# EVQ1923-RE-00A

100V, 8A, High-Frequency Half-Bridge Gate Driver Evaluation Board

#### **DESCRIPTION**

The EVQ1923-RE-00A is an evaluation board designed to demonstrate the MPQ1923, a high-frequency half-bridge gate driver. The MPQ1923 has a 7A source current ( $I_{SOURCE}$ ) and 8A sink current ( $I_{SINK}$ ) at a 12V driver power supply voltage ( $V_{DD}$ ).

The integrated bootstrap (BST) diode reduces the external component count. The device's high-side MOSFET (HS-FET) and low-side MOSFET (LS-FET) drivers are controlled independently, and can be matched with a time delay (<5ns). If the IC supply is insufficient, then under-voltage lockout (UVLO) protection on both the HS-FET and LS-FET force the outputs low.

The MPQ1923 is designed for motor drivers and other power-control applications (e.g. telecommunication half-bridge power supplies, avionics DC/DC converters, two-switch forward converters, and active-clamp forward converters.

The MPQ1923 is available in a small QFN-10 (4mmx4mm) or QFN-8 (4mmx4mm) package.

The EVQ1923-RE-00A is configured as a buck converter. The INH and INL pins are independent signals. Choose complementary pulse-width modulation (PWM) signals and a proper dead time (DT) for INH and INL.

### PERFORMANCE SUMMARY

Specifications are at  $T_A = 25$ °C, unless otherwise noted.

Parameters	Conditions	Value
Driver power supply voltage range (V <sub>DD</sub> )		5V to 17V
Input power supply voltage range (V <sub>IN</sub> )		0V to 100V
Floating HS-FET gate driver maximum source current (Isource_MAX)	V <sub>DD</sub> = 12V	7A
Floating HS-FET gate driver maximum sink current (Isink_MAX)	V <sub>DD</sub> = 12V	8A
LS-FET gate driver Isource_max	V <sub>DD</sub> = 12V	7A
LS-FET gate driver Isink_max	V <sub>DD</sub> = 12V	8A

### **QUICK START GUIDE**

- 1. Preset the driver power supply between 5V and 17V.
- 2. Preset the input voltage (V<sub>IN</sub>) between 0V and 100V.
- 3. Connect two complementary pulse-width modulation (PWM) signals with a proper dead time to CN1. It is recommended to choose either 3.3V or 5V for the INH and INL logic high voltage.
- 4. Connect the driver power supply terminals to:
  - a. Positive (+): VDD
  - b. Negative (-): GND
- 5. Connect the input power supply terminals to:
  - a. Positive (+): V<sub>POWER</sub>
  - b. Negative (-): GND
- 6. Attach the load terminals to:
  - a. Positive (+): V<sub>LOAD</sub>
  - b. Negative (-): GND
- 7. Turn on the driver's power supply.
- 8. Check the INH, INL, DRVH, and DRVL signals to ensure that a sufficient dead time (DT) has been established for DRVH and DRVL.
- 9. Turn on the input power supply. The board should start up automatically.
- 10. Turn on the load, then check the output voltage (V<sub>OUT</sub>) and output current (I<sub>OUT</sub>) to ensure the buck circuitry is operating normally.
- 11. To turn off the system, follow the steps below:
  - a. Turn off the load.
  - b. Turn off the input power supply.
  - c. Turn off the driver power supply.
