

Agilent AFBR-5204Z/-5205Z ATM Multimode Fiber Transceivers for SONET OC-3/SDH STM-1 in Low Cost 1x9 Package Style Data Sheet

AFBR-5204Z/-5204PZ/-5204TZ

1300 nm 500 m

AFBR-5205Z/-5205AZ/-5205APZ/-5205ATZ/-5205PZ/-5205TZ/-5205PEZ

1300 nm 2 km

Description

The AFBR-5200Z family of transceivers from Agilent Technologies provide the system designer with products to implement a range of solutions for multimode fiber SONET OC-3 (SDH STM-1) physical layers for ATM and other services.

These transceivers are all supplied in the new industry standard 1x9 SIP package style with either a duplex SC or a duplex ST* connector interface.

ATM 2000 m Backbone Links

The AFBR-5205Z/-5205TZ are 1300 nm products with optical performance compliant with the SONET STS-3c (OC-3) Physical Layer Interface Specification. This physical layer is defined in the ATM Forum User-Network Interface (UNI) Specification Version 3.0. This document references the ANSI T1E1.2 specification for the details of the interface for 2000 meter multimode fiber backbone links.

Selected versions of these

transceivers may be used to implement the ATM Forum UNI Physical Layer Interface at the 155 Mbps/194 MBd rate.

The ATM 100 Mbps/125 MBd Physical Layer interface is best implemented with the AFBR-5100Z family of FDDI Transceivers which are specified for use in this 4B/5B encoded physical layer per the FDDI PMD standard.

ATM 500 m Backbone and Desktop Links

The AFBR-5204Z/-5204TZ are 1300 nm products which are similar to the AFBR-5205Z/5205TZ except that they are intended to provide a lower cost SONET OC-3 link to distances up to 500 meters in 62.5/125 μ m multimode fiber optic cables.

Features

- Full compliance with ATM Forum UNI SONET OC-3 Multimode Fiber Physical Layer Specification
- Multisourced 1x9 package style with choice of duplex SC or duplex ST* receptacle
- Wave solder and aqueous wash process compatibility
- RoHS Compliance

Applications

- Multimode fiber ATM backbone links
- Multimode fiber ATM wiring closet to desktop links
- ATM 155 Mbps/194 MBd encoded links (available upon special request)

Transmitter Sections

The transmitter sections of the AFBR-5204Z and AFBR-5205Z series utilize 1300 nm InGaAsP LEDs. These LEDs are packaged in the optical subassembly portion of the transmitter section. They are driven by a custom silicon IC which converts differential PECL logic signals, ECL referenced (shifted) to a +5 Volt supply, into an analog LED drive current.

*ST is a registered trademark of AT&T Lightguide Cable Connectors.

Receiver Sections

The receiver sections of the AFBR-5204Z and AFBR-5205Z series utilize InGaAs PIN photodiodes coupled to a custom silicon transimpedance preamplifier IC. These are packaged in the optical subassembly portion of the receiver.

These PIN/preamplifier combinations are coupled to a custom quantizer IC which provides the final pulse shaping for the logic output and the Signal Detect function. The data output is differential. The signal detect output is single-ended. Both data and signal detect outputs are PECL compatible, ECL referenced (shifted) to a +5 volt power supply.

Package

The overall package concept for the Agilent transceivers consists of three basic elements; the two optical subassemblies, an electrical subassembly, and the housing as illustrated in the block diagrams in Figure 1 and Figure 1a.

The package outline drawing and pin out are shown in Figures 2, 2a, and 3. The details of this package outline and pin out are compliant with the multisource definition of the 1x9 SIP. The low profile of the Agilent transceiver design complies with the maximum height allowed for the duplex SC connector over the entire length of the package.

Figures 2b and 2c show the outline drawings for options that include mezzanine height and extended and flush shields respectively.

The optical subassemblies utilize a high volume assembly process together with low cost lens elements which result in a cost effective building block.

The electrical subassembly consists of a high volume multilayer printed circuit board on which the IC chips and various surface-mounted passive circuit elements are attached.

The package includes internal shields for the electrical and optical subassemblies to insure low EMI emissions and high immunity to external EMI fields.

The outer housing including the duplex SC connector or the duplex ST ports is molded of filled non-conductive plastic to provide mechanical strength and electrical isolation. The solder posts of the Agilent design are isolated from the circuit design of the

transceiver and do not require connection to a ground plane on the circuit board.

The transceiver is attached to a printed circuit board with the nine signal pins and the two solder posts which exit the bottom of the housing. The two solder posts provide the primary mechanical strength to withstand the loads imposed on the transceiver by mating with the duplex or simplex SC or ST connected fiber cables.

Note: The "T" in the product numbers indicates a transceiver with a duplex ST connector receptacle. Product numbers without a "T" indicate transceivers with a duplex SC connector receptacle.

Application Information

The Applications Engineering group in the Agilent Optical Communication Division is available to assist you with the technical understanding and design trade-offs associated with these transceivers. You can contact them through your Agilent sales representative.

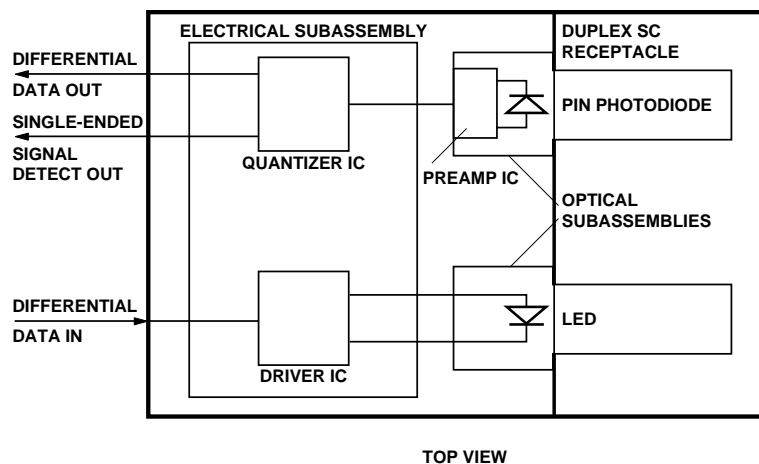

Figure 1. SC block diagram.

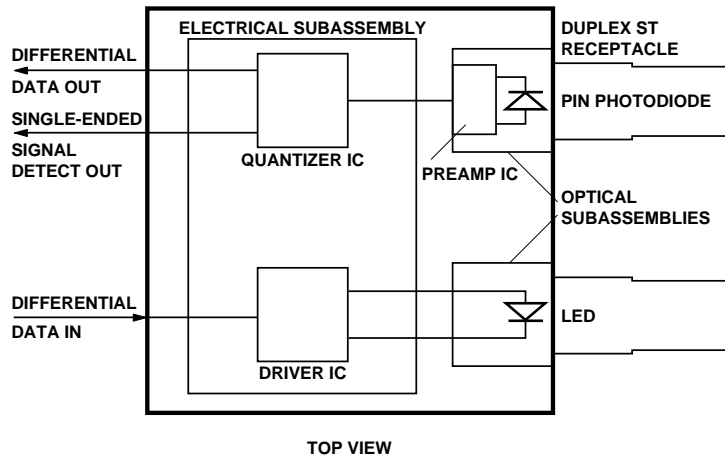

Figure 1a. ST block diagram.

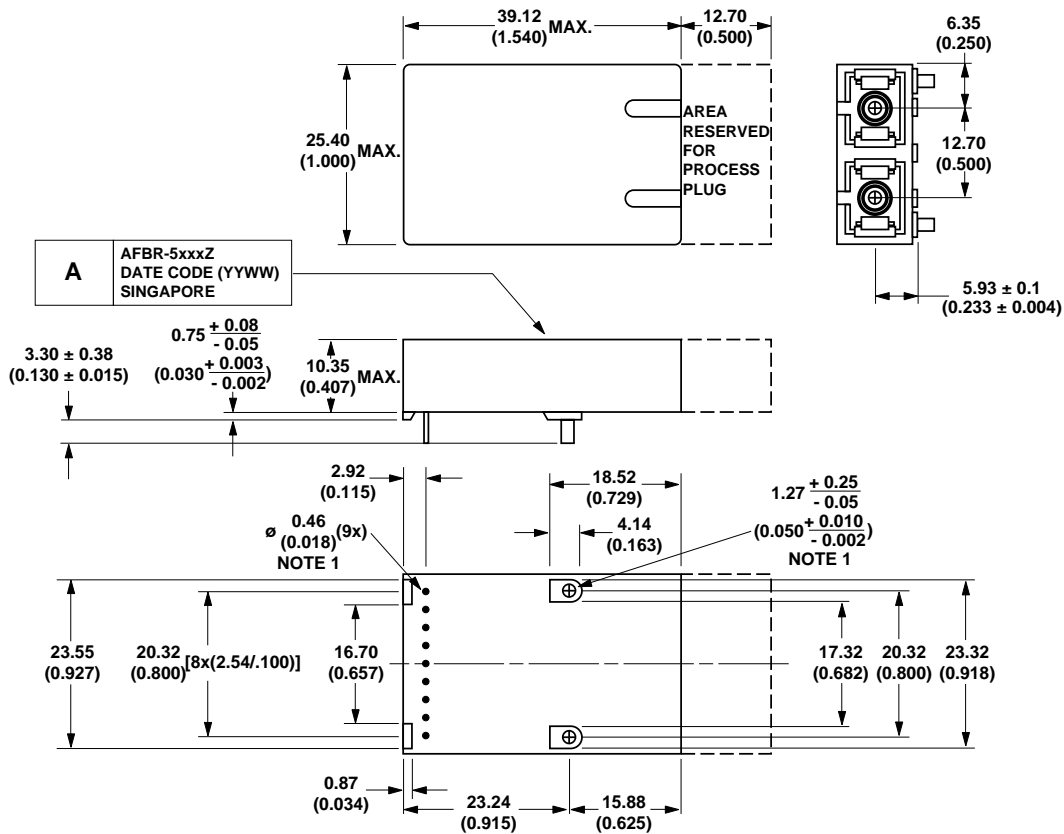

Figure 2. SC package outline drawing with standard height.

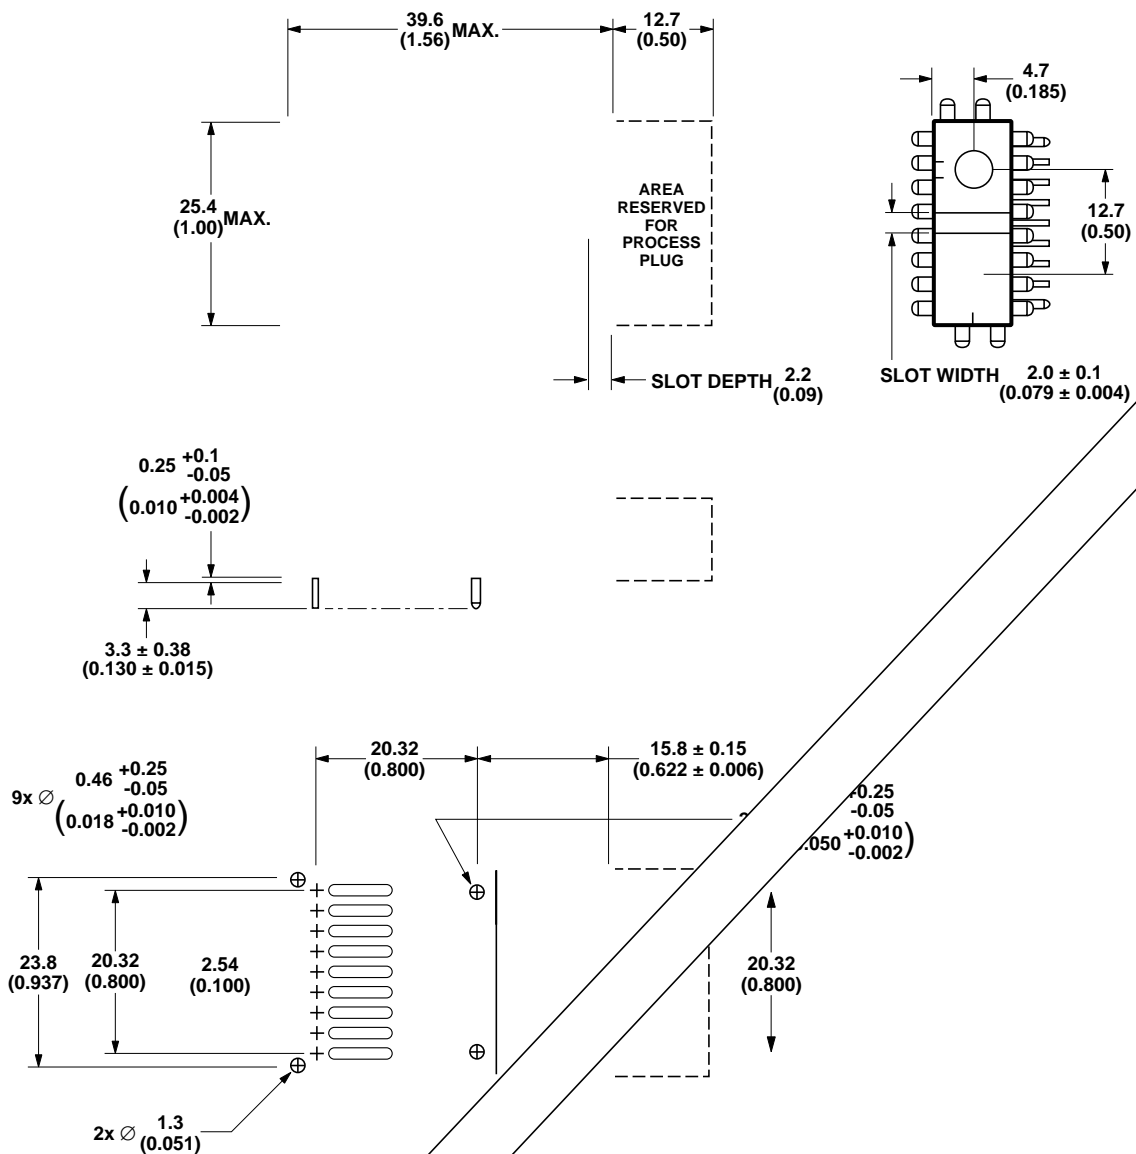

Figure 2c. Package outline drawing with mechanical dimensions and flush shield.

Figure 3. Pin out diagram.

The following information is provided to answer some of the most common questions about the use of these parts.

Transceiver Optical Power Budget versus Link Length

Optical Power Budget (OPB) is the available optical power for a fiber optic link to accommodate fiber cable losses plus losses due to in-line connectors, splices, optical switches, and to provide margin for link aging and unplanned losses due to cable plant reconfiguration or repair.

Figure 4 illustrates the predicted OPB associated with the three transceivers series specified in this data sheet at the Beginning of Life (BOL). These curves represent the attenuation and chromatic plus modal dispersion losses associated with the 62.5/125 μm and 50/125 μm fiber cables only. The area under the curves represents the remaining OPB at any link length, which is available for overcoming non-fiber cable losses.

Agilent LED technology has produced 1300 nm LED devices with lower aging characteristics than normally associated with

these technologies in the industry. The industry convention is 1.5 dB aging for 1300 nm LEDs. The 1300 nm Agilent LEDs are specified to experience less than 1 dB of aging over normal commercial equipment mission life periods. Contact your Agilent sales representative for additional details.

Figure 4 was generated for the 1300 nm transceivers with an Agilent fiber optic link model containing the current industry conventions for fiber cable specifications and the draft ANSI T1E1.2. These optical parameters are reflected in the guaranteed performance of the transceiver specifications in this data sheet. This same model has been used extensively in the ANSI and IEEE committees, including the ANSI T1E1.2 committee, to establish the optical performance requirements for various fiber optic interface standards. The cable parameters used come from the ISO/IEC JTC1/SC 25/WG3 Generic Cabling for Customer Premises per DIS 11801 document and the EIA/TIA-568-A Commercial Building Telecommunications Cabling Standard per SP-2840.

Transceiver Signaling Operating Rate Range and BER Performance
For purposes of definition, the symbol (Baud) rate, also called signaling rate, is the reciprocal of the symbol time. Data rate (bits/sec) is the symbol rate divided by the encoding factor used to encode the data (symbols/bit).

When used in 155 Mbps SONET OC-3 applications the performance of the 1300 nm transceivers, AFBR-5204Z/5205Z is guaranteed to the full conditions listed in individual product specification tables.

Figure 4. Optical power budget vs. fiber optic cable length.

The transceivers may be used for other applications at signaling rates different than 155 Mbps with some variation in the link optical power budget. Figure 5 gives an indication of the typical performance of these products at different rates.

These transceivers can also be used for applications which require different Bit Error Rate (BER) performance. Figure 6 illustrates the typical trade-off between link BER and the receivers input optical power level.

Transceiver Jitter Performance

The Agilent 1300 nm transceivers are designed to operate per the system jitter allocations stated in Table B1 of Annex B of the draft ANSI T1E1.2 Revision 3 standard.

The Agilent 1300 nm transmitters will tolerate the worst case input electrical jitter allowed in Annex B without violating the worst case output optical jitter requirements.

The Agilent 1300 nm receivers will tolerate the worst case input optical jitter allowed in Annex B without violating the worst case output electrical jitter allowed.

The jitter specifications stated in the following 1300 nm transceiver specification tables are derived from the values in Table B1 of Annex B. They represent the worst case jitter contribution that the transceivers are allowed to make to the overall system jitter without violating the Annex B allocation example. In practice,

the typical contribution of the Agilent transceivers is well below these maximum allowed amounts.

Recommended Handling Precautions

Agilent recommends that normal static precautions be taken in the handling and assembly of these transceivers to prevent damage which may be induced by electrostatic discharge (ESD). The AFBR-5204Z/-5205Z series of transceivers meet MIL-STD-883C Method 3015.4 Class 2 products.

Care should be used to avoid shorting the receiver data or signal detect outputs directly to ground without proper current limiting impedance.

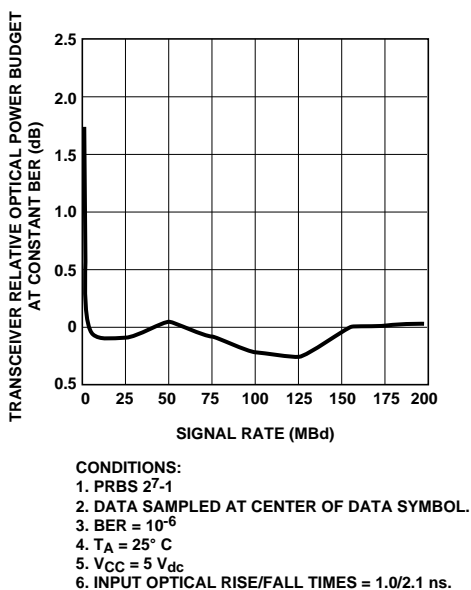

Figure 5. Transceiver relative optical power budget at constant BER vs. signaling rate.

Figure 6. Bit error rate vs. relative receiver input optical power.

Solder and Wash Process Compatibility

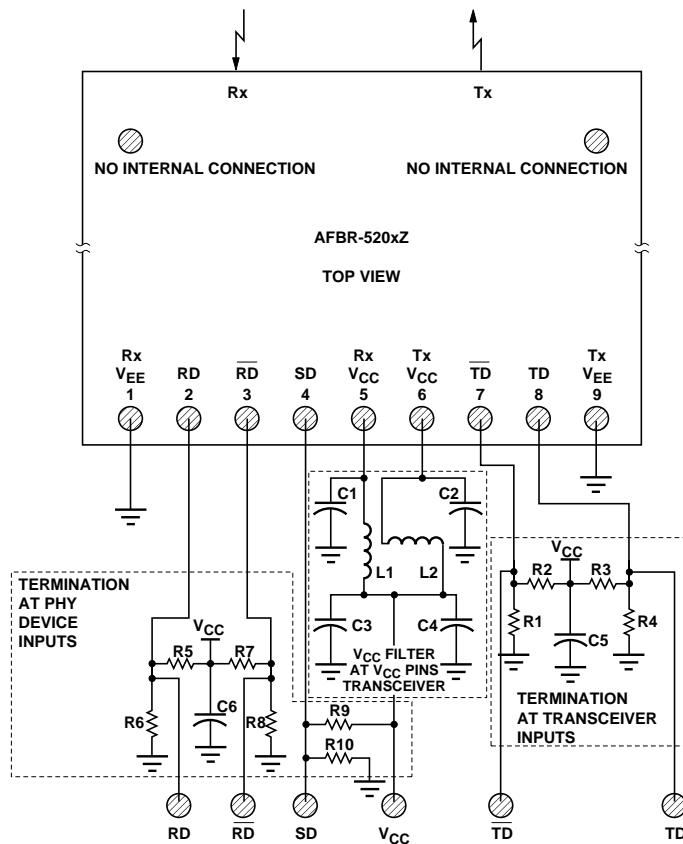

The transceivers are delivered with protective process plugs inserted into the duplex SC or duplex ST connector receptacle. This process plug protects the optical subassemblies during

wave solder and aqueous wash processing and acts as a dust cover during shipping.

These transceivers are compatible with either industry standard wave or hand solder processes.

Shipping Container

The transceiver is packaged in a shipping container designed to protect it from mechanical and ESD damage during shipment or storage.

NOTES:

THE SPLIT-LOAD TERMINATIONS FOR ECL SIGNALS NEED TO BE LOCATED AT THE INPUT OF DEVICES RECEIVING THOSE ECL SIGNALS. RECOMMEND 4-LAYER PRINTED CIRCUIT BOARD WITH 50 OHM MICROSTRIP SIGNAL PATHS BE USED.

R1 = R4 = R6 = R8 = R10 = 130 OHMS.

R2 = R3 = R5 = R7 = R9 = 82 OHMS.

C1 = C2 = C3 = C5 = C6 = 0.1 μ F.

C4 = 10 μ F.

L1 = L2 = 1 μ H COIL OR FERRITE INDUCTOR.

Figure 7. Recommended decoupling and termination circuits.

Board Layout – Decoupling Circuit and Ground Planes

It is important to take care in the layout of your circuit board to achieve optimum performance from these transceivers. Figure 7 provides a good example of a schematic for a power supply decoupling circuit that works well with these parts. It is further recommended that a contiguous ground plane be provided in the

circuit board directly under the transceiver to provide a low inductance ground for signal return current. This recommendation is in keeping with good high frequency board layout practices.

Board Layout – Hole Pattern

The Agilent transceiver complies with the circuit board “Common Transceiver Footprint” hole

pattern defined in the original multisource announcement which defined the 1x9 package style. This drawing is reproduced in Figure 8 with the addition of ANSI Y14.5M compliant dimensioning to be used as a guide in the mechanical layout of your circuit board.

Figure 8. Recommended board layout hole pattern.

Board Layout – Art Work

The Applications Engineering group is developing Gerber file art work for a multilayer printed circuit board layout incorporating the recommendations above. Contact your local Agilent sales representative for details.

Board Layout – Mechanical

For applications interested in providing a choice of either a

duplex SC or a duplex ST connector interface, while utilizing the same pinout on the printed circuit board, the ST port needs to protrude from the chassis panel a minimum of 9.53 mm for sufficient clearance to install the ST connector.

Please refer to Figure 8a for a mechanical layout detailing the recommended location of the

duplex SC and duplex ST transceiver packages in relation to the chassis panel.

For both shielded design options, Figures 8b and 8c identify front panel aperture dimensions.

Regulatory Compliance

These transceiver products are intended to enable commercial system designers to develop equipment that complies with the various international regulations governing certification of Information Technology Equipment. See the Regulatory Compliance Table for details. Additional information is available from your Agilent sales representative.

Electrostatic Discharge (ESD)

There are two design cases in which immunity to ESD damage is important.

The first case is during handling of the transceiver prior to mounting it on the circuit board. It is important to use normal ESD handling precautions for ESD sensitive devices. These precautions include using grounded wrist straps, work benches, and floor mats in ESD controlled areas.

The second case to consider is static discharges to the exterior of the equipment chassis containing the transceiver parts. To the extent that the duplex SC connector is exposed to the outside of the equipment chassis it may be subject to whatever ESD system level test criteria that the equipment is intended to meet.

Figure 8a. Recommended common mechanical layout for ST and ST 1x9 connected transceivers.

Figure 8b. Dimensions shown for mounting module with extended shield to panel.

AFBR-5205Z TRANSMITTER TEST RESULTS OF λ_c , $\Delta\lambda$ AND t_{rf} ARE CORRELATED AND COMPLY WITH THE ALLOWED SPECTRAL WIDTH AS A FUNCTION OF CENTER WAVELENGTH FOR VARIOUS RISE AND FALL TIMES.

Figure 9. Transmitter output optical spectral width (FWHM) vs. transmitter output optical wavelength and rise/fall times.

CONDITIONS:
 1. $T_A = 25^\circ \text{C}$
 2. $V_{CC} = 5 \text{ Vdc}$
 3. INPUT OPTICAL RISE/FALL TIMES = 1.0/2.1 ns.
 4. INPUT OPTICAL POWER IS NORMALIZED TO CENTER OF DATA SYMBOL.
 5. NOTE 16 AND 17 APPLY.

Figure 10. Relative input optical power vs. eye sampling time position.

Regulatory Compliance Table

Feature	Test Method	Performance
Electrostatic Discharge (ESD) to the Electrical Pins	MIL-STD-883C Method 3015.4	Meets Class 2 (2000 to 3999 Volts) Withstand up to 2200 V applied between electrical pins.
Electrostatic Discharge (ESD) to the Duplex SC Receptacle	Variation of IEC 801-2	Typically withstand at least 25 kV without damage when the Duplex SC Connector Receptacle is contacted by a Human Body Model probe.
Electromagnetic Interference (EMI)	FCC Class B CENELEC EN55022 Class B (CISPR 22B) VCCI Class 2	Typically provide 13dB margin to the noted standards however, it should be noted that final margin depends on the customer's board and chasis design.
Immunity	Variation of IEC 61000-4-3	Typically show no measurable effect from a 10 V/m field swept from 10 to 450 MHz applied to the transceiver when mounted to a circuit card without a chassis enclosure.

DIMENSIONS ARE IN MILLIMETERS (INCHES).
ALL DIMENSIONS ARE ± 0.025 mm UNLESS OTHERWISE SPECIFIED.

Figure 8c. Dimensions shown for mounting module flush to panel.

Immunity

Equipment utilizing these transceivers will be subject to radio-frequency electromagnetic fields in some environments. These transceivers have a high immunity to such fields.

For additional information regarding EMI, susceptibility, ESD and conducted noise testing procedures and results on the 1x9 transceiver family, please refer to Applications Note 1075, Testing and Measuring Electromagnetic Compatibility Performance of the AFBR-510XZ/-520XZ Fiber Optic Transceivers.

Transceiver Reliability and Performance Qualification Data

The 1x9 transceivers have passed Agilent reliability and performance qualification testing and are undergoing ongoing quality monitoring. Details are available from your Agilent sales representative.

These transceivers are manufactured at the Agilent Singapore location which is an ISO 9002 certified facility.

Applications Support Materials

Contact your local Agilent Component Field Sales Office for information on how to obtain PCB Layouts, Test Boards and demo boards for the 1x9 transceivers.

Evaluation Kits

Agilent has available three evaluation kits for the 1x9 transceivers. The purpose of these kits is to provide the necessary materials to evaluate the performance of the AFBR-520XZ family in a pre-existing 1x13 or 2x11 pinout system design configuration or when connected to various test equipment.

1. HFBR-0319 – Evaluation Test Fixture Board:
This test fixture converts +5 V ECL 1x9 transceivers to –5 V

ECL BNC Coax Connections so that direct connections to industry standard fiber optic test equipment can be accomplished.

Accessory Duplex SC Connected Cable Assemblies

Agilent recommends for optimal coupling the use of flexible-body duplex SC connected cable.

Accessory Duplex ST Connected Cable Assemblies

Agilent recommends the use of Duplex Push-Pull ST connected cable for optimal repeatability of the optical power coupling.

Notes:

- This is the maximum voltage that can be applied across the Differential Transmitter Data Inputs to prevent damage to the input ESD protection circuit.
- The outputs are terminated with 50 Ω connected to V_{CC} -2 V.
- The power supply current needed to operate the transmitter is provided to differential ECL circuitry. This circuitry maintains a nearly constant current flow from the power supply. Constant current operation helps to prevent unwanted electrical noise from being generated and conducted or emitted to neighboring circuitry.
- This value is measured with the outputs terminated into 50 Ω connected to V_{CC} -2 V and an Input Optical Power level of -14 dBm average.
- The power dissipation value is the power dissipated in the receiver itself. Power dissipation is calculated as the sum of the products of supply voltage and currents, minus the sum of the products of the output voltages and currents.
- This value is measured with respect to V_{CC} with the output terminated into 50 Ω connected to V_{CC} -2 V.
- The output rise and fall times are measured between 20% and 80% levels with the output connected to V_{CC} -2 V through 50 Ω.
- These optical power values are measured with the following conditions:
 - The Beginning of Life (BOL) to the End of Life (EOL) optical power degradation is typically 1.5 dB per the industry convention for long wavelength LEDs. The actual degradation observed in Agilent's 1300 nm LED products is <1 dB, as specified in this datasheet.
 - Over the specified operating voltage and temperature ranges.
 - With 25 MBd (12.5 MHz square-wave) input signal.
 - At the end of one meter of noted optical fiber with cladding modes removed. The average power value can be converted to a peak power value by adding 3 dB. Higher output optical power transmitters are available on special request.
- The Extinction Ratio is a measure of the modulation depth of the optical signal. The data "1" peak output optical power is compared to the data "0" output optical power and expressed in decibels. With the transmitter driven by a 25 MBd (12.5 MHz square-wave) input signal, the average optical power is measured. The data "1" peak power is then calculated by adding 3dB to the measured average optical power. The data "0" output optical power is found by measuring the optical power when the transmitter is driven by a logic "0" input. The extinction ratio is the ratio of the optical power at the "1" level compared to the optical power at the "0" level expressed in decibels.

10. The transmitter will provide this low level of Output Optical Power when driven by a logic "0" input. This can be useful in link troubleshooting.
11. The relationship between Full Width Half Maximum and RMS values for Spectral Width is derived from the assumption of a Gaussian shaped spectrum which results in a $2.35 \times \text{RMS} = \text{FWHM}$ relationship.
12. The optical rise and fall times are measured from 10% to 90% when the transmitter is driven by a 25 MBd (12.5 MHz square-wave) input signal. The ANSI T1E1.2 committee has designated the possibility of defining an eye pattern mask for the transmitter optical output as an item for further study. Agilent will incorporate this requirement into the specifications for these products if it is defined. The AFBR-5204Z and AFBR-5205Z products typically comply with the template requirements of CCITT (now ITU-T) G.957 Section 3.2.5, Figure 2 for the STM-1 rate, excluding the optical receiver filter normally associated with single mode fiber measurements which is the likely source for the ANSI T1E1.2 committee to follow in this matter.
13. Systematic Jitter contributed by the transmitter is defined as the combination of Duty Cycle Distortion and Data Dependent Jitter. Systematic Jitter is measured at 50% threshold using a 155.52 MBd (77.5 MHz square-wave), 2⁷ - 1 psuedorandom data pattern input signal.
14. Random Jitter contributed by the transmitter is specified with a 155.52 MBd (77.5 MHz square-wave) input signal.
15. This specification is intended to indicate the performance of the receiver section of the transceiver when Input Optical Power signal characteristics are present per the following definitions. The Input Optical Power dynamic range from the minimum level (with a window time-width) to the maximum level is the range over which the receiver is guaranteed to provide output data with a Bit Error Ratio (BER) better than or equal to 1×10^{-10} .
 - At the Beginning of Life (BOL)
 - Over the specified operating temperature and voltage ranges
 - Input is a 155.52 MBd, 2²³ - 1 PRBS data pattern with 72 "1"s and 72 "0"s inserted per the CCITT (now ITU-T) recommendation G.958 Appendix I.
 - Receiver data window time-width is 1.23 ns or greater for the clock recovery circuit to operate in. The actual test data window time-width is set to simulate the effect of worst case optical input jitter based on the transmitter jitter values from the specification tables. The test window time-widths are as follows: HFBR-5205 and HFBR-5204 are 3.32 ns.
 - Transmitter operating with a 155.52 MBd, 77.5 MHz square-wave, input signal to simulate any cross-talk present between the transmitter and receiver sections of the transceiver.
16. All conditions of Note 15 apply except that the measurement is made at the center of the symbol with no window time-width.
17. Systematic Jitter contributed by the receiver is defined as the combination of Duty Cycle Distortion and Data Dependent Jitter. Systematic Jitter is measured at 50% threshold using a 155.52 MBd (77.5 MHz square-wave), 2⁷ - 1 psuedo-random data pattern input signal.
18. Random Jitter contributed by the receiver is specified with a 155.52 MBd (77.5 MHz square-wave) input signal.
19. This value is measured during the transition from low to high levels of input optical power.
20. This value is measured during the transition from high to low levels of input optical power.
21. The Signal Detect output shall be asserted within 100 μs after a step increase of the Input Optical Power (130 μs for -40°C to 0°C).
22. Signal detect output shall be de-asserted within 350 μs after a step decrease in the Input Optical Power.
23. The AFBR-5205Z transceiver complies with the requirements for the tradeoffs between center wave-length, spectral width, and rise/fall times shown in Figure 9. This figure is derived from the FDDI PMD standard (ISO/IEC 9314-3 : 1990 and ANSI X3.166 - 1990) per the description in ANSI T1E1.2 Revision 3. The interpretation of this figure is that values of Center Wavelength and Spectral Width must lie along the appropriate Optical Rise/Fall Time curve.

Ordering Information

The following 1300 nm transceivers are available for production orders through the Agilent Component Field Sales Offices and Authorized Distributors world wide.

*For flush shield options, please contact Field Sales Offices and Authorized Distributors world wide.

1300nm LED, ATM/SONET OC-3, 155MBd temperature range 0°C to +70°C

AFBR-5204Z	DuplexSC Connector1X9, 500M
AFBR-5204TZ	Duplex ST Connector 1X9
AFBR-5204PZ	Duplex SC Connector, Mezzanine Height
AFBR-5205Z	DUPLEX SC Connector 1X9, 2KM
AFBR-5205TZ	Duplex ST Connector 1X9
AFBR-5205PZ	Duplex SC Connector 1x9, Mezzanine Height
AFBR-5205PEZ	Duplex SC Connector 1x9, Mezzanine Height with Extended Shield

1300nm LED, 155MBd temperature range -40°C to +85°C

AFBR-5205AZ	ATM/SONET OC-3 DUPLEX SC Connector 1X9
AFBR-5205ATZ	ATM/SONET OC-3 DUPLEX ST Connector1X9
