MM74HC4060 14 Stage Binary Counter

General Description

The MM74HC4060 is a high speed binary ripple carry counter. These counters are implemented utilizing advanced silicon-gate CMOS technology to achieve speed performance similar to LS-TTL logic while retaining the low power and high noise immunity of CMOS.

The MM74HC4060 is a 14-stage counter, which device increments on the falling edge (negative transition) of the input clock, and all their outputs are reset to a low level by applying a logical high on their reset input. The MM74HC4060 also has two additional inputs to enable easy connection of either an RC or crystal oscillator.

This device is pin equivalent to the CD4060. All inputs are protected from damage due to static discharge by protection diodes to $V_{\rm CC}$ and ground.

Features

- Typical propagation delay: 16 ns
- Wide operating voltage range: 2–6V
- Low input current: 1 μA maximum
- Low quiescent current: 80 µA maximum (74 Series)
- Output drive capability: 10 LS-TTL loads

Note 1: Maximum Ratings are those values beyond which damage to the device may occur.

Note 2: Unless otherwise specified all voltages are referenced to ground.

DC Electrical Characteristics (Note 4)

Note 4: For a power supply of 5V \pm 10% the worst case output voltages (V_{OH} , and V_{OL}) occur for HC at 4.5V. Thus the 4.5V values should be used when designing with this supply. Worst case V_{IH} and V_{IL} occur at $V_{CC} = 5.5V$ and 4.5V respectively. (The V_{IH} value at 5.5V is 3.85V.) The worst case leakage current (I_{IN} , I_{CC} , and I_{OZ}) occur for CMOS at the higher voltage and so the 6.0V values should be used.

Note 5: Typical Propagation delay time to any output can be calculated using: $t_P = 17 + 12(N-1)$ ns; where N is the number of the output, Q_W , at $V_{CC} = 5V$.

Note 6: C_{PD} determines the no load dynamic power consumption, $P_D = C_{PD} \ V_{CC}^2 \ f+I_{CC} \ V_{CC}$, and the no load dynamic current consumption, $I_S = C_{PD} \ V_{CC} \ f+I_{CC}$.
