

Evaluation Kit for Sensirion's Differential Pressure Sensors of the SDP800 Series

Sensirion's EK-P5 evaluation kit provides a straightforward and cost-effective option for testing the differential pressure sensors of the SDP800 series.

The set consists of a USB stick that is connected to the SDP810-500Pa sensor by an adapter cable. With the software, which is available online for download, the differential pressure sensor can be tested under realistic conditions by following simple installation steps. Consequently, there is no need to program a microprocessor as the evaluation kit is connected directly to a PC. The included software allows displaying measured values on the screen and additionally provides the option of exporting the data to an Excel datatype. This enables the data to be saved and processed in a simple manner.
