

## 256K SPI™ Bus Serial EEPROM

### Device Selection Table

Part Number	Vcc Range	Page Size	Temp. Ranges	Packages
25LC256	2.5-5.5V	64 Byte	I, E	P, SN, SM, ST, MF
25AA256	1.8-5.5V	64 Byte	I	P, SN, SM, ST, MF

### Features:

- Max. clock 10 MHz
- Low-power CMOS technology:
  - Max. Write Current: 5 mA at 5.5V, 10 MHz
  - Read Current: 5 mA at 5.5V, 10 MHz
  - Standby Current: 1  $\mu$ A at 5.5V
- 32,768 x 8-bit organization
- 64 byte page
- Self-timed erase and write cycles (5 ms max.)
- Block write protection:
  - Protect none, 1/4, 1/2 or all of array
- Built-in write protection:
  - Power-on/off data protection circuitry
  - Write enable latch
  - Write-protect pin
- Sequential read
- High reliability:
  - Endurance: 1,000,000 erase/write cycles
  - Data retention: > 200 years
  - ESD protection: > 4000V
- Temperature ranges supported:
  - Industrial (I): -40°C to +85°C
  - Automotive (E): -40°C to +125°C
- Pb-free packages available

### Pin Function Table

Name	Function
$\overline{\text{CS}}$	Chip Select Input
SO	Serial Data Output
$\overline{\text{WP}}$	Write-Protect
Vss	Ground
SI	Serial Data Input
SCK	Serial Clock Input
$\overline{\text{HOLD}}$	Hold Input
Vcc	Supply Voltage

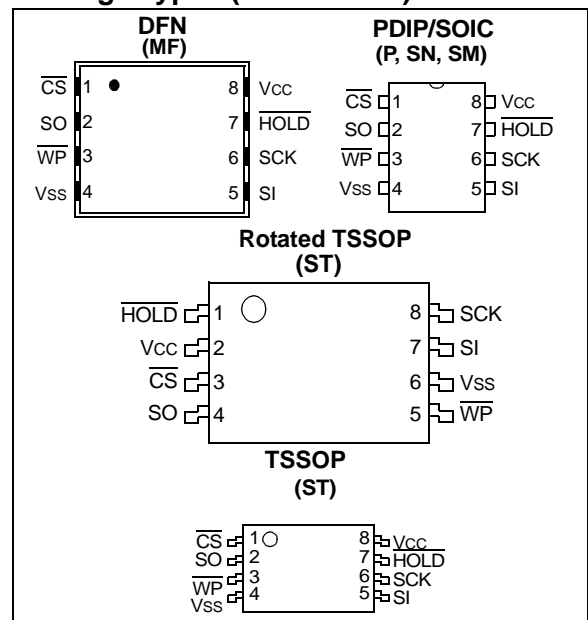

### Description:

The Microchip Technology Inc. 25AA256/25LC256 (25XX256\*) are 256k-bit Serial Electrically Erasable PROMs. The memory is accessed via a simple Serial Peripheral Interface™ (SPI™) compatible serial bus. The bus signals required are a clock input (SCK) plus separate data in (SI) and data out (SO) lines. Access to the device is controlled through a Chip Select ( $\overline{\text{CS}}$ ) input.

Communication to the device can be paused via the hold pin ( $\overline{\text{HOLD}}$ ). While the device is paused, transitions on its inputs will be ignored, with the exception of Chip Select, allowing the host to service higher priority interrupts.

The 25XX256 is available in standard packages including 8-lead PDIP and SOIC, and advanced packaging including 8-lead DFN and 8-lead TSSOP. Pb-free (Pure Sn) finish is available.

### Package Types (not to scale)

SPI is a registered trademark of Motorola Corporation.

\* 25XX256 is used in this document as a generic part number for the 25AA256, 25LC256 devices.

# 25AA256/25LC256

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings (†)

V <sub>CC</sub> .....	6.5V
All inputs and outputs w.r.t. V <sub>SS</sub> .....	-0.6V to V <sub>CC</sub> +1.0V
Storage temperature .....	-65°C to 150°C
Ambient temperature under bias .....	-40°C to 125°C
ESD protection on all pins .....	4 kV

† NOTICE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for an extended period of time may affect device reliability.

**TABLE 1-1: DC CHARACTERISTICS**

DC CHARACTERISTICS			Industrial (I): TA = -40°C to +85°C		Automotive (E): TA = -40°C to +125°C		V <sub>CC</sub> = 1.8V to 5.5V		V <sub>CC</sub> = 2.5V to 5.5V		
Param. No.	Sym.	Characteristic	Min.	Typ.	Max.	Units	Test Conditions

## 2.0 FUNCTIONAL DESCRIPTION

### 2.1 Principles of Operation

The 25XX256 is a 32,768-byte Serial EEPROM designed to interface directly with the Serial Peripheral Interface (SPI) port of many of today's popular microcontroller families, including Microchip's PICmicro<sup>®</sup> microcontrollers. It may also interface with microcontrollers that do not have a built-in SPI port by using discrete I/O lines programmed properly in firmware to match the SPI protocol.

The 25XX256 contains an 8-bit instruction register. The device is accessed via the SI pin, with data being clocked in on the rising edge of SCK. The  $\overline{CS}$  pin must be low and the HOLD pin must be high for the entire operation.

Table 2-1 contains a list of the possible instruction bytes and format for device operation. All instructions, addresses, and data are transferred MSB first, LSB last.

Data (SI) is sampled on the first rising edge of SCK after  $\overline{CS}$  goes low. If the clock line is shared with other peripheral devices on the SPI bus, the user can assert the HOLD input and place the 25XX256 in 'HOLD' mode. After releasing the  $\overline{HOLD}$  pin, operation will resume from the point when the  $\overline{HOLD}$  was asserted.

### 2.2 Read Sequence

The device is selected by pulling  $\overline{CS}$  low. The 8-bit READ instruction is transmitted to the 25XX256 followed by the 16-bit address, with the first MSB of the address being a "don't care" bit. After the correct READ instruction and address are sent, the data stored in the memory at the selected address is shifted out on the SO pin. The data stored in the memory at the next address can be read sequentially by continuing to provide clock pulses. The internal Address Pointer is automatically incremented to the next higher address after each byte of data is shifted out. When the highest address is reached (7FFFh), the address counter rolls over to address 0000h allowing the read cycle to be continued indefinitely. The read operation is terminated by raising the  $\overline{CS}$  pin (Figure 2-1).

### 2.3 Write Sequence

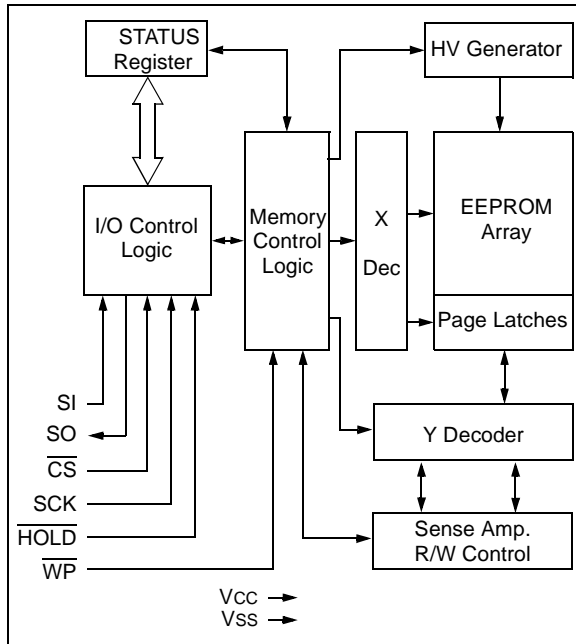

Prior to any attempt to write data to the 25XX256, the write enable latch must be set by issuing the  $\overline{WREN}$  instruction (Figure 2-4). This is done by setting  $\overline{CS}$  low and then clocking out the proper instruction into the 25XX256. After all eight bits of the instruction are transmitted, the  $\overline{CS}$  must be brought high to set the write enable latch. If the write operation is initiated immediately after the  $\overline{WREN}$  instruction without  $\overline{CS}$  being brought high, the data will not be written to the array because the write enable latch will not have been properly set.

Once the write enable latch is set, the user may proceed by setting the  $\overline{CS}$  low, issuing a WRITE instruction, followed by the 16-bit address, with the first MSB of the address being a "don't care" bit, and then the data to be written. Up to 64 bytes of data can be sent to the device before a write cycle is necessary. The only restriction is that all of the bytes must reside in the same page.

**Note:** Page write operations are limited to writing bytes within a single physical page, **regardless** of the number of bytes actually being written. Physical page boundaries start at addresses that are integer multiples of the page buffer size (or 'page size') and, end at addresses that are integer multiples of page size - 1. If a Page Write command attempts to write across a physical page boundary, the result is that the data wraps around to the beginning of the current page (overwriting data previously stored there), instead of being written to the next page as might be expected. It is therefore necessary for the application software to prevent page write operations that would attempt to cross a page boundary.

For the data to be actually written to the array, the  $\overline{CS}$  must be brought high after the Least Significant bit (D0) of the  $n^{th}$  data byte has been clocked in. If  $\overline{CS}$  is brought high at any other time, the write operation will not be completed. Refer to Figure 2-2 and Figure 2-3 for more detailed illustrations on the byte write sequence and the page write sequence, respectively. While the write is in progress, the STATUS register may be read to check the status of the WPEN, WIP, WEL, BP1 and BP0 bits (Figure 2-6). A read attempt of a memory array location will not be possible during a write cycle. When the write cycle is completed, the write enable latch is reset.

## BLOCK DIAGRAM

**TABLE 2-1: INSTRUCTION SET**

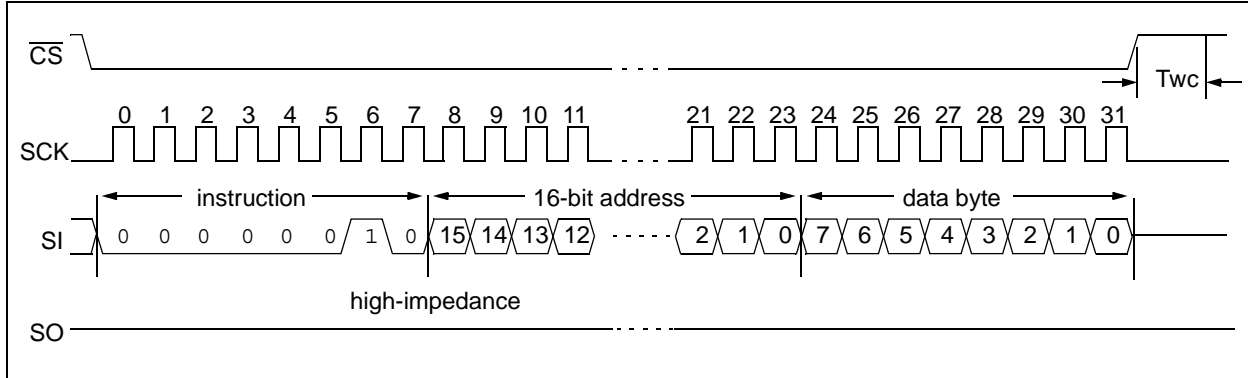

Instruction Name	Instruction Format	Description
READ	0000 0011	Read data from memory array beginning at selected address
WRITE	0000 0010	Write data to memory array beginning at selected address
WRDI	0000 0100	Reset the write enable latch (disable write operations)
WREN	0000 0110	Set the write enable latch (enable write operations)
RDSR	0000 0101	Read STATUS register
WRSR	0000 0001	Write STATUS register

**FIGURE 2-1: READ SEQUENCE**

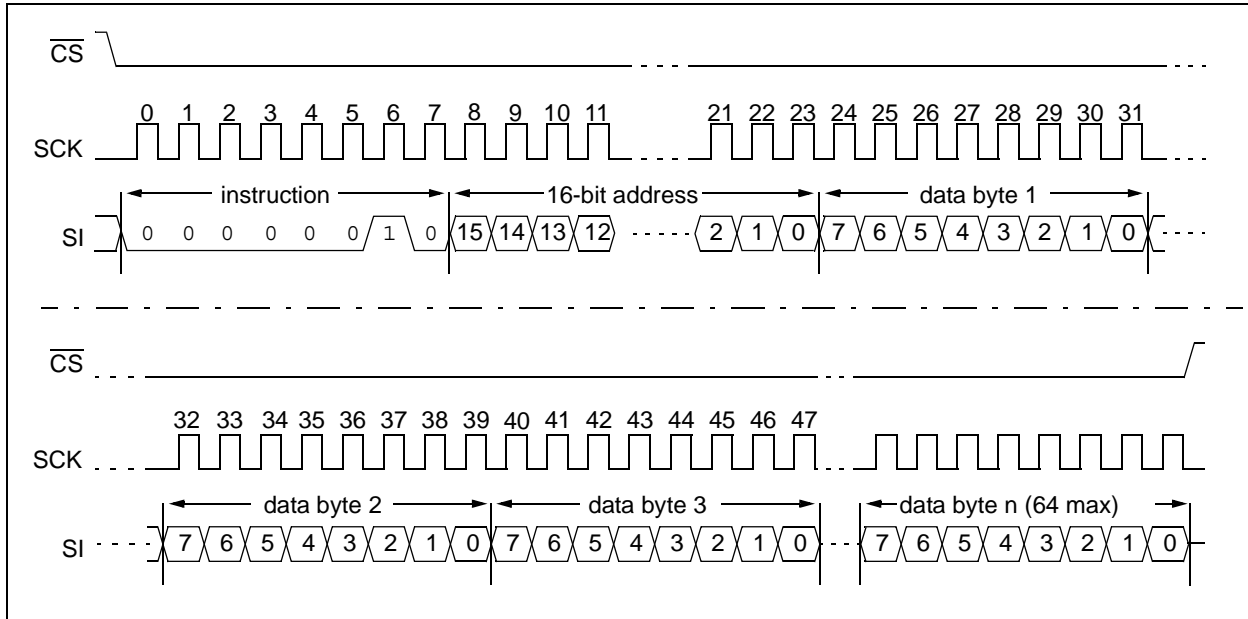

# 25AA256/25LC256

**FIGURE 2-2: BYTE WRITE SEQUENCE**

**FIGURE 2-3: PAGE WRITE SEQUENCE**

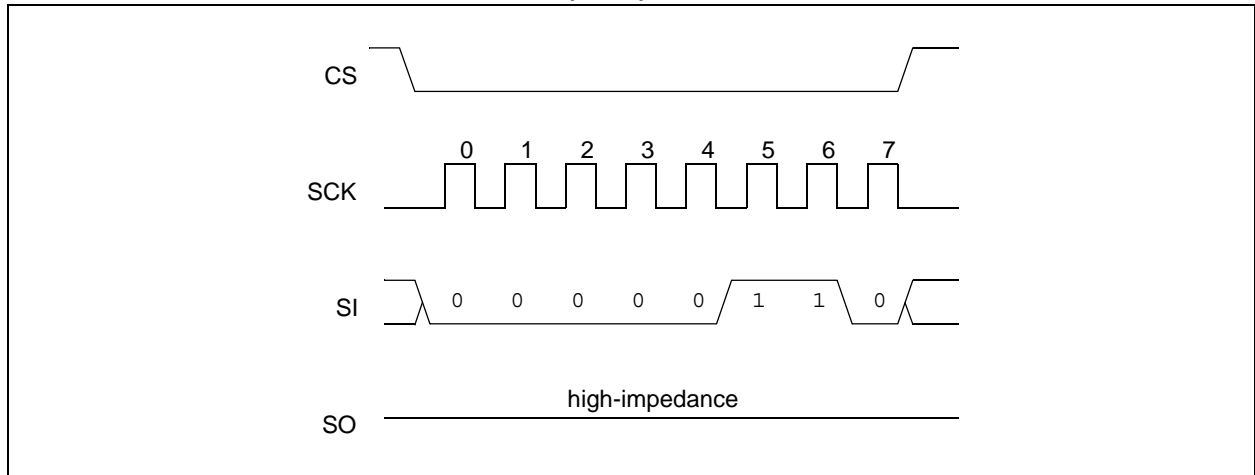

## 2.4 Write Enable (WREN) and Write Disable (WRDI)

The 25XX256 contains a write enable latch. See Table 2-4 for the Write-Protect Functionality Matrix. This latch must be set before any write operation will be completed internally. The WREN instruction will set the latch, and the WRDI will reset the latch.

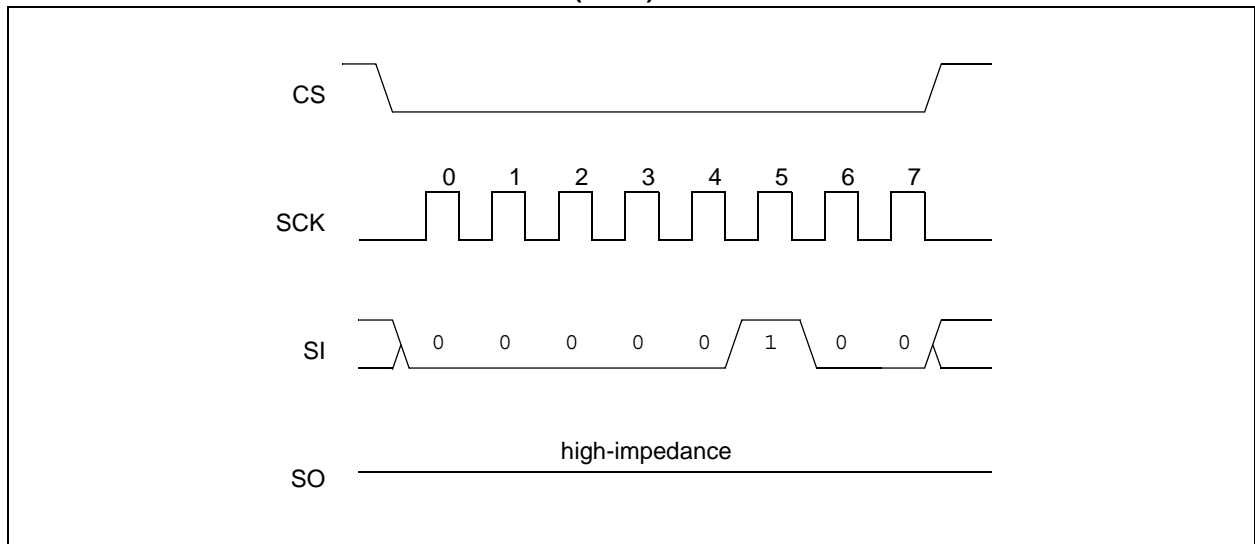

The following is a list of conditions under which the write enable latch will be reset:

- Power-up
- WRDI instruction successfully executed
- WRSR instruction successfully executed
- WRITE instruction successfully executed

**FIGURE 2-4: WRITE ENABLE SEQUENCE (WREN)**

**FIGURE 2-5: WRITE DISABLE SEQUENCE (WRDI)**

# 25AA256/25LC256

## 2.5 Read Status Register Instruction (RDSR)

The Read Status Register instruction (RDSR) provides access to the STATUS register. The STATUS register may be read at any time, even during a write cycle. The STATUS register is formatted as follows:

**TABLE 2-2: STATUS REGISTER**

7	6	5	4	3	2	1	0
W/R	-	-	-	W/R	W/R	R	R
WPEN	x	x	x	BP1	BP0	WEL	WIP

W/R = writable/readable. R = read-only.

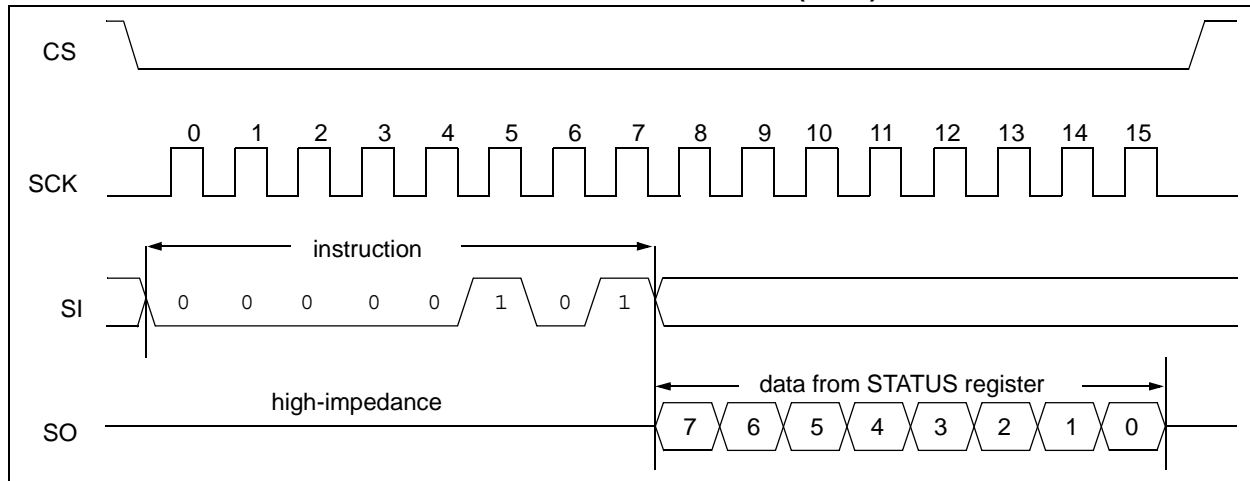

The **Write-In-Process (WIP)** bit indicates whether the 25XX256 is busy with a write operation. When set to a '1', a write is in progress, when set to a '0', no write is in progress. This bit is read-only.

The **Write Enable Latch (WEL)** bit indicates the status of the write enable latch and is read-only. When set to a '1', the latch allows writes to the array, when set to a '0', the latch prohibits writes to the array. The state of this bit can always be updated via the WREN or WRDI commands, regardless of the state of write protection on the STATUS register. These commands are shown in Figure 2-4 and Figure 2-5.

The **Block Protection (BP0 and BP1)** bits indicate which blocks are currently write-protected. These bits are set by the user issuing the WRSR instruction. These bits are nonvolatile, and are shown in Table 2-3.

See Figure 2-6 for the RDSR timing sequence.

**FIGURE 2-6: READ STATUS REGISTER TIMING SEQUENCE (RDSR)**

## 2.6 Write Status Register Instruction (WRSR)

The Write Status Register instruction ( $WRSR$ ) allows the user to write to the nonvolatile bits in the STATUS register as shown in Table 2-2. The user is able to select one of four levels of protection for the array by writing to the appropriate bits in the STATUS register. The array is divided up into four segments. The user has the ability to write-protect none, one, two, or all four of the segments of the array. The partitioning is controlled as shown in Table 2-3.

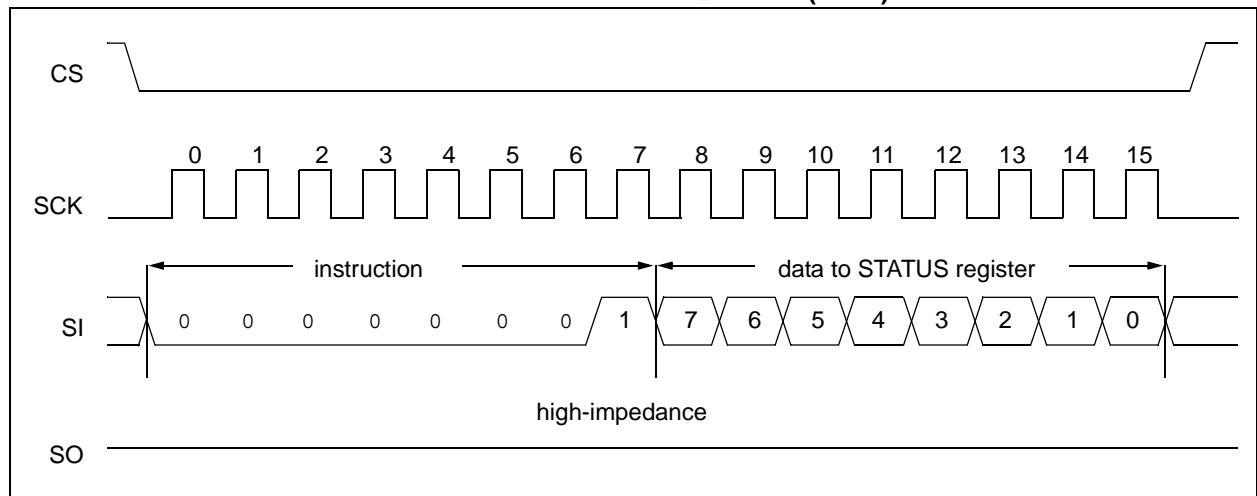

The Write-Protect Enable (WPEN) bit is a nonvolatile bit that is available as an enable bit for the  $\overline{WP}$  pin. The Write-Protect ( $\overline{WP}$ ) pin and the Write-Protect Enable (WPEN) bit in the STATUS register control the programmable hardware write-protect feature. Hardware write protection is enabled when  $\overline{WP}$  pin is low and the WPEN bit is high. Hardware write protection is disabled when either the  $\overline{WP}$  pin is high or the WPEN bit is low. When the chip is hardware write-protected, only writes to nonvolatile bits in the STATUS register are disabled. See Table 2-4 for a matrix of functionality on the WPEN bit.

See Figure 2-7 for the  $WRSR$  timing sequence.

**TABLE 2-3: ARRAY PROTECTION**

BP1	BP0	Array Addresses Write-Protected
0	0	none
0	1	upper 1/4 (6000h-7FFFh)
1	0	upper 1/2 (4000h-7FFFh)
1	1	all (0000h-7FFFh)

**FIGURE 2-7: WRITE STATUS REGISTER TIMING SEQUENCE ( $WRSR$ )**

**Note:** An internal write cycle (TWC) is initiated on the rising edge of  $\overline{CS}$  after a valid write STATUS register sequence.

# 25AA256/25LC256

---

## 2.7 Data Protection

The following protection has been implemented to prevent inadvertent writes to the array:

- The write enable latch is reset on power-up
- A write enable instruction must be issued to set the write enable latch
- After a byte write, page write or STATUS register write, the write enable latch is reset
- $\overline{CS}$  must be set high after the proper number of clock cycles to start an internal write cycle
- Access to the array during an internal write cycle is ignored and programming is continued

## 2.8 Power-On State

The 25XX256 powers on in the following state:

- The device is in low-power Standby mode ( $\overline{CS} = 1$ )
- The write enable latch is reset
- SO is in high-impedance state  $\overline{CS}$
- A high-to-low-level transition on  $\overline{CS}$  is required to enter active state

**TABLE 2-4: WRITE-PROTECT FUNCTIONALITY MATRIX**

WEL (SR bit 1)	WPEN (SR bit 7)	$\overline{WP}$ pin	Protected Blocks	Unprotected Blocks	STATUS Register
0	x	x	Protected	Protected	Protected
1	0	x	Protected	Writable	Writable
1	1	0 (low)	Protected	Writable	Protected
1	1	1 (high)	Protected	Writable	Writable

x = don't care

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

**TABLE 3-1: PIN FUNCTION TABLE**

Name	PDIP/SOIC TSSOP/DFN	Rotated TSSOP	Function
$\overline{\text{CS}}$	1	3	Chip Select Input
SO	2	4	Serial Data Output
$\overline{\text{WP}}$	3	5	Write-Protect Pin
Vss	4	6	Ground
SI	5	7	Serial Data Input
SCK	6	8	Serial Clock Input
$\overline{\text{HOLD}}$	7	1	Hold Input
Vcc	8	2	Supply Voltage

### 3.1 Chip Select ( $\overline{\text{CS}}$ )

A low level on this pin selects the device. A high level deselects the device and forces it into Standby mode. However, a programming cycle which is already initiated or in progress will be completed, regardless of the  $\overline{\text{CS}}$  input signal. If  $\overline{\text{CS}}$  is brought high during a program cycle, the device will go into Standby mode as soon as the programming cycle is complete. When the device is deselected, SO goes to the high-impedance state, allowing multiple parts to share the same SPI bus. A low-to-high transition on  $\overline{\text{CS}}$  after a valid write sequence initiates an internal write cycle. After power-up, a low level on  $\overline{\text{CS}}$  is required prior to any sequence being initiated.

### 3.2 Serial Output (SO)

The SO pin is used to transfer data out of the 25XX256. During a read cycle, data is shifted out on this pin after the falling edge of the serial clock.

### 3.3 Write-Protect ( $\overline{\text{WP}}$ )

This pin is used in conjunction with the WPEN bit in the STATUS register to prohibit writes to the nonvolatile bits in the STATUS register. When  $\overline{\text{WP}}$  is low and WPEN is high, writing to the nonvolatile bits in the STATUS register is disabled. All other operations function normally. When  $\overline{\text{WP}}$  is high, all functions, including writes to the nonvolatile bits in the STATUS register, operate normally. If the WPEN bit is set,  $\overline{\text{WP}}$  low during a STATUS register write sequence will disable writing to the STATUS register. If an internal write cycle has already begun,  $\overline{\text{WP}}$  going low will have no effect on the write.

The  $\overline{\text{WP}}$  pin function is blocked when the WPEN bit in the STATUS register is low. This allows the user to install the 25XX256 in a system with  $\overline{\text{WP}}$  pin grounded and still be able to write to the STATUS register. The  $\overline{\text{WP}}$  pin functions will be enabled when the WPEN bit is set high.

### 3.4 Serial Input (SI)

The SI pin is used to transfer data into the device. It receives instructions, addresses and data. Data is latched on the rising edge of the serial clock.

### 3.5 Serial Clock (SCK)

The SCK is used to synchronize the communication between a master and the 25XX256. Instructions, addresses or data present on the SI pin are latched on the rising edge of the clock input, while data on the SO pin is updated after the falling edge of the clock input.

### 3.6 Hold ( $\overline{\text{HOLD}}$ )

The  $\overline{\text{HOLD}}$  pin is used to suspend transmission to the 25XX256 while in the middle of a serial sequence without having to retransmit the entire sequence again. It must be held high any time this function is not being used. Once the device is selected and a serial sequence is underway, the  $\overline{\text{HOLD}}$  pin may be pulled low to pause further serial communication without resetting the serial sequence. The  $\overline{\text{HOLD}}$  pin must be brought low while SCK is low, otherwise the HOLD function will not be invoked until the next SCK high-to-low transition. The 25XX256 must remain selected during this sequence. The SI, SCK and SO pins are in a high-impedance state during the time the device is paused and transitions on these pins will be ignored. To resume serial communication,  $\overline{\text{HOLD}}$  must be brought high while the SCK pin is low, otherwise serial communication will not resume. Lowering the HOLD line at any time will tri-state the SO line.

	T	Temperature (I, E)
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code (2 characters for small packages)
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)

**Note:** For very small packages with no room for the Pb-free JEDEC designator (e3), the marking will only appear on the outer carton or reel label.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

# 25AA256/25LC256

## APPENDIX A: REVISION HISTORY

### Revision C (11/03)

Corrections to Section 1.0, Electrical Characteristics.

### Revision D (06/05)

Update package information.

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com), click on Customer Change Notification and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://support.microchip.com>**

In addition, there is a Development Systems Information Line which lists the latest versions of Microchip's development systems software products. This line also provides information on how customers can receive currently available upgrade kits.

**The Development Systems Information Line numbers are:**

1-800-755-2345 – United States and most of Canada

1-480-792-7302 – Other International Locations

## READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

To: Technical Publications Manager  
RE: Reader Response  
Total Pages Sent \_\_\_\_\_

From: Name \_\_\_\_\_  
Company \_\_\_\_\_  
Address \_\_\_\_\_  
City / State / ZIP / Country \_\_\_\_\_  
Telephone: (\_\_\_\_\_) \_\_\_\_\_ - \_\_\_\_\_ FAX: (\_\_\_\_\_) \_\_\_\_\_ - \_\_\_\_\_

Application (optional):

Would you like a reply? \_\_\_Y \_\_\_N

Device: 25AA256/25LC256

Literature Number: DS21822D

Questions:

1. What are the best features of this document?

---

---

2. How does this document meet your hardware and software development needs?

---

---

3. Do you find the organization of this document easy to follow? If not, why?

---

---

4. What additions to the document do you think would enhance the structure and subject?

---

---

5. What deletions from the document could be made without affecting the overall usefulness?

---

---

6. Is there any incorrect or misleading information (what and where)?

---

---

7. How would you improve this document?

---

---

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>		<u>X</u>	-	<u>X</u>	<u>/XX</u>
Device	Tape & Reel			Temp Range	Package
<b>Device:</b>	25AA256			256k-bit, 1.8V, 64-Byte Page, SPI Serial EEPROM	
	25LC256			256k-bit, 2.5V, 64-Byte Page, SPI Serial EEPROM	
	25AA256X			256k-bit, 1.8V, 64-Byte Page, SPI Serial EEPROM, rotated pinout (ST only)	
	25LC256X			256k-bit, 2.5V, 64-Byte Page, SPI Serial EEPROM, rotated pinout (ST only)	
<b>Tape &amp; Reel:</b>	Blank	=		Standard packaging (tube)	
	T	=		Tape & Reel	
<b>Temperature Range:</b>	I	=		-40°C to+85°C	
	E	=		-40°C to+125°C	
<b>Package:</b>	MF	=		Micro Lead Frame (6 x 5 mm body), 8-lead	
	P	=		Plastic DIP (300 mil body), 8-lead	
	SN	=		Plastic SOIC (150 mil body), 8-lead	
	ST	=		TSSOP, 8-lead	
	SM	=		Plastic SOIC (208 mil body), 8-lead	

**Examples:**

- a) 25AA256T-I/SN = 256k-bit, 1.8V Serial EEPROM, Industrial temp., Tape & Reel, SOIC package
- b) 25AA256T-I/ST = 256k-bit, 1.8V Serial EEPROM, Industrial temp., Tape & Reel, TSSOP package
- c) 25LC256-I/P = 256k-bit, 2.5V Serial EEPROM, Industrial temp., P-DIP package
- d) 25LC256T-E/ST = 256k-bit, 2.5V Serial EEPROM, Extended temp., Tape & Reel, TSSOP package
- e) 25LC256XT-I/ST = 256k-bit, 2.5V Serial EEPROM, Industrial temp., Tape and Reel, Rotated TSSOP package

## Sales and Support

### Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### New Customer Notification System

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.
