Synchronous Regulator, TINYBOOST®, 3 MHz

FAN4860

Description

The FAN4860 is a low−power boost regulator designed to provide a regulated 3.3 V, 5.0 V or 5.4 V output from a single cell Lithium or Li−Ion battery. Output voltage options are fixed at 3.3 V, 5.0 V, or 5.4 V with a guaranteed maximum load current of 200 mA at V_{IN} = 2.3 V and 300 mA at V_{IN} = 3.3 V. Input current in Shutdown Mode is less than 1 μA, which maximizes battery life.

Light−load PFM operation is automatic and “glitch−free”. The regulator maintains output regulation at no−load with as low as 37 μA quiescent current.

The combination of built−in power transistors, synchronous rectification, and low supply current make the FAN4860 ideal for battery powered applications.

The FAN4860 is available in 6−bump 0.4 mm pitch Wafer−Level Chip Scale Package (WLCSP) and a 6−lead 2 x 2 mm ultra−thin MLP package.

Features

- Operates with Few External Components:
  1 μH Inductor and 0402 Case Size Input and Output Capacitors
- Input Voltage Range from 2.3 V to 5.4 V
- Fixed 3.3 V, 5.0 V, or 5.4 V Output Voltage Options
- Maximum Load Current >150 mA at V_{IN} = 2.3 V
- Maximum Load Current 300 mA at V_{IN} = 3.3 V, V_{OUT} = 5.4 V
- Maximum Load Current 300 mA at V_{IN} = 3.3 V, V_{OUT} = 5.0 V
- Maximum Load Current 300 mA at V_{IN} = 2.7 V, V_{OUT} = 3.3 V
- Up to 92% Efficient
- Low Operating Quiescent Current
- True Load Disconnect During Shutdown
- Variable On−time Pulse Frequency Modulation (PFM) with Light−Load Power−Saving Mode
- Internal Synchronous Rectifier
  (No External Diode Needed)
- Thermal Shutdown and Overload Protection
- 6−Pin 2 × 2 mm UMLP
- 6−Bump WLCSP, 0.4 mm Pitch

Applications

- USB “On the Go” 5 V Supply
- 5 V Supply – HDMI, H−Bridge Motor Drivers
- Powering 3.3 V Core Rails
- PDAs, Portable Media Players
- Cell Phones, Smart Phones, Portable Instruments

Table 2. PIN DEFINITIONS

Pin #		Name	Description
WLCSP	UMLP		
A1	6	VIN	Input Voltage. Connect to Li−Ion battery input power source and input capacitor (C_{IN})
B1	5	SW	Switching Node. Connect to inductor
C1	4	EN	Enable. When this pin is HIGH, the circuit is enabled. This pin should not be left floating
C2	3	FB	Feedback. Output voltage sense point for V_{OUT}. Connect to output capacitor (C_{OUT})
B2	2	VOUT	Output Voltage. This pin is both the output voltage terminal as well as an IC bias supply
A2	1, P1	GND	Ground. Power and signal ground reference for the IC. All voltages are measured with respect to this pin

Table 3. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter		Min.	Max.	Units
V_{IN}	VIN Pin		−0.3	5.5	V
V_{OUT}	VOUT Pin		−2	6	V
V_{FB}	FB Pin		−2	6	V
V_{SW}	SW Node	DC	−0.3	5.5	V
		Transient: 10 ns, 3 MHz	−1.0	6.5	
V_{EN}	EN Pin		−0.3	5.5	V
ESD	Electrostatic Discharge Protection Level	Human Body Model per JESD22−A114	2		kV
		Charged Device Model per JESD22−C101	1		
T_J	Junction Temperature		−40	+150	°C
T_{STG}	Storage Temperature		−65	+150	°C
T_L	Lead Soldering Temperature, 10 Seconds			+260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 4. RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter		Min.	Max.	Units
V_{IN}	Supply Voltage	5.4 V_{OUT}	2.3	4.5	V
		5.0 V_{OUT}	2.3	4.5	
		3.3 V_{OUT}	2.5	3.2	
I_{OUT}	Output Current			200	mA
T_A	Ambient Temperature		−40	+85	°C
T_J	Junction Temperature		−40	+125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Table 5. THERMAL PROPERTIES

Symbol	Parameter		Typical	Units
θ_{JA}	Junction−to−Ambient Thermal Resistance	WLCSP	130	°C/W
		UMLP	57	°C/W

1. Junction−to−ambient thermal resistance is a function of application and board layout. This data is measured with four−layer 2s2p boards in accordance to JEDEC standard JESD51. Special attention must be paid not to exceed junction temperature $T_{J(max)}$ at a given ambient temperate T_A.

FUNCTIONAL DESCRIPTION

Circuit Description

The FAN4860 is a synchronous boost regulator, typically operating at 3 MHz in Continuous Conduction Mode (CCM), which occurs at moderate to heavy load current and low V_{IN} voltages.

At light−load currents, the converter switches automatically to power−saving PFM Mode. The regulator automatically and smoothly transitions between quasi−fixed−frequency continuous conduction PWM Mode and variable−frequency PFM Mode to maintain the highest possible efficiency over the full range of load current and input voltage.

PWM Mode Regulation

The FAN4860 uses a minimum on−time and computed minimum off−time to regulate V_{OUT}. The regulator achieves excellent transient response by employing current mode modulation. This technique causes the regulator output to exhibit a load line. During PWM Mode, the output voltage drops slightly as the input current rises. With a constant V_{IN}, this appears as a constant output resistance.

The “droop” caused by the output resistance when a load is applied allows the regulator to respond smoothly to load transients with negligible overshoot.

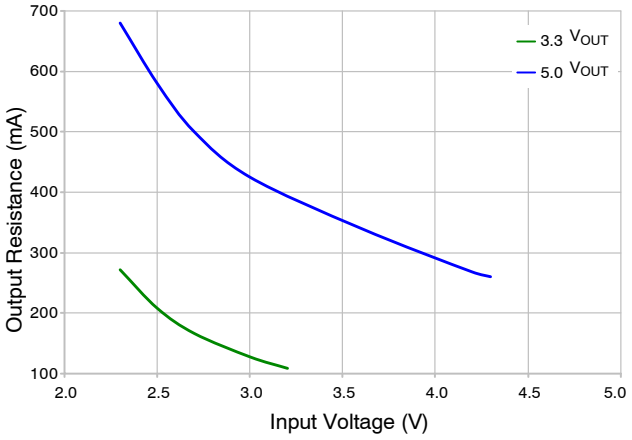

Figure 45. Output Resistance (R_{OUT})

When the regulator is in PWM CCM Mode and the target V_{OUT} = 5.05 V, V_{OUT} is a function of I_{LOAD} and can be computed as:

$$V_{OUT} = 5.05 - R_{OUT} \times I_{LOAD} \quad \text{(eq. 1)}$$

For example, at V_{IN} = 3.3 V, and I_{LOAD} = 200 mA, V_{OUT} drops to:

$$V_{OUT} = 5.05 - 0.38 \times 0.2 = 4.974\ V \quad \text{(eq. 2)}$$

At V_{IN} = 2.3 V, and I_{LOAD} = 200 mA, V_{OUT} drops to:

$$V_{OUT} = 5.05 - 0.68 \times 0.2 = 4.914\ V \quad \text{(eq. 3)}$$

PFM Mode

If $V_{OUT} > V_{REF}$ when the minimum off−time has ended, the regulator enters PFM Mode. Boost pulses are inhibited until $V_{OUT} < V_{REF}$. The minimum on−time is increased to enable the output to pump up sufficiently with each PFM boost pulse. Therefore, the regulator behaves like a constant on−time regulator, with the bottom of its output voltage ripple at 5.05 V in PFM Mode.

Table 7. OPERATING STATES

Mode	Description	Invoked When:
LIN	Linear Startup	$V_{IN} > V_{OUT}$
SS	Boost Soft−Start	$V_{OUT} < V_{REG}$
BST	Boost Operating Mode	$V_{OUT} = V_{REG}$

Shutdown and Startup

If EN is LOW, all bias circuits are off and the regulator is in Shutdown Mode. During shutdown, true load disconnect between battery and load prevents current flow from V_{IN} to V_{OUT}, as well as reverse flow from V_{OUT} to V_{IN}.

LIN State

When EN rises, if V_{IN} > UVLO, the regulator first attempts to bring V_{OUT} within about 1V of V_{IN} by using the internal fixed current source from V_{IN} (I_{LIN1}). The current is limited to about 630 mA during LIN1 Mode.

If V_{OUT} reaches V_{IN}−1V during LIN1 Mode, the SS state is initiated. Otherwise, LIN1 times out after 16 clock counts and the LIN2 Mode is entered.

In LIN2 Mode, the current source is incremented to 850 mA. If V_{OUT} fails to reach V_{IN}−1 V after 64 clock counts, a fault condition is declared.

SS State

Upon the successful completion of the LIN state ($V_{OUT} \geq V_{IN} - 1$ V), the regulator begins switching with boost pulses current limited to about 50% of nominal level, incrementing to full scale over a period of 32 clock counts.

If the output fails to achieve 90% of its set point within 96 clock counts at full−scale current limit, a fault condition is declared.

BST State

This is the normal operating mode of the regulator. The regulator uses a minimum t_{OFF}−minimum t_{ON} modulation scheme. Minimum t_{OFF} is proportional to V_{IN} / V_{OUT}, which keeps the regulator’s switching frequency reasonably constant in CCM. $t_{ON(MIN)}$ is proportional to V_{IN} and is higher if the inductor current reaches 0 before $t_{OFF(MIN)}$ during the prior cycle.

To ensure that V_{OUT} does not pump significantly above the regulation point, the boost switch remains off as long as FB > V_{REF}.

Fault State

The regulator enters the FAULT state under any of the following conditions:

- V_{OUT} fails to achieve the voltage required to advance from LIN state to SS state
- V_{OUT} fails to achieve the voltage required to advance from SS state to BST state
- Sustained (32 CLK counts) pulse−by−pulse current limit during the BST state
- The regulator moves from BST to LIN state due to a short circuit or output overload (V_{OUT} < V_{IN}−1 V)

Once a fault is triggered, the regulator stops switching and presents a high−impedance path between V_{IN} and V_{OUT}. After waiting 480 CLK counts, a restart is attempted.

Soft−Start and Fault Timing

The soft−start timing for each state, and the fault times, are determined by the fault clock, whose period is inversely proportional to V_{IN}. This allows the regulator more time to charge larger values of C_{OUT} when V_{IN} is lower. With higher V_{IN}, this also reduces power delivered to V_{OUT} during each cycle in current limit.

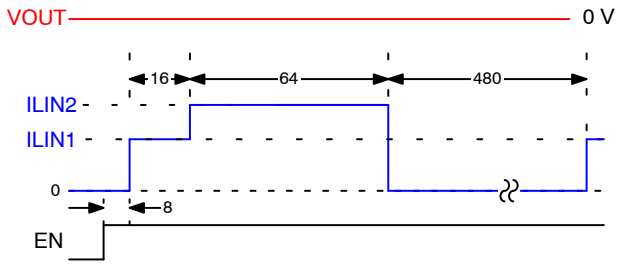

Figure 46. Fault Response into Short Circuit

The fault clock period as a function of V_{IN} is shown in Figure 47.

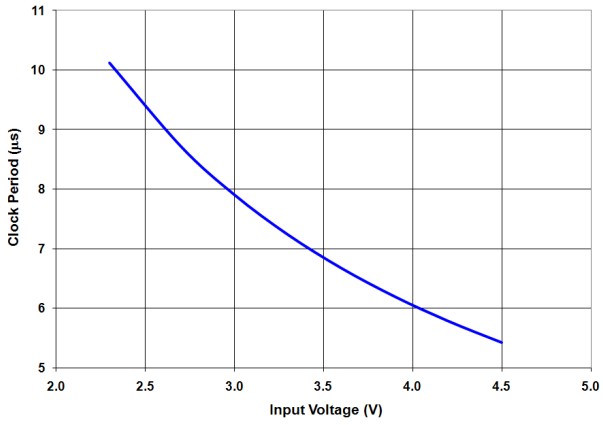

Figure 47. Fault Clock Period vs. V_{IN}

The V_{IN}−dependent LIN Mode charging current is illustrated in Figure 48.

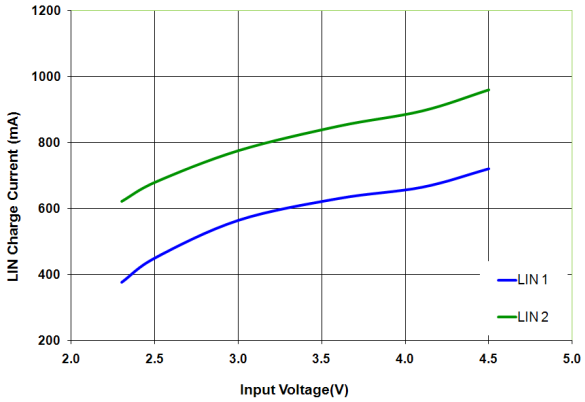

Figure 48. LIN Mode Current vs. V_{IN}

Over−Temperature Protection (OTP)

The regulator shuts down when the thermal shutdown threshold is reached. Restart, with soft−start, occurs when the IC has cooled by about 30°C.

Over−Current Protection (OCP)

During Boost Mode, the FAN4860 employs a cycle−by−cycle peak current limit to protect switching elements. Sustained current limit, for 32 consecutive fault clock counts, initiates a fault condition.

During an overload condition, as V_{OUT} collapses to approximately V_{IN}-1 V, the synchronous rectifier is immediately switched off and a fault condition is declared.

Automatic restart occurs once the overload/short is removed and the fault timer completes counting.

APPLICATION INFORMATION

External Component Selection

Table 8 shows the recommended external components for the FAN4860:

Table 8. EXTERNAL COMPONENTS

REF	Description	Manufacturer
L1	1.0 μH, 0.8 A, 190 mΩ, 0805	Murata LQM21PN1R0MC0, or equivalent
C_{IN}	2.2 μF, 6.3 V, X5R, 0402	Murata GRM155R60J225M
		TDK C1005X5R0J225M
C_{OUT}	4.7 μF, 10 V, X5R, 0603 (Note 5)	Kemet C0603C475K8PAC
		TDK C1608X5R1A475K

5. A 6.3 V−rated 0603 capacitor may be used for C_{OUT}, such as Murata GRM188R60J225M. All datasheet parameters are valid with the 6.3 V−rated capacitor. Due to DC bias effects, the 10 V capacitor offers a performance enhancement; particularly output ripple and transient response, without any size increase.

Output Capacitance (C_{OUT})

Stability

The effective capacitance (C_{EFF}) of small, high−value, ceramic capacitors decrease as their bias voltage increases, as shown in Figure 49.

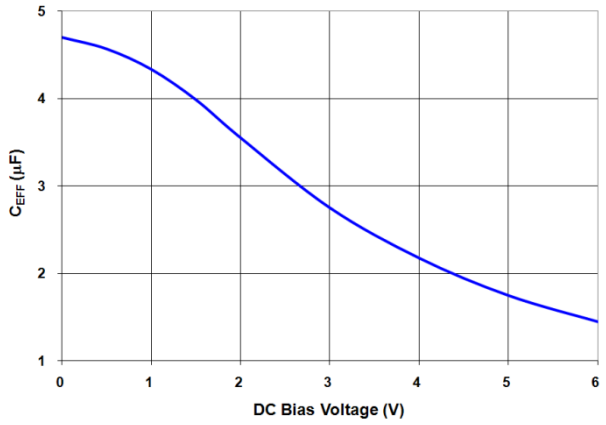

Figure 49. C_{EFF} for 4.7 μF, 0603, X5R, 6.3 V (Murata GRM188R60J475K)

FAN4860 is guaranteed for stable operation with the minimum value of C_{EFF} ($C_{EFF(MIN)}$) outlined in Table 9.

Table 9. MINIMUM C_{EFF} REQUIRED FOR STABILITY

Operating Conditions		
V_{IN} (V)	I_{LOAD} (mA)	$C_{EFF(MIN)}$ (μF)
2.3 to 4.5	0 to 200	1.5
2.7 to 4.5	0 to 200	1.0
2.3 to 4.5	0 to 150	1.0

C_{EFF} varies with manufacturer, dielectric material, case size, and temperature. Some manufacturers may be able to provide an X5R capacitor in 0402 case size that retains C_{EFF} > 1.5 μF with 5 V bias; others may not. If this C_{EFF} cannot be economically obtained and 0402 case size is required, the IC can work with the 0402 capacitor as long as the minimum V_{IN} is restricted to > 2.7 V.

For best performance, a 10 V−rated 0603 output capacitor is recommended (Kemet C0603C475K8PAC, or equivalent). Since it retains greater C_{EFF} under bias and over temperature, output ripple can is reduced and transient capability enhanced.

Output Voltage Ripple

Output voltage ripple is inversely proportional to C_{OUT}. During t_{ON}, when the boost switch is on, all load current is supplied by C_{OUT}.

$$V_{RIPPLE(P-P)} = t_{ON} \times \frac{I_{LOAD}}{C_{OUT}} \quad \text{(eq. 4)}$$

and

$$t_{ON} = t_{SW} \times D = t_{SW} \times \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \quad \text{(eq. 5)}$$

Therefore:

$$V_{RIPPLE(P-P)} = t_{SW} \times \left(1 - \frac{V_{IN}}{V_{OUT}}\right) \times \frac{I_{LOAD}}{C_{OUT}} \quad \text{(eq. 6)}$$

Where:

$$t_{SW} = \frac{1}{f_{SW}} \quad \text{(eq. 7)}$$

As can be seen from Equation 6, the maximum V_{RIPPLE} occurs when V_{IN} is minimum and I_{LOAD} is maximum.

Startup

Input current limiting is in effect during soft−start, which limits the current available to charge C_{OUT}. If the output fails to achieve regulation within the time period described in the soft−start section above; a FAULT occurs, causing the circuit to shut down, then restart after a significant time period. If C_{OUT} is a very high value, the circuit may not start on the first attempt, but eventually achieves regulation if no load is present. If a high−current load and high capacitance are both present during soft−start, the circuit may fail to achieve regulation and continually attempt soft−start, only to have C_{OUT} discharged by the load when in the FAULT state.

The circuit can start with higher values of C_{OUT} under full load if V_{IN} is higher, since:

$$I_{OUT} = \left(I_{LIM(PK)} - \frac{I_{RIPPLE}}{2}\right) \times \frac{V_{IN}}{V_{OUT}} \quad \text{(eq. 8)}$$

Generally, the limitation occurs in BST Mode.

The FAN4860 starts on the first pass (without triggering a FAULT) under the following conditions for $C_{EFF(MAX)}$:

Table 10. MAXIMUM C_{EFF} FOR FIRST−PASS STARTUP

Operating Conditions				$C_{EFF(MAX)}$ (μF)
	$R_{LOAD(MIN)}$ (Ω)			
V_{IN} (V)	5.4 V_{OUT}	5.0 V_{OUT}	3.3 V_{OUT}	
> 2.3	27	25	16	10
> 2.7	27	25	16	15
> 2.7	37	33	20	22

C_{EFF} values shown in Table 10 typically apply to the lowest V_{IN}. The presence of higher V_{IN} enhances ability to start into larger C_{EFF} at full load.

Transient Protection

To protect against external voltage transients caused by ESD discharge events, or improper external connections, some applications employ an external transient voltage suppressor (TVS) and Schottky diode (D1 in Figure 50).

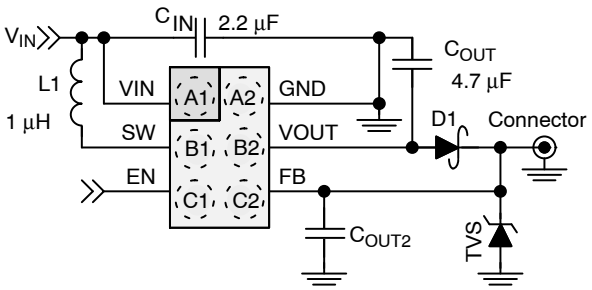

Figure 50. FAN4860 with External Transient Protection

The TVS is designed to clamp the FB line (system V_{OUT}) to +10 V or –2 V during external transient events. The Schottky diode protects the output devices from the positive excursion. The FB pin can tolerate up to 14 V of positive excursion, while both the FB and VOUT pins can tolerate negative voltages.

The FAN4860 includes a circuit to detect a missing or defective D1 by comparing V_{OUT} to FB. If V_{OUT} − FB > about 0.7 V, the IC shuts down. The IC remains shut down until V_{OUT} < UVLO and V_{IN} < UVLO + 0.7 or EN is toggled.

C_{OUT2} may be necessary to preserve load transient response when the Schottky is used. When a load is applied at the FB pin, the forward voltage of the D1 rapidly increases before the regulator can respond or the inductor current can change. This causes an immediate drop of up to 300 mV, depending on D1's characteristics if C_{OUT2} is absent. C_{OUT2} supplies instantaneous current to the load while the regulator adjusts the inductor current. A value of at least half of the minimum value of C_{OUT} should be used for C_{OUT2}. C_{OUT2} needs to withstand the maximum voltage at the FB pin as the TVS is clamping.

The maximum DC output current available is reduced with this circuit, due to the additional dissipation of D1.

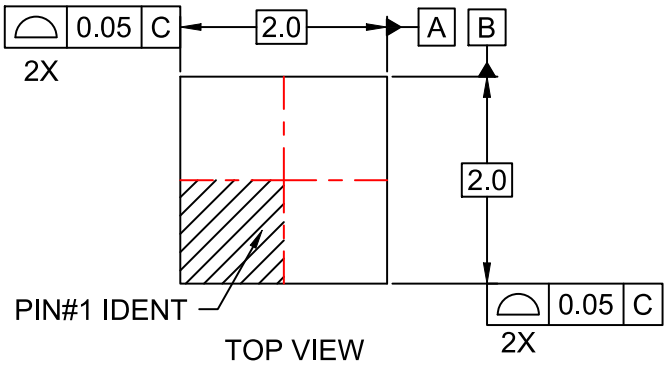
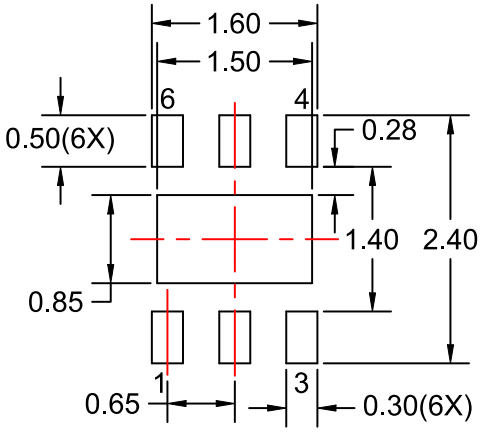
PRODUCT−SPECIFIC DIMENSIONS

Product	D	E	X	Y
FAN4860UC5X	1.230mm ±0.030 mm	0.880 mm ±0.030 mm	0.240 mm	0.215 mm
FAN4860UC33X				

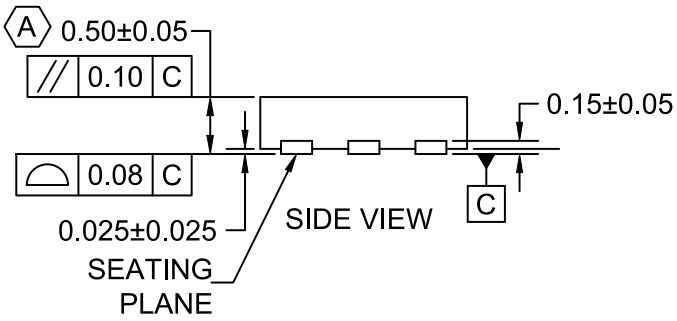
UDFN6 2x2, 0.65P
CASE 517DS
ISSUE O

DATE 31 OCT 2016





RECOMMENDED
LAND PATTERN



NOTES:

A. CONFORM TO JADEC REGISTRATIONS MO-229, VARIATION VCCC, EXCEPT WHERE NOTED.

B. DIMENSIONS ARE IN MILLIMETERS.

C. DIMENSIONS AND TOLERANCES PER ASME Y14.5M, 2009.

D. LAND PATTERN RECOMMENDATION IS EXISTING INDUSTRY LAND PATTERN.
