

## **PCI-NT DRIVER**

Designed to support the Blue Chip Technology range of PCI data acquisition cards this kernel mode device driver and API (Application Programming Interface) library provide an easy way for the programmer to develop applications for Windows NT using Visual Basic, C/C++ and Delphi.

A simple installation procedure ensures that all the system files are copied to the correct locations along with an on-line manual for the drivers and sample programs. All necessary registry keys and settings are added as part of the installation procedure and application development can start within a matter of minutes.

The API provides simple functions that allow access to the hardware functions provided by the PCI data acquisition cards without the developer requiring an indepth knowledge of the card or the associated Windows NT architecture. Having been designed specifically for Windows NT these drivers fully support multi-threaded applications.
