

EiceDRIVER™ 2EDR8259H, 2EDRx259X, 2EDRx258X

Dual-channel isolated gate driver ICs in 300 mil DSO package

EiceDRIVER™ 2EDR8259H, 2EDRx259X, 2EDRx258X is a family of dual-channel isolated gate driver ICs, designed to drive Si and SiC MOSFETs and GaN HEMTs power switches. All products are available in a DSO package with 8 mm input-to-output creepage and provide reinforced isolation by means of on-chip coreless transformer (CT) technology. 2EDRx259X and 2EDRx258X variants in a 14-pin DSO package offer increased channel-to-channel creepage. They are suited for use in applications with higher bus voltage or higher pollution degree and, in general, can ease PCB routing. All versions offer optional shoot-through protection (STP) and dead-time control (DTC) functionality. This allows the operation as dual-channel low-side, dual-channel high-side or half-bridge gate driver with a configurable dead-time. With excellent common-mode transient immunity (CMTI), low part-to-part skew and fast signal propagation, the products are best suited for use in fast-switching power conversion systems.

Features

- 2-channel isolated gate driver for Si and SiC MOSFETs and GaN HEMTs power switches
- Fast input-to-output propagation (38 ns) with excellent stability (+9/-5 ns)
- Strong output stage: 5 A/9 A source/ sink
- Fast output clamping for $V_{DDA/B} < UVLO$
- Fast UVLO recovery time ($< 2 \mu s$)
- Four $VDDA/B$ UVLO options: 4 V, 8 V, 12 V, 15 V
- $CMTI > 150 V/ns$
- Available in 16/14-pin 300 mil DSO package

Isolation and safety certificates

- UL1577 with $V_{ISO} = 5700 V_{RMS}$ (certification n. E311313)
- VDE0884-11 with $V_{IOTM} = 8000 V_{pk}$, $V_{IORM} = 1767 V_{pk}$, $V_{IOSM} = 6875 V_{pk}$ (certification n. 40052310)
- IEC 60747-17 (certification n. 40055138)
- IEC62368-1 (certification n. 40052310, appendix 500Z1)

Product validation

Fully qualified for industrial applications

2 Functional description

2.1 Block diagram

A simplified functional block diagram for EiceDRIVER™ 2EDR8259H, 2EDRx259X is given in [Figure 3](#).

Figure 3 Block diagram

2.2 Power supply and Undervoltage Lockout (UVLO)

Due to the input-to-output and channel-to-channel isolation, three power domains with independent power management are required. Undervoltage Lockout (UVLO) functions for both input and output supplies ensure a defined startup and robust functionality under all operating conditions.

2.2.1 Input supply voltage

The input die is powered via VDDI and supports a wide supply voltage range from 3 V to 17 V. A ceramic bypass capacitor must be placed between VDDI and GNDI in close proximity to the device; a minimum bypass capacitance of 100 nF is recommended.

Power consumption to some extent, depends on switching frequency, as the input signal is converted into a train of repetitive current pulses to drive the coreless transformer. Due to the chosen robust encoding scheme the average repetition rate of these pulses and thus the average supply current depends on the switching frequency, f_{sw} . However, for $f_{sw} < 500$ kHz this effect is very small.

The Undervoltage Lockout function for the input supply V_{DDI} ensures that, as long as V_{DDI} is below UVLO (e.g. in startup), no data is transferred to the output side and the gate driver output is held low (safety Lock-down at startup). When V_{DDI} exceeds the UVLO level, the PWM input signal is transferred to the output side. If the output side is ready (not in UVLO condition), the output reacts according to the logic input.

2.2.2 Output supply voltage

The two output dies are powered via two independent supply voltages V_{DDA} and V_{DDB} (up to 20 V).

Two ceramic bypass capacitors must be placed between VDDA and GNDA and between VDDB and GNDB in close proximity to the device. A minimum capacitance of $20 \times C_{iss}$ (MOSFET input capacitance) is recommended to ensure an acceptable ripple (5% of V_{DDO}) on the supply pin.

The minimum supply voltage is set by the Undervoltage Lockout (UVLO) function. The gate driver output can be switched only if the output supply voltage (V_{DDA} , V_{DDB}) exceeds the output-side UVLO. Thus, it can be guaranteed that the switch transistor is not operated if the driving voltage is too low to achieve a complete and fast transition to the "on" state. Low driving voltage, in fact, could cause the power MOSFET to enter its saturation (ohmic) region with potentially destructive power dissipation; the output UVLO ensures that the

2 Functional description

switch transistor always stays within its Safe Operating Area (SOA). Versions with 4 V, 8 V, 12 V and 15 V UVLO thresholds for the output supply are currently available. [Table 3](#) shows the recommended UVLO levels for different Infineon power switch families.

Table 3 Recommended UVLO levels for typical use-cases

Inputs	Examples of part number	Recommended driver
Logic level OptiMOS™	BSC010N04LS6, BSZ070N08LS5, ..	2EDR7259 (4 V UVLO)
Normal level OptiMOS™	BSC040N10NS5, BSZ084N08NS5, ..	2EDR825x (8 V UVLO)
CoolMOS™	IPP60R099C7, IPB60R600P6, ..	2EDR825x (8 V UVLO)
650 V CoolSiC™	IMZA65R027M1H, IMW65R107M1H, ..	2EDR6258/ 2EDR925x (12/15 V UVLO)
650 V CoolGaN™	IGOT60R070D1, IGLD60R070D1, ..	2EDR7259 (4 V UVLO for unipolar driving) 2EDR825x (8 V UVLO for bipolar driving)

2.3 Input stage - INA, INB, DISABLE

The inputs INA and INB control two independent PWM channels. The input signal is transferred non-inverted to the corresponding gate driver outputs OUTA and OUTB. All inputs are compatible with LV-TTL threshold levels and provide a hysteresis of typically 0.8 V. The hysteresis is independent of the supply voltage V_{DDI} .

The PWM inputs are internally pulled down to a logic low voltage level (GNDI). In case the PWM-controller signals have an undefined state during the power-up sequence, the gate driver outputs are forced to the "off"-state (low).

If the DIS/EN input is at high/low state, this unconditionally drives both channel outputs to low state regardless of the state of INA or INB.

[Table 4](#) and [Table 5](#) shows the INA, INB, DIS/EN driver logic in case of sufficiently high supply voltage. Otherwise the outputs of the driver are determined by the Undervoltage Lockout (UVLO) and Output Active Clamping functionalities as shown in [Table 8](#).

Table 4 Logic table in case of sufficient bias power - INA, INB, DIS

Inputs		DIS	Supplies	Outputs		Note
INA	INB		V_{DDI} , V_{DDA} , V_{DDB}	OUTA	OUTB	
L	L	L or left open	> $UVLO_{VDDx,on}$ (active)	L	L	–
L	H	L or left open		L	H	–
H	H	L or left open		H	H	DTC/STP pin tied to VDDI or left open
				L	L	DTC/STP pin tied to GNDI via R_{DTC}
Left open	Left open	L or left open		L	L	Input pins internally pulled down
x	x	H		L	L	Outputs disabled via DIS high

2 Functional description

Table 5 **Logic table in case of sufficient bias power - INA, INB, EN**

Inputs		EN	Supplies	Outputs		Note
INA	INB		V_{DDI} , V_{DDA} , V_{DDB}	OUTA	OUTB	
L	L	H	> $UVLO_{VDDx,on}$ (active)	L	L	–
L	H	H		L	H	–

				L	L	DTC/STP pin tied to GNDI via R_{DTC}
Left open	Left open	H		L	L	Input pins internally pulled down
x	x	L or left open		L	L	Outputs disabled via EN low

2 Functional description

2.4 Shoot-through protection and configurable dead-time - STP/DTC

The shoot-through protection pulls down the outputs OUTA and OUTB when both input signals INA, INB are at high state. Its activation is recommended when the driver is used as half-bridge driver to prevent dangerous shoot-through due to unwanted overlap of INA and INB. A dead-time can be ensured and configured via pin STP/DTC as shown in Table 6.

Table 6 STP/DTC logic table

Conditions on the STP/DTC pin	Shoot-through protection	Configurable dead-time
Tied to VDDI or left open	Disabled	Disabled
Connected to GNDI via resistor R_{DTC}	Enabled	Enabled with $t_{dt} [ns] = 10 \times R_{DTC} [k\Omega]$; allowed R_{DTC} range is 1.2k Ω to 100k Ω
Connected to GNDI	Enabled	Disabled

The driver dead-time logic is triggered during the falling edge of an input and delays the rising transition of the other input. The delay is only assigned if the driver configured dead-time is longer than the inputs signals' own dead-time.

The dead-time can be configured by changing the current fed into the STP/DTC pin via an external resistance according to the formula: $t_{dt} [ns] = 10 \times R_{DTC} [k\Omega]$. It is recommended to use resistors with 1% accuracy in the 1.2 k Ω to 100 k Ω range. Connecting capacitors to the DTC pin must be avoided when the dead-time control functionality is used.

Figure 4 Logic for STP/DTC pin connected to GNDI via resistance R_{DTC}

Table 7 Logic for STP/DTC pin connected to GNDI via resistance R_{DTC}

Condition	STP/DTC logic
A, B	The driver logic assigns the configured dead-time since it is longer than the input signals' dead-time
C, D	The driver logic does not assign the configured dead-time since it is shorter than the input signals' dead-time

(table continues...)

2 Functional description

Table 7 (continued) Logic for STP/DTC pin connected to GNDI via resistance R_{DTC}

Condition	STP/DTC logic
E, F	The shoot-through protection pulls down the outputs OUTA, OUTB until one of the outputs goes low. At this point, after the configured driver dead-time, the other output is allowed to go high

2.5 Gate driver outputs

The rail-to-rail output stage realized with complementary MOS transistors is able to provide a typical 5 A sourcing and 9 A sinking peak current. The low on-resistance coming together with high driving current is particularly beneficial for fast switching of very large MOSFETs. With a R_{on} of $\sim 1 \Omega$ for the sourcing pMOS and $\sim 0.5 \Omega$ for the sinking nMOS transistor the driver can in most applications be considered as a nearly ideal switch. The p-channel sourcing transistor enables real rail-to-rail behavior without suffering from the voltage drop unavoidably associated with nMOS source follower stages.

In case of floating inputs or insufficient supply voltage not exceeding the UVLO thresholds, the driver outputs are actively clamped to the "low" level (GNDA, GNDB).

2.6 Fast active output clamping in UVLO conditions

The Undervoltage Lockout (UVLO) ensures that the gate driver output is not operated if the supplies are below the UVLO thresholds. However, this is not sufficient to guarantee that the output of the driver is kept low. Transients or noise in the power stage may pull-up the output node of the driver and the gate voltage causing an unwanted turn-on of the switch; this is particularly critical in system using bootstrapping since, during start-up, the supply of the high-side channel is delayed, while the low-side MOSFET is already switching. In resonant topologies (as LLC), the half-bridge switching node may be pulled up after the turn-off of the low-side switch. When the low-side MOSFET is turned on again, the high-side gate voltage increase induced by dV/dt event cannot be clamped by the driver $R_{DS(on),sink}$ if the bootstrap supply is not yet available.

With a fast output clamping circuit in the output stage, the driver ensures safe operation against output induced overshoots in all UVLO situations. This structure allows fast reaction and effective clamping of the output pins (OUTA, OUTB). The exact reaction time depends on the output supply (V_{DDA} , V_{DDB}) and on the output voltage levels; however, already for very low supply levels (~ 1 V), the active output clamp is able to react in some tens of ns.

Undervoltage Lockout together with the output active clamping ensures that the outputs are actively held low in case of insufficient supply voltages.

Table 8 Logic table in case of insufficient bias power - INA, INB, DISABLE

Inputs		DIS	Supplies			Outputs	
INA	INB		V_{DD}	V_{DDA}	V_{DDB}	OUTA	OUTB
X	X	X	$< UVLO_{VDDI,on}$	X	X	L	L
X	X	X	$> UVLO_{VDDI,on}$	$< UVLO_{VDDI,on}$	$< UVLO_{VDDI,on}$	L	L
X	X	X	$> UVLO_{VDDI,on}$	$> UVLO_{VDDI,on}$	$< UVLO_{VDDI,on}$	Follows INA	L
X	X	X	$> UVLO_{VDDI,on}$	$< UVLO_{VDDI,on}$	$> UVLO_{VDDI,on}$	L	Follows INB

2.7 CT communication and input to output data transmission

A coreless transformer (CT) based communication module is used for PWM signal transfer between input and output. A proven high-resolution pulse repetition scheme in the transmitter combined with a watchdog timeout at the receiver side enables recovery from communication fails and ensures safe system shut-down in failure cases.

3 Electrical characteristics

3 Electrical characteristics

The absolute maximum ratings are listed in Table 9. Stresses beyond these values may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

3 Electrical characteristics

Table 19 Dead-time control (DTC) and shoot-through protection (STP)

Parameter	Symbol	Values			Unit	Note or condition
		Min.	Typ.	Max.		
Dead-time	t_{dt}	85	100	115	ns	$R_{DTC} = 10\text{ k}\Omega$
Dead-time	t_{dt}	255	300	345	ns	$R_{DTC} = 30\text{ k}\Omega$
Dead-time	t_{dt}	800	950	1100	ns	$R_{DTC} = 100\text{ k}\Omega$ ¹⁾
Channel-to-channel dead-time mismatch	$\Delta t_{dt,Ch-Ch}$	0	–	10	ns	$R_{DTC} = 10\text{ k}\Omega$
Channel-to-channel dead-time mismatch	$\Delta t_{dt,Ch-Ch}$	0	–	14	ns	$R_{DTC} = 30\text{ k}\Omega$
Channel-to-channel dead-time mismatch	$\Delta t_{dt,Ch-Ch}$	0	–	40	ns	$R_{DTC} = 100\text{ k}\Omega$ ¹⁾
Part-to-part dead-time mismatch	$\Delta t_{dt,p-p}$	0	–	20	ns	$R_{DTC} = 10\text{ k}\Omega$ ²⁾
Part-to-part dead-time mismatch	$\Delta t_{dt,p-p}$	0	–	55	ns	$R_{DTC} = 30\text{ k}\Omega$ ²⁾
Part-to-part dead-time mismatch	$\Delta t_{dt,p-p}$	0	–	105	ns	$R_{DTC} = 100\text{ k}\Omega$ ^{1) 2)}

1) Not subject to production test - verified by design/characterization.

2) The parameter gives the difference in the dead-time inserted from different samples under the same conditions, including same ambient temperature.

Table 20 Static output characteristics

Parameter	Symbol	Values			Unit	Note or condition
		Min.	Typ.	Max.		
High-level (sourcing) output resistance	R_{on_SRC}	0.6	0.95	1.5	Ω	$I_{SRC} = 50\text{ mA}$
Peak sourcing output current	I_{SRC_pk}	–	5	–	A	$C_{LOAD} = 22\text{ nF}$ ¹⁾
Low-level (sinking) output resistance	R_{on_SNK}	0.24	0.39	0.62	Ω	$I_{SNK} = 50\text{ mA}$
Peak sinking output current	I_{SNK_pk}		-9	–	A	$C_{LOAD} = 22\text{ nF}$ ¹⁾

1) Not subject to production test - verified by design/characterization.

Table 21 Dynamic characteristics

Parameter	Symbol	Values			Unit	Note or condition
		Min.	Typ.	Max.		
INx to OUTx turn-on propagation delay	$t_{pDon,INx}$	33	38	47	ns	See Figure 5 , Figure 6

(table continues...)

3 Electrical characteristics

Table 21 (continued) Dynamic characteristics

Parameter	Symbol	Values			Unit	Note or condition
		Min.	Typ.	Max.		
INx to OUTx turn-off propagation delay	$t_{PDoff,INx}$	30	36	46	ns	See Figure 5 , Figure 6
Part-to-part turn-on propagation delay mismatch	$\Delta t_{PDon,p-p}$	0	–	6	ns	¹⁾
Part-to-part turn-off propagation delay mismatch	$\Delta t_{PDoff,p-p}$	0	–	8	ns	¹⁾
Channel-to-channel turn-on propagation delay mismatch	$t_{PDon,ChA-ChB}$	-4	–	4	ns	²⁾ See Figure 7
Channel-to-channel turn-off propagation delay mismatch	$\Delta t_{PDoff,ChA-ChB}$	-5.5	–	3	ns	²⁾ See Figure 7
Pulse width distortion	t_{PWD}	-5	2	5.5	ns	³⁾ See Figure 8
Channel turn-off to channel turn-on propagation delay mismatch	t_{DTD}	-5	-2	1	ns	^{4) 5)} See Figure 9
Rise time	t_{rise}	–	7.5	14	ns	⁶⁾ $C_{LOAD} = 1.8 \text{ nF}$, see Figure 10
Fall time	t_{fall}	–	6	11	ns	⁶⁾ $C_{LOAD} = 1.8 \text{ nF}$, see Figure 10
Minimum input pulse width that changes output state	t_{PW}	10	17	25	ns	See Figure 11
Input-side start-up time	$t_{START,VDDI}$	–	3.5	5	μs	⁶⁾ see Figure 12
Input-side deactivation time	$t_{STOP,VDDI}$	600	750	–	ns	⁶⁾ see Figure 12
Output-side start-up time	$t_{START,VDDA/B}$	–	2.5	5	μs	⁶⁾ see Figure 13
Output-side deactivation time	$t_{STOP,VDDA/B}$	500	800	–	ns	⁶⁾ see Figure 13

- 1) The parameter gives the difference in the propagation delay between different samples switching in the same direction under same conditions, including same ambient temperature; therefore, is an indication of the production spread. The limits given are valid for all channels combination: $t_{PD_ChA} - t_{PD_ChA}$, $t_{PD_ChB} - t_{PD_ChB}$, $t_{PD_ChA} - t_{PD_ChB}$, $t_{PD_ChB} - t_{PD_ChA}$.
- 2) The parameter gives the difference in the propagation delay of channel A and channel B switching in the same direction in the same sample.
- 3) The parameter gives the difference between ON and OFF propagation delay in the same channel (ChA or ChB), in the same sample at same ambient temperature.

3 Electrical characteristics

- 4) The parameter gives the difference between the ON propagation delay of one channel and the OFF propagation delay of the other channel, in the same sample at same room temperature. This parameter represents the distortion of the inputs dead-time only when the driver DTC is not used or not enforced otherwise, please refer to [Table 19](#).
- 5) Not subject to production test - verified by characterization.
- 6) Not subject to production test - verified by design/characterization.

Table 22 Common-Mode Transient Immunity (CMTI)

Parameter	Symbol	Values			Unit	Note or condition
		Min.	Typ.	Max.		
Static Common-Mode Transient Immunity	$ CM_{Static,H} $	150	–	–	V/ns	$V_{CM} = 1500\text{ V}$; INA, INB tied to V_{DDI} (logic high inputs) ¹⁾
Static Common-Mode Transient Immunity	$ CM_{Static,L} $	150	–	–	V/ns	$V_{CM} = 1500\text{ V}$; INA, INB tied to GNDI (logic low inputs) ¹⁾

1) Minimum slew rate of a common-mode voltage that is able to cause an incorrect output signal

3.5 Isolation specifications

Table 23 Isolation specifications

Parameter	Symbol	Value	Unit	Note or condition
External input-to-output creepage ¹⁾	CRP	8	mm	Shortest distance over package surface from any input pin to any output pin according to IEC 60664-1
External input-to-output clearance ¹⁾	CLR	8	mm	Shortest distance in air from any input pin to any output pin according to IEC 60664-1
Comparative tracking index	CTI	> 400	V	According to DIN EN 60112 (VDE 0303-11)
Material group	–	II	–	According to IEC 60112
Pollution degree	–	II	–	According to IEC 60664-1
Overvoltage category (for reinforced isolation)	–	I - IV	–	Rated mains voltage $\leq 150\text{ V}_{RMS}$
	–	I - IV	–	Rated mains voltage $\leq 300\text{ V}_{RMS}$
	–	I - III	–	Rated mains voltage $\leq 600\text{ V}_{RMS}$

Input-to-output isolation according to UL1577 Ed.5 ²⁾

Input-to-output isolation voltage	V_{ISO}	5700	V_{RMS}	$V_{TEST} = V_{ISO}$ for $t = 60\text{ s}$ (qualification); $V_{TEST} = 1.2 \times V_{ISO}$ for $t = 1\text{ s}$ (100% productive tests)
-----------------------------------	-----------	------	-----------	---

Input-to-output isolation according to DIN VDE V0884-11 ³⁾ and IEC 60747-17 ⁴⁾

Maximum impulse voltage	V_{IMP}	8000	V_{pk}	According to IEC 60664-1
Maximum rated transient isolation voltage	V_{IOTM}	8000	V_{pk}	$V_{TEST} = V_{IOTM}$ for $t_{ini} = 60\text{ s}$ (type tests and quarterly monitoring) $V_{TEST} = 1.2 \times V_{IOTM}$ for $t_{ini} = 1\text{ s}$ (100% productive tests)

(table continues...)

3 Electrical characteristics

Table 23 (continued) Isolation specifications

Parameter	Symbol	Value	Unit	Note or condition
Maximum rated repetitive isolation voltage	V_{IORM}	1767	V_{pk}	According to Time Dependent Dielectric Breakdown (TDDB) Test for reinforced isolation
Apparent charge	q_{PD}	< 5	pC	$V_{ini,b1} = 1.2 \times V_{IOTM}$ (100% productive tests) and $V_{ini,b1} = V_{IOTM}$ (type tests preconditioning) for $t_{ini} = 1s$ $V_{pd(m)} = 1.875 \times V_{IORM}$ for $t_m = 1 s$ ⁵⁾
				After subgroup 1 life tests (type test) and in quarterly monitoring $V_{ini,a} = V_{IOTM}$ for $t_{ini} = 60 s$ $V_{pd(m)} = 1.6 \times V_{IORM}$ for $t_m = 10 s$
				After subgroup 2, 3 endurance tests (type test) $V_{ini,a} = V_{IOTM}$ for $t_{ini} = 60 s$ $V_{pd(m)} = 1.2 \times V_{IORM}$ for $t_m = 10 s$
Maximum surge isolation voltage ⁶⁾	V_{IOSM}	6875	V_{pk}	$V_{IOSM_TEST} = 1.6 \times V_{IOSM}$ for reinforced isolation according VDE 0884-11
		11000	V_{pk}	$V_{IOSM_TEST} = 11 kV_{pk} \geq 1.3 \times V_{IOSM}$ for reinforced isolation according IEC 60747-17
Isolation resistance input-to-output ⁷⁾	R_{IO}	10^{12}	Ω	$V_{IO} = 500 V_{dc}$ for $t = 60 s$, $T_A = 25^\circ C$ (type tests subgroup 1)
		10^{11}	Ω	$V_{IO} = 500 V_{dc}$ for $t = 60 s$, $T_A = 125^\circ C$ (type tests preconditioning, type test subgroup 4 and quarterly monitoring)
		10^9	Ω	$V_{IO} = 500 V_{dc}$ for $t = 60 s$, $T_A = 25^\circ C$ (type tests subgroup 1, 2, 3) or $T_A = T_S$ (type tests subgroup 4 and quarterly monitoring)
Capacitance input-to-output ⁷⁾	C_{IO}	2	pF	$f = 1 MHz$

1) Creepage and clearance requirements depend on the application and related end-equipment isolation standard. Care should be taken to keep the required creepage and clearance value on printed-circuit-board level.

2) See UL 1577 certificate n. E311313.

3) See VDE 0884-11 certificate n. 40052310.

4) See IEC 60747-17 certificate n. 40055138.

5) The partial discharge voltage $VPD(m)$ applied during production tests is greater ($4411 V_{pk} > 1.875 \times V_{IORM}$) to include the F4 factor required by end equipment standards IEC 60664-1, IEC 62368-1 ($VPD(m) = F1 \times F2 \times F3 \times F4 \times V_{IORM} = 1.875 \times F4 \times V_{IORM}$).

6) The surge test is performed in insulation oil to determine the intrinsic surge immunity of the insulation barrier.

7) The parameters apply to the product converted in a two terminals device with all terminals on side 1 connected together and all terminals on side 2 connected together.

3 Electrical characteristics

Table 24 **Output channel-to-channel isolation specifications**

Parameter	Symbol	Value	Unit	Note or condition
External channel-to-channel creepage ¹⁾	CRP _{Ch-Ch, 14pin}	3.3	mm	Shortest distance over package surface between any output channel A pin and any output channel B pin
	CRP _{Ch-Ch, 16pin}	2.5	mm	

1) Creepage and clearance requirements depend on the application and related end-equipment isolation standard. Care should be taken to keep the required creepage and clearance value on printed-circuit-board level

4 Timing diagrams

4 Timing diagrams

Figure 5 illustrates the input-to-output propagation delays as observed at the capacitively loaded output.

Figure 5 INx to OUTx propagation delays

Figure 6 illustrates the disable-to-output propagation delays as observed at the capacitively loaded output.

Figure 6 DISABLE to OUTx propagation delays

Figure 7 illustrates the channel-to-channel propagation delay mismatch at the unloaded outputs. This parameter is relevant when the channels drive parallel switches as it represents the delay in the two driving signals.

Figure 7 Channel-to-channel propagation delay mismatch

Figure 8 illustrates the pulse width distortion at the unloaded output. Ideally the width of the input pulse (t_{PW_INx}) equals the width of the output pulse (t_{PW_OUTx}); however, the driver introduces an output pulse distortion t_{PW} given by the difference between ON and OFF propagation delay.

4 Timing diagrams

Figure 8 Pulse width distortion

Figure 9 illustrates the dead-time distortion at the unloaded outputs. This parameter is relevant in operation with complementary signals, as for the half-bridge driving when a certain dead-time t_{DT_INx} is set on the inputs INA, INB. Ideally the dead-time on the driver output (t_{DT_OUTx}) equals the input dead-time; however, the driver introduces a distortion t_{DTc} given by the difference between the OFF propagation delay of one channel and the ON propagation delay of the other channel.

Figure 9 Channel turn-off to channel turn-on propagation delay mismatch

Figure 10 illustrates the rise and fall time as observed at the capacitively loaded output.

Figure 10 Rise and fall time

Figure 8 illustrates the behavior of the deglitch filter that filters spurious pulses on INA, INB with duration shorter than t_{PWmin} .

Figure 11 Minimum pulse that changes the output state

4 Timing diagrams

Figure 12 illustrates the input-side supply UVLO behavior. It depicts the reaction time to UVLO events when V_{DDI} crosses the UVLO thresholds during rising or falling transitions (power-up, power-down, supply noise).

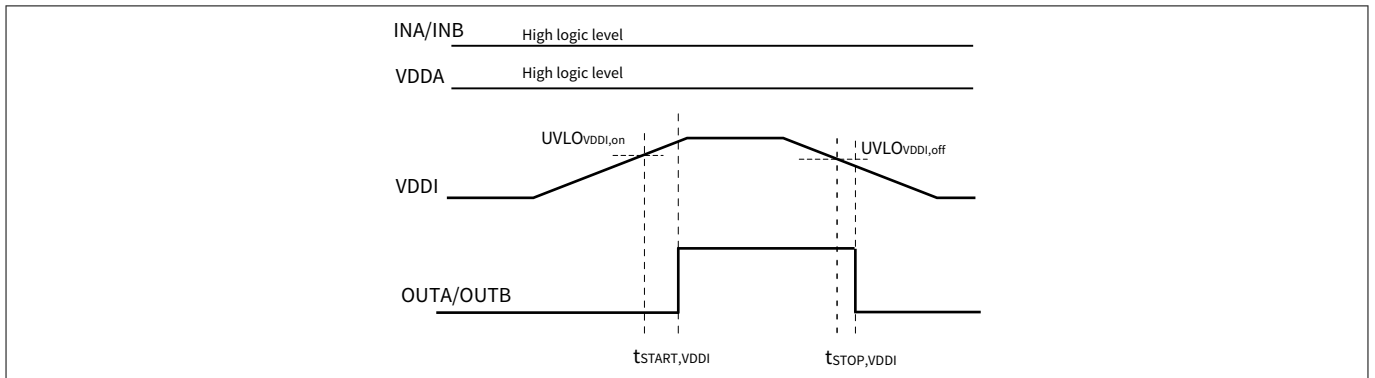

Figure 12 V_{DDI} UVLO behavior, start-up and deactivation time

Figure 13 illustrates the output-side supply UVLO behavior. It depicts the reaction time to UVLO events when $V_{DDA/B}$ crosses the UVLO thresholds during rising or falling transitions (power-up, power-down, supply noise).

Figure 13 V_{DDA}, V_{DDB} UVLO behavior, start-up and deactivation time

Figure 14 illustrates the shoot-through protection and dead-time logic. When enabled, the dead-time is added on top of the turn-off propagation delay if the driver dead-time is longer than the signals' own dead-time.

Figure 14 Shoot-through and configurable dead-time

5 Typical characteristics

5 Typical characteristics

$V_{DDI} = 3.3\text{ V}$, $V_{DDA/B} = 12\text{ V}$, $T_A = 25^\circ\text{C}$, $f_{sw} = 1\text{ MHz}$, no load unless otherwise noted

Green Product (RoHS compliant)

To meet the worldwide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e. Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020). Further information on packages: <https://www.infineon.com/packages>

7 Revision history

7 Revision history

Revision	Date	Description of changes
Rev 1.4	2023-10-30	Fixed typo in Table 11 : minimum T_A : 40°C → -40°C
Rev 1.3	2023-02-27	Added condition "DTC pin connected to ground" Fixed typo in the OPN of Table 25
Rev 1.2	2023-01-19	Fixed typo in channel-to-channel propagation delay mismatch
Rev 1.1	2022-12-12	Removed watermark "restricted" "Dead-time distortion" renamed as "Channel turn-off to channel turn-on propagation delay mismatch" in Table 21
Rev 1.0	2022-12-09	Initial release
