The PD240 is a convenient pocket-sized, battery powered proving unit that produces a 240Vdc output.

A proving unit is essential for the proving of voltage indicators before and after use, in order to follow safe electrical working practices.

The PD240 is current limited to 3.5mA and is suitable for use with neon voltage indicators and with other voltage indicators that have an input impedance greater than 120kΩ.

The unit is actuated by microswitch when probes of a voltage indicator are inserted into the probe apertures on front face.

The Indicator LED adjacent to probe apertures shows when unit is powered.

Switch-mode electronics ensure long battery life.

Flush-mounted pocket clip permits stable bench use when desired.
