

**RxxC2Txx series / Power Module**

2W / 21-27VDC / 36 Pin SSOP Package

**FEATURES**

- 2W isolated DC/DC converter
- Programmable asymmetrical output voltages
- Ideal for IGBT/Si/SiC/GaN gate drive bias voltages
- High 3kVAC/1min isolation
- 0.5W at 125°C
- Less than 3.5pF isolation capacitance
- Compact 7.5x12.83mm SMD package
- 3 years warranty

Dimensions (HxWxD): 3.55 x 7.5 x 12.83mm (0.14 x 0.29 x 0.50 inch)  
0.1g (0.0032 oz)

**APPLICATIONS****SAFETY & EMC****DESCRIPTION**

The R24C2T25 series 2W isolated DC/DC converter is a versatile solution designed for isolated gate bias voltages, particularly for transistors such as IGBTs and Si and SiC MOSFETs. This compact converter features programmable asymmetrical output voltages, ensuring precise control and performance optimization for power electronics applications. With high 3kVAC/1min isolation and remarkable stability even at 125°C (0.5W), it offers superior reliability. The ultra-low isolation capacitance, less than 3.5pF, ensures minimal noise propagation across the isolation barrier. All of these exceptional features are packaged in a compact 7.5 x 12.83mm SMD form factor, making it an ideal choice for all isolated gate bias voltage needs.

**SELECTION GUIDE**

| Part Number | Input Voltage Range [VDC] | Output Voltage Range <sup>(1)</sup> [VDC]   | Output Current max. [mA]                    | Efficiency typ. [%] |
|-------------|---------------------------|---|---|---------------------|
| R24C2T25    | 21 - 27                   | $V_{OUT+} = 2.5 - 22.5$<br>$V_{OUT-} = (-2.5) - (-22.5)$<br>$V_{TOTAL} = 18 - 25$ | $I_+ = 100\text{mA}$<br>$I_- = 12\text{mA}$ | 55                  |

Note1:  $V_{OUT+}$  and  $V_{OUT-}$  can be set from 2.5VDC to 22.5VDC but the sum of both must be within 18VDC to 25VDC. The  $V_{OUT+}$  to  $V_{OUT-}$  is the main output of the module. The power stage operation is determined by the sensed  $V_{OUT+}$  to  $V_{OUT-}$  voltage on the FBV<sub>OUT+</sub> pin. For more information see „Typical Application“ below.

### REGULATIONS

| Parameter                       | Symbol   | Condition                           | Min.      | Typ.   | Max.     |
|---------------------------------|----------|-------------------------------------|-----------|--------|----------|
| Feedback Voltage <sup>(3)</sup> | $V_{FB}$ | $V_{OUT+}$ to $V_{OUT-}$            | 2.4675VDC | 2.5VDC | 2.533VDC |
| Feedback $V_{OUT+}$ Hysteresis  |          | hysteresis at the FBV $_{OUT+}$ pin | 9mV       | 10mV   | 12.3mV   |
| Output Voltage Accuracy         |          | 0.1% of FB resistors                | -1.5%     |        | 1.5%     |

Note3: For isolated gate driver applications, one positive and one negative output are needed. In this case,  $V_{OUT+}$  to  $V_{OUT-}$  is the total output voltage, and the middle point becomes the reference point. Because the total voltage between  $V_{OUT+}$  and  $V_{OUT-}$  is always regulated through the FBV $_{OUT+}$  feedback, the COM pin only must regulate the middle point voltage so that it can give the correct positive and negative voltages. The COM control is achieved through FBV $_{OUT-}$  pin as described in AGND to  $V_{OUT-}$  Voltage Regulation.

BASIC CHARACTERISTICS (measured @  $T_{AMB} = 25^{\circ}\text{C}$ , nom.  $V_{IN}$ , full load and after warm-up unless otherwise stated)

Derating Graph

Note4: Exceeding maximum allowable power dissipation causes device to enter thermal shutdown which protects device from permanent damage.

Note5: Keep the average power at 2W max. or peak power 2.5W for 5 seconds max.

Note6: Test with Recom 50x50mm standard EVM board with 70 $\mu\text{m}$  copper, double layer

**ADJUSTABILITY**

| Parameter               | Condition                | Min.   | Typ. | Max.                     |
|-------------------------|--------------------------|--------|------|--------------------------|
| Output Voltage Trimming | $V_{OUT+}$ to $V_{OUT-}$ | 18VDC  |      | 25VDC                    |
|                         | AGND to $V_{OUT-}$       | 2.5VDC |      | $V_{OUT+}$ to $V_{OUT-}$ |

The R24C2T25 module creates two regulated outputs. It can be configured as a single output converter,  $V_{OUT+}$  to  $V_{OUT-}$  only, or a dual-output converter,  $V_{OUT+}$  to  $V_{OUT-}$  and COM to  $V_{OUT-}$ . Even though the module uses  $V_{OUT-}$  as the reference point to create two positive output voltages, the outputs can use COM as the reference point and become a positive and a negative output.

These two outputs are controlled independently through hysteresis control. Furthermore, the  $V_{OUT+}$  to  $V_{OUT-}$  is the main output, and COM to  $V_{OUT-}$  uses the main output as its input to create a second regulated output voltage.

**Typical Application**

$V_{TOTAL} = 18\text{-}25\text{VDC}$ ,  $P_{MAX} = 2$  watts

**Example**

To set the device into dual configuration, for example to +15/-9V, start to define main output voltage as the sum of both desired voltages ( $|15\text{V}| + |-9\text{V}| = 24\text{V}$ ). 24V are  $V_{OUT+}$  to  $V_{OUT-}$ . Then set the negative output.

+15/-9  $V_{TOTAL} = 24\text{VDC}$ ,  $V_{OUT-} = -9\text{VDC}$

+20/-5  $V_{TOTAL} = 25\text{VDC}$ ,  $V_{OUT-} = -5\text{VDC}$

+15/-3  $V_{TOTAL} = 18\text{VDC}$ ,  $V_{OUT-} = -3\text{VDC}$

+15/-4  $V_{TOTAL} = 19\text{VDC}$ ,  $V_{OUT-} = -4\text{VDC}$

Note7: Set  $V_{TOTAL}$  first and afterwards  $V_{OUT-}$ .  $V_{TOTAL}$  must be between 18VDC and 25VDC

# RxxC2Txx series / Power Module

## 2W / 21-27VDC / 36 Pin SSOP Package

### TRIM FUNCTION

#### Setting the main output - Single Configuration

The  $V_{OUT+}$  to  $V_{OUT-}$  output is the primary module output, regulated by the sensed voltage on  $FBV_{OUT+}$  pin. The  $V_{OUT+}$  to  $V_{OUT-}$  voltage is sensed through a voltage divider ( $R_1$  and  $R_2$ ). When  $FBV_{OUT+}$  voltage is below the turn-off threshold (approx. 10mV above the 2.5V reference), the power stage operates, raising the output voltage. Once the output reaches the turn-off threshold, the power stage turns off, causing the voltage to drop due to load current. When the output voltage falls below the turn-on threshold (approx. 10 mV below the 2.5V reference), the power stage is reactivated. Precise voltage reference and hysteresis control ensure accurate regulation. For enhanced noise immunity, add a 330pF capacitor between  $FBV_{OUT+}$  and  $V_{OUT-}$  pins, avoiding excessive capacitance to prevent output voltage ripple or stability issues.

Recommended resistor values for common  $V_{OUT+}$ :

#### Calculation

$$R_1 = \frac{(V_{OUT+} - V_{ref})}{V_{ref}} \times R_2$$

#### Example

$$R_1 = \frac{(18V - 2.5V)}{(2.5V)} \times 110k\Omega = \mathbf{682k\Omega}$$

| $V_{OUT+}$ [VDC] | $R_2$ [kΩ] | $R_1$ [kΩ] |
|------------------|------------|------------|
| 18               | 110        | 682        |
| 19               |            | 726        |
| 20               |            | 770        |
| 21               |            | 814        |
| 22               |            | 858        |
| 23               |            | 902        |
| 24               |            | 946        |
| 25               |            | 990        |

\*(according to E96)

#### Setting the second output - Dual Configuration

For isolated gate drivers,  $V_{OUT+}$  to  $V_{OUT-}$  provides the regulated total voltage with the midpoint as the reference. The COM pin regulates the midpoint voltage for accurate positive and negative outputs based on  $FBV_{OUT+}$  feedback.

In Figure below, COM to  $V_{OUT-}$  is monitored through  $R_3$  and  $R_4$  on  $FBV_{OUT-}$ . A 330pF capacitor on  $FBV_{OUT-}$  filters noise. Charging resistor activation, controlled by  $FBV_{OUT-}$ , raises COM to  $V_{OUT-}$  voltage. After reaching the stop charging threshold, the charging resistor turns off. The discharge resistor, with a 20mV hysteresis, is then controlled by  $FBV_{OUT-}$ .

The COM to  $V_{OUT-}$  regulator protects against prolonged high-side FET activation during a COM to  $V_{OUT-}$  short. It monitors COM pin voltage, adjusting the high-side FET duty ratio. If COM pin voltage is below 0.645V while  $FBV_{OUT-}$  is under 2.48V, a 20% duty ratio control overrides normal hysteresis. When COM pin voltage exceeds 0.73V, duty ratio control is disabled, and normal operation resumes.

#### Calculation

$$R_3 = \frac{(V_{OUT-} - V_{ref})}{V_{ref}} \times R_4 - R_{LIM}$$

#### Example

$$R_3 = \frac{(5V - 2.5V)}{2.5V} \times 499k\Omega - 387k\Omega = \mathbf{498.6k\Omega}$$

Recommended resistor values for common  $V_{OUT-}$ :

| $V_{OUT-}$ [VDC] | $R_4$ [kΩ] | $R_{LIM}$ [kΩ] | $R_3$ [kΩ] |
|------------------|------------|----------------|------------|
| 18               | 499        | 220            | 99.6       |
| 19               |            | 303            | 299        |
| 20               |            | 387            | 498.6      |
| 21               |            | 720            | 1296.7     |

\*(according to E96)

Note8: To minimize the power consumption under light loads, it is desirable to choose a resistance value of between 100kΩ and 500kΩ for  $R_4$

#### Defining $R_{LIM}$

When the device has been configured to dual configuration, the  $R_{LIM}$  resistor is a true current limiting resistor. Set up the  $R_{LIM}$  resistor as the maximum load current ( $I_{OUT-max}$ ) needed for  $V_{OUT-}$  to COM path using following equation:

#### Calculation

$$R_{LIM} = \frac{V_{OUT-}}{I_{OUT-max}} - R_{LIM\_internal}$$

$$* R_{LIM\_internal} = 30\Omega$$

$$* I_{OUT-max} = \text{depends on application}$$

#### Example $R_{LIM}$ for $V_{OUT-} = 5VDC$

$$R_{LIM} = \frac{5V}{12mA} - 30\Omega = \mathbf{387\Omega}$$

$$* I_{OUT-max} \text{ has been defined as 12mA for the target application}$$

**CAPACITOR SELECTION**

For  $C_{IN}$  place a 10- $\mu$ F and a 0.1- $\mu$ F high-frequency decoupling capacitor in parallel close to  $V_{IN}$  pins. A capacitance greater than 10 $\mu$ F can be used to reduce the voltage ripple when the series impedance from the voltage source to the  $V_{IN}$  pins is large. For  $C_{OUT1}$  add a 2.2 $\mu$ F and a 100nF capacitor for high-frequency decoupling of  $V_{OUT+}$  to  $V_{OUT-}$ . Place close to the  $V_{OUT+}$  and  $V_{OUT-}$  pins. A capacitance greater than 2.2 $\mu$ F can be used to reduce the output voltage ripple. The selection of  $C_{OUT2}$  and  $C_{OUT3}$  is based on the gate charge requirement for the gate driver load, the charge balancing during the start-up, and the expected maximum current loading. Calculate  $C_{OUT2}$  first.

**Calculation**

$$C_{OUT2} = \frac{Q}{V_{out+} * \frac{V_{pp}}{100}}$$

| Parameter  |                  | Unit |
|------------|------------------|------|
| Q          | gate charge      | nC   |
| $V_{PP}$   | accepted Ripple  | %    |
| $V_{OUT+}$ | output voltage + | VDC  |

Then calculate the  $C_{OUT3}$  value based on the output voltage ratios, the load current expected, and the variation of the output capacitors.

**Calculation**

$$C_{OUT3} = \frac{C_{OUT2} * V_{out+} * (I_{max} - I_{max_{Vout-}})}{V_{out-} * (I_{max} - I_{max_{Vout+}})}$$

| Parameter        |                      | Unit |
|------------------|----------------------|------|
| $I_{MAX\_VOUT-}$ | output current -     | IDC  |
| $V_{OUT-}$       | output voltage -     | VDC  |
| $I_{MAX\_VOUT+}$ | output current +     | IDC  |
| $I_{MAX}$        | total output current | IDC  |
| $P_{MAX}$        | output power         | W    |

**Example**

| Parameter        |                      | Value     |
|------------------|----------------------|-----------|
| Q                | gate charge          | 55nC      |
| $V_{PP}$         | accepted Ripple      | 1%        |
| $V_{OUT+}$       | output voltage +     | 15VDC     |
| $I_{MAX\_VOUT-}$ | output current -     | 0.012IDC  |
| $V_{OUT-}$       | output voltage -     | 9VDC      |
| $I_{MAX\_VOUT+}$ | output current +     | 0.012IDC  |
| $I_{MAX}$        | total output current | 0.0833UDC |
| $P_{MAX}$        | output power         | 2W        |

| CIN                | COUT1 (VOUT+ to VOUT-) | VOUT+ to COM | COUT2 | VOUT- to COM | COUT3       |
|--------------------|------------------------|--------------|-------|--------------|-------------|
| 10 $\mu$ F + 100nF | 22 $\mu$ F + 100nF     | 20VDC        | 270nF | 5VDC         | 1 $\mu$ F   |
| 10 $\mu$ F + 100nF | 22 $\mu$ F + 100nF     | 15VDC        | 390nF | 9VDC         | 680nF       |
| 10 $\mu$ F + 100nF | 22 $\mu$ F + 100nF     | 15VDC        | 390nF | 3VDC         | 1.8 $\mu$ F |
| 10 $\mu$ F + 100nF | 22 $\mu$ F + 100nF     | 15VDC        | 390nF | 4VDC         | 1.5 $\mu$ F |

## 2W / 21-27VDC / 36 Pin SSOP Package

### PROTECTIONS

| Parameter  | Condition | Min. | Typ.       | Max.      |
|--|-----------|------|------------|-----------|
| Over Power Protection (OPP)                      |           |      |            | latch-off |
| Over Temperature Protection <sup>(9)</sup> (OTP) |           |      |            | latch-off |
| Over Temperature Shutdown Setpoint               |           |      | 150°C±10°C |           |
| Over Temperature Shutdown Hysteresis             |           |      | 20°C±5°C   |           |

Note9: The R24C2T25 integrates power stages with over-temperature protection. If temperatures exceed limits, it stops switching and enters a latch-off protection mode.

### THERMAL OPERATING CONDITIONS

| Parameter                | Condition   | Min. | Typ.                   | Max.  |
|--------------------------|---|------|------------------------|-------|
| Thermal Impedance        | junction to case  |      | 16.6K/W                |       |
|                          | junction to board   |      | 25.9K/W                |       |
|                          | case to ambient <sup>(6)</sup>                                  |      | 30K/W                  |       |
| ESD                      | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001              |      |                        | ±2kV  |
|                          | Charged-device model (CDM), per JEDEC specification JESD22-C101 |      |                        | ±500V |
| Moisture Sensitive Level |   |      | Level 3, 260°C, 168hrs |       |

### ISOLATION CAPABILITIES

| Parameter                                 | Condition  | Min.                            | Typ.   | Max.                       |
|---|--|---------------------------------|--------|----------------------------|
| Comparative tracking index (CTI)          | DIN EN 60112 (VDE 0303-11); IEC 60112                                  |                                 |        | 600VDC                     |
| Overvoltage Category                      | Rated mains voltage ≤ 300 VRMS   |                                 |        | I-IV                       |
|   | Rated mains voltage ≤ 600 VRMS   |                                 |        | I-IV                       |
|   | Rated mains voltage ≤ 1000 VRMS  |                                 |        | I-III                      |
| Isolation Voltage <sup>(10)</sup>         | tested in qualification  |                                 |        | 3kVAC/1min.                |
|   | tested in production   |                                 |        | 3.6kVAC/1sec.              |
| Repetitive peak isolation voltage         | AC voltage (bipolar)   |                                 |        | 1.2kVp                     |
| Working isolation voltage <sup>(11)</sup> | AC voltage (sine wave) Time dependent dielectric breakdown (TDDb) test |                                 |        | 850VRMS                    |
|   | DC voltage   |                                 |        | 1.2kVDC                    |
| Transient isolation voltage               | tested in qualification<br>tested in production                        |                                 |        | 4.2kVp/1min.<br>5kVp/1sec. |
| Impulse voltage                           | waveform per IEC 62368-1   |                                 |        | 5kVp                       |
| Surge isolation voltage                   | waveform per IEC 62368-1   |                                 |        | 6.5kVp                     |
| Isolation Resistance                      | input to output  | VIO= 500VDC, TA= 25°C           | 1000GΩ |                            |
|   |  | VIO= 500VDC, 100°C ≤ TA ≤ 125°C | 100GΩ  |                            |
|   |  | VIO= 500VDC at TS= 150°C        | 1GΩ    |                            |
| Isolation Capacitance                     | input to output  |                                 |        | 3.5pF                      |
| External Clearance                        |  | 8mm                             |        |                            |
| External Creepage                         |  | 8mm                             |        |                            |

Note10: High voltage isolation testing of a barrier component can degrade isolation capability. RECOM therefore strongly advises against repeated high-voltage isolation testing. If required, reduce specified test voltage by 20%.

Note11: When the insulation in the R24C2T25 series is not used as a safety barrier, i.e. provides functional isolation only, continuous or switched voltages across the barrier up to 1.2kVp are sustainable. This is established by measuring the partial discharge inception voltage in accordance with IEC60270. Please contact techsupport@recom-power.com for further information.

| Parameter         | Type | Value  |

# RxxC2Txx series / Power Module

## 2W / 21-27VDC / 36 Pin SSOP Package

### DIMENSION & PHYSICAL CHARACTERISTICS

#### Pad Information

| Pad #   | Function            | Description  |
|---|---------------------|--|
| 1, 2, 5, 8, 9, 10,<br>11, 12, 13, 14,<br>15, 16, 17, 18 | PGND                | Primary side power ground. Place several vias to copper pours for thermal relief.  |
| 3   | PG                  | Power good open-drain output. Low when UVLO, OVLO, UVP, OVP, and OTP are not triggered.  |
| 4   | CTRL                | Pull high to enable the device. Leave open or connect to ground to disable the device.   |
| 6   | AV <sub>IN</sub>    | Primary side analog input. Connect a 330pF ceramic capacitor between AV <sub>IN</sub> and pin 5.   |
| 7   | PV <sub>IN</sub>    | Primary side power input. Connect a 0.1µF and a 22µF ceramic capacitor to pin 8.   |
| 19, 20, 21, 22,<br>23, 24, 25, 26,<br>27, 30, 31, 36    | V <sub>OUT-</sub>   | Secondary side negative output voltage.  |
| 28, 29  | V <sub>OUT+</sub>   | Secondary side positive output voltage. Connect a 10µF and 0.1µF ceramic capacitor between V <sub>OUT+</sub> and V <sub>OUT-</sub> .                                   |
| 32  | COM                 | Connect 1kΩ current limiting resistor to COM node of circuit. See application example.   |
| 33  | FBV <sub>OUT-</sub> | FBV <sub>OUT</sub> Feedback (COM – V <sub>OUT-</sub> ) output voltage sense pin used to set the output (COM – V <sub>OUT-</sub> ) voltage.                             |
| 34  | FBV <sub>OUT+</sub> | FBV <sub>OUT</sub> Feedback (V <sub>OUT+</sub> – V <sub>OUT-</sub> ) output voltage sense pin used to set the output (V <sub>OUT+</sub> – V <sub>OUT-</sub> ) voltage. |
| 35  | FB <sub>COM</sub>   | Use as reference for FBV <sub>OUT+</sub> and FBV <sub>OUT-</sub> .   |

### PACKAGING INFORMATION

| Parameter                   | Type                             | Value  |
|-----------------------------|----------------------------------|--|
| Packaging Dimension (LxWxH) | Suffix -R: tape and reel         | 38 x 36 x 5.5 mm<br>1.5 x 1.42 x 0.22 inch   |
|                             | Suffix -CT: moisture barrier bag | 100 x 100 x 30 mm<br>3.94 x 3.94 x 1.18 inch |
| Packaging Quantity          | Suffix -R: tape and reel         | 750pcs                                       |
|                             | Suffix -CT: moisture barrier bag | 10pcs  |
| Storage Temperature Range   |                                  | -40°C to +125°C                              |
| Storage Humidity            | non-condensing                   | 5% - 95% RH max.                             |

The product information and specifications may be subject to changes even without prior written notice. The product has been designed for various applications; its suitability lies in the responsibility of each customer. The products are not authorized for use in safety-critical applications without RECOM's explicit written consent. A safety-critical application is an application where a failure may reasonably be expected to endanger or cause loss of life, inflict bodily harm or damage property. The applicant shall indemnify and hold harmless RECOM, its affiliated companies and its representatives against any damage claims in connection with the unauthorized use of RECOM products in such safety-critical applications.
