

## AD8603/AD8607/AD8609

### FEATURES

- Low offset voltage: 50  $\mu$ V max
- Low input bias current: 1 pA max
- Single-supply operation: 1.8 V to 5 V
- Low noise: 22 nV/ $\sqrt{\text{Hz}}$
- Micropower: 50  $\mu$ A max
- Low distortion
- No phase reversal
- Unity gain stable

### APPLICATIONS

- Battery-powered instrumentation
- Multipole filters
- Sensors
- Low power ASIC input or output amplifiers

### GENERAL DESCRIPTION

The AD8603/AD8607/AD8609 are, single/dual/quad micro-power rail-to-rail input and output amplifiers, respectively, that features very low offset voltage as well as low input voltage and current noise.

These amplifiers use a patented trimming technique that achieves superior precision without laser trimming. The parts are fully specified to operate from 1.8 V to 5.0 V single supply or from  $\pm 0.9$  V to  $\pm 2.5$  V dual supply. The combination of low offsets, low noise, very low input bias currents, and low power consumption make the AD8603/AD8607/AD8609 especially useful in portable and loop-powered instrumentation.

The ability to swing rail to rail at both the input and output enables designers to buffer CMOS ADCs, DACs, ASICs, and other wide output swing devices in low power single-supply systems.

The AD8603 is available in a tiny 5-lead TSOT-23 package. The AD8607 is available in 8-lead MSOP and SOIC packages. The AD8609 is available in 14-lead TSSOP and SOIC packages.

## ABSOLUTE MAXIMUM RATINGS

Table 3. AD8603/AD8607/AD8609 Stress Ratings<sup>1,2</sup>

Parameter	Rating
Supply Voltage	6 V
Input Voltage	GND to $V_S$
Differential Input Voltage	$\pm 6$ V
Output Short-Circuit Duration to GND	Indefinite
Storage Temperature Range	
All Packages	$-65^{\circ}\text{C}$ to $+150^{\circ}\text{C}$
Lead Temperature Range (Soldering, 60 Sec)	$300^{\circ}\text{C}$
Operating Temperature Range	$-40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$
Junction Temperature Range	
All Packages	$-65^{\circ}\text{C}$ to $+150^{\circ}\text{C}$

Table 4. Package Characteristics

Package Type	$\theta_{JA}$ <sup>3</sup>	$\theta_{JC}$	Unit
5-Lead TSOT-23 (UJ)	207	61	$^{\circ}\text{C}/\text{W}$
8-Lead MSOP (RM)	210	45	$^{\circ}\text{C}/\text{W}$
8-Lead SOIC (R)	158	43	$^{\circ}\text{C}/\text{W}$
14-Lead SOIC (R)	120	36	$^{\circ}\text{C}/\text{W}$
14-Lead TSSOP (RU)	180	35	$^{\circ}\text{C}/\text{W}$

<sup>1</sup> Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

<sup>2</sup> Absolute maximum ratings apply at  $25^{\circ}\text{C}$ , unless otherwise noted.

<sup>3</sup>  $\theta_{JA}$  is specified for the worst-case conditions, i.e.,  $\theta_{JA}$  is specified for device soldered in circuit board for surface-mount packages.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although these parts feature proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## APPLICATIONS

### NO PHASE REVERSAL

The AD8603/AD8607/AD8609 do not exhibit phase inversion even when the input voltage exceeds the maximum input common-mode voltage. Phase reversal can cause permanent damage to the amplifier, resulting in system lockups. The AD8603/AD8607/AD8609 can handle voltages of up to 1 V over the supply.

Figure 41. No Phase Response

### INPUT OVERVOLTAGE PROTECTION

If a voltage 1 V higher than the supplies is applied at either input, the use of a limiting series resistor is recommended. If both inputs are used, each one should be protected with a series resistor.

To ensure good protection, the current should be limited to a maximum of 5 mA. The value of the limiting resistor can be determined from the equation

$$(V_{IN} - V_S)/(R_S + 200 \Omega) \leq 5 \text{ mA}$$

### DRIVING CAPACITIVE LOADS

The AD8603/AD8607/AD8609 are capable of driving large capacitive loads without oscillating. Figure 42 shows the output of the AD8603/AD8607/AD8609 in response to a 100 mV input signal, with a 2 nF capacitive load.

Although it is configured in positive unity gain (the worst case), the AD8603 shows less than 20% overshoot. Simple additional circuitry can eliminate ringing and overshoot.

One technique is the snubber network, which consists of a series RC and a resistive load (see Figure 43). With the snubber in place, the AD8603/AD8607/AD8609 are capable of driving capacitive loads of 2 nF with no ringing and less than 3% overshoot.

The use of the snubber circuit is usually recommended for unity gain configurations. Higher gain configurations help improve the stability of the circuit. Figure 44 shows the same output response with the snubber in place.

Figure 42. Output Response to a 2 nF Capacitive Load, without Snubber

Figure 43. Snubber Network

Figure 44. Output Response to a 2 nF Capacitive Load, with Snubber

Optimum values for  $R_S$  and  $C_S$  are determined empirically; Table 5 lists a few starting values.

Table 5. Optimum Values for the Snubber Network

$C_L$ (pF)	$R_S$ ( $\Omega$ )	$C_S$ (pF)
100~500	500	680
1500	100	330
1600~2000	400	100

**PROXIMITY SENSORS**

Proximity sensors can be capacitive or inductive and are used in a variety of applications. One of the most common applications is liquid level sensing in tanks. This is particularly popular in pharmaceutical environments where a tank must know when to stop filling or mixing a given liquid. In aerospace applications, these sensors detect the level of oxygen used to propel engines. Whether in a combustible environment or not, capacitive sensors generally use low voltage. The precision and low voltage of the AD8603/AD8607/AD8609 make the parts an excellent choice for such applications.

**COMPOSITE AMPLIFIERS**

A composite amplifier can provide a very high gain in applications where high closed-loop dc gains are needed. The high gain achieved by the composite amplifier comes at the expense of a loss in phase margin. Placing a small capacitor,  $C_F$ , in the feedback in parallel with  $R_2$  (Figure 45) improves the phase margin. Picking  $C_F = 50$  pF yields a phase margin of about  $45^\circ$  for the values shown in Figure 45.

A composite amplifier can be used to optimize dc and ac characteristics. Figure 46 shows an example using the AD8603 and the AD8541. This circuit offers many advantages. The bandwidth is increased substantially, and the input offset voltage and noise of the AD8541 become insignificant since they are divided by the high gain of the AD8603.

The circuit of Figure 46 offers a high bandwidth (nearly double that of the AD8603), a high output current, and a very low power consumption of less than  $100 \mu\text{A}$ .

Figure 45. High Gain Composite Amplifier

Figure 46. Low Power Composite Amplifier

# AD8603/AD8607/AD8609

## BATTERY-POWERED APPLICATIONS

The AD8603/AD8607/AD8609 are ideal for battery-powered applications. The parts are tested at 5 V, 3.3 V, 2.7 V, and 1.8 V and are suitable for various applications whether in single or dual supply.

In addition to their low offset voltage and low input bias, the AD8603/AD8607/AD8609 have a very low supply current of 40  $\mu$ A, making the parts an excellent choice for portable electronics. The TSOT package allows the AD8603 to be used on smaller board spaces.

## PHOTODIODES

Photodiodes have a wide range of applications from bar code scanners to precision light meters and CAT scanners. The very low noise and low input bias current of the AD8603/AD8607/AD8609 make the parts very attractive amplifiers for I-V conversion applications.

Figure 47 shows a simple photodiode circuit. The feedback capacitor helps the circuit maintain stability. The signal bandwidth can be increased at the expense of an increase in the total noise; a low-pass filter can be implemented by a simple RC

network at the output to reduce the noise. The signal bandwidth can be calculated by  $\frac{1}{2\pi R_2 C_2}$  and the closed-loop bandwidth is the intersection point of the open-loop gain and the noise gain.

The circuit shown in Figure 47 has a closed-loop bandwidth of 58 kHz and a signal bandwidth of 16 Hz. Increasing  $C_2$  to 50 pF yields a closed-loop bandwidth of 65 kHz, but only 3.2 Hz of signal bandwidth can be achieved.
