MICROCHIP

Product Change Notification / SYST-30XUJC204

Date:

10-Jul-2023

Product Category:

8-bit Microcontrollers

PCN Type:

Document Change

Notification Subject:

ERRATA - PIC18F04/05/14/15Q40 Silicon Errata and Data Sheet Clarifications

Affected CPNs:

SYST-30XUJC204_Affected_CPN_07102023.pdf
SYST-30XUJC204_Affected_CPN_07102023.csv

Notification Text:

SYST-30XUJC204

Microchip has released a new Errata for the PIC18F04/05/14/15Q40 Silicon Errata and Data Sheet Clarifications of devices. If you are using one of these devices please read the document located at PIC18F04/05/14/15Q40 Silicon Errata and Data Sheet Clarifications.

Notification Status: Final

Description of Change: Adding silicon revision E0. Adding silicon errata 1.3.2, 1.3.3, 1.3.4 and 1.7.1.

Impacts to Data Sheet: None

Reason for Change: To Improve Productivity

Change Implementation Status: Complete

Date Document Changes Effective: 10 Jul 2023

NOTE: Please be advised that this is a change to the document only the product has not been changed.

Markings to Distinguish Revised from Unrevised Devices: N/A

Attachments:

PIC18F04/05/14/15Q40 Silicon Errata and Data Sheet Clarifications

Please contact your local Microchip sales office with questions or concerns regarding this notification.

Terms and Conditions:

If you wish to <u>receive Microchip PCNs via email</u> please register for our PCN email service at our PCN home page select register then fill in the required fields. You will find instructions about registering for Microchips PCN email service in the PCN FAQ section.

If you wish to <u>change your PCN profile, including opt out,</u> please go to the PCN home page select login and sign into your myMicrochip account. Select a profile option from the left navigation bar and make the applicable selections.

PIC18F04/05/14/15Q40 Silicon Errata and Data Sheet Clarifications

PIC18F04/05/14/15Q40

The PIC18F04/05/14/15Q40 devices you have received conform functionally to the current device data sheet (DS40002236**C**), except for the anomalies described in this document.

The silicon issues discussed in the following pages are for silicon revisions with the Device and Revision IDs listed in the table below.

The errata described in this document will be addressed in future revisions of the PIC18F04/05/14/15Q40 silicon.

Note: This document summarizes all silicon errata issues from all revisions of silicon, previous as well as current.

Table 1. Silicon Device Identification

Part Number	Device ID	Revision ID		
		D1	D3	E0
PIC18F04Q40	0x7640	0xA0C1	0xA0C3	0xA0D0
PIC18F05Q40	0x7600	0xA0C1	0xA0C3	0xA0D0
PIC18F14Q40	0x7620	0xA0C1	0xA0C3	0xA0D0
PIC18F15Q40	0x75E0	0xA0C1	0xA0C3	0xA0D0

Important: Refer to the **Device/Revision ID** section in the current **"PIC18FXXQ40 Family Programming Specification"** (DS40002185) for more detailed information on Device Identification and Revision IDs for your specific device.

Table 2. Silicon Issue Summary

Module	Feature	Item No.	Issue Summary	Affected Revisions		
				D1	D3	E0
Analog-to-Digital Converter with Computation	ADCC	1.1.1	Double Sample Conversions	X	X	
Electrical Specifications	ADC Offset Error	1.2.1	ADC Offset Error specification lowered in ECH, ECM and ECL modes	X		
I²C	I²C	1.3.1	I²C Start and/or Stop flags may be set When I²C is enabled	X		
		1.3.2	MDR bit is not cleared after Bus Timeout	X	X	X
		1.3.3	Bus Timeout not detected properly when External Host Clock stretches	X	X	X
		1.3.4	Clock Stretch Disable not working properly	X	X	X
		1.3.5	Bus Timeout causes false Start/ Stop	X	X	X
Universal Asynchronous Receiver Transmitter	UART	1.4.1	UART TXDE signal may go low before the STOP bit has been entirely transmitted.	X	X	X
		1.4.2	Asynchronous 9-bit UART Address mode address mismatch	X	X	
Signal Measurement TImer	SMT	1.5.1	Reset Bit	X	X	
PIC18 CPU	FSR Shadow Registers	1.6.1	FSR Shadow Registers are not writable	X	X	
ICSP™	Low-Voltage Programming (LVP)	1.7.1	Low Voltage Programming is not possible when VDD is below BORV while BOR is enabled.	X	X	X

Note: Only those issues indicated in the last column apply to the current silicon revision.

MICROCHIP

1.   Silicon Errata Issues

CAUTION	**Notice:** This document summarizes all silicon errata issues from all revisions of silicon, previous and current. Only the issues indicated by the bold font in the following tables apply to the current silicon revision.

1.1   Module: Analog-to-Digital Converter with Computation (ADCC)

1.1.1   Double Sample Conversions

When enabling a Double Sample Conversion (DSEN = 1) with no Precharge time (ADPRE = 0) and no Acquisition time (ADACQ = 0), the maximum number of cycles of acquisition time is inserted prior to the second conversion. The first conversion will be performed as expected with no Precharge time and no Acquisition time. It is only between the first and second conversions where a maximum number of cycles of Acquisition time is performed unexpectedly.

Work around
Method 1:

Disable Double Sample Conversion (DSEN = 0) and perform two single conversions back to back.

Method 2:

If adding acquisition time is acceptable, then select no Precharge time, along with the desired Acquisition time.

Affected Silicon Revisions

D1	D3	E0
X	X	

1.2   Module: Electrical Specifications

1.2.1   ADC Offset Error Specification Lowered in ECH, ECM and ECL Modes

When operating the device using an external clock source as the system clock in ECH, ECM or ECL mode, the ADC Offset Error (AD04: E_{OFF}) is updated to 12 Least Significant bits.

Work around
To meet the specified ADC Offset Error limit of 6 Least Significant bits, do not operate the device using the system clock in ECH, ECM or ECL mode when using the ADC.

Affected Silicon Revisions

D1	D3	E0
X		

1.3   Module: Inter-Integrated Circuit (I^{2}C)

1.3.1   The I^{2}C Start and/or Stop Flags May Be Set When I^{2}C Is Enabled

When I^{2}C is enabled, erroneous Start and/or Stop conditions may be detected. This can generate erroneous I^{2}C interrupts if enabled.

Work around
Use the following procedure to correctly detect the Start and Stop conditions:

1. Disable the Start and Stop conditions interrupt functions.
2. Enable the I^{2}C module.
3. Wait 250 ns + six instructions cycles (F$_{OSC}$/4).
4. Clear the Start and Stop conditions interrupt flags.
5. Enable the Start and Stop conditions interrupt functions if used.

```
I2CxPIEbits.SCIE = 0;         // Disable Start condition interrupt
I2CxPIEbits.PCIE = 0;         // Disable Stop condition interrupt
I2CxCON0bits.EN = 1;          // Enable I2C
Delay();                      // Wait for 250 ns + 6 instruction cycles (FOSC/4)
I2CxPIRbits.SCIF = 0;         // Clear the Start condition interrupt flags
I2CxPIRbits.PCIF = 0;         // Clear the Stop condition interrupt flags
I2CxPIEbits.SCIE = 1;         // Enable Start condition interrupt if used
I2CxPIEbits.PCIE = 1;         // Enable Stop condition interrupt if used
```

Affected Silicon Revisions

D1	D3	E0
X		

1.3.2 MDR Bit Is Not Cleared after Bus Timeout

In the Host mode of the I^{2}C module, when a bus timeout occurs during clock stretching and TOREC = `1`, the MDR bit will not be cleared and a Stop will not be transmitted on the bus.

Work around

Force a Stop on the bus by setting the P bit upon bus timeout in Host mode. Forcing a Stop on the bus clears the MDR bit.

Affected Silicon Revisions

D1	D3	E0
X	X	X

1.3.3 Bus Timeout Not Detected Properly when External Host Clock Stretches

When the module is operating in Client mode and an external Host device is clock stretching after the eighth SCL clock and a bus timeout occurs, the bus timeout is not detected properly. When the external Host times out before the Client and releases SCL to generate a Stop condition, the module continues to stretch SDA as if to generate an ACK and hangs the bus, and a Stop is never seen on the bus.

Work around

Reset the module by toggling the EN bit.

Affected Silicon Revisions

D1	D3	E0
X	X	X

1.3.4 Clock Stretch Disable Not Working Properly

When the CSD bit is set between a Start condition and the eighth falling SCL edge, the I^{2}C module enters a state where the module clock stretches indefinitely after the next Start until a bus timeout occurs.

Work around

Force a reset of the module by toggling the EN bit.

Affected Silicon Revisions

D1	D3	E0

MICROCHIP

X	X	X

1.3.5 Clock Stretch Disable Not Working Properly

When the module is operating in Client mode and an external Host device is clock stretching and a bus timeout occurs in the Client, the Client releases SDA and goes into the idle state. After the external Host generates a Stop condition on the bus by releasing SCL, the module can erroneously drive a low pulse on the SDA line, which acts as a false Start and Stop on the bus.

Work around

None.

Affected Silicon Revisions

D1	D3	E0
X	X	X

## 1.4 Module: Universal Asynchronous Receiver Transmitter (UART)

1.4.1 UART TXDE Signal May Go Low Before the STOP Bit Has Been Entirely Transmitted

The UART Transmit Drive Enable (TXDE) signal could potentially transition into a low state before the UART STOP bit has been entirely transmitted due to the effects of parasitic capacitance on the TX line. In some applications, this could result in communication being prematurely terminated due to the TXDE bit going low before the STOP bit has had enough time to settle.

Work around

To ensure that the STOP bit settles into its final logic state before the TXDE signal transitions low, a biasing circuit can be implemented. A biasing circuit allows the TX line to either be driven high or low, rather than being left in a floating tri-state mode where prolonged rise or fall times could lead to communication being disrupted. This bias circuit should only be implemented on one end of the serial bus, and a termination resistor should be used on the other end. The figure below show an example of a bias circuit that can be used to achieve this.

Please note that the resistor values used in this circuit are recommendations, and that the actual resistor values required may vary based on the application.
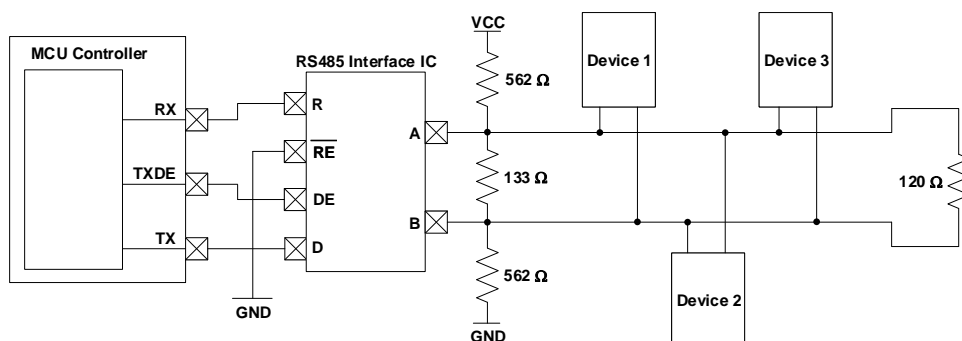

Affected Silicon Revisions

D1	D3	E0
X	X	X

1.4.2 Asynchronous 9-bit UART Address Mode Address Mismatch

In Asynchronous 9-bit UART Address mode there is the possibility that a false address mismatch may occur even when the address of both devices match, or that a false address match may occur when there is an address mismatch between the devices.

Work around

None. Do not use the UART modules in Asynchronous 9-bit Address Mode

Affected Silicon Revisions

D1	D3	E0
X	X	

1.5 Module: Signal Measurement Timer (SMT)

1.5.1 Reset Bit

If the SMT clock prescaler is set to any value other than `'00'`, setting the RST bit will cause the module to stop working. The RST bit will remain at the value `'1'`, the counter will not increment, and no interrupts will be generated. The problem is cleared by turning the module off and on, or by a device reset.

Work around
Method 1:

Do not set the RST bit; manual reset is usually not required for typical operation because the measurement logic will reset the counter automatically.

Method 2:

Write zero to the counter manually. The module enable or the clock should be disabled when using this method.

Method 3:

Use 1:1 prescaler (PS = `00`).

Method 4:

Use the CLKREF subsystem to provide a prescaled clock and set PS = `00`.

Affected Silicon Revisions

D1	D3	E0
X	X	

1.6 Module: PIC18 Core

1.6.1 FSR Shadow Registers Are Not Writable

Writing to the FSR Shadow Registers does not result in accurate values being stored in the registers. Consequently, reading the FSR Shadow Registers after they have been written will return inaccurate data.

Work around

Writes to the FSR shadow registers can be performed safely using the following steps:

1. Save regular FSR2 value into RAM.
2. Write the regular FSR2 with the targeted value minus the computed offset (IR[6:0] + 1, see below).
3. Write the shadow FSRxL (data doesn't matter), this will clock the shadow FSR with the FSR computed offset value.
4. Decrement FSR2 value by 1 since FSRxH increments the address by 1 (IR[6:0]).
5. Write FSRxH.
6. Restore the regular FSR2 from the stored RAM value.

MICROCHIP

The FSR shadow should have the value desired and the regular FSR should have the original value.

Affected Silicon Revisions

D1	D3	E0
X	X	

1.7 Module: Low-Voltage In-Circuit Serial Programming™ (LVP)

1.7.1 Low-Voltage Programming Not Possible

Low-Voltage Programming is not possible when V_{DD} is below the selected BORV voltage level while BOR is enabled.

Work around
Method 1:

Disable BOR to use Low-Voltage Programming.

Method 2:

Raise V_{DD} above the selected BORV level while using Low-Voltage Programming.

2.   Data Sheet Clarifications

The following typographic corrections and clarifications are to be noted for the latest version of the device data sheet (DS40002236**C**):

Note:

Corrections are shown in **bold**. Where possible, the original bold text formatting has been removed for clarity.

2.1   None

There are no known data sheet clarifications as of this publication date.

3. Appendix A: Revision History

Doc. Rev.	Date	Comments
E	06/2023	Adding silicon revision E0. Adding silicon errata 1.3.2, 1.3.3, 1.3.4 and 1.7.1.
D	05/2022	Adding silicon revision D3.
C	04/2022	Updating the flash memory cell endurance specification data sheet clarification. Adding silicon errata 1.6.1
B	02/2022	Adding silicon errata 1.1.1, 1.4.1 and 1.5.1.
A	01/2021	Initial document release.

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable". Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

Microchip Information

The Microchip Website

Microchip provides online support via our website at www.microchip.com/. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to www.microchip.com/pcn and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: www.microchip.com/support

Microchip Devices Code Protection Feature
