**

Pin 10, Input

Function:

The master clock frequency must be either 256x, 384x, 512x or 768x the input sample rate in Single Speed Mode; either 128x, 192x 256x or 384x the input sample rate in Double Speed Mode; or 64x, 96x 128x or 192x the input sample rate in Quad Speed Mode. Tables 4-6 illustrate the standard audio sample rates and the required master clock frequencies.

Sample Rate (kHz)	MCLK (MHz)			
	256x	384x	512x	768x
32	8.1920	12.2880	16.3840	24.5760
44.1	11.2896	16.9344	22.5792	33.8688
48	12.2880	18.4320	24.5760	36.8640

Table 4. Single Speed (16 to 50 kHz sample rates) Common Clock Frequencies

Sample Rate (kHz)	MCLK (MHz)			
	128x	192x	256x	384x
64	8.1920	12.2880	16.3840	24.5760
88.2	11.2896	16.9344	22.5792	33.8688
96	12.2880	18.4320	24.5760	36.8640

Table 5. Double Speed (50 to 100 kHz sample rates) Common Clock Frequencies

Sample Rate (kHz)	MCLK (MHz)			
	64x	96x	128x	192x
176.4	11.2896	16.9344	22.5792	33.8688
192	12.2880	18.4320	24.5760	36.8640

Table 6. Quad Speed (100 to 200 kHz sample rates) Common Clock Frequencies
Serial Clock - SCLK
Pin 11, Input
Function:

Clocks individual bits of serial data into the SDATA pin. The required relationship between the Left/Right clock, serial clock and serial data is defined by either the Mode Control Byte in Control Port Mode or the M0 - M4 pins in Hardware Mode. The options are detailed in Figures 20-23

Left/Right Clock - LRCK
Pin 12, Input
Function:

The Left/Right clock determines which channel is currently being input on the serial audio data input, SDATA. The frequency of the Left/Right clock must be at the input sample rate. Audio samples in Left/Right sample pairs will be simultaneously output from the digital-to-analog converter whereas Right/Left pairs will exhibit a one sample period difference. The required relationship between the Left/Right clock, serial clock and serial data is defined by the Mode Control Byte and the options are detailed in Figures 20-23

Serial Audio Data - SDATA
Pin 13, Input
Function:

Two's complement MSB-first serial data is input on this pin. The data is clocked into SDATA via the serial clock and the channel is determined by the Left/Right clock. The required relationship between the Left/Right clock, serial clock and serial data is defined by the Mode Control Byte and the options are detailed in Figures 20-23

Soft Mute - $\overline{\text{MUTE}}$
Pin 15, Input
Function:

The analog outputs will ramp to a muted state when enabled. The ramp requires 1152 left/right clock cy-

cles in Single Speed, 2304 cycles in Double Speed and 4608 cycles in Quad Speed mode. The bias voltage on the outputs will be retained and MUTE \overline{C} will go active at the completion of the ramp period.

The analog outputs will ramp to a normal state when this function transitions from the enabled to disabled state. The ramp requires 1152 left/right clock cycles in Single Speed, 2304 cycles in Double Speed and 4608 cycles in Quad Speed mode. The MUTE \overline{C} will release immediately on setting MUTE = 1.

The converter analog outputs will mute when enabled. The bias voltage on the outputs will be retained and MUTE \overline{C} will go active during the mute period.

Mute	DESCRIPTION
0	Enabled
1	Normal operation mode

Control Port / Hardware Mode Select - C/H $\overline{}$

Pin 16, Input

Function:

Determines if the device will operate in either the Hardware Mode or Control Port Mode.

C/H $\overline{}$	DESCRIPTION
0	Hardware Mode Enabled
1	Control Port Mode Enabled

Mute Control - MUTE \overline{C}

Pin 17, Output

Function:

The Mute Control pin goes low during power-up initialization, reset, muting, master clock to left/right clock frequency ratio is incorrect or power-down. This pin is intended to be used as a control for an external mute circuit to prevent the clicks and pops that can occur in any single supply system. Use of Mute Control is not mandatory but recommended for designs requiring the absolute minimum in extraneous clicks and pops.

Analog Ground - AGND

Pins 18 and 21, Inputs

Function:

Analog ground reference.

Differential Analog Output - AOUTR $\overline{-}$, AOUTR $\overline{+}$ and AOUTL $\overline{-}$, AOUTL $\overline{+}$

Pins 19, 20, 23 and 24, Outputs

Function:

The full scale differential analog output level is specified in the Analog Characteristics specifications table.

Analog Power - VA

Pin 22, Input

Function:

Power for the analog and reference circuits. Typically 5VDC.

Common Mode Voltage - CMOUT

Pin 25, Output

Function:

Filter connection for internal bias voltage, typically 50% of VREF. Capacitors must be connected from CMOUT to analog ground, as shown in Figure 4. CMOUT has a typical source impedance of 25 k Ω and any current drawn from this pin will alter device performance

Reference Ground - FILT-

Pin 26, Input

Function:

Ground reference for the internal sampling circuits. Must be connected to analog ground.

Reference Filter - FILT+

Pin 27, Output

Function:

Positive reference for internal sampling circuits. External capacitors are required from FILT+ to analog ground, as shown in Figure 4. The recommended values will typically provide 60 dB of PSRR at 1 kHz and 40 dB of PSRR at 120 Hz. FILT+ is not intended to supply external current.

Voltage Reference Input- VREF

Pin 28, Input

Function:

Analog voltage reference. Typically 5VDC.

HARDWARE MODE**Mode Select - M0, M1, M2, M3, M4**

Pins 2, 3, 4, 5 and 14, Inputs

Function:

The Mode Select pins determine the operational mode of the device as detailed in Tables 7-10. The options include;

Selection of the Digital Interface Format which determines the required relationship between the Left/Right clock, serial clock and serial data as detailed in Figures 20-23

Selection of the standard 15 μ s/50 μ s digital de-emphasis filter response, Figure 28, which requires re-configuration of the digital filter to maintain the proper filter response for 32, 44.1 or 48 kHz sample rates.

Selection of the appropriate clocking mode to match the input sample rates.

CONTROL PORT MODE**Address Bit 0 / Chip Select - AD0 / $\overline{\text{CS}}$**

Pin 2, Input

Function:

In I²C mode, AD0 is a chip address bit. $\overline{\text{CS}}$ is used to enable the control port interface in SPI mode. The device will enter the SPI mode at anytime a high to low transition is detected on this pin. Once the device has entered the SPI mode, it will remain until either the part is reset or undergoes a power-down cycle.

Address Bit 1 / Control Data Input - AD1/CDIN

Pin 3, Input

Function:

In I²C mode, AD1 is a chip address bit. CDIN is the control data input line for the control port interface in SPI mode.

Serial Control Interface Clock - SCL/CCLK

Pin 4, Input

Function:

In I²C mode, SCL clocks the serial control data into or from SDA/CDOOUT.

In SPI mode, CCLK clocks the serial data into AD1/CDIN and out of SDA/CDOOUT.

Serial Control Data I/O - SDA/CDOOUT

Pin 5, Input/Output

Function:

In I²C mode, SDA is a data input/output. CDOOUT is the control data output for the control port interface in SPI mode.

M1 - Mode Select

Pin 14, Input

Function:

This pin is not used in Control Port Mode and must be terminated to ground.

5.0 APPLICATIONS

5.1 Recommended Power-up Sequence

1. Hold $\overline{\text{RST}}$ low until the power supplies, master, and left/right clocks are stable.
2. Bring $\overline{\text{RST}}$ high.

6.0 CONTROL PORT INTERFACE

The control port is used to load all the internal settings of the CS4396. The operation of the control port may be completely asynchronous to the audio sample rate. However, to avoid potential interference problems, the control port pins should remain static if no operation is required.

The control port has 2 modes: SPI and I²C, with the CS4396 operating as a slave device in both modes. If I²C operation is desired, AD0/ \overline{CS} should be tied to VD or DGND. If the CS4396 ever detects a high to low transition on AD0/ \overline{CS} after power-up, SPI mode will be selected.

6.1 SPI Mode

In SPI mode, \overline{CS} is the CS4396 chip select signal, CCLK is the control port bit clock, CDIN is the input data line from the microcontroller, CDOUT is the data output and the chip address is 0010000. The data is clocked on the rising edge of CCLK.

Figure 5 shows the operation of the control port in SPI mode. To write to a register, bring \overline{CS} low. The first 7 bits on CDIN form the chip address, and must be 0010000. The eighth bit is a read/write indicator (R/\overline{W}). The next 8 bits form the Memory Address Pointer (MAP), which is set to 01h. The next 8 bits are the data which will be placed into the register designated by the MAP.

6.2 I²C Mode

In I²C mode, SDA is a bi-directional data line. Data is clocked into and out of the part by the clock, SCL, with the clock to data relationship as shown in Figure 2. There is no \overline{CS} pin. Pins AD0 and AD1 form the partial chip address and should be tied to VD or DGND as required. The 7-bit address field, which is the first byte sent to the CS4396, must be 00100(AD1)(AD0) where (AD1) and (AD0) match the setting of the AD0 and AD1 pins. The eighth bit of the address byte is the R/\overline{W} bit (high for a read, low for a write). If the operation is a write, the next byte is the Memory Address Pointer, MAP, which selects the register to be read or written. The MAP is then followed by the data to be written. If the operation is a read, then the contents of the register pointed to by the MAP will be output after the chip address.

For more information on I²C, please see “The I²C-Bus Specification: Version 2.0”, listed in the References section.

CRUSTAL

7.0 PARAMETER DEFINITIONS

Total Harmonic Distortion + Noise (THD+N)

The ratio of the rms value of the signal to the rms sum of all other spectral components over the specified bandwidth (typically 10Hz to 20kHz), including distortion components. Expressed in decibels.

Dynamic Range

The ratio of the full scale rms value of the signal to the rms sum of all other spectral components over the specified bandwidth. Dynamic range is a signal-to-noise measurement over the specified bandwidth made with a -60 dBFS signal. 60 dB is then added to the resulting measurement to refer the measurement to full scale. This technique ensures that the distortion components are below the noise level and do not effect the measurement. This measurement technique has been accepted by the Audio Engineering Society, AES17-1991, and the Electronic Industries Association of Japan, EIAJ CP-307.

Interchannel Isolation

A measure of crosstalk between the left and right channels. Measured for each channel at the converter's output with all zeros to the input under test and a full-scale signal applied to the other channel. Units in decibels.

Interchannel Gain Mismatch

The gain difference between left and right channels. Units in decibels.

Gain Error

The deviation from the nominal full scale analog output for a full scale digital input.

Gain Drift

The change in gain value with temperature. Units in ppm/°C.
