2.Summary

TFT 10.1" is a IPS transmissive type color active matrix TFT liquid crystal display . In-Plane Switching (IPS) was one of the first refinements to produce significant gains in the light-transmissive characteristics of TFT panels. It is a technology that addresses the two main issues of a standard twisted nematic (TN) TFT display: colour and viewing angle.

3. General Specifications

■ Screen Diagonal: 10.1 inch

■ Number of Pixels: 1280 x 3(RGB) x 800 dots

■ Module dimension: 229.34 x 148.98 x 4.8 mm

■ Active area: 216.96 (H) x 135.6(V) mm

■ Pixel pitch: 0.1695 x 0.1695 mm

■ Display Mode: Normally Black

■ Pixel Arrangement: R.G.B. Vertical Stripe

■ Backlight Type: LED,Normally White

■ Aspect Ratio: 16:9

■ Electrical Interface (Logic): LVDS

■ With /Without TP: With RTP

Surface: Anti-Glare

*Color tone slight changed by temperature and driving voltage.

4.Interface

Interface Connector

A 40pin connector is used for the module electronics interface. The recommended model is F62240-H1210B manufactured by Vigorconn.

Note 1: Definition of viewing angle range

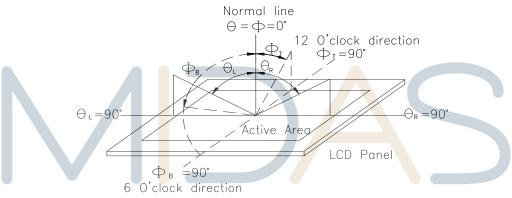

Fig. 9.1. Definition of viewing angle

Note 2: Test equipment setup:

After stabilizing and leaving the panel alone at a driven temperature for 10 minutes, the measurement should be executed. Measurement should be executed in a stable, windless, and dark room. Optical specifications are measured by Topcon BM-7 or BM-5 luminance meter 1.0° field of view at a distance of 50cm and normal direction.

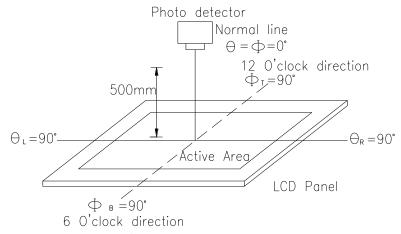

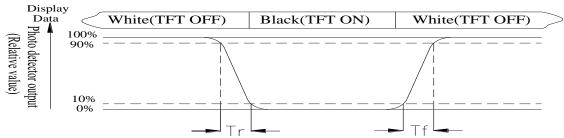

Fig. 9.2. Optical measurement system setup

Note 3: Definition of Response time:

The response time is defined as the LCD optical switching time interval between "White" state and "Black" state. Rise time, Tr, is the time between photo detector output intensity changed from 90% to 10%. And fall time, Tf, is the time between photo detector output intensity changed from 10% to 90%

Note 4: Definition of contrast ratio:

The contrast ratio is defined as the following expression.

Contrast ratio (CR) = Luminance measured when LCD on the "White" state

Luminance measured when LCD on the "Black" state

Note 5: White $Vi = V_{i50} \pm 1.5V$

Black Vi = V_{i50} ± 2.0V

"±" means that the analog input signal swings in phase with VCOM signal.

"±" means that the analog input signal swings out of phase with VCOM signal.

The 100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 6: Definition of color chromaticity (CIE 1931)
Color coordinates measured at the center point of LCD

Note 7: Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.
