## **1** Introduction

This document details the procedure to setup and use the **BCM4343W IoT Starter Kit** for easy prototyping of cloud-connected IoT designs.

The Starter Kit is unique in that it also facilitates rapid transition from development to production using the pre-certified wireless SoC module. It features an Arduino<sup>™</sup> form-factor carrier fitted with a pre-certified **Avnet BCM4343W SoC module** that combines advanced Cypress® 802.11 b/g/n WiFi and Bluetooth® 4.1 combo SoC, together with 8Mb SPI Serial Flash and STM32F411 ARM® Cortex<sup>™</sup> M4 Microcontroller (with 512KB Flash, 128KB RAM)

Figure 1 – BCM4343W SoC Module

MCU interface peripherals can be connected to a wide range of expansion boards via:

- 1. Arduino-compatible header connectors, as well as
- 2. The Pmod<sup>™</sup>-compatible 2x6 peripheral connector

Various options are provided for cloud-connected application development: **Amazon Web Services (AWS IoT)** examples are provided within Cypress WICED<sup>™</sup> Studio **IBM Bluemix (Watson IoT)** examples based on ZentriOS SDK are provided on the CloudConnectKits website (see detail on next page)

## 2 What's Inside the Box?

#### 2.1 BCM4343W IoT Starter Kit Kit contents

- Avnet BCM4343W IoT Starter Kit board (part#: AES-EVB-BCM4343W-G)
- MicroUSB cable
- Quick Start Card (with instructions on how to run the AWS IoT Shadow demo)

## 3 What's on the Web?

Documents are located at: www.cloudconnectkits.org

- Getting Started Guide
- Hardware User Guide
- Schematics
- Bill Of Materials
- PCB Layout (Gerber files)
- Mechanical Drawing
- Avnet BCM4343W IoT Starter Kit Brochure
- Avnet BCM4343W SoC Module Brochure

### 3.1 Tutorials and Reference Designs:

These are located under the "**Startup Files & Reference Designs**" tab at: http://cloudconnectkits.org/product/avnet-bcm4343w-iot-starter-kit

- AV01: Connect to IBM Watson IoT using Avnet BCM4343W IoT Starter Kit
- AV02: Sending Alerts from BCM4343W IoT Starter Kit using IBM Bluemix
- AV03: WICED Sense BLE data publish to IBM Bluemix via BCM94343W\_AVN
- AV04: Alexa Voice-Controlled Smart Home demo using BCM4343W IoT Starter Kit and IBM Bluemix
- AV05 Sending Alerts from BCM4343W IoT Starter Kit Alexa Voice-Controlled Smart Home Demo (v1.1)
- AV06: WICED Sense2 BLE Tag to IBM Bluemix demo
- AV07 Creating Dashboards Using Bluemix Services (v1.1)
- AV08: Sensor-to-Cloud Using TI SensorTag and Watson IoT Quickstart
- AV09: Zentri to IBM Bluemix Notifications and Visualizations
- AV10: NXP 3D Shield LED Matrix demo
- AV11 Webpage Controlled LED Matrix Display (ZentriOS, Wi-Fi v1.0)

### 3.2 Trainings and Videos:

Accessible under: http://cloudconnectkits.org/product/avnet-bcm4343w-iot-starter-kit

### 3.3 BCM4343W IoT Starter Kit Key Features

- Arduino<sup>™</sup> form-factor baseboard
- Pre-certified Avnet BCM4343W SoC Module
  - WiFi + BLE + MCU module
  - STM32F411 ARM® Cortex™ M4 MCU (512KB Flash, 128KB SRAM)
  - 8Mb SPI Serial Flash
  - Supports 802.11 b/g/n and Bluetooth 4.1 (with upgrade path to Bluetooth 4.2)
  - Dual fractal PCB antennas supporting antenna diversity
  - Onboard connectors for dual external antennas
- Arduino compatible shield expansion connectors
  - GPIO (4), Analog inputs (3)
  - 2x I2C ports (1 shared), 1x SPI port, 2x UARTs (1 shared)
  - Peripheral expansion connector (Pmod-compatible, 2x6 format)
  - I2C port (shared)
- USB-based JTAG debugger/ programmer and serial UART port
- 1x Reset push button switch, 1x User push button switch
- 2x User LEDs
- 4x Status LEDs (UART, JTAG and WLAN activity LEDs, plus 3V3 Power LED)
- 1x Ambient light sensor
- USB Powered (5V), onboard high capacity 5V to 3.3V regulated supply

Figure 2 – BCM4343W IOT STARTER KIT – Feature Identification

Figure 4 – AWS IoT Page 7

### 3.4 Overview: AWS IoT Service

**AWS IOT** is a new managed service that enables Internet-connected **THINGS** (sensors, devices, actuators, apps) to easily and securely interact with each other and the cloud.

A THING / DEVICE reports it's STATE by PUBLISHING messages to a BROKER through TOPICS. A BROKER delivers received messages to all clients SUBSCRIBED to that TOPIC.

**THING SHADOW** is a **JSON** document located in the cloud, used to store and retrieve current **STATE** info for a **THING**. It provides a persistent record of the physical device, which by design typically has only intermittent connection to the Internet.

**RULES ENGINE** evaluates inbound messages published to **AWS IoT**, then transforms and delivers these to AWS Services or External Endpoints (via **AWS SNS** and **AWS Lambda**)

### 3.5 Overview: Out-of-box Shadow Example

This exercises a number of key AWS IoT concepts:

- At launch of the Shadow App, the Starter Kit software retrieves its X.509 CERTIFICATE and PRIVATE KEY that you previously stored in the MCU's DCT flash memory.
- Using these credentials, it then establishes an authenticated, TLS secured connection with the specified MQTT MESSAGE BROKER.
- When the USER Pushbutton is pressed on the Starter Kit,
  - an MQTT protocol message is published to this MQTT Broker and
  - the SHADOW JSON description of USER1 LED status is toggled (ON or OFF)
- From the AWS IoT Console webpage, a User edit to the SHADOW record then demos the ability to remotely control the state of the physical USER1 LED on the Starter Kit

### 3.6 Overview: More Advanced Exercises

This document is currently being updated to exercise more advanced AWS IoT concepts, highlighting their utility in solving real world IoT challenges, as well as making simple code edits within Cypress's WICED SDK software development tool so that sensor data is also sent to the Cloud, eg.

- From AWS IoT Console: Set-up a RULE to action the AWS SNS service to send a text message to User's cellphone, each time the USER button is pressed on the Starter Kit.
- From WICED SDK: Edit the Shadow app so that sensor data (measured ambient light level) is sent to the cloud each time the USER pushbutton is pressed.
- A template for sampling an I2C sensor (via Pmod interface) and publishing this data to AWS IoT will also be provided

## 4 BCM4343W IoT Starter Kit Setup and Operation

### 4.1 AWS IoT Console Procedure

1. Go to Amazon **Web Services** website and register a new user account <u>https://aws.amazon.com/IoT</u>

- 2. A credit card number will be requested when registering but you will not incur any cost unless the AWS Free Tier limit is exceeded, ie. 250,000 messages per month
- 3. Once registered, sign-in to Amazon's general AWS Management Console.

🎁 Services 🗸 Reso	urce Groups 🗸 🔭		Avnet 👻 N. Virginia 🔺	Support 🗸

4. **Note**: Before going any further, ensure that the **US East** server region (N. Virginia) is selected!

(Correct the region by selecting **US East (N.Virginia)** from the drop-down list)

5. Click on either the AWS IoT icon or "AWS IoT" under the Internet of Things category to proceed to AWS IoT Console

6. Click on Get started followed by click on Create a Thing

- 7. Enter a unique name for your board. In the example shown, "**starterkit\_4431**" was used (ie. includes last 4 digits from board's serial number label)
- 8. Click on Create

#### 9. Click on View Thing

10. Click on Connect a Device

- 11. Click on Embedded C followed by click on Generate Certificate and Policy
- 12. Click on each of the three download links. Use Windows file-explorer to move the downloaded keys and certificate file to a suitable folder, eg. **\AWS\_IoT\_Credentials**
- 13. Click on Confirm and Start Connecting

14. Take a screenshot of the reported #define values (is a useful reference) then click on **Return to Thing Detail** 

OpenSSL     OpenSSL     mbed-TLS     Set up the SDK using the instructions in our README on GitHub. - 15. At this stage your Starter Kit has been fully provisioned with attachment of an active authentication certificate and policy. Certificates are used to link together the Policy and the Thing for secure authentication with AWS IoT.
- 16. This can be checked at any time by clicking on your Thing (eg. starterkit\_4431)

17. Followed by clicking on the Linked Certificate Show All link (which automatically turns to "Hide All" after clicking)

- 18. Next, click on the certificate shown. Viewed from this perspective you should see:
  - a. The Policy (eg. starterkit\_0040\_Policy) , and
  - b. The Thing (eg. starterkit\_0040)

	Subject	CN=AWS IoT Certificate				
	Created date	Nov 14, 2016 6:16:08 PM -0800				
	Effective date Nov 14, 2016 6:14:08 PM -0800

	Select all	Detach 🛓				
	starterkit_4431-	starterkit_4431				
	Policy					
J.	7 0	2° -				

- 19. Your setup in AWS IoT Console is now complete!
- 20. Next, proceed to the board configuration: the writing of certificate, key and network configuration details into the flash memory of your BCM4343W IoT Starter Kit...

PS: You can return to the AWS IoT Console at any time by going to: https://console.aws.amazon.com/iot/home?region=us-east-1

#### BCM4343W IoT Starter Kit Board Configuration

- 21. Connect the provided USB cable from the BCM4343W IoT Starter Kit to your computer, the 3V3 power LED will illuminate.
- 22. Connect your computer's Wi-Fi to **WICED\_AWS** (the SSID of WICED module in SoftAP mode). When prompted, enter a password of **12345678**
- 23. Enter IP address **192.168.0.1** into your internet browser, this will take you to a webpage served by the board, this is where you define the Thing Name, upload your AWS certificate and Private Key, as well as selecting a suitable Wireless Access Point.

24	Thing Name <u>starterkit</u> 4431	
	Upload Certificate and Key :	
25	Choose File No file chosen Upload Certificate	25
26	Choose File No file chosen Upload ke	26

### WICED<sup>™</sup> AWS IOT Service

- 24. Enter the same **Thing Name** that you used in AWS IoT Console (eg. **starterkit\_4431**), Follow this by clicking on the adjacent Thing Name **Save Settings** button.
- 25. Choose the AWS certificate file that was attached in AWS IoT Console to your Thing (eg. 6ae5bf0d7c-certificate.pem.crt in the example slides previously shown) Follow this by clicking on the adjacent Upload Certificate button.
- 26. Choose the AWS private key file that was downloaded at same time as the certificate for your Thing (eg. 6ae5bf0d7c-private.pem.key in the example previously shown) Follow this by clicking on the adjacent **Upload Key** button.

(A completed progress bar and "Transfer Complete" message should display for both the certificate and key uploads)

27. With the AWS credentials now written to DCT flash memory, proceed to configuring your network settings. Click on the Wi-Fi Set button, this will take you to a new webpage that displays a listing of SSIDs reported from the module's local scan

Broadcom WICED Dev >					Peter =	. 🗆	x
← → C 🗋 192.168.0	.1/config/scan_pag	e_outer.html			<u>م</u>	C	≡
BROADCOM.	WICED™	Device	Configurati	on			_
✓ Scan Complete							
< Device Setup							
2WIRE872				â	00000		
Password	Connect		Ŀ,				
OWNED DC				A	al		

- 28. Select the **SSID** of the desired Wireless A/P, enter the applicable **Password**, then click on the **Connect** button.
- 29. If attempting to connect to a Wireless A/P that does not broadcast it's SSID, use the **Add Network manually** option that is listed...

dd network manually 29
dd Via WPS

30. After connection is made with the selected Wireless A/P, the webpage will darken and the following message will display:

- Your Starter Kit is now configured for communication with the AWS IoT Services and the board exits configuration mode and commences running the Shadow App. (Board resets will now auto-connect to selected Wireless A/P and launch the App)
- 32. If needing to re-upload different AWS certificate and key, or connect to a different Wireless A/P, perform a hard reset by holding SW2 for 5 seconds during Reset (this clears the module's DCT memory and again launches the SoftAP mode)

### 4.2 Simple Exercise: Run the Out-of-Box "Thing Shadow" Application

33. To commence testing the Shadow application, your internet browser needs to be displaying the AWS IoT Console page, with your Starter Kit "Thing" selected. The goal is to securely transfer data from your device into the AWS portal, as boxed on the right of the image below.

34. Now press the **SW2** User button on the Starter Kit. This **turns-on USER1** green LED and updates the Shadow state to "**On**" To check Shadow state, view this in the right sidebar "Thing" screen of the AWS IoT Console (- click refresh button to see the changed state)

- 35. Press SW2 again, this turns-off USER1 green LED and updates Shadow state to "Off" (- click refresh button to see the changed state)
- 36. Repeatedly pressing SW2 increments State Version and toggles on/off the JSON descriptor of the Shadow status.
  Note: Screen updates are delayed!
  For immediate updates, click the refresh button

Publish SUCCEEDED for topic [\$aws/things/starterkit_0040/shadow/update]
Button is pressed
Publish SUCCEEDED for topic [\$aws/things/starterkit_0040/shadow/update]

The Starter Kit "**Publishes**" its status to the **update topic** \$aws/things/starter\_kit\_4431/shadow/update/

The Starter Kit "**Subscribes**" to (and takes instruction from) the **delta topic** \$aws/things/starter\_kit\_4431/shadow/update/delta

- 37. Next we will remotely update the physical USER1 LED on the Starter Kit, by publishing to the delta topic, from the IoT Console sidebar in your browser.
- 38. If the User1 LED is currently illuminated, press the User button one more time to turn it OFF. Using the "Thing" screen of the AWS IoT Console still displayed in your browser, select the "Update Shadow" tab and edit the value of the desired status to from "OFF" to "ON" then follow this by clicking Update Shadow
- 39. On clicking this button, the Shadow Thing immediately publishes a JSON update message to the Delta Topic. The Starter Kit which is a Subscriber to the Delta Topic, decodes this message and updates it's USER1 LED accordingly.

### 4.3 Advanced Exercise: Sending Email and SMS Messages

We have completed the basic exercise, verifying Publish and Subscribe operation between the Starter Kit "Thing" and it's persistent cloud-based Shadow JSON record.

Next we will set-up AWS SNS (Simple Notification Service) plus two Rules in AWS IoT to trigger two different SNS services:

- EMAIL message each time the User pushbutton is pressed on Starter Kit
- SMS text message whenever User1 LED is remotely updated from AWS IoT Console

#### 4.3.1 AWS SNS: Setup EMAIL Messaging Topic

Up to this point, AWS IoT was the only service used from Amazon Web Services. For this next exercise, two additional aspects of AWS will be utilized:

- SNS (Notification delivery service: where we define topics and subscriptions)
- **IAM** (Identity and Access Management: to define role and policy)
- 40. Return to the main AWS Console and scroll down to select SNS

#### 41. In SNS, click on Get started

#### 42. Click Create Topic

SNS dashboard	SNS dashboard	SNS dashboard				
Topics Applications	Common actions	Resources				
Text messaging (SMS)	<ul> <li>Create topic Create a communication channel to send messages and subscribe to notifications</li> <li>Create platform application Create a platform application for mobile devices</li> </ul>	You are using the following Amazon SNS resources in the us-east-1 region: Topic 1 Subscriptions 0 Applications 0 Endpoints 0				

43. Fill-in **Topic Name** and **Display Name** as shown, then click **Create Topic** (Display Name is a short label you provide to identify the source of the messages)

Create new topic		
A topic name will be used to o	create a permanent unique identifier called an Amazon Resource Name (ARN).	
Topic name	send_email_topic	0
Display name	AWS-IOT>	0
	Cancel	Create topic

To this **send\_email\_topic** we now need to add a subscription that defines the service and endpoint where the email will be sent to

#### 4.3.2 AWS SNS: Setup EMAIL Subscription to EMAIL Topic

- 44. Back at the SNS Topics page, check the box next to **send\_email\_topic** that has just been created
- 45. Click on Actions then Subscribe to topic

🎁 AWS	- Services	~	Edit 🗸		
SNS Home Topics Applications		Topics       Publish to topic       Create new topic			Actions -
Subscriptions		Filt	er		Edit topic display name
			News		
			Name	ARN	Confirm a subscription
			send_email_topic	arn:aws:	Edit topic policy :send_email_topic
					Edit topic delivery policy
					Delivery Status
					Delete Topics

The Create Subscription dialog box will now open...

For Protocol : select Email

For Endpoint : enter the email address that you'd like messages sent to

Create Subscription				
Topic ARN	arn:aws:sns:us-east-1:474693229845:send_email_topic			
Protocol	Email		-	
Endpoint	username@gmail.com	Ι		
			Cancel Create S	ubscription

- 46. Click on **Create Subscription**
- 47. Click on the Subscriptions on left side of your screen, the new subscription will be listed with a "Pending Confirmation" label.
- 48. Check your email inbox and click on the **Confirm subscription** link in the subscription confirmation email from **AWS-IOT>** that you should have now received

Fri 10/30/2015 6:55 AM AWS-IOT> <no-reply@sns.amazonaws.com> AWS Notification - Subscription Confirmation</no-reply@sns.amazonaws.com>
To Fenn, Peter
You have chosen to subscribe to the topic: arn:aws:sns:us-east-1:474693229845:sns2phone_topic

49. Refresh your SNS browser screen. Your subscription should now list as shown below

### Subscriptions

C	reate Subscription	Request confirmations	Actions -			
Filt	ter					
	Subscription ARN			Protocol	Endpoint	Topic ARN
	arn:aws:sns:us-east-1	email	peter.fenn@	arn:aws:sns:us		

### 4.3.3 AWS SNS: Setup SMS Messaging Topic

50. We will now set-up a 2nd SNS topic for SMS messaging. As before, select **Topics**, then **Create New Topic** 

51. Fill-in **Topic Name** and **Display Name** as shown, then click **Create Topic** (the same Display Name label as before can be used to ID the source of the messages)

Create new topic				
A topic name will be used to	create a permanent unique	e identifier called an Amazon Resource Name (AR	₹N).	
Topic name	send_SMS_topic			0
Display name	AWS-IOT>	ka a second		0
			Cancel	Create topic

To this **send\_SMS\_topic** we will now add a **subscription** that defines the service protocol and the cellphone number where the SMS will be sent to

### 4.3.4 AWS SNS: Setup SMS Subscription to SMS Topic

- 52. Back at the SNS Topics page, check the box next to **send\_SMS\_topic** that has just been created
- 53. Click on Actions then Subscribe to topic

То	pics			
Pu	ıblish to topic	Create new top	Dic	Actions -
Filte	er			Edit topic display name
	Name	AF	RN	Confirm a subscription
	send_email_topi	ic ar	n:aws:	Edit topic policy :send_email_topic
•	send_SMS_topic	c ar	n:aws:	Edit topic delivery policy Send_SMS_topic
7				Delete Topics

54. The **Create Subscription** dialog box will now open...

For Protocol: select SMS

For Endpoint: enter cellphone number where you'd like the messages sent

Create Subscription		
Topic ARN	arn:aws:sns:us-east-1:474693229845:sns2phone_topic	
Protocol	SMS •	
Endpoint	1-206-555-6423	-
	Cancel Create Subscrip	tion

- 55. Click on Create Subscription
- 56. Select Subscriptions on left side of your screen, the new SMS subscription will be listed with a "Pending Confirmation" label.
- 57. Check your cellphone for a subscription confirmation text message from **AWS-IOT>** and follow the on-screen directions...

Page 26

#### 4.3.5 AWS IoT: Setup Rule1: Send EMAIL on User Button Press

58. Clear your AWS IoT Console by selecting **Rules** and deselecting the other resources 59. Click on **Create a resource** 

- 60. Click on **Create a Rule** (you can also get to this step via the "Create a Rule" button at the bottom of Thing Shadow's detail screen)
- 61. Enter/select the values shown below... (Topic filter will be in the following format, with your thing name in lieu of 'starterkit\_XXXX' \$aws/things/starterkit\_XXXX/shadow/update/+)

Create	a thing Create a thing type Create a rule Use my certificate Create a c						
Create a rule							
Create a rule to evaluate ir endpoint such as a Dynam	Create a rule to evaluate inbound messages published into AWS IoT. Your rule can deliver a message to endpoint such as a DynamoDB table.						
Name your rule and add ar	Name your rule and add an optional description.						
Name	Rule1_email_on_button_press						
Description	Send email when User button presse						

Indicate the source of the	nessages you want to process with this rule.
Rule query statement	SELECT * FROM '\$aws/things/starterk:
