

PRODUCT OVERVIEW

The D1U86P-W-1600-12-HBxDC products are high efficiency 1600 watt, power factor corrected front end supplies with a 12V main output and a 12V (30W) standby. They have current sharing and up to 8 supplies may be operated in parallel. The supplies may be hot plugged, they recover from overtemperature faults, and have logic and PMBus monitoring and control. Their low profile 1U package and >38.6W/cubic inch power density make them ideal for delivering reliable, efficient power to servers, workstations, storage systems and other 12V distributed power systems.

CURRENT SHARING NOTES

Main Output: Current share is achieved using the droop method. Nominal output voltage (12.41V) is achieved at 1A load and output voltage droops at a rate of 3.10mv per amp increase. Startup of parallel power supplies is not internally synchronized. If more than 1600W combined power is needed, start-up synchronization must be provided by using a common PS_ON signal. To account for $\pm 10\%$ full load current sharing accuracy and the reduction in full load output voltage due to droop, available output power must be derated by 15% when units are operated in parallel.

Standby output can be tied together for redundancy but total combined output power must not exceed 30W for 12V or 20W for 3.3V, Internal MOSFET ORing devices are used.
